The selection of more expensive varieties should include the following: Large trumpets: Apricot, perianth white and trumpet apricot buff; Duke of Bedford, a very fine bicolor; Hodsock Pride, a superb variety, with flowers of large size, the perianth white, and the trumpet rich yellow; Countess of Cadogan, a charming variety, with elegant flowers, the perianth white, and the trumpet primrose; Glory of Leiden, flowers large and of a rich shade of yellow; Madame de Graaff, white perianth, pale primrose trumpet, very beautiful; Weardale Perfection, white perianth, with primrose trumpet. Barri varieties: Dorothy E. Wemyss, white perianth and pale yellow cup; Sensation, primrose, the cup-edged scarlet; Incomparabilis varieties; Brigadier, flowers large, perianth white with yellow cup; Flambeau, yellow, with orange-red cup; Gloria Mundi, yellow, the cup marked with scarlet; Lulworth, white, with orange cup; and Torch, yellow perianth and red cup. Leedsi varieties: Albatross, Ariadne, Elaine, Seagull, Waterwitch, and White Lady are six varieties that can be specially recommended. Nelsoni varieties: Lady Gore Booth and White Wings are two distinct and charming varieties.

BULB CULTURE IN MOSS FIBRE.

As so well known to our readers, Mr. Robert Sydenham has for some years past given special attention to the cultivation of bulbous plants in moss fibre for indoor decoration and achieved much success in his endeavour to popularise this simple method of flower production. At one of the spring exhibitions held this year by the Royal Horticultural Society, Mr. Sydenham offered liberal prizes for hyacinths, tulips, narcissi, and other bulbs grown in moss fibre, and one of the most successful of the exhibitors on that occasion was Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham Common. Impressed by the success achieved by Mr. Howe in the use of moss fibre, we had several of his specimens photographed, and some we have the pleasure of illustrating herewith. Mr. Howe has kindly written, in response to our request, an article fully describing his method of procedure. He writes:

I have much pleasure in giving your readers particulars of the method of procedure which I have found to answer admirably. In preparing the moss fibre it is necessary to see that all lumps are broken up fine, and to each bushel of the fibre add about 7 or 8 lbs. of crushed oyster shell, and about 6 lbs. of crushed charcoal. Mix the materials thoroughly, and add enough water to just moisten the fibre. Let it stand about twenty-four hours before using, by which time it will have greatly increased in bulk.

If used in vases without drainage a few pieces of charcoal should be placed at the bottom of each vase to keep the compost sweet. According to the size of the vase put two or three inches of the fibre on the charcoal, and then place the bulbs in position, as many as may be required for the size of vase. Work the fibre between the bulbs lightly, and cover the latter with an inch of material, but do not press it tightly, as they root better when the compost is loose. Fill up the vases to about an inch below the rim.

When the bulbs are potted they should be plunged in cocoanut fibre refuse or similar material, and covered to a depth of two or three inches, and not watered till the bulbs have made an inch of growth; if possible, glass lights should be placed over them to keep off rain. When they have made the growth as before mentioned they should be taken out of the plunging material and carefully examined, and any that are dry should be given just enough water to moisten the fibre, then placed in a frame for a few days, and covered over with any shading material that may be available. Subsequently they can be exposed to the light, and brought into the greenhouse as required, and from thence to the forcing houses, providing they have made plenty of roots, and whether they have done so or not can easily be ascertained by lifting a little of the fibre with a pointed stick.

The principle point to ensure success in the cultivation of bulbs in moss fibre is careful watering. The fibre must always be kept in a moist state, and any that show signs of being too wet must be placed on their sides, and the water allowed to drain out of the vases. I find a little soot water, weak, is beneficial to them, also weak guano water when the flowers are becoming prominent.

I tried some narcissi and tulips last year in fibre in the ordinary pots, and they did remarkably well, the flowers being quite up to the standard of those grown in soil. This year I shall grow more bulbs in the fibre. The following are the varieties that I grew in fibre last season:

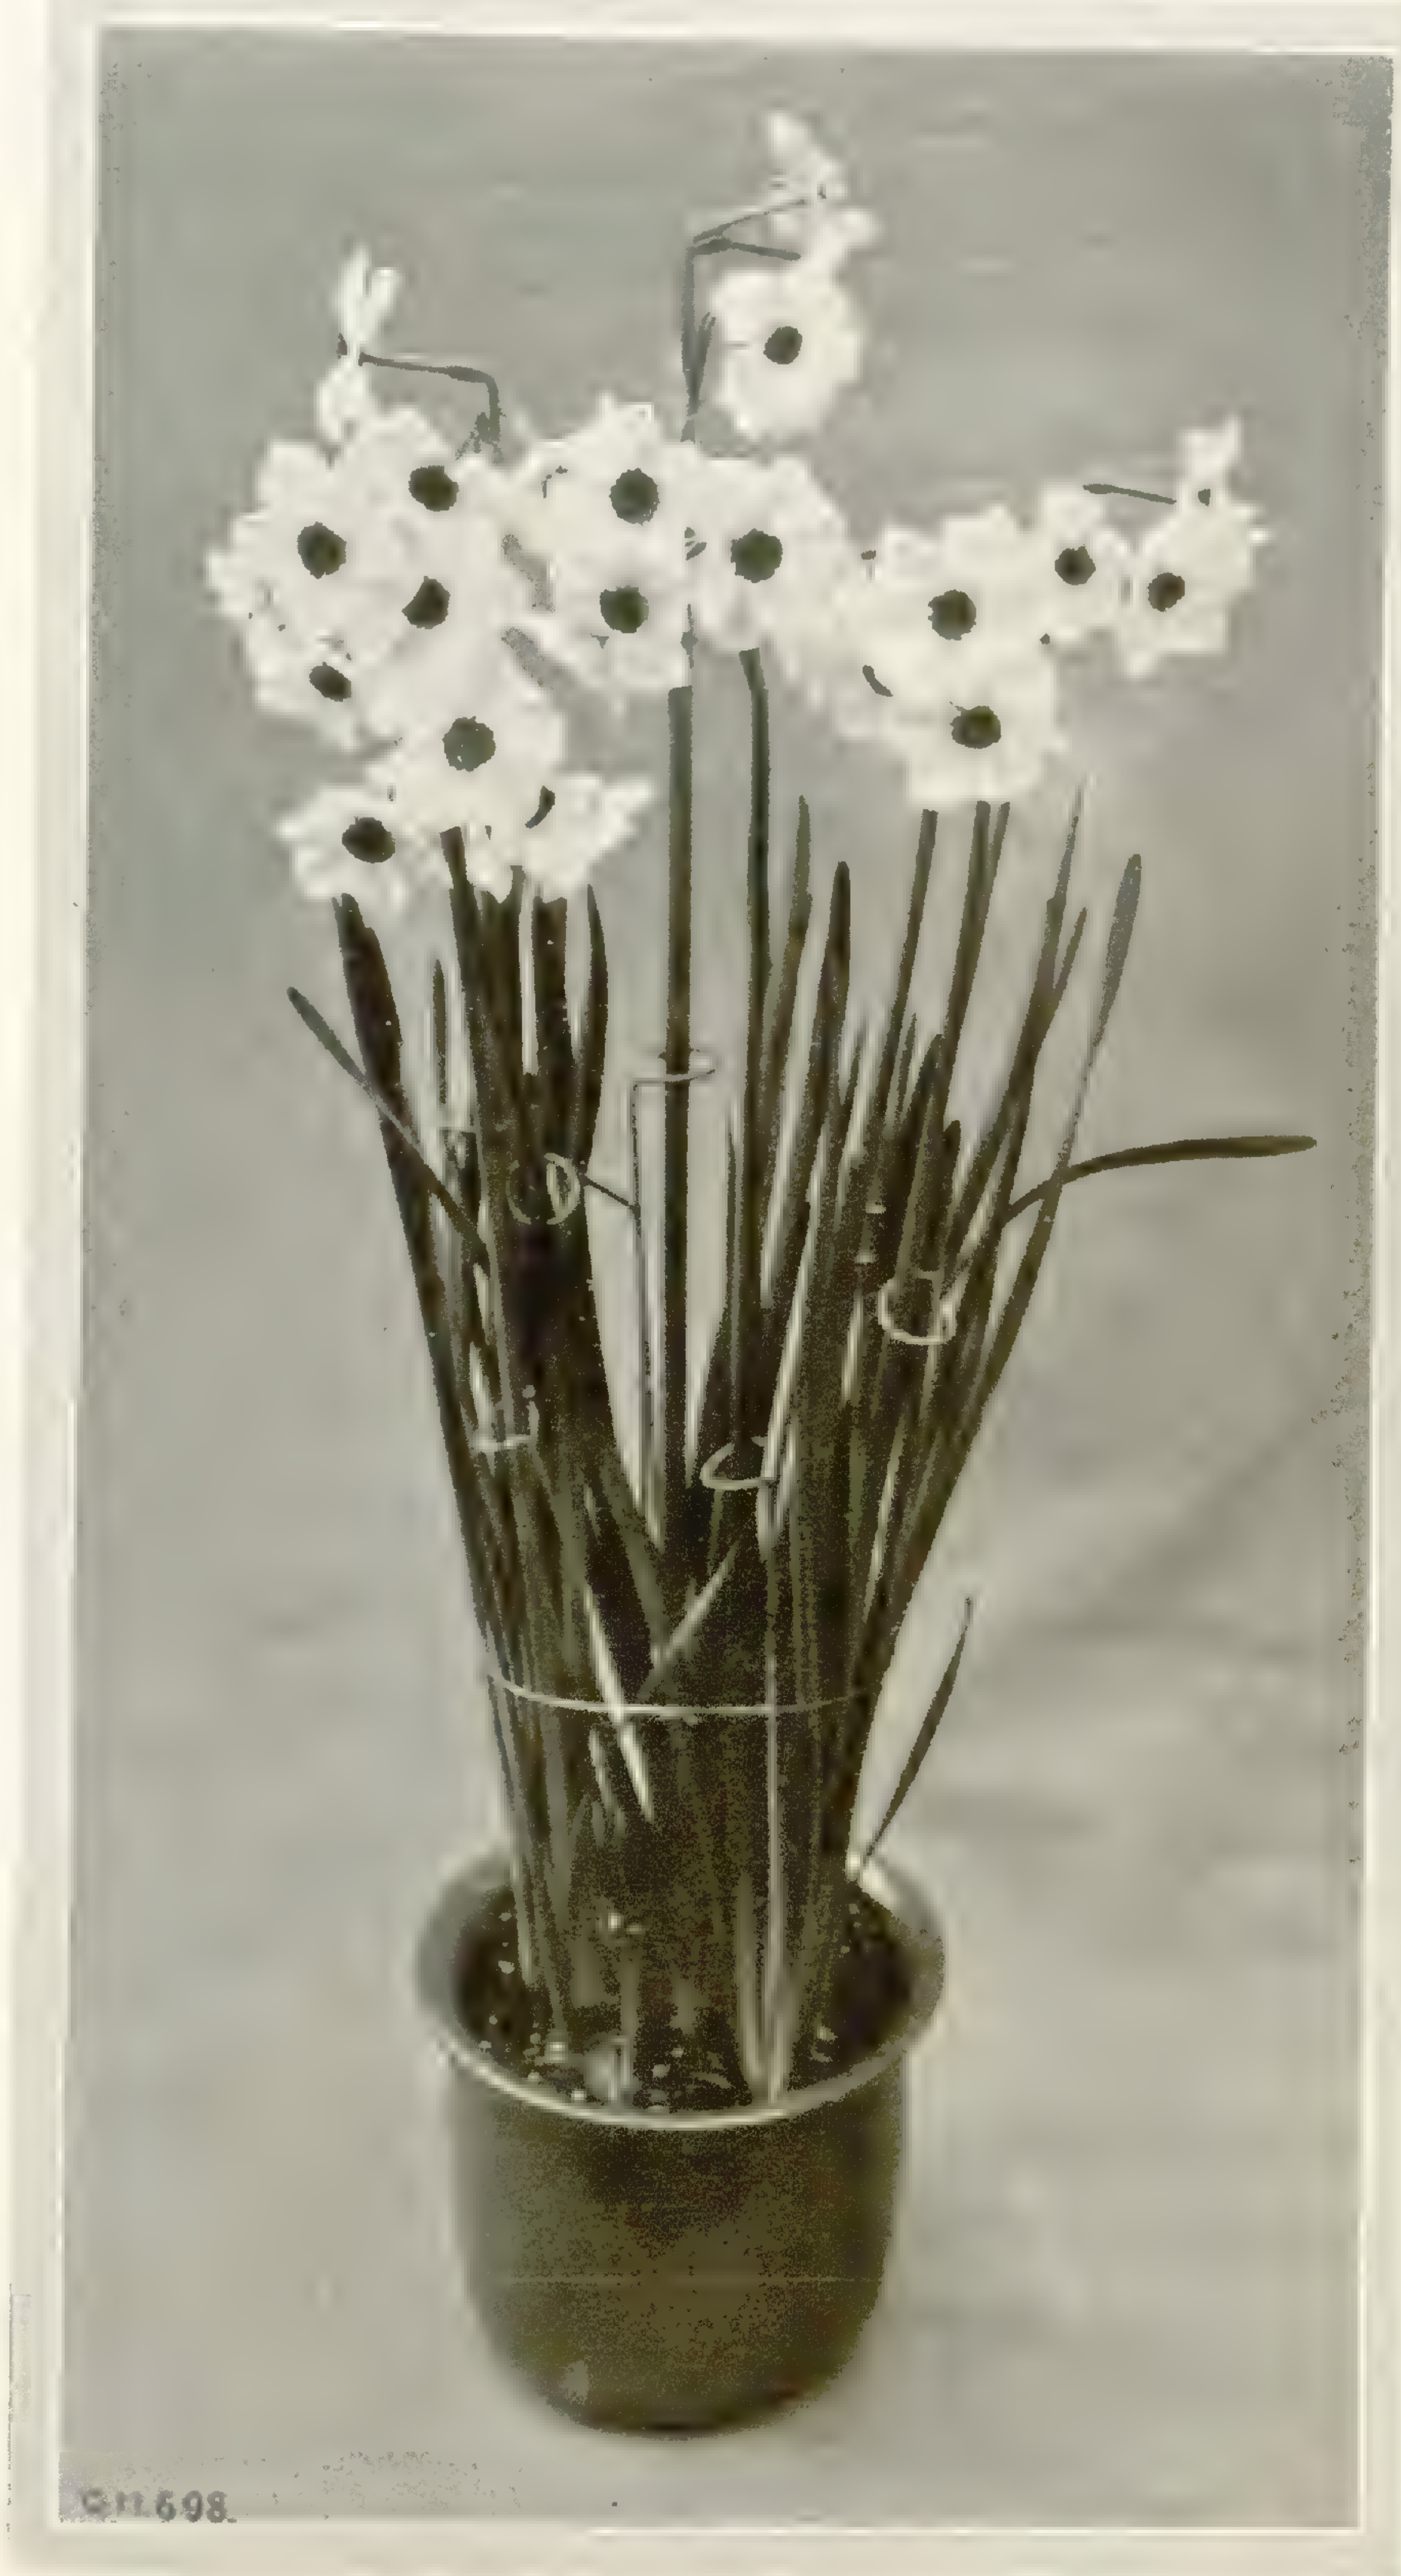
Narcissi.—Emperor, Empress, Golden Spur, Victoria, Madame Plemp, Madame de Graaf, Albicans, Lulworth, Glory of Leiden, Waterwitch, Barri conspicuus, Sir Watkin, Campernelle, Rugulosus, Poetarum, Poetaz Aspasia, Poeticus ornatus, and Van Sion.

Tulips.—Duchesse de Parma, Keizerskroon, La Reine, Mon Tresor, Prince of Austria, Proserpine, Rose Gris de Lin, Thomas Moore, Unique, Van de Neer, Vermilion Brilliant, White Pottebakker, and Grace Darling.

Hyacinths. — Balfour, Grand Lilas, Grand Vedette, Grand Maitre, L'Innocence, Isabella, Jacques, Johan, Koh-i-noor, King of the Blues, King of the Belgians, and La Grandesse.

Wm. Howe.

The Gardens, Park Hill,
Streatham Common.



POETAZ NARCISSUS ASPASIA GROWN IN FIBRE.
A valuable variety for indoor culture; the flowers white with yellow cup.

Rose Madame Isaac Pereire.—This hybrid Bourbon rose is one of the best for growing for the production of cut flowers throughout the summer season. It is a grand variety for training over arches and pergolas, as plenty of space is necessary for the full development of the branches. Severe pruning is, I think, a mistake, except where the plant is growing in very poor soil. I have one very large specimen that I would not like to be without, for it has supplied me with flowers for vases every week since last May, and still bears many buds. The flowers are deliciously fragrant. The only fault I find is the very early buds open with green centres.—G. B.

OUTDOOR CULTURE OF HIPPEASTRUMS.

The culture of these bulbous plants has hitherto been under glass, and therefore to advocate their being planted in the open may at first appear somewhat startling. Yet, when we consider the origin of the progenitors of the present-day hippeastrums, there appears to be no reason why we should not grow them outside in suitable positions, and there are spots in many gardens where these bulbs might be planted. Where the culture of hippeastrums is taken up it very often occurs that in growing on seedlings one obtains more bulbs than the space at command will accommodate, for friends will not always take the surplus, and one hesitates, after growing them to the flowering stage, to throw them away; hence the question as to what to do with the surplus arises.

There are in many gardens narrow borders of 18in. or so width, in front of houses or pits, that cannot be utilised for many subjects, and in such places the surplus bulbs can be planted. If protection from heavy rains and severe frosts is given, such borders furnish an ideal place for the purpose. Excessive wet would be the chief thing to guard against, as the winter is the period of rest for these bulbs. Except in very severe frost the warmth from the houses would keep them safe in that respect.

The position here described is what the plants would also enjoy during the summer months, and an occasional watering during that period would supply their needs.

Under such conditions I have seen as fine flowers produced as the same bulbs would give cultivated in pots under glass. The bulk of the plants grown in pots will now be gradually ripening up, and when they have matured and are dormant the autumn provides a suitable time for transferring any not required to the narrow borders mentioned. A prepared bed is not necessary for the bulbs, and if the staple consists of fairly good garden soil, it will answer well for their culture.

T. H. Slade.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read the Second Edition of CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE, by D. B. Crane, price 2s. 6d. net; or by post, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

BULBS FOR MID-WINTER DECORATIONS.

The flowers of bulbous plants are so thoroughly appreciated by everyone at the present time that there is a great demand for them in a cut state, and for the plants for conservatory and room decoration. No doubt much of their popularity is due to the ease and rapidity with which they may be had in bloom, and there are very few places where they are not required in bloom quite by Christmas, or as soon after as possible. The flowering of bulbous plants in these days of cold storage is nothing like so difficult a matter as was the case a few years ago, and a quite respectable display of bulbs may be had at midwinter, providing, of course, one has suitable accommodation for them.

HYACINTH JACQUES GROWN IN FIBRE.
A charming variety; the flowers bright pink.

Where house room is limited, and cut flowers are in great demand, bulbs are especially welcome, and it is really wonderful the many batches that may be passed through one house during the season. Now, to obtain good results in the early forcing of all kinds of bulbs an early commencement is essential, and good, firm, well-ripened bulbs must be secured. Although by commencing now a certain degree of success may be achieved, the cultivator cannot hope for the same success as when an earlier start is made. It is not, of course, necessary that the actual forcing should be in process, but the bulbs should all have been potted up, and most of them making roots in the ash bed.

Those who have for many years been forcing bulbs will have their own favourite varieties and methods of forwarding them, but this need not deter me from giving the names of some of the best, and a few notes on their culture. We all know what a simple matter bulb growing in pots is when their flowers are required near their natural time of blooming, but to have them really early there are several very essential points to be borne in mind. The chief one is to have them well rooted before any attempt is made to subject them to artificial heat, and this applies to all classes of bulbs, with perhaps the exception of the lily of the valley.

Liliums.

In large establishments where there is plenty of room liliums should be grown largely for midwinter blooming, as they are splendid subjects for decorative purposes, and the varieties best suited are L. longiflorum, L. speciosum Melpomene, and L. speciosum album Krætzeri. These, of course, must be retarded bulbs from the year previous, and be obtained from cold storage about the end of July or early in August, and potted straight away either singly in 48's, or three in 24's, according to requirements. Nothing suits them better than friable loam and sand, to which has been added some well-broken charcoal. In potting bulbs of the speciosum varieties a little room may be left for a top-dressing, but with the longiflorum bulbs this is not necessary. After potting they should be placed in a fairly cool position out of doors, and the pots just covered either with leaf-mould or old straw litter. Here they will soon make root, and should not be disturbed till the middle or end of September, when they should be brought indoors and given a temperature not higher than 50 to 55 degrees at night, according to the weather, which will promote a steady growth, and it will not be necessary to give them more heat than this till the bloom buds are well formed, or dropped buds will result; but should it be necessary after this the temperature may be raised to 60 or 65 degrees.

During growth watering must be carefully done, and a little liquid manure given them when well rooted, also one or two moderate applications of Peruvian guano may be made, but it is necessary to be very careful about the time the bloom buds are forming. A little air should be given during the day on all favourable occasions, and light fumigations will keep down green-fly. Under this treatment they should flower well, although, of course, the blooms may not be so large or quite as many on a stem as if flowered during July and August.

Freesias.

Freesias are also very much sought after for flowering during the winter, and to have these in good condition during January corms should be secured early in August, and potted seven or eight in each 48-size pot. Use a light compost consisting of loam, leaf-soil, well-rotted manure, and sand. After potting place in a quite cold frame until the young growth is about two inches high, when, if the weather is cold, they may be removed to a slightly heated house, and put on a shelf near the glass. This is even better than allowing them to remain in a heated pit, as the air all round the plants tends to promote a stout growth. Freesias will also take a fair amount of liquid manure when growing freely. The temperature at night even in mild weather should not exceed 60 degrees, and during cold spells 55 degrees will be sufficient, and if this temperature is maintained they will commence to produce their flower spikes early in December.

Fumigation is very apt to injure the tips of the leaves, so that if it is really necessary let it be done lightly, or, better still, syringe the plants with a little soft soap to remove green-fly.

Freesia refracta alba (cultivated corms) will be found to give more satisfaction than those sold ordinarily for that variety, as the flowers come pure white, and are of much better form.

Tulips and Narcissi.

Tulips are, without doubt, the brightest of all winter and spring flowering bulbs, and as early forced subjects I am afraid they are grown with less success than most other bulbs, and one seldom sees any other than the Van Thol varieties in bloom at Christmas, and these are usually so small in flower and short of stem that they are only useful in the making up of small vases. Van Thol, scarlet, and maximus are the two best of this type. A few other really good varieties for early forcing are Rosa Mundi. Huikmann, pink; King of Yellows, Thomas Moore, orange; L'Immaculée, white; and Chrysolora, yellow. The whole of the foregoing varieties should be procured, and potted as early as possible; they should then be covered to the depth of six inches, preferably with old cocoanut-fibre, ashes being somewhat liable to injure the young growth, and left under this till rooting freely, when they may be removed to a house in which a temperature ranging from 50 to 55 degrees is maintained at night. To secure good stems heavy shading will be necessary, two or three thicknesses of coarse tiffany being none too much, so that where part of a house only is used this must be put over them inside, and should not be removed until a few days before the flowers are fit to cut. As they make growth and the buds can be felt well out of the bulb, the temperature of the house may be increased to about 65 degrees, and this latter will be quite necessary to ensure their full development early in January.

JONQUILS IN THE WILD GARDEN.

A delightful effect produced by the judicious use of these fragrant golden flowers in the Royal Gardens, Kew.

Boxes are far the best to use in forcing tulips, as the roots can be kept at a more equable degree of moisture, and it is absolutely essential that they shall not become dry after growth commences.

Narcissi will require practically the same treatment as the tulips up to the time of being taken indoors, but after this somewhat cooler quarters must be afforded them. The earliest to bloom after the Paper White are the varieties Trumpet Major and the Double Van Sion, and these, with a little care, may be had in bloom by Christmas. For following these to bloom about the middle of January, Poeticus ornatus, Golden Spur, and Victoria are of much value; the last-named I consider one of the finest of all narcissi for pot culture.

Roman Hyacinths and Lily of the Valley.

Roman hyacinths are, in my opinion, the most easily forced of all bulbs, and they are usually over by the middle of January, but their graceful spikes of bloom are so useful for table decoration in conjunction with other flowers, and when well grown in pots are so valuable in the conservatory that they might with advantage be had in bloom over a longer period. For following these closely the blue and white Italian hyacinths are also useful. In many instances they are preferred to the more formal Dutch hyacinths that follow them along rather later in the season.

Another very pretty bulb that may be had in bloom quite early in the year is Iris reticulata, and although not of much service for the supply of cut flowers, a few examples arranged amongst other plants produce a very pleasing effect.

Lily of the valley flowers are easy of production at any season of the year, and for mid-winter blooming it is best to rely on retarded bulbs; if potted as soon as received and covered with a little moss or fibre, and placed in a house with a temperature at not over 60 degrees, they will in from four to five weeks produce flowers fit for cutting or using in any other way that may be desirable.

Thomas Stevenson.

Woburn Place Gardens.

JONQUILS AND CAMPERNELLES IN GRASS.

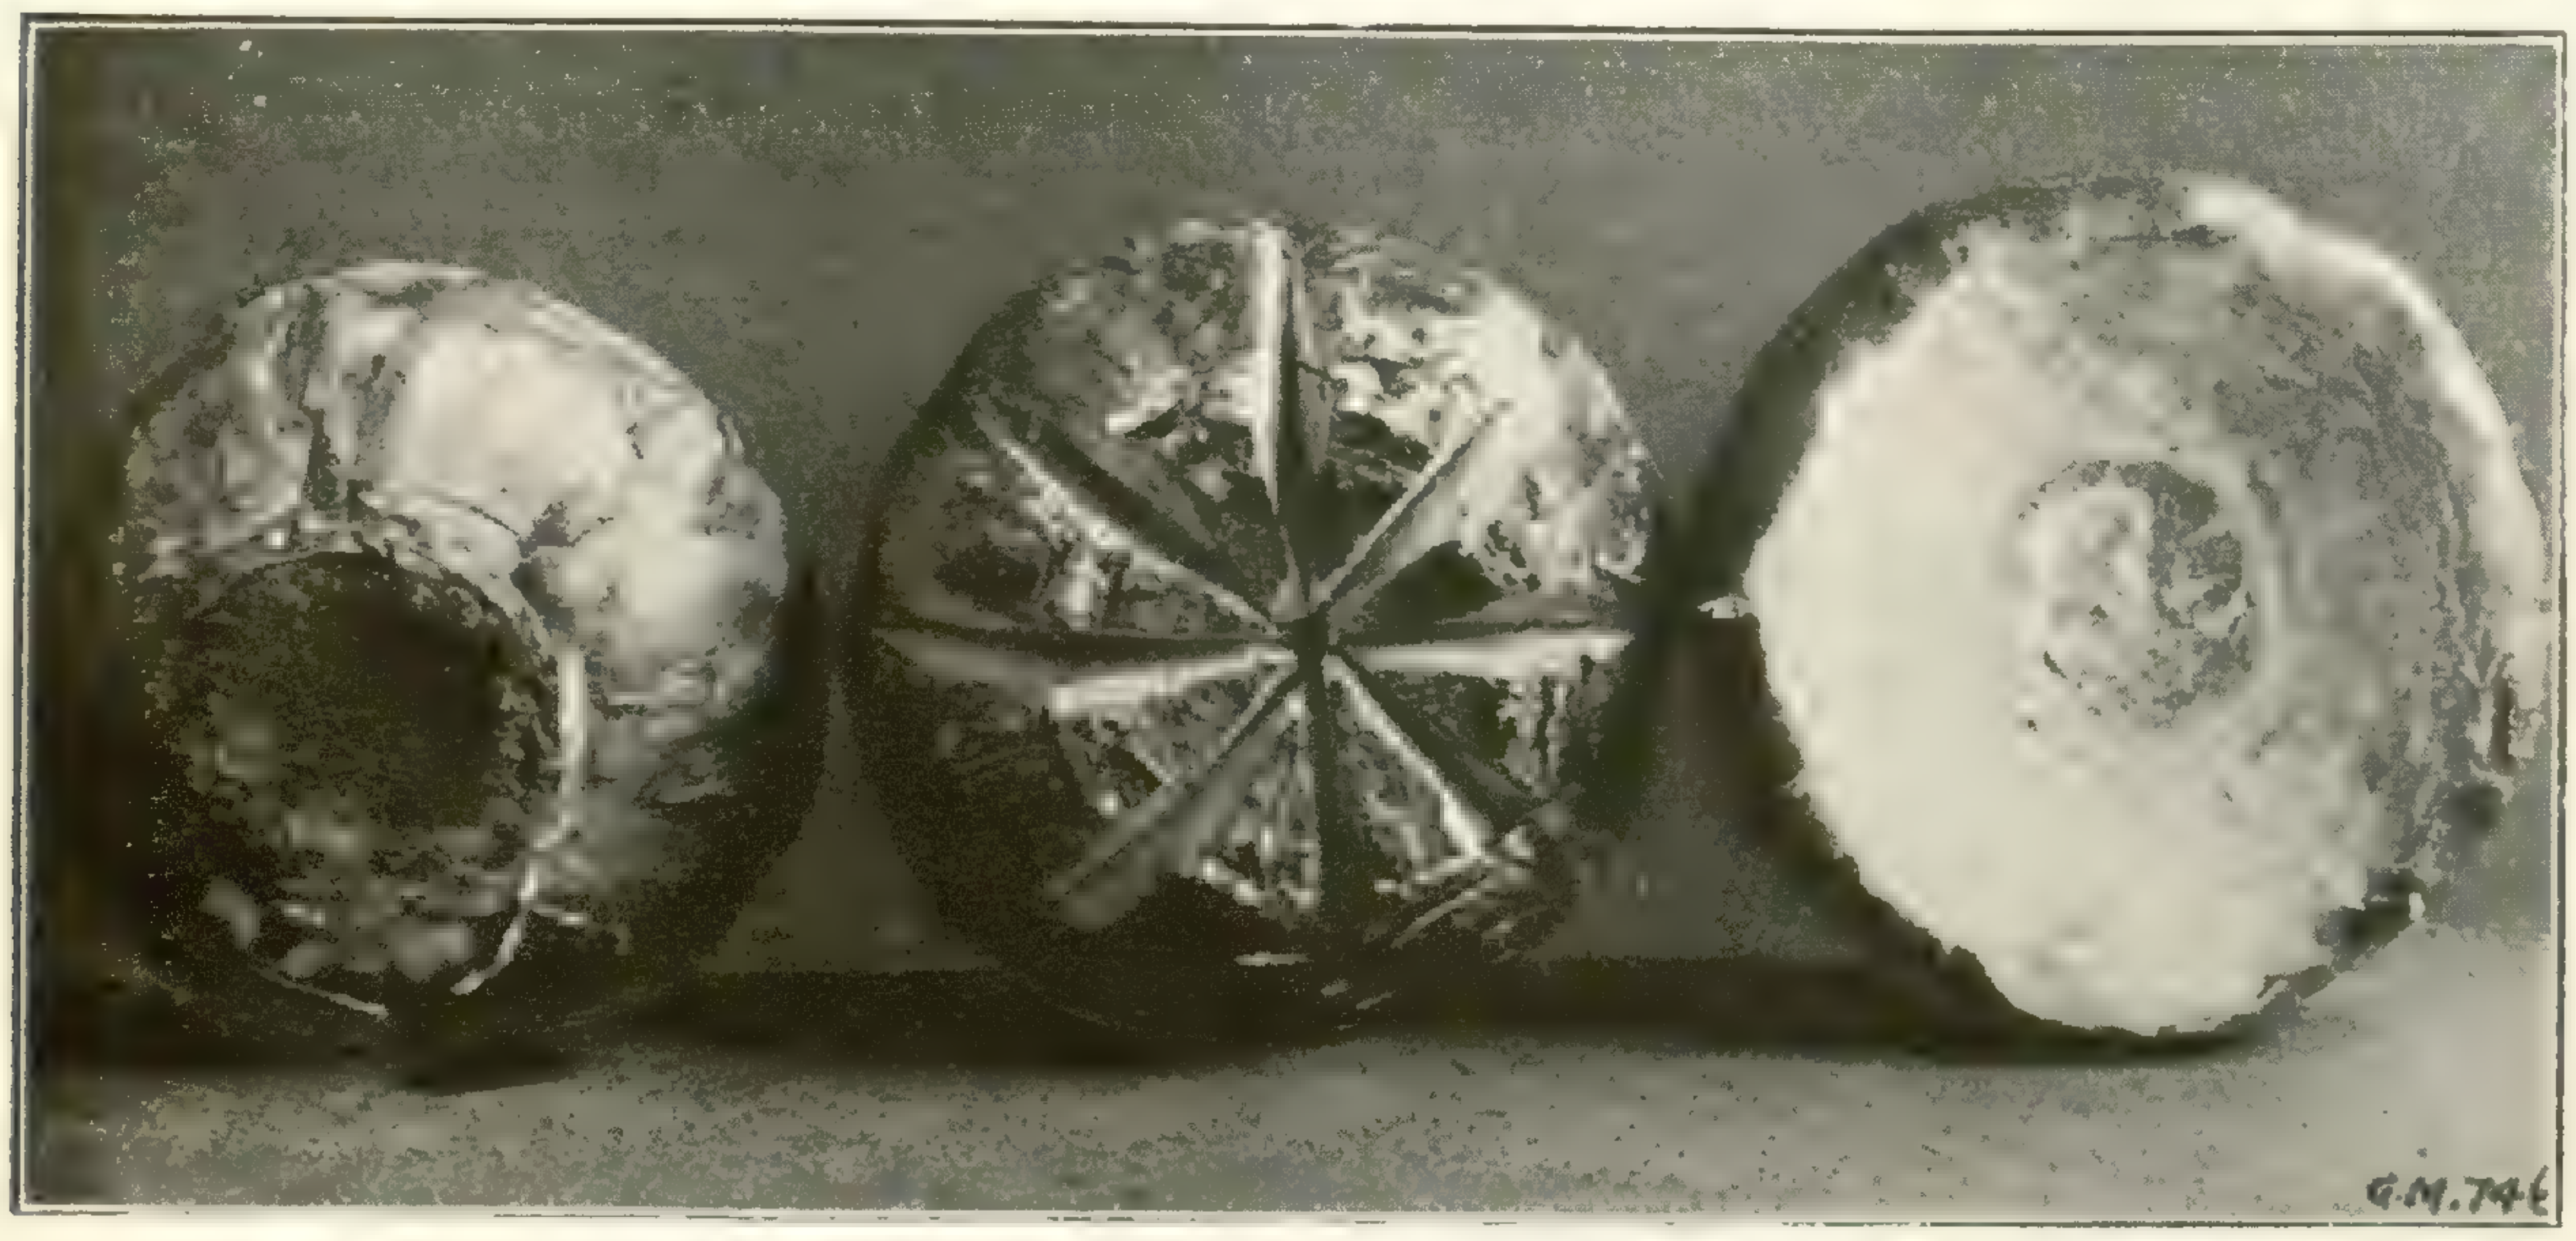
The group of Campernelles which in spring carpet the ground with a golden covering beneath the large group of maples between the Temperate House and Picture Gallery at Kew, always attract a goodly share of attention from visitors, for, in addition to being distinct in appearance from the many acres of different kinds of narcissi found in other parts of the gardens, they are attended with a delicious perfume, which scents the air for some distance around. Both the Jonquils and Campernelles are very graceful, with their slender, rush-like leaves, and small flowers borne several together on stems nine to twelve inches high, and, like other narcissi, look far better when growing in a free and natural manner, than when huddled together in beds cut out of a smoothly-shaven lawn. They are, however, not so well fitted for growing amongst coarse, dense grass, as some other sorts are, and ought only to be planted where the grass is moderately thin, or, better still, in a thin wood or plantation where the soil is moderately good. In grass land they last for a number of years, but gradually deteriorate. In more open ground they grow vigorously, and continue to increase in strength. Of the two, the Campernelle, Narcissus odorus, appears to succeed best, being a somewhat stronger grower than the Jonquil, Narcissus jonquilla.

W. Dallimore.

Beet.—Frost is likely to damage beet if left too long, and it is wise to lift the crop before this is likely to happen. Preserve the roots intact in lifting the crop by working a fork well under them to loosen the soil.—C. F.

PROPAGATION OF HYACINTHS.

Along the west coast of the Continent there is no country so liberally supplied with water as Holland. Everyone has a place to live on, but the Dutchman made about the half of his country himself. Very interesting is it that Holland is protected by a mighty dyke of sand, every particle brought in by the waves. So there has formed a strip of land on or above the original peat, consisting mostly of sand. From the dunes along the sea coast, about two or three miles inland, and in length about one hundred miles from Alkmaar to the Hook, is the most beautiful and oldest part of the Netherlands. But few of those who have their hyacinths, tulips, or narcissi on their tables or in their gardens, think of the careful way in which the flower bulbs are produced.



BULBS SHOWING FIRST STAGE OF HYACINTH PROPAGATION.
The left-hand bulb is intact, the middle bulb has had eight cuts across its base, and the right-hand bulb has been hollowed out.

We think it will be very interesting to give your readers some information relating to the propagation and preparation of hyacinths as carried out in Holland. Everyone knows the bulb of the hyacinth, as it comes to us for potting or for planting in beds and borders, but a quantity of full grown bulbs, very sound and big, are kept back by the growers for the increase of stock.

In commencing the work of propagation in summer time, the big bulb is, in our case, hollowed out, as so well shown in the first of the illustrations. It is known that in all bulbous plants roots appear as very small leafbuds, which develop to small bulbs. A second method of producing the same result is to cut the bulbs on the underside over the base crosswise, thus eight cuts from the centre. Both hollowed and cross-cut bulbs are strewn with a drying substance as stentite, peat-ash, lime, etc., to dry the cut surface as soon as possible, as well as to prevent the loss of sap.

Now the bulbs are taken to a room as shown in the second illustration, which is well warmed and ventilated. From floor to ceiling the movable shelves are filled with bulbs, which rest on very small open laths or wire net.

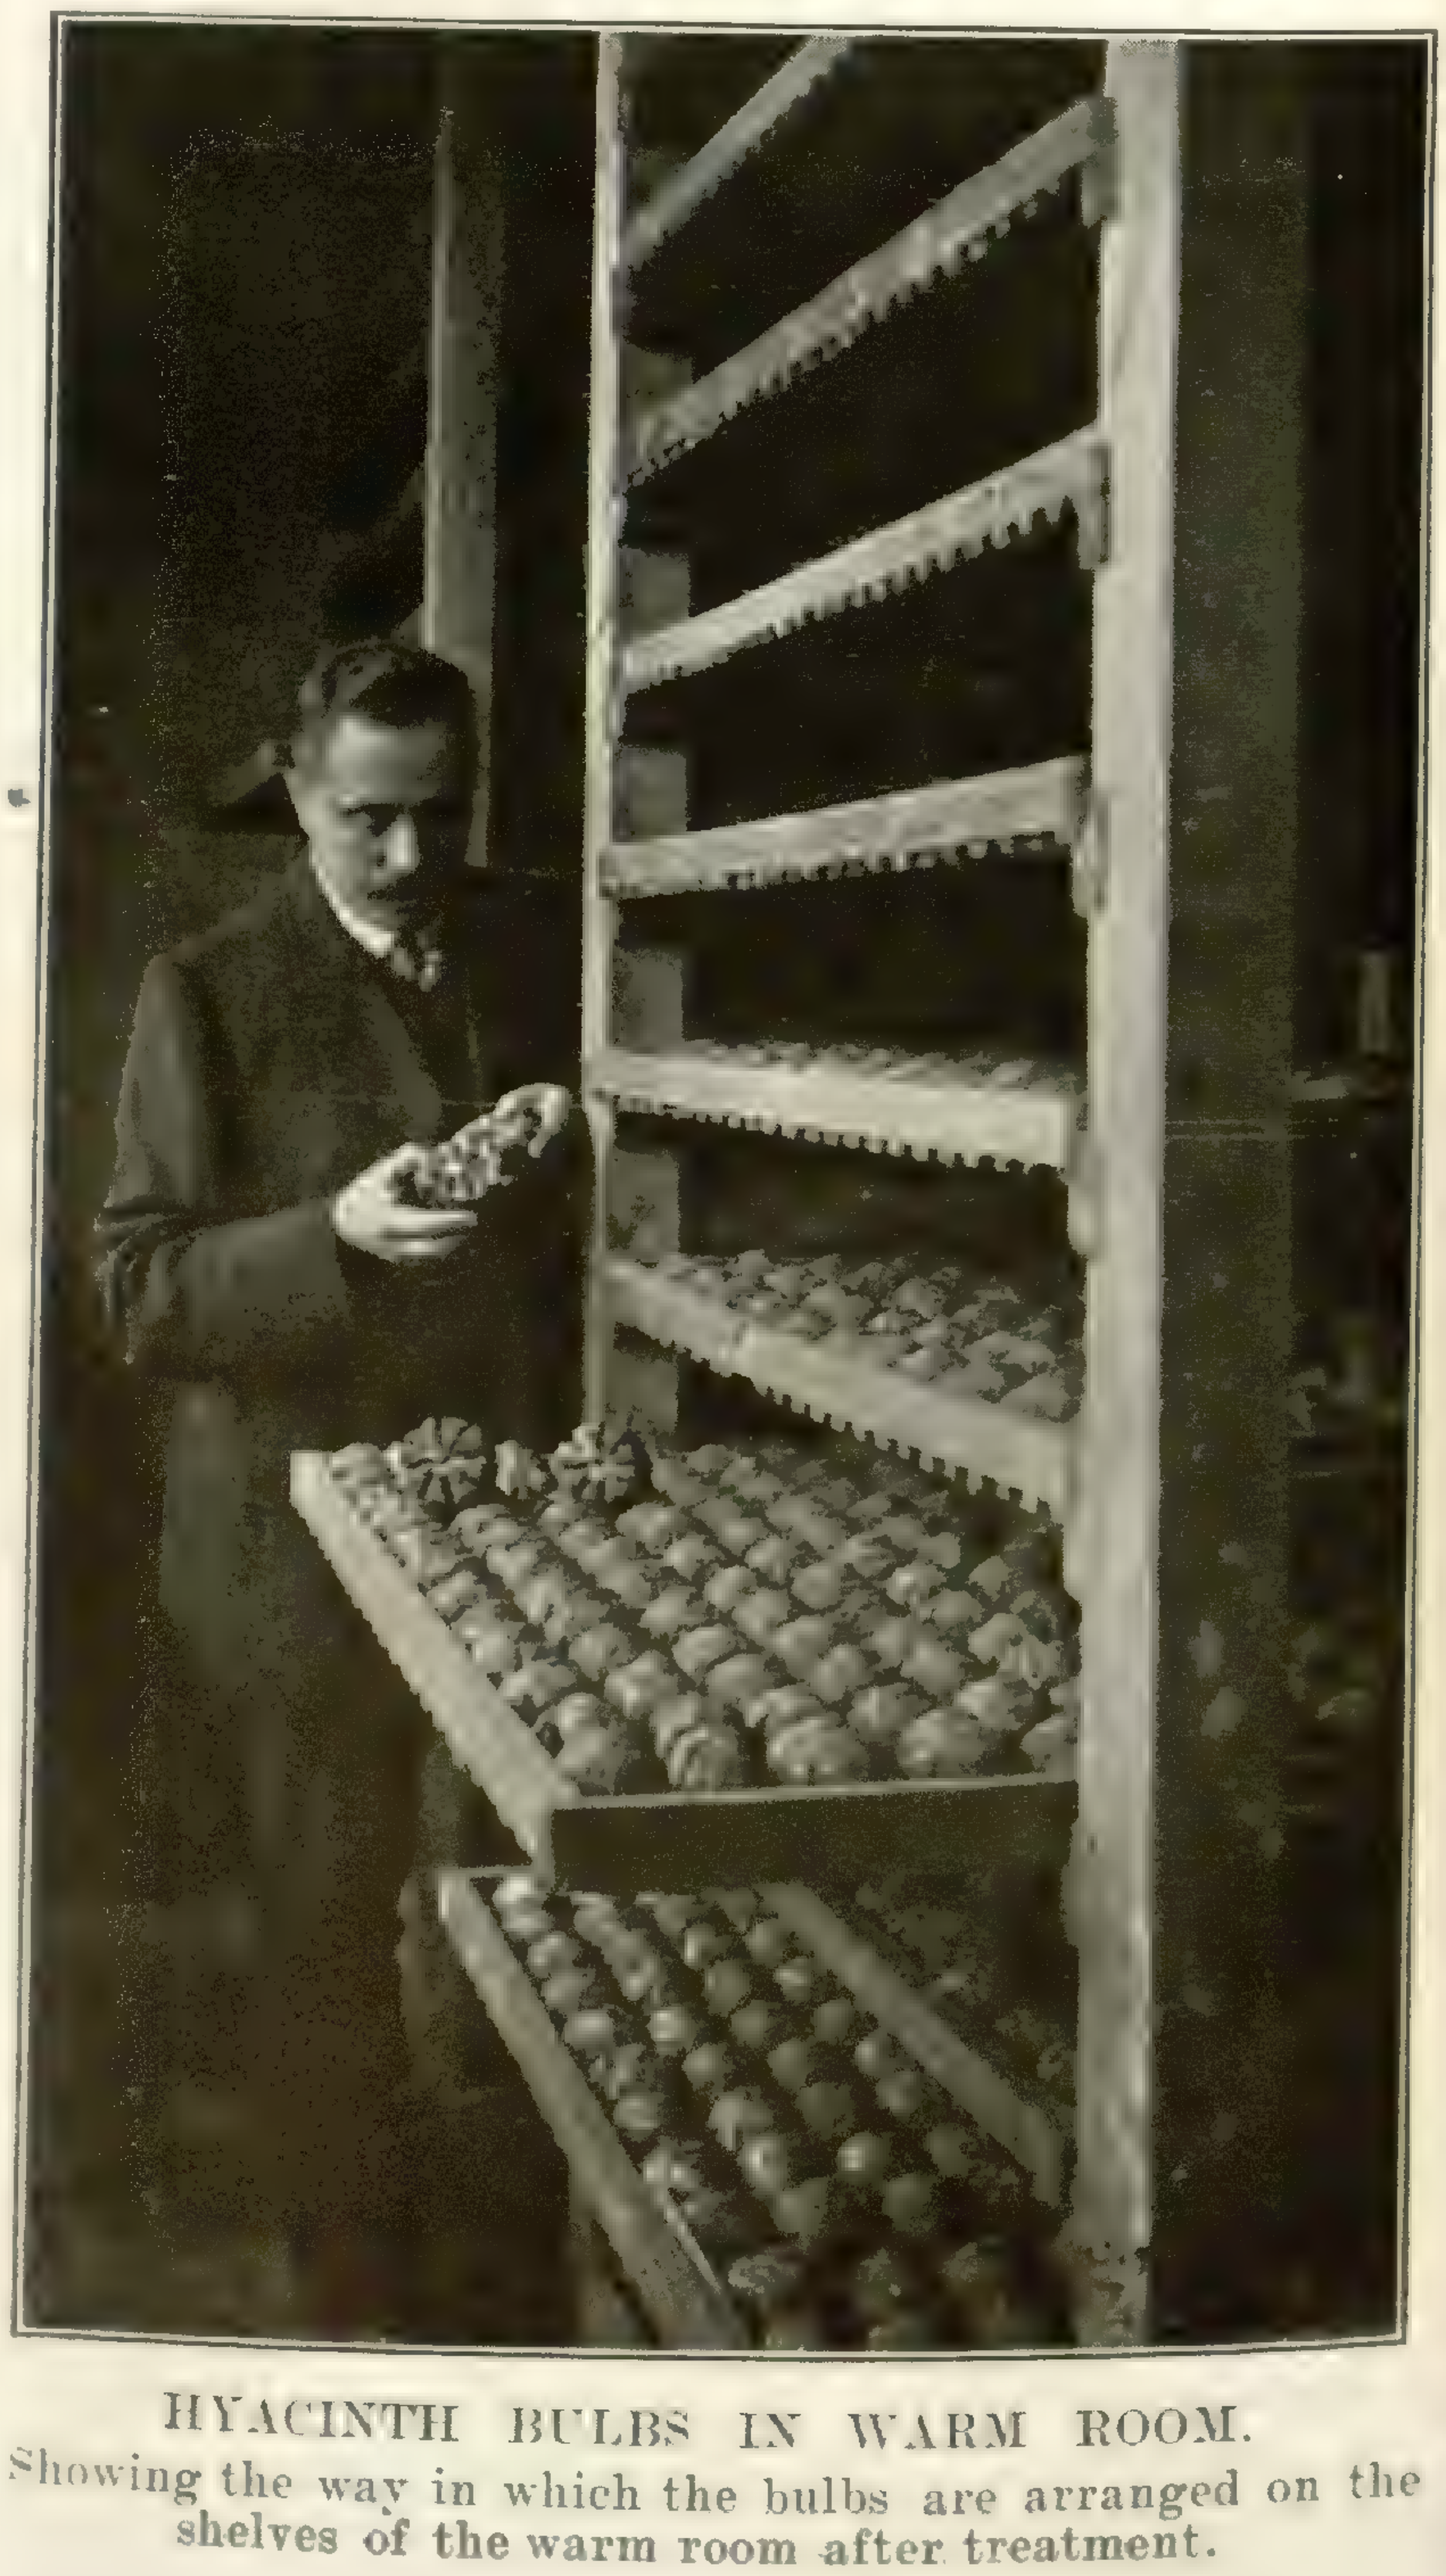
Every grower has his own way of treatment, but the main point is always the same, i.e., to keep the room warm and airy. In the autumn there appears at the edge of every cut surface the small embryos, which develop into small bulbs, so the parts of the cut or hollowed bulb make more and more room for the young ones. While in the cut bulbs more room is given the small bulblets more food is taken from the mother bulb. The cut bulb brings stronger and bigger bulblets, while those which have been hollowed give a much greater number of small ones.

In November the time comes when the latter part of the work is done in the fields. The beds are well manured the previous year and the mother bulbs are placed six in a row in the bed, where they remain throughout the winter. The small bulbs make no plant, but the mother bulb makes a bundle of leaves, which prepare and convey the food to the small new bulbs, which are in July lifted. By this time the mother bulb has disappeared and left a great number of small bulbs. In the case of the hollowed bulb there will be a great number, usually between sixty and eighty, from each bulb. The small bulbs from the cross-cut bulbs will be fewer, but will be bigger and stronger.

The young bulbs are, of course, dried and stored in ventilated houses. They are carefully watched and kept in good condition, to be planted again in September or October, to bloom the following year in a small way. According to circumstances, as ground, weather, etc., the bulbs have to be grown two, three, or four years before they reach a saleable size. Every year the flower-spikes are cut as soon as possible to prevent them imposing a check upon the growth. The utmost care is taken in the fields as well as in the stores to remove the faulty bulbs. The importance of this care need hardly be mentioned, because it will be seen that unless the imperfect bulbs were removed at an early stage there would be much waste of ground and time.

In conclusion, thanks must be given to Mr. F. de Meulder, one of the leading growers at Lisse, who allowed us to have a look into his sanctum, and thus enabled us to show the various stages of hyacinth propagation, as carried out in Holland.

Piet Ammerlaan.



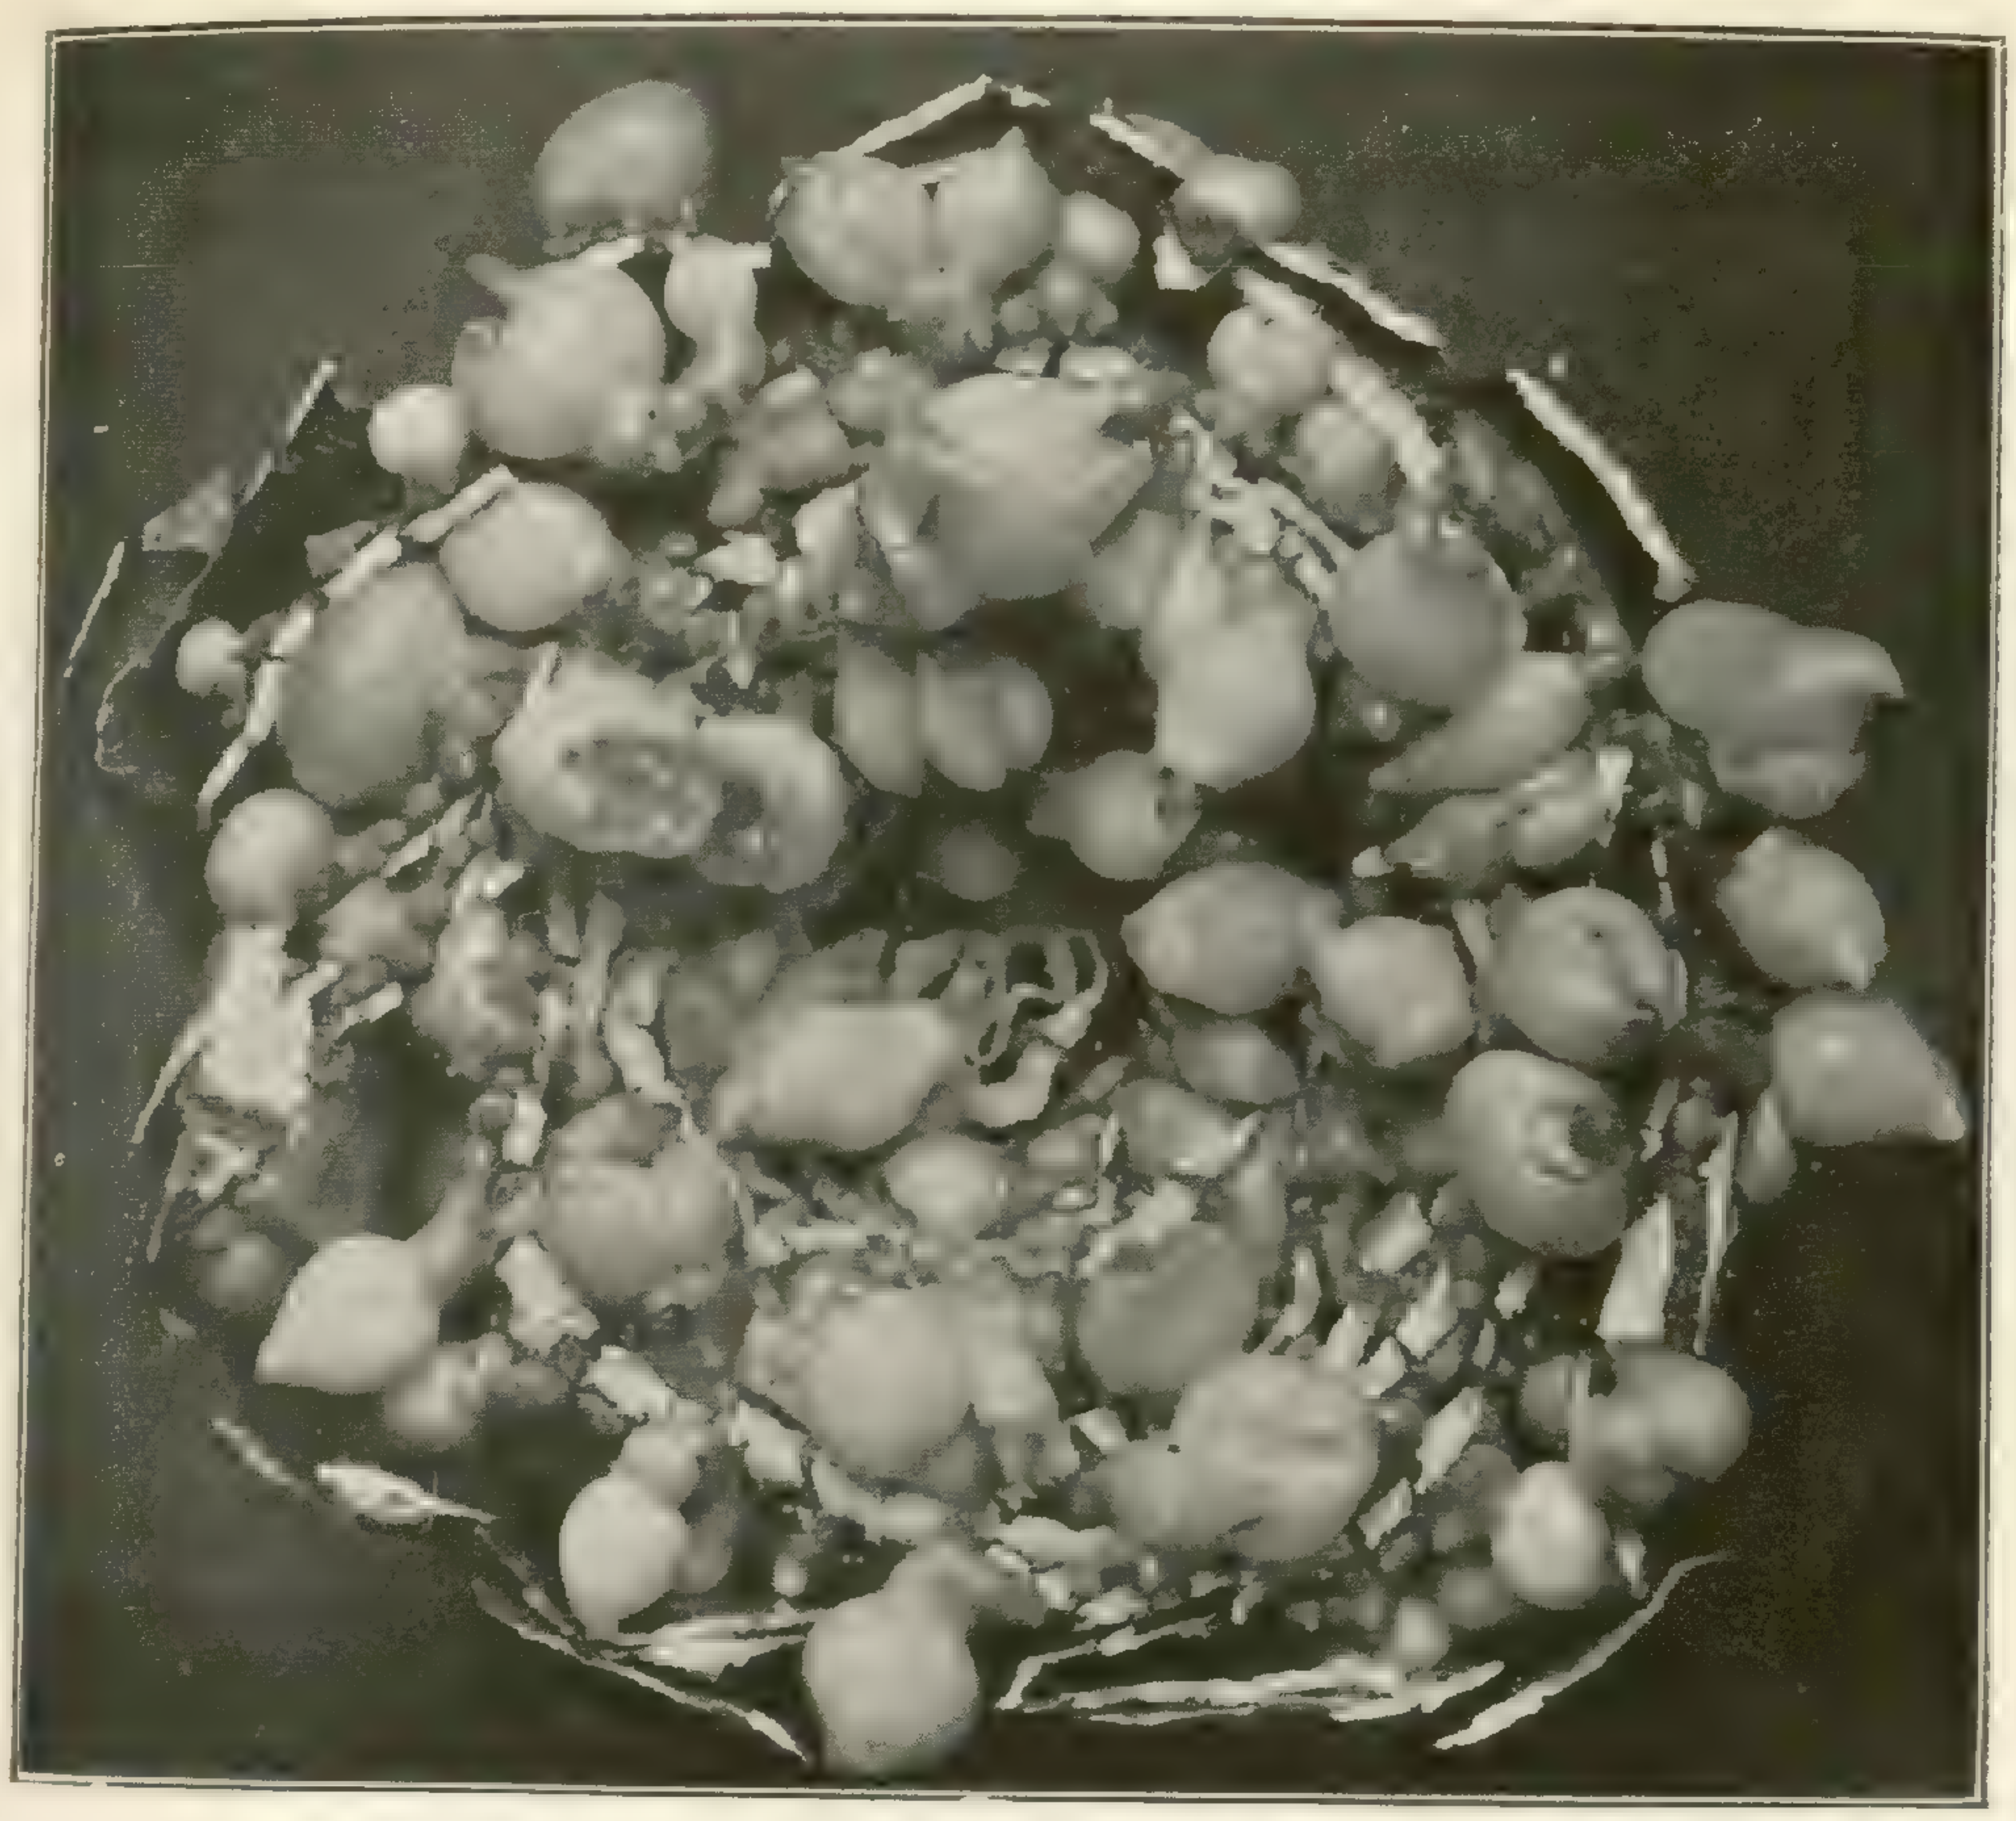
HYACINTH BULBS IN WARM ROOM.
Showing the way in which the bulbs are arranged on the shelves of the warm room after treatment.

CHOICE BULBS FOR THE ROCKERY.

Some there are who contend that bulbous and tuberous-rooted plants should be excluded from the rockery, holding that the dying foliage of these flowers is a decided objection to their presence in a choice collection of alpine flowers. There may be some ground for the contention if the rockery has, as its sole inhabitants, a few only of the choicest plants which delight the heart of the exclusive alpinist, but in the average rockery, the property of the average lover of alpine flowers, the bulbous and tuberous plants cannot be omitted without a serious detraction from the real beauty and interest of the garden. In by far the greater number of rockeries there is room enough for at least a selection of suitable bulbs, either growing by themselves or carpeted by some dwarf alpines, not too choice and delicate to suffer from this association, but good growers; not too tall at the flowering period of the bulbs they cover, nor too lacking in vigour to be the worse for the leaves of the bulbs remaining among them until they fall into the sere and yellow leaf, and can be removed without detriment to the flowering of the bulbs another year.

Situations for Bulbs on the Rockery.

It is never difficult to find on the average rockery more than one position for some bulbs, and it may be noted that the greater number of the suitable plants of this class require sun, such as can be obtained on



HOLLOWED HYACINTH BULB WITH BULBLETS
At the time of planting in the autumn.

the sunny side, but there are others, such as the snowdrops, the scillas, and even the chionodoxas, which will thrive and flower on the shady side. Among ferns is an excellent position for early bulbs, which generally ripen their foliage ere the ferns have developed their fronds. The rockery arranged in terraces gives many places for bulbs, but in others the pockets for other plants can be utilised as well, and there are in many rockeries little chinks in the stones with soil behind in which the bulbs can be placed, and where they will spear through the crevices and give their flowers in plenty. Then at the base there may be pretty nooks where the bulbs will look well, and will flourish from year to year.

The Soil in which to Plant.

A soil such as that which is suitable for the alpines will serve for the bulbs quite well. Loam, lightened by the addition of leaf-soil, if heavy, and with some sharp sand and grit added, will answer well for such, but the greater number of rockery bulbs are not exclusive in their diet, and will content themselves with the daily fare of their companions. Many alpines require plenty of stones about them, and will not flourish without these. The bulbs will accommodate themselves to these conditions perfectly.

When to Plant and How.

Early in the autumn is generally the best time to plant all the bulbs on a rockery, and I prefer that it should be done as soon as possible, so that the alpines used as carpeters may have time to establish themselves before winter. In planting the good rule to plant the bulbs at a depth practically corresponding to twice their height from crown to base may be followed, with some exceptions in the case of snowdrops, snowflakes, and scillas, which all, I find, grow stronger if planted deeper. Six inches is not too much for the two first-named, and four will do for the greater number of the scillas It has to be remembered that these bulbs should be as seldom disturbed as possible, only removing and replanting them when they are too crowded to flower, or increase is required. Plant firmly when the soil is not too wet and stiff.

Here a word may be said about carpeting. The smaller mossy saxifrages are excellent for the purpose, and among other things such dwarf veronicas as repens, prostrata, saxatilis, etc., will be excellent, together with cerastiums for dark-flowered bulbs; Arenaria balearica for the shade; Arenaria cæspitosa, dwarf campanulas, sedums, Potentilla alchemilloides, and many other dwarf plants which will not suffer from the leaves of the bulbs remaining until they become yellow, and can be safely removed.

What Bulbs to Plant.

The best bulbs are naturally those of dwarf habit, as we do not require to plant tall flowers among the choicer alpines, and the smaller kinds are more according to the genius of the rockery. Those which have been left untouched by the florist and are natural species and varieties are the best. Such flowers as the crocus species will afford a long succession of bloom beginning with C. speciosus, C. pulchellus, C. asturicus, the lovely C. iridiflorus, and C. medius, the lovely C. zonatus, and passing on to the fine C. alatavicus, C. ancryensis, different forms of C. aureus, the lovely C. Balansæ, the handsome C. banaticus, the several forms of C. biflorus, such as Pestalozzæ and Weldeni, candidus, chrysanthus, etruscus, the indispensable Imperati, reticulatus, Sieberi and Tommasinianus, with others of the race to form a long succession.

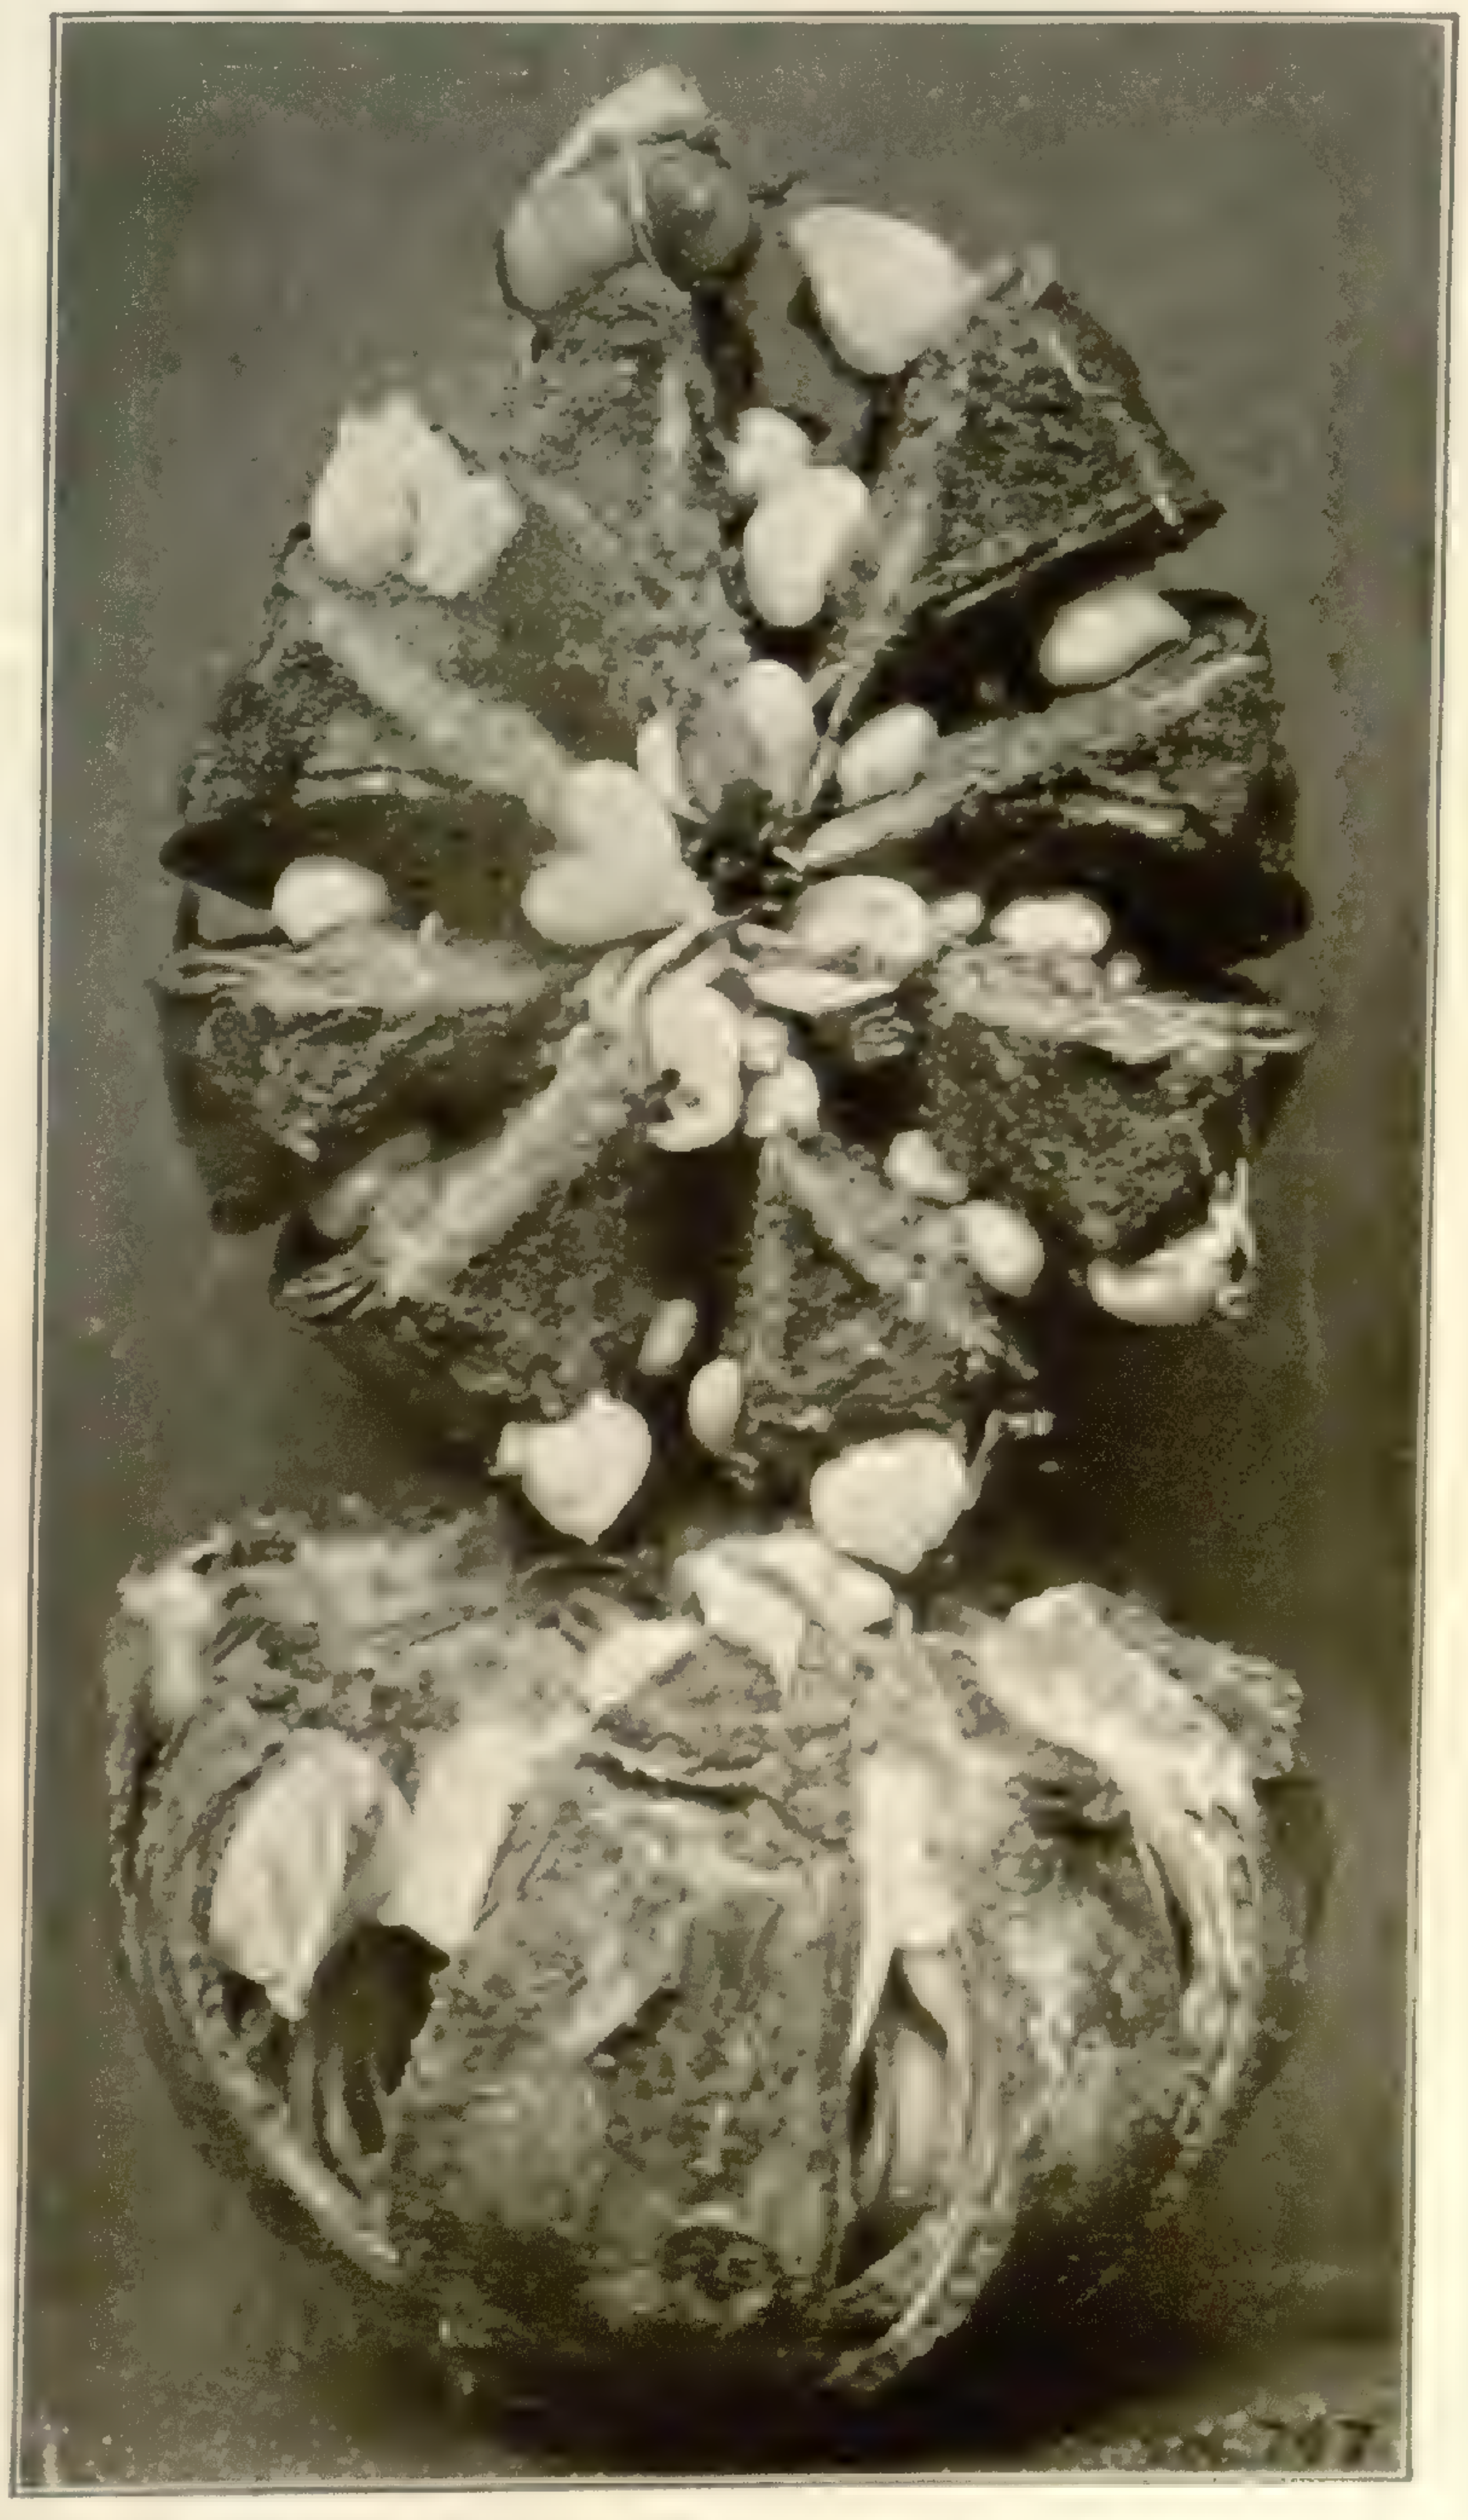
The choicer snowdrops, such as Galanthuses Imperati, plicatus, Elwesi, and its varieties, will look well early in the year, and the common one is not to be despised in little groups on the large rock garden. A group or two of Eranthis cilicicus or of the common winter aconite, E. hyemalis, on the shady side near the base, will give a gay appearance at a time when colour is not too plentiful. Such hardy cyclamens as Coum, ibericum, cilicicum, and the autumnal neapolitanum will be excellent.

Scillas are a host in themselves, and S. sibirica, S. bifolia, S. italica, and on the rougher parts, varieties of S. hispanica, and some choice varieties of the lovely common blue bell, S. nutans, will be capital. Chionodoxas are all suitable, and some lovely effects can be made with any of these. Hyacinthus amethystinus and the muscaris are all charming, and groups of the finer fritillaria species look delightful in their time, although F. recurva is not very reliable.

The puschkinia may be added, and the bright flowers of Bulbocodium vernum look well in early spring, although they are liable to the attacks of slugs, often troublesome on a rockery. For summer bloom Brodiæa ixioides may be added as one of the most reliable of its race. Allium Ostrowskyanum is a good bulb also, and not too common in the garden. Enough have been named, however, to satisfy all but the confirmed bulb lover.

The anemones must, however, be mentioned, and in A. nemorosa, especially its varieties flore pleno, Robinsoniana, and Alleni, we have desirable things, while A. apennina in several forms, with the earlier A. blanda, are all excellent for the rockery.

S. Arnott.



CROSS-CUT HYACINTH BULBS WITH BULBLETS
At the time of planting in the autumn

BOLD BULB PLANTING.

Every gardener has a chance to practice bold planting of bulbs; even a three-feet wide and twelve feet long border can contain several fine groups, instead of the usual insignificant-looking lines of bulbous plants, but it is, of course, in the large garden that the art can be carried out to perfection. Bank sides and summits, stretches of spare ground anywhere, glades among the evergreens of the shrubbery, terrace slopes either of earth or turf, are suitable places for this kind of adornment, while the neighbourhood of lakes and streams, as well as rock gardens of all descriptions, absolutely demand it.

It is a satisfactory truth, too, that bulbous plants are, on an average, less expensive than others of similar effectiveness and durability; two dozen Crown Imperials, costing less than half a sovereign, will create a spring bank covering that can scarcely be surpassed; crocuses by the thousand are little more money, and when massed, create wonderful glades of gold, purple, or silver; five hundred nodding daffodils upon which ten shillings have been spent will turn a piece of woodland or meadow into a vision of great loveliness. Then where the bulbs are set, there they increase year by year, needing the minimum of care. Narcissus poeticus is one of the most charming when represented by hundreds; a few high banks or knolls crowned and wholly covered by these grey-green spear leaves and snowy blossoms, backed perhaps by some thickets of Berberis aquifolium and young copper beeches, form a magnificent setting to a lake or stream. Early planting of Crown Imperials and Madonna lilies is necessary, so the gardener's work in connection with bulbs begins during the hottest months of summer; a triple avenue of either of these, on each side of a grass walk, with shrubs or a rose hedge or trellis for background, constitutes a fine feature. Perhaps, however, Lilium candidum never looks quite so well as when planted in groups to rise here and there out of grass lawns or turn embankments to terraces, the foliage concealing all sign of bed, or with one of the mossy saxifrages used for a carpet to attain the same all-green effect. Immense groups of Crown Imperials, carpeted by purple and white crocuses, should exist near all lakes and ponds.

PLANTING HYACINTH BULBS IN HOLLAND.

The bulbs that are being planted are those which have been cut and have produced bulblets in the warm room.

Every person familiar with the lovely appearance of many fields in poppy season will realise the value of scarlet in a landscape; now the vermilion tulip is capable of giving just as gorgeous a show as the field poppy, only it is not often generously enough employed. The early Van Thol is best for use in turf, because it is over and the foliage sufficiently yellowed before there is need to cut the grass of the parkland; the trim lawn is not, of course, fit for this treatment. Later single and double red tulips should be used to fill large spaces in the shrubbery, or occupy any immense beds or borders that are afterwards to be filled with bedding plants. They can be splendidly planted, too, upon small islands of lakes or rivers. Different results, as fair if less striking, are gleaned by the massing of white, gold, deep crimson, or purple, rose, or orange tulips. In woods and quite dense shade, Darwin tulips may generally be depended upon, and give a bolder result than do the dainty anemones and bluebells, so are suited to wider spaces. In colour production the tulip has value that should be more recognised: to mass the cheaper varieties will assuredly give greater pleasure to those who dwell near or merely visit the scene, than will be gained by the cultivation of specimen tulips of high cost. Tulip species live permanently out; some, such as the orange-vermilion Griegi, are too expensive for the majority of flower lovers to plant in profusion, but there are others, the price of which can be reckoned as less, or but little more, than half a sovereign a hundred. Notably good are Tulipa cornuta, yellow and red, with threadlike petals; T. Billietiana, yellow, edged cerise; T. Didieri alba, cream; T. fulgens, scarlet-crimson, T. Mauriana, scarlet; T. retroflexa, clear yellow; and T. sylvestris, yellow. In rockeries these also give a fine show.

The hardiest bulbous plants are among the best for covering banks, leaving room between them for the introduction of a few such bedding subjects as ivy-leaved pelargoniums. The leucojums, or snowflakes, indeed, can be combined on a bank so as to provide the only floral show, since some blossom in spring, others in summer and autumn, and as they love shade they supply a need. Leucojum pulchellum, and the minute pink Leucojum roseum should not be forgotten when the ordinary Leucojums æstivum, vernum, carpathicum, and autumnale are ordered.

Where to place the Himalayan Lily, Lilium giganteum, is a puzzle to some, but there are no woodlands or shrubberies where it cannot be well cultivated if some peat is introduced into the soil, and there is semi-shade. The finest effects with the lily are gained by lake or river sides, where their enormous foliage can be fully observed. Only large bulbs can be trusted to bloom the first season.

Coloured lilies are of immense service against white or dull-looking walls of the house or garden; the Cottagers' Orange Lily, L. croceum thrives almost anywhere, preferring sunshine, and sends up free spikes of tawny, black-spotted, fine blossoms to a height of seven feet. A wooden summer-house, ivy-covered, can be beautifully surrounded by a thicket of these lilies, and climbed by the violet Clematis Jackmanni, with a ground carpeting of the many variegated thymes, or else of different sedums. Scarlet Turk's Cap lilies will wonderfully brighten front gardens that contain little beside dark evergreens. The Oregon lily, Lilium columbianum, though giving only a few small orange and crimson blooms, can be specially recommended for the sake of its rich hue; the tomato-orange Lilium Batemani, three feet high, the five-feet yellow, crimson-spotted L. Humboldti, and the apricot, purple-spotted Lilium Wilsoni, when well represented in a garden, have a rich effect.

It is only by making careful note of the exact times at which plants blossom that the gardener can succeed in creating the fairest landscapes round the home; by the use of bulbs alone every month, aye, each week, of spring, summer, and autumn, may be replete with floral beauty, while the noble scarlet-crimson schizostylis, many crocus species, yellow aconites, and other hardy subjects carry the loveliness on throughout winter. Use these bulbs sparingly, and pretty patches only are visible; cover the land lavishly, and then something is gained of the prodigal effects which Nature, the servant of God, works with such perfection in the woods and meadows.

M. H.

Notes on Bulbous Plants.—The earliest opportunity should now be taken to pot up the first batches of bulbs. Such subjects as lachenalias, freesias, Roman hyacinths, and narcissus will be potted up in batches from this time forward, the former particularly requiring a long growing season and cool conditions during all subsequent stages of growth. The latter are, of course, largely depended upon for Christmas displays, and unless thoroughly well rooted before being placed in the forcing bed the best results cannot be secured. Of hardy subjects, snowdrops and aconites (Eranthis) should be planted without delay, as these always make a great amount of root growth before any indication of vegetative activity is apparent above ground. Of alli- subjects Ostrowskia magnifica and eremuri ought to be planted as early in autumn as one can procure them. The possibilities are then in favour of some display the following season.—THOMAS SMITH.

UNCOMMON GREENHOUSE BULBS.

While some bulbous plants that require the protection of a greenhouse, such as hippeastrums, lachenalias, nerines, vallotas, and others, are very generally grown, and may be met with in many gardens, there are, on the other hand, a large number that, if not actually rare, may be looked upon as decidedly uncommon. Some of them are very beautiful when in flower, and so distinct from the general run of greenhouse plants as to well merit extended cultivation. A long list of such may be compiled, but I will confine myself to the few set forth below.

Acidanthera bicolor.

A native of Abyssinia, and a near relative of the gladiolus. The strap-shaped leaves are disposed in two rows, and the flower stem, which reaches a height of a couple of feet or more, bears on the upper portion several loosely disposed drooping blossoms. They are from three to four inches in diameter, creamy-white, with a blotch of purple in the centre. These flowers, which are agreeably scented, are borne during the summer months.

Anoiganthus breviflorus.

This forms a solid brownish bulb, and from it are produced several stiff, nearly erect leaves, about a foot long and an inch in width. The flower stem, which, as a rule, just overtops the foliage, is terminated by a loose umbel of blossoms. They are of a rich golden colour, and about a couple of inches long, but are so constructed at the base that at no time do they expand fully. This anoiganthus often blooms during the late autumn and winter months, but it may also be had in flower in the spring. Though very uncommon it is, I see, quoted at a cheap rate in the catalogue of one of the bulb dealers.

Babianas.

Pretty little bulbs, whose leaves are clothed with greyish down, and the comparatively large flowers are of various shades of blue and purple. These may be bought at a cheap rate in the autumn, and if eight bulbs are put into a five-inch pot, they form effective specimens when in flower in the spring.

Brunsvigia Josephinæ.

A very large bulb and a remarkably showy one when in flower, but unfortunately it cannot always be depended upon to do this. The greatest measure of success is attained by giving it much the same treatment as a nerine, that is to say, it should be kept growing during the winter, and given a period of absolute rest in the summer. When in good condition the flower scape will reach a height of a couple of feet or more, and when terminated by a large rounded head of 20 to 30 flowers it is very showy. The flowers, in shape somewhat like those of the Belladonna Lily, are bright red in colour.

Callipsyche aurantiaca.

A very uncommon bulbous plant, native of the Andes of Ecuador. It is quite distinct from any other bulb, and usually flowers during the autumn and winter months. These flowers, which are borne in an umbel at the top of a stem a couple of feet or so in height, are of a golden yellow colour, and in general appearance somewhat like a small hemerocallis. The most prominent feature of the inflorescence is furnished by the long prominent stamens, which protrude three or four inches from the mouth of the perianth. As the flowers are disposed almost on one plane, a head of blossoms is very suggestive of a sweep's brush.

Cyrtanthus.

A variable genus, for some species have large bulbs, while in others they are about the size of a snowdrop. This last-named section is the more useful, as the different members grow freely, and can be depended upon to flower well. Among the best are C. angustifolius, scarlet; C. lutescens, yellow; and C. Macowani, bright red. There is a distinct and attractive species known as C. sanguineus, which was formerly called Gastronema sanguinea. The flowers of this remind one of a vallota, and hybrids have been raised between the two. These different cyrtanthuses flower at various times of the year, but the greater amount of blossoms are borne in the spring.

Eucomis punctata.

This forms a mass of handsome waved leaves, from the centre of which is pushed up a stout flower scape to a height of a couple of feet or so. It is in colour green spotted with brown, and the strongly-scented greenish flowers are disposed in a fox-brushlike manner around the upper half. Flowering as it does towards the latter part of the summer, this eucomis is very useful for greenhouse decoration.

Freesia Tubergeni.

One of the hybrid freesias, in the production of which the South African F. Armstrongi has been employed. The flowers of this are of a pleasing shade of soft carmine rose.

Hæmanthus coccineus.

The South African Blood Flower, as this is termed, forms a very striking feature in the greenhouse about the end of August or in September. It needs a thorough baking in the summer to ensure a good display of blossoms. The most prominent feature of the inflorescence is the brushlike mass of stamens. In H. albiflos the flowers are white, and the filaments of the same hue with yellow anthers.

Ixias, Sparaxis, and Tritonias.

These are all small bulbs that may be grown eight together in a five-inch pot. They are all very beautiful, and the flowers are, in the case of the ixias and sparaxis, extremely varied in colour. In the tritonias most of the flowers are more or less of an orange-scarlet tint.

Lycoris aurea.

A beautiful bulbous plant, but a very difficult one to flower. As a rule, freshly-imported bulbs bloom well, but this is seldom the case afterwards. The flowers of this are of a golden hue.

Moræa glaucopis, the Peacock Iris, known also as Iris Pavonia and Vieusseuxia glaucopis. The flowers of this are white, with a large eyelike spot of metallic blue in the centre of each segment. This may be readily grown in pots, putting about eight bulbs in a five-inch pot.

Phædranassa chloracea.

A South American bulb that bears a spike of drooping flowers, in colour yellow tipped with green. There are other species, but this is the one most generally met with.

Sprekelia formosissima.

This, known also as Amaryllis formosissima, and popularly termed the Jacobean Lily, bears its deep blood-red flowers in early summer. It needs the same treatment as the garden varieties of hippeastrum.

Urceolina pendula.

The bulb and foliage of this are not unlike those of the eucharis, but the flowers, which are borne in the autumn, are quite distinct. They are disposed in an umbel, and are individually urn-shaped, drooping, and in colour yellow, tipped with green and margined with white. It is a native of South America, and is also known as Urceolina aurea.

Watsonia iridifolia O'Brieni or Ardernei.

A beautiful gladiolus-like flower of the purest white. Grown in pots it forms a very attractive object in the greenhouse during the summer.

Zephyranthes carinata.

This, one of the best of the zephyranthes, has flowers nearly as large as those of Vallota purpurea, and of a deep rich rose colour. It has bulbs about the size of a small daffodil, and readily lends itself to cultivation. The flowers, as a rule, are borne during the summer months.

W. T.

WINTER ACONITE.

The Winter Aconite (Eranthis hyemalis) may properly be called the first flower of spring, for, though it begins to flower in January, it lasts long enough to be contemporary with the snowdrop, with which, indeed, it forms a very beautiful combination. It is a flower which cheers us up in the winter as a herald of the floral procession of the year. It will not succeed in cold, wet soils, but warm or light soils, especially those in which chalk is present in some quantity, are most suitable to it, and in such soils it will increase rapidly.

I know a garden where it is a veritable weed, and is allowed to come up in its thousands along the edges of the gravel paths. As it can be cleared away before the spring is far advanced it is not a bad idea to let it grow wild where it will in this fashion. We cannot spare room for it on the beds and borders, and in fact it is better, as a rule, on rough banks and under deciduous shrubs or trees, where, if the conditions are not too dry, it will luxuriate, and, after its display of cloth of gold, form a carpet of shining leaves on the ground in the spring. It looks specially well when so grown mixed with chionodoxas, early scillas, and anemones. I have even seen it smothering the ground in combination with snowdrops under a big Portugal laurel. Where the soil is favourable it is a useful plant for naturalising in grass, and it is an advantage that it can be cut away earlier than the remains of most bulbs.

It should be planted as early in the autumn as possible, or still better, in the summer, as it dislikes being dried off. If it is intended to grow it in a rough place it would be better in the season of purchase to plant it in some good light soil by itself, and then, as soon as it has died down in the early summer, it can be lifted and put in its permanent quarters, this being the best time of the year for moving it in any case.

Alger Petts.

Pear, Emile d'Heyst.—This is not an attractive pear, but its quality is of the highest. It is at its best from the middle of October until the middle of December. Of medium size, with a very rich juicy flesh, melting and sugary, it is a variety that should be in every collection of pears. I have not had experience of it in heavy soil, but in a medium one I have, and in such I may safely say that the cultivator that grows it once will always grow it. A wall with a south-west aspect should be selected for the trees, though the latter will succeed as bushes and standards in the open.—G. B.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

DENDROBIUM FORMOSUM GIGANTEUM.—Most of the plants of this species will now have developed their new pseudobulbs, and the flower buds will be advancing. The plants must be liberally treated in the matter of heat and moisture until the flowers have become fully expanded. After this, if the plants are removed to cooler and drier quarters, they retain their flowers in perfection for a considerably longer period. If allowed to remain in an atmosphere that is heavily charged with atmospheric moisture, they are liable to become spotted and unsightly. I have previously pointed out the advantage of growing this desirable species where there is a demand for flowers in the early autumn months. They are exceedingly useful for decorative purposes, and where white flowers are especially required for any purpose there are few orchids more serviceable. I find this species grows exceedingly well when suspended in baskets from the roof of the ordinary plant stove. I have no reason to complain of difficulties in its culture. The plants we have were in the collection when I took charge, nearly eight years ago, and they have retained their normal vigour, although they have flowered freely annually. I might add that after the flowers have been removed the plants are placed again in the stove to ripen their pseudo-bulbs. Little water is necessary during the winter; only sufficient should be given to maintain the pseudo-bulbs in a plump state.

SOBRALIAS.—Many beautiful species and hybrids are included in this genus that are easily cultivated, and are exceedingly useful for cultivating in large conservatories and other structures where an intermediate temperature is maintained. We cannot state that they are useful for the supply of cut flowers, but they produce a succession of flowers on the same stem, and the plants are capable of giving an effective display during the greater part of the summer and autumn months. At the present season many of the young growths will have advanced to the stage when the new roots are being made, and any potting requirements necessary should be attended to at this period. It is not advisable to annually disturb sobralias, so that when repotting ample pot room should be allowed, thorough drainage given, and the materials used should be of a lasting character. An excellent compost is formed with equal portions of good turfy, fibrous loam, fibrous peat, or polypodium fibre, some chopped sphagnum, and sufficient sand and broken crocks added to render the compost porous. Make the potting compost firm about the roots, and give a good watering, using rain water, as soon as potting is completed, wetting the compost through. Shade from strong light and spray the plants overhead for a few days until the new roots are running freely in the compost. The stock may be increased by divisions at the time of repotting by severing the rhizome as described, and taking away the portion thus divided.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

SHADING, ETC.—It will not be advisable to continue the use of blinds after this date; benefit will rather be derived from a fuller exposure, as light has a tendency to mature growths and foliage. Where blinds are annually removed in the autumn, the first dry day should be taken advantage of to secure them in a proper condition. If whiting or other material has been used in place of blinds, this should be washed off as soon as possible. Examine hot-water piping, furnaces, etc., as defects seen to early before extra pressure is put upon the piping may prevent a breakdown at a more critical time. Continue to close the stove early in the afternoon, so as to husband as much sunheat as possible to economise the firing. Spray freely such plants as crotons, etc. A portion of the stock of eucharis should be induced to produce flowers, which will come in useful as the supply from out of doors becomes less.

WINTER BLOOMING PLANTS.—Poinsettias must have attention. Do not let the temperature fall below 55 deg., or they will suffer at the roots, with a consequent loss of foliage. With growth advancing, every encouragement should be given the plants to produce the best possible growths, as stout, well-matured stems are sure, with due attention, to produce fine bracts.

CALADIUMS.—Some of the plants will now be beginning to naturally loose their foliage. These should be allowed to pass into a resting stage. Gradually decrease the supply of water, but do not send them to rest prematurely, or place them in a cold position, as under such conditions the tubers are liable to decay. In a temperature of 60 deg. they will be safe; late vineries where heat is still maintained are suitable places for them. Plants of Caladium argyrites that have had a long season of rest, may be started into growth for decorative purposes during the winter. Remove the tubers from the old soil, and repot, using a fresh compost. The most suitable pots are those three and five inches in diameter. Both plants and leaves will be found useful in decorations.

GARDENIAS that have been kept in a cool house for a time will, if placed in a brisk heat, give flowers that will be very useful; and where flowers are wanted at Christmas, the plants having been pushed on to make strong growth, should be placed in a cool house or pit for a time to give the necessary maturity. Let there be a little warmth in the pipes on cold nights. Feeding should be discontinued until the plants are put into heat.—W. FYFE, Lockinge Park Gardens.

FRUITS UNDER GLASS.

VINES IN EARLY HOUSES.—The vines in the early houses should be afforded all the rest possible now, and, as I suggested in a previous calendar, all the cleansing that can be done should be attended to, so as to clear the house and vines of any pests. All the lights should be thrown open. The branches may now be shortened back to about three or four eyes if the wood is sufficiently ripened, which it should be after the hot and bright weather experienced through August. Much more water should not be necessary, though the border must not be allowed to become too dry on the surface, or the little fibrous roots will be sacrificed, and it is very essential to keep these going. Any root pruning or lifting may be taken in hand, and it is a good plan to do this before all the foliage has fallen, so that there is some circulation of sap after the operation has been effected.

UNHEALTHY VINES.—Vines that are in a bad condition should be treated with a view of bringing them into a better condition, and in order to do this thoroughly a start should be made at the extreme outside of the border. First ascertain whether the drainage is sound, for here very often lies the mischief. If the drainage is choked, or in any way defective, take steps to remedy this first of all. All defective drainage should be removed and a sound lot put in before anything else can be effectually done, taking care there is a proper outlet so that no stagnant water can at any time remain. If the drainage is all right, then proceed to move the soil, taking care of all living roots, laying these on one side and keeping them covered with damp mats. After this is done and the old soil taken away, bring the new soil and make it as firm as possible, taking care to distribute the roots evenly all over the border. Let the soil be of the very best loam, containing some lime, and if this latter is not present some must be added, together with some bone-meal, ¼-inch bones, and some good vine manure, such as is offered by the leading dealers. After the operation is completed, give a sufficient watering to moisten the whole, but not to make it very wet; shade the vines for a time from very bright sunshine, and moisten the remaining leaves by syringing them occasionally as the weather demands.

SUCCESSIONAL HOUSES.—Muscats, if now ripe, should be kept cooler and shaded from fierce sunshine.

LATE HOUSES.—Hasten the ripening of late grapes, and if the nights prove cold turn on a little fire-heat. See that the borders are not lacking moisture, and in fine weather keep the floors and stages damp.—W. A. COOK, Leonardslee Gardens.

THE KITCHEN GARDEN.

CUCUMBERS. — Seeds sown last month will have produced plants that are now large enough to be established in their winter quarters. Low, light, span-roofed houses are the most suitable structures for their growth. The chief point to consider is to grow them along slowly, so that they will be fortified against the sunless and short days that are fast approaching. This to a great extent can be done by permitting only a light crop, and admitting air at the top of the house whenever the outside temperature is sufficiently warm. Liberally assist the young surface roots with dressings of good loam as they show themselves.

TOMATOES.—Where tomatoes are grown in pots outside and utilised for the purpose of providing fruit through the early part of the winter, they will need to be placed under glass where they can have a steady warm temperature, and free ventilation. Top-dress the plants with rich soil from time to time with the addition of some stimulating manure, when the fruits are swelling. Artificially fertilise the flowers at midday, and see that the plants do not become unduly dry at the roots, or faulty setting of the fruits will assuredly follow.

CARROTS.—The large and main crop of carrots will require lifting and storing. If left too long after maturing the roots are subject to cracking, and consequently a great percentage of loss is experienced. The roots should be allowed to become fairly dry, and afterwards packed in moderately dry sand in the root house, or shed. See that only sound specimens are placed together, or decay may spread to a considerable quantity surrounding the affected ones.

ONIONS.—These will be sufficiently matured to pull for storage. Should the weather be favourable, they may be left on the ground to dry for a day or two; otherwise a dry, airy shed is best, and kept frequently turned until quite dry. I much advocate the roping system of keeping them. They can be suspended in the air and are less liable to rot than when laying close together on shelves, etc. This kind of storage entails more labour, but the ropes may be made on wet days when the staff is unable to work outside, consequently the labour is not seriously missed.

POTATOES.—Continue to lift the main crop of potatoes. Disease in many parts is badly affecting them, and will continue to do so as long as they remain in the soil. Carefully remove all tubers that are unsound, and only store those that appear free from disease, keeping them as dry as possible. Probably no better way of keeping the larger bulk of the crop can be found than the method of clamping them in ridges, and covering them with straw and soil. In cases where it is properly carried out, potatoes invariably come out satisfactory.

FRENCH BEANS.—The late sown plants on south borders will require protection by placing frames over them. Do not keep the lights too close, but apply plenty of air on fine days, admitting, except when frost is expected, a little during the night. Where this excellent vegetable is required throughout the year, a sowing should be made in pots in rich soil and placed in a cool position until nicely up, to be placed later in a more growing temperature to form a successional crop of the above.—CHARLES FLACK, Cholmondeley Castle Gardens.

DAFFODILS

A Great Speciality.

Being large **growers** of these Bulbs, we are able to offer the very best at lowest prices. No finer Bulbs can be obtained from any source; we hold numerous testimonials as to the excellent blooms they produce.

NARCISSUS FLORENCE PEARSON.

SOME PRICES OF LEADING NARCISSI.

	1000	100
Agnes Barr, one of the very best Burbidgei's ...	35/0	4/0
Argent, a beautiful new semi-double, **10/-** doz., **1/-** each.		
Barrii Conspicuus, largest size	25/0	3/0
Beauty, incomp.	—	8/0
Crown Prince, 3/6 doz., **4d.** each.		
Duchess of Westminster, 2/6 doz.	—	17/6
Emperor, mammoth bulbs for forcing, will produce from 2 to 4 flowers each ...	75/0	8/0
Do. a size smaller, excellent bulbs ...	50/0	6/0
Empress, largest forcing size	60/0	7/0
Frank Miles, a very fine incomp....	40/0	5/0
Golden Spur	—	7/0
Horsfieldii	40/0	5/0
J. B. M. Camm, 2/- doz.	—	17/6
Jonquil Odorus Rugulosus, the finest	20/0	2/6
Katherine Spurrell, 2/6 doz.	—	17/0
Mme. de Graaf, the giant white, **7/6** doz., **8d.** ea.		
Nelsoni Major, late, very distinct	35/0	4/0
Poeticus Ornatus	20/0	2/6
Princeps, giant variety	—	3/0
Queen Bess, very early incomp.	42/0	4/6
Sir Watkin	55/0	6/0
Mixed Star Narcissi, from the incomp. Burbidgei, Leedsii, and Poeticus sections, all flowering size	20/0	2/6

	1000	100
Mixed, trumpet varieties only	25/0	3/0
Do. all kinds, and seedlings, all flowering bulbs	20/0	2/6

NEWER VARIETIES.

	Per Bulb.
Alert, a very early trumpet daffodil, A.M., R.H.S., 1904	6/0
Branston, the finest form of white Barrii Conspicuus	3/6
Bridal Flower, a very chaste Leedsii, **15/-** doz. ...	1/6
Evangeline, a lovely new Leedsii, **15/-** per bulb.	
Florence Pearson, magnificent white trumpet daffodil	£5 5 0
Gipsy Queen, a grand incomp.	4 4 0
Heroine, the giant "Albatross"	6 0 0
Hon. Mrs. J. L. Francklin, a perfectly formed giant Leedsii	8 8 0
Hyacinth, a pretty starry Burbidgei, with Hyacinth-like scent, **6d.** each, **5/-** per doz.	
Lowdham Beauty, Giant Leedsii, of faultless form	5 5 0
Scarletta, one of the very best red cups	12/0
Scarlet Eye, pure white, with brilliant red eye ...	7/6
Sirdar, a remarkably fine giant Leedsii, early	£10 10 0
Steadfast, a very late incomp. of perfect form ...	5/0
Waterwitch, lovely drooping Leedsii, a great favourite, **4d.** each, **3/6** doz.	

Our Illustrated Bulb List of 72 pages now ready, free on application.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

The meeting held on September 14 was a full one, and most of the displays were of large size. Dahlias, hardy flowers, bamboos, fruits, and potatoes were all very much in evidence, and orchids were well shown for the season. The fruit was especially good, and unusually fine features were the pot fruit trees from Maidstone, the collection of fruits from Lockinge Park, and the fine grapes and melons from The Hendre. Novelties were neither numerous nor of outstanding merit.

FLORAL COMMITTEE.

Dahlias were extensively displayed by Messrs. J. Cheal and Son, Crawley, who had cactus varieties in fine form, showing good bunches of Mrs. Alfred Dyer, Pearl, Snowdon, Ruby Grinstead, Sunshine, Buttercup, and C. E. Wilkins. The single varieties shown by this firm were also very beautiful. Although the group of dahlias put up by Mr. J. T. West, Tower Hill, Brentwood, was rather stiff and formal, it contained beautiful flowers of W. Marshall, Coronation, Constancy, Oscar, Sunbeam, Mrs. W. Baxter, Nelly Riding, and numerous seedling cactus varieties, and a fine lot of pompon dahlias of perfect form and good colour, and a set of the bold pæony-flowered varieties.

A grand bank of dahlias, almost all cactus varieties, was arranged by Messrs. Carter Page and Co., London Wall, E.C. The tall and large stands of Decima, Harold Peerman, Lustre, Francis Graham, and Thos. Wilson were very bold and attractive, while the baskets of Faunus, Australian, Dr. G. G. Gray, and Harlequin, contained very beautiful blooms. This exhibit occupied both sides of a whole table length, and at either end were selections of single, pompon, and pæony-flowered varieties.

Specially well-grown blooms of show and cactus dahlias were arranged on boards by Mr. S. Mortimer, Farnham, Surrey; among the latter, Snowdon, J. B. Riding, Wm. Marshall, Crepuscule, Brigadier, and C. H. Curtis were prominent, and conspicuous show varieties were Glow-worm, Lord Salisbury, Buffalo Bill, Jas. Cocker, J. T. West, Esmond, J. H. Keynes, Red Cap, and H. Walton. New cactus dahlias were shown by Messrs. J. Burrell and Co., Cambridge, the varieties, Enetta, Una, and Comedy standing out well. Mr. H. Shoesmith, Woking, also showed new dahlias, and gained an A.M. for the white Prima Donna. Messrs. Stredwick and Son, St. Leonards, showed new cactus dahlias, and gained distinction for H. H. Thomas, Jupiter, Red Admiral, Indomitable, and Iolanthe.

Messrs. H. Cannell and Son's exhibit consisted of decorative, pæony-flowered, cactus, and collarette dahlias, shown in the usual fine Swanley style. Messrs. H. B. May and Sons, Edmonton, were represented by a collection of gymnogrammas and veronicas. Mr. F. Brasier, Caterham Valley, filled one corner with phloxes, Michaelmas daisies, and early chrysanthemums. Messrs. Keynes, Williams, and Co., Salisbury, had a few new dahlias, including the new red and yellow Little Beeswing, a pretty pompon variety that gained an A.M. Edward Mawley (A.M.), a big crimson show dahlia was submitted by Mr. Chas. Turner, Slough.

A brave show of late hardy flowers was made by Mr. Maurice Prichard, Christchurch, and in his fine display he had Kniphofia Macowani, K. tricolor maxima, K. Leichtlini, K. Triumph, K. tricolor, and the fine K. Northiæ, as well as forms of Anemone japonica, montbretias, gladioli, Crinum Powelli, the new Potentilla atrosanguinea Gibson's Scarlet (A.M.), Helenium Riverslea Beauty (A.M.), and other good things. Messrs. W. Cutbush and Son, Highgate, put up a large bank of hardy flowers, and arranged these in excellent style. There were batches of Lilium speciosum, helianthuses, phloxes, pentstemons, delphiniums, veronicas, Michaelmas daisies, montbretias, etc., with water lilies in front, and an edging of Adiantum pedatum. Messrs. Barr and Sons, Covent Garden, contributed tritomas, varieties of Anemone japonica, Crinum Powelli, and C. P. alba, gladioli, phloxes, and a collection of small plants of various eucalypti.

Roses were contributed by Mr. W. Leggett, West Bergholt, Colchester, but they showed the effect of the recent bad weather. The new single-flowered early chrysanthemums from Messrs. W. Wells and Co., Merstham, were very interesting, and such varieties as Nellie King, Masterpiece, Eric, Pink Gem, Roderick, and Gold Lace came in for a good deal of admiration. Conspicuous in the display made by Mr. Amos Perry, Enfield, were the baskets of the lovely Amaryllis Belladonna, Valotta purpurea, and batches of pentstemons, and a splendid lot of delphiniums, among which Lemartin, Pluto, Mrs. Creighton, and King of Delphiniums were very imposing.

Extremely graceful and beautiful was the splendid display of bamboos arranged by Mr. L. R. Russell, Richmond, Surrey. This display almost filled one side of the hall, and it was a great and unique attraction. The exhibit contained thirty-nine distinct species and varieties, varying greatly in height, habit, and colour, and it showed in an admirable manner the scope and usefulness of bamboos for garden decoration. A few of the kinds that mostly appealed to us were Bambusa rubicunda, B. sulphurea, B. gracilis, B. marmorata variegata. Arundinaria Simoni, A. fastuosa, A. Fortunei variegata, A. anceps, A. japonica, A. auricoma, Phyllostachys Quilioi, P. aurea, P. castillonis, P. nigra, and P. Kumasasa.

The double Michaelmas daisy Beauty of Colwall was finely shown by its introducers, Messrs. T. S. Ware, Lim., Feltham. This firm also showed the effective Feltham Blue variety, and made a brilliant display with select varieties of cactus and pæony-flowered dahlias. From the Guildford Hardy Plant Company came a small collection of hardy flowers, and from Messrs. R. Harkness and Co., Hitchin, came a small selection of gladioli. Messrs. Paul and Son, Cheshunt, displayed a comprehensive collection of shrubs that contained many having coloured and otherwise ornamental leafage. There were also Lonicera Hildebrandti, Clematis Kermesina, Abutilon vitifolium, Hydrangea paniculata grandiflora, Hypericum Moserianum, Coronilla emerus, Tamarix germanica, and various shrubby hibiscus, to represent flowering shrubs. Berried plants, Rhus sinica (A.M.), and Rosa sericea pteracantha were also very attractive in this group. Mr. John Peed, West Norwood, contributed an interesting collection of succulent plants associated with rockwork.

Very fine in spike and flower were the stately gladioli set up in large numbers by Messrs. J. Burrell and Co., Cambridge; it was a fine array, and worthy of special note as consisting entirely of spikes cut from seedlings flowering for the first time.

ORCHID COMMITTEE.

Mr. Black, gardener to R. G. Thwaites, Esq., Chessington, Streatham, showed Cattleya Roupelliana, derived from C. superba and C. Hardyana; Sophro-lælia Ortoniana, from S. grandiflora and Lælia Diana, etc. Messrs. Stanley and Co., Southgate, showed several forms of a handsome cross between Cattleya bicolor and C. Eldorada, named C. iridescens (A.M.), the result being a flower with broad, rounded petals and a yellow lip with a purple apex—a most distinct hybrid. From Messrs. J. and A. McBean, Cooksbridge, came a fine specimen of Vanda Sanderiana with two good spikes, Cattleya Iris, C. aurea, Oncidium ornithorhynchum, and Odontoglossum Harryanum. The group of orchids set up by Messrs. Stuart Low and Co., Bush Hill Park, contained Dendrobium formosum giganteum, Vanda Kimballiana, Cattleya Gaskelliana alba, Anguloa Clowesi, Cypripedium Godefroyæ leucochilum, C. niveum, C. concolor, and other good things.

Cattleya Iris was well shown by Messrs. Sander and Sons, St. Albans, this firm also contributing good examples of C. Wendlandiana, Lælio-cattleya Eximia, L.-c. Carissima, Rhyncostylis retusa majus, and Cycnoches Egertonianum viride, the latter carrying spikes of both male and female flowers. Messrs. Charlesworth and Co., Haywards Heath, were responsible for a goodly display of orchids, in which were such hybrids as Cattleya F. W. Wigan, C. Iris, C. Mrs. Pitt, L.-c. Elva, L.-c. Dominiana, L.-c. St. Gothard, Brasso-cattleya Mdme. Chas. Maron, and the beautiful Sophro-cattleya Heatonense, Oncidium ornithorhynchum album, Odontoglossum Harryanum, and the fine O. grande.

Mr. Edward V. Low, Vale Bridge, Haywards Heath, showed some good forms of Cattleya Iris, L.-c. Bletchleyensis, and Cypripedium Maudiæ. The tall and curious Angræcum Eichlerianum was well shown by Mr. Collier, gardener to Sir J. Colman, Bart., Gatton Park, Reigate, and gained a cultural commendation. From Sir Trevor Lawrence's collection came a fine example of Angræcum Kotschzi, with eight drooping spikes of white flowers, one carrying fifteen blooms; A. stylosum (B.C.), and Sophrolælia pum-eximea. From Messrs. William Bull and Sons, Chelsea, came numerous examples of Cattleya Maroni, C. Adula, C. Pittiana, and C. Greavesiæ, together with the graceful Stenoglottis longifolia.

FRUIT AND VEGETABLE COMMITTEE.

The whole of the top end of the hall was occupied by Messrs. G. Bunyard and Co., Maidstone, who filled the long stage with splendid examples of orchard-house fruit culture. It was a magnificent exhibit, and contained splendidly cropped trained peaches and nectarines, and fine examples of pot-grown bushes of Sea Eagle, Duchess of York, Thos. Rivers, and Princess of Wales peaches. The plums, President, Bell de Septembre, Jefferson, and Coe's Golden Drop, were carrying wonderful crops of fine fruit, and the pears, notably Beurre Alexandre Lucas, Princess Marguerite Marillat, Marie Benoist, and Doyenne du Comice, were grand, the fruits being abundant and of large size. Apples were equally fine, and the pick of the trees and varieties were Gascoigne's Scarlet, Cox's Orange Pippin, James Grieve, Peasgood's Nonsuch, Allington Pippin, and Emperor Alexander. The picked fruits were of first-class order, and the dishes of Rival, Coronation, Norfolk Beauty, Gascoigne's Scarlet, Twenty-ounce, Emperor Alexander, Peasgood's Nonsuch, Lady Sudeley, Ribston Pippin, and Houblon were fine; and equally good were the dishes of Clapp's Favourite, Dr. Jules Guyot, Doyenne Boussoch, Marguerite Marillat, Souv. du Congrès, Durondeau, Williams' Bon Chretien, White Doyenne, and Fondante Thirriott. Undoubtedly the display was one of the great attractions of the meeting.

The display of fruits made by Mr. W. Fyfe, gardener to Lady Wantage, Lockinge Park, Wantage, was a large one for a private establishment. It was also most tastefully arranged, and contained some very fine dishes of grapes, etc. There were altogether about sixty dishes of fruits. Grapes were represented by good clusters of Black Hamburgh, Buckland Sweetwater, Foster's Seedling, Alicante (very heavy), Madresfield Court, Gros Maroc. and Muscat of Alexandria. The pick of the rest of the collection staged by this veteran grower comprised Condor, Hale's Early, and Dymond peaches; Lord Napier nectarines; The Queen, Gascoigne's Scarlet, Jas. Grieve, Peasgood's Nonsuch, and Lady Sudeley apples; Dr. Jules Guyot, Beurre Hardy, and Louise Bonne of Jersey pears; and Jefferson's, Washington.

and White Magnum Bonum plums. Messrs. Stuart Low and Co., Enfield, showed a collection of small apple trees in pots, all finely cropped, and carrying fruits of good quality.

A large set of excellent vegetables, put up in a very attractive manner by Mr. A. Grubb, gardener to C. F. Raphael, Esq., Porter's Park, Shenley, Herts, was another great attraction, and proved that Mr. Grubb must be counted among the foremost of vegetable cultivators. He had beautiful heads of Early Giant, Walcheren, Mammoth, Early Autumn Giant, and Autumn Giant cauliflowers, and grand bulbs of Giant Rocca and Ailsa Craig onions. Scarlet Emperor and Hackwood Park Success runner beans, Black, and Globe beet, Model carrots, Snowball, Surprise, Windsor Castle, Sharpe's Express, and Duchess of Cornwall potatoes, Dwarf Gem Brussels sprouts, Sunrise and Perfection tomatoes, Matchless cucumbers, Maltese parsnips, and Standard Bearer celery.

Mr. T. Coomber, gardener to Lord Llangattock, The Hendre, Monmouth, put up sixteen beautiful bunches of grapes and eight fine melons. The grapes were grandly finished, especially Muscat of Alexandria, Lady Downes, Alicante, Lady Hutt, and Gros Maroc. The melon was The Hendre Seedling. Mr. W. Camm, gardener to Waldorf Astor, Esq., Clivedon, submitted beautifully finished and highly-coloured Alicante grapes grown on supernumerary vines in half-paraffin casks. Grapes were largely shown by Mr. T. Heron, gardener to H. B. Brandt, Esq., Capenor, Nutfield, Surrey; Appley Towers, Diamond Jubilee, Prince of Wales, and Alicante were especially good.

The display of apples from Messrs. W. Seabrook and Sons, Chelmsford, was greatly admired; Lady Sudeley, Emperor Alexander, Worcester Pearmain, and Langley Pippin were very well coloured. Mr. G. W. Miller, Clarkson's Nursery, Wisbech, showed a new and very attractive apple named Miller's Red Victoria; this is a very early, weighty, and brilliant crimson variety. Mr. G. Kelf, gardener to M. Drummond, Esq., Danesbury, Welwyn, Herts, showed fine samples of Pond's Seedling, Transparent Gage, Late Orange, Victoria, Monarch, Jefferson's and Kirke's plums. Mr. Nicholls, St. Clere Gardens, Kemsing, contributed some very fine pears from pot-grown trees; Mdme. Treyve, Pitmaston Duchess, Gansel's Bergamotte, Souv. du Congrès, Magnate, and Marguerite Marillat were specially large.

Though a mid-September strawberry is not exactly novel, it is a matter of great interest, especially if it be a good one. In the present instance the variety Laxton's Perpetual (A.M.) merited attention because of its fine flavour and big, spreading trusses of fruits. The colour is rich red. From Wisley Gardens came various cauliflowers, runner beans, and potatoes, that have been on trial there.

Forty-one baskets of clean, even-sized tubers of as many varieties of potatoes were put up by Messrs. Dobbie and Co., Rothesay, and it is rarely that one sees such a fine and indeed handsome collection. The Admiral, a white oval variety that promises well, and Dobbie's Red Kidney, a fine kidney-shaped red-skinned variety, are a pair of excellent new potatoes. Other fine varieties on view were Windsor Castle, Eightyfold, White City, Epicure, Climax, King Edward VII., Dobbie's Favourite, Adirondack, The Factor, Dalmeny Radium, and Midlothian Early.

In the competitive classes for fruits, Mr. M. Nicholls, gardener to Sir Mark W. Collet, Bart., Kemsing, was first for two dishes of dessert apples with Wealthy and Lady Sudeley. Mr. Pateman, gardener to M. W. Price, Esq., The Node, Welwyn, led for four dishes of dessert apples with fine specimens of Washington, Chas. Ross, Cox's Orange Pippin, and Lady Sudeley. Mr. Bacon, gardener to Sir Marcus Samuel, The Mote, Maidstone, scored for six dishes of cooking apples with Grenadier, Peasgood's Nonsuch, Lord Grosvenor, Ecklinville, Stirling Castle, and Emperor Alexander. Mr. F. W. Church, gardener to E. S. Hanbury, Esq., Poles Park, Ware, second for two dishes of pears, and Mr. Nicholls led for four dishes of pears, with beautiful fruits of Beurre Mortillet, Souv. du Congrès, Triomphe de Vienne, and Marguerite Marillat.

AWARDS OF MERIT.

Awards of Merit were granted as follows:

To Cactus Dahlias Red Admiral, Jupiter, Indomitable, H. H. Thomas, and Iolanthe, from Messrs. J. Stredwick and Son, St. Leonards.

To Pompon Dahlia Little Beeswing, from Messrs. Keynes, Williams, and Co., Salisbury.

To Show Dahlia Edward Mawley, from Mr. Chas. Turner, Slough.

To Cactus Dahlia Prima Donna, from Mr. H. Shoesmith, Woking.

To Chrysanthemum Leslie, from Messrs. W. Wells and Co., Merstham.

To Potentilla atrosanguinea Gibson's Scarlet, and to Helenium Riverslea Beauty, from Mr. Maurice Prichard, Christchurch.

To Rhus sinica, from Messrs. Paul and Son, Cheshunt.

To Cattleya iridescens, from Messrs. Stanley and Co., Southgate.

To Strawberry Laxton's Perpetual, from Messrs. Laxton Brothers, Bedford.

MEDALS.

Gold.—To Messrs. G. Bunyard and Co., Maidstone, for fruit trees in pots.

Silver-gilt Knightian.—Messrs. Dobbie and Co., Rothesay, for potatoes; Mr. W. Fyfe, gardener to Lady Wantage, Lockinge Park, Wantage, for fruits; Mr. T. Coomber, gardener to Lord Llangattock, The Hendre, Monmouth, for grapes and melons; Mr. Grubb, gardener to C. Raphael, Esq., Porters Park, Shenley, for vegetables.

Silver-gilt Flora.—To Mr. L. R. Russell, Richmond, for collection of bamboos; Messrs. Paul and Son, Cheshunt, for cut sprays of ornamental shrubs; Messrs. Carter, Page, and Co., London Wall, E.C., for dahlias.

Silver-gilt Banksian.—To Messrs. J. Burrell and Co., Cambridge, for gladioli; Messrs. W. Seabrook and Sons, Chelmsford, for apples; Mr. Nicholls, gardener to Sir Mark W. Collet, Bart., St. Clere, Kemsing, Sevenoaks, for pears.

Silver Knightian.—To Mr. T. Heron, gardener to H. B. Brandt, Esq., Capenor, Nutfield, Surrey, for grapes.

Silver Flora.—Messrs. H. B. May and Sons, Edmonton, for gymnogrammas; Mr. S. Mortimer, Farnham, for dahlias; Mr. J. T. West, Brentwood, for dahlias; Mrs. Matthews, Anerley, for Vallota purpurea; Messrs. Charlesworth and Co., Haywards Heath, for orchids; Messrs. Sander and Sons, St. Albans, for orchids; Messrs. Stuart Low and Co., Bush Hill Park, for orchids.

Silver Banksian.—Messrs. J. and A. A. McBean, Cooksbridge, for orchids; Mr. E. V. Low, Haywards Heath, for orchids; Mr. Maurice Prichard, Christchurch, for hardy flowers; Mr. W. Camm, gardener to Waldorf Astor, Esq., Cliveden, for grapes; Mr. E. Kelf, gardener to M. Drummond, Esq., Danesbury, Welwyn, for plums.

Bronze Flora.—To Messrs. H. Cannell and Sons, Swanley, for dahlias; to Messrs. J. Cheal and Sons, Crawley, for dahlias; Messrs. T. S. Ware, Lim., Feltham, for dahlias.

Bronze Banksian.—To Messrs. Barr and Sons, Thames Ditton, for hardy flowers; Messrs. W. Cutbush and Son, Highgate, for hardy flowers.

United Horticultural Benefit and Provident Society.

The monthly meeting of this society was held at the Horticultural Hall, Vincent Square, Westminster, on Monday evening last. Mr. Charles H. Curtis presided. Six new members were elected. The death certificate of the late Mr. J. H. Wilson was produced, and the amount standing to his credit in the society's books (£65 17s. 3d.) was passed for payment to his nominee, Mrs. Wilson. The amount paid out in sick benefit since the last meeting was £47 6s. The annual dinner will be held at the Waldorf Hotel in October, particulars of which will shortly be given.

A Great Onion Show.

To the person who looks upon vegetables as eatables and nothing more, a show devoted solely to onions will doubtless appear a very tame and uninteresting affair: but to the grower who has studied the points of "type" and "quality," and strives to reach a high position as an expert cultivator, an onion show is as full of interest and importance as a show of roses or sweet peas may be to those whose aspirations lean that way.

That there are plenty of gardeners who are what may be termed onion enthusiasts is well known, and that an onion show may really be an affair of importance was well evidenced by the capital exhibition organised by Messrs. Dickson and Robinson, which was held in their extensive premises at Cheetham, Manchester, on Wednesday, September 15.

Having introduced an onion of very fine type and quality named Premier, the firm conceived the idea of offering prizes for the best specimens, and on Wednesday the result of their enterprise was submitted to the public in a display of large, well-grown bulbs, of beautiful form and quality. Each competitor staged four bulbs, and the entries numbered 117. Mr. Ben Ashton, who undertook the task of selecting ten dishes, to be awarded prizes varying in value from £5 to 4s., had no easy task, but, as is well known, Mr. Ashton is himself a grower of high repute, and therefore can pick out the "best" specimens with comparative ease.

"Premier" is an onion of excellent type and quality. It is not of globular shape, but still has good depth. The skin is beautifully fine, evenly veined, and of a pleasing straw-colour. We may add that, judging by the exhibits, which came from all quarters of the United Kingdom, the type is well fixed.

PRIZE LIST.

That redoubtable champion, Mr. E. Beckett, gardener to Hon. Vicary Gibbs, Aldenham House, Elstree, added another leaf to his laurels by securing the first prize with four most perfect models of what a high-class onion should be. We have seen bigger bulbs, the weight of the four being 8lb. 5oz., but for evenness, fineness of skin, and neat, small neck these were as good as one could wish to see. Mr. Bowerman, Hackwood Park Gardens, Basingstoke, was second, his weight being 8lb. 10oz., but his bulbs were scarcely so even or so fine in neck. Mr. T. Wilkinson, Tyntesfield Gardens, Flaxbourton, Bristol, was third; 8lb. 6oz. was the weight of his four good bulbs, which were, however, rather rough in skin. Mr. E. Johnson, Duffield House Gardens, Stoke Green, Slough, came fourth, his bulbs having too much shoulder. The remainder of the prizes were awarded to Mr. George Duncan, Merstham House Gardens, Merstham; Mr. T. Avory, Loudwater House Gardens, Rickmansworth; Mr. W. Folkes, Ampthill, Beds; Mr. H. Tysoe, The Lodge Gardens, Bedford; Mr. J. Fraser, Ottershaw Park Gardens, Chertsey; and Mr. H. Parrott, Brockhampton Court Gardens, Hereford, who occupied positions in the order named.

Much as the fine array of onions engaged the attention of the visitors, there was also great interest shown in the more decorative exhibits of flowers arranged by Messrs. Dickson and Robinson, which were of varied character and excellent quality, proving the firm to be good florists as well as seedsmen. Well-grown dahlias of cactus, pompon, and double types were shown in the form of specimen blooms and in bamboo stands. A fine bank of phloxes constituted another delightful feature, and there were also early-flowering chrysanthemums, and beautiful sweet scabious. Heavily laden branches of the very effective tomatoes Golden Nugget and Cascade came in for much praise.

Bristol Gardeners' Association.

The usual monthly meeting was held at St. John's Parish Rooms, Mr. Shaddick in the chair. Mr. C. Holt, gardener to Mrs.

Baker, Henbury, gave a practical lecture upon "Tuberous Begonias." Mr. Holt, who has charge of the best named and most up-to-date collection in the neighbourhood, was eagerly listened to. The Chairman, and Messrs. Morse, Lee, Bird, Thoday, Curtis, Brook, and House took part in the discussion. A hearty vote of thanks was accorded to Mr. Holt at the close.

For two pots of begonias Mr. Holt was first, and he also gained two points for a collection of named varieties. Mr. Gosling was awarded three points for four hybrid cypripediums of C. Rothschildianum parentage, and Mr. Curtis two points for a pot of vallota.

THE ROYAL BOTANIC SOCIETY.

As I have for many years taken an interest in this society, I would like to say a word on the suggestions that have been made with regard to the future of the Botanic Gardens. These suggestions are (1) that the gardens should be thrown into Regent's Park, and (2) that the gardens of the Zoological Society should be enlarged with a view to uniting the two societies.

There are many objections to the second proposal. The objects of the societies are wholly different. The new buildings that would have to be erected would cost thousands of pounds.

The adoption of the first proposal would, in my view, be most unfortunate. London cannot afford to lose the one ideal place still available for flower and horticultural exhibitions, and for outdoor receptions by public bodies and societies. Regent's Park is already one of the largest and most attractive in London, covering, with Primrose Hill, some 470 acres, and, except in the principal avenues, the frequenters over acres are few and far between.

I favour an amalgamation with the Royal Horticultural Society—a well-managed and consequently flourishing body. Under enlightened control the Botanic Gardens would, I am sure, soon become what they should be, one of the brightest and most useful places in London.

J. S. RUBINSTEIN.

76, Addison Road, Kensington, W.

NEW BOOKS.

A FRENCH GARDEN IN ENGLAND.

By Helen Nursey and O. J. Cockerell (Stead's Publishing House, Bank Buildings, Kingsway, London). Price 1s. net.

An interesting account of the first year's experience of two women gardeners in intensive culture, or what is commonly known as French gardening. The garden, we are told, is situate on an estate in Sussex, and has the advantage of a good soil, and is within a convenient distance of a railway station. Both partners had had the advantage of a year's training in a French garden in England, but it would appear that, owing to their commencing operations two months late, they had many difficulties to contend with, more particularly in disposing of the crops. No balance-sheet is given in the book, but the results were so far satisfactory that the two fair gardeners are anticipating future operations with some degree of confidence.

HOME-BOTTLED FRUITS.

By G. W. S. Brewer (Harvey and Healing, Manchester Street, Cheltenham). Price sixpence net.

A small but extremely useful work on the bottling of the various kinds of fruit grown in British gardens. It is essentially practical, and gives the temperature best suited for each kind of fruit.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

SALT FOR ASPARAGUS PLUMOSUS.—A. L., Fairlie: We have had no experience of the use of agricultural salt for Asparagus plumosus. It might prove useful in the form of a weak solution, but nitrate of soda would be better. Given good soil to grow in Asparagus plumosus thrives if given liquid cow manure when well rooted. By the way, what is the asparagus doing in a vine border?

RUST ON MUSCAT GRAPES.—M. E. G., Buxton: The discoloration of the grapes is probably due to the berries having been handled during the process of thinning. It is, of course, possible that cold draughts on the one hand, or excessive dryness of the atmosphere on the other, may have produced a similar result. In most cases, however, the rusty discoloration is due to lack of care during the work of thinning the berries, and the tender skins become slightly bruised, or the protecting waxy covering that presently develops as "bloom" is rubbed off.

OUTDOOR TOMATOES.—J. S. B., Haslemere: If you can fix frame lights over the outdoor tomatoes you should do so at once, as this will materially increase the chances of maturing the crop. Pick all fruits directly they commence to colour, and place these on a shelf in a warm greenhouse to finish ripening. Do not permit side growths to extend, and if you have not already done so, cut out the growing point at one leaf beyond a promising truss of fruit. At this season you may also rather severely shorten the leaves, but it is a mistake to remove these altogether. At the approach of frosts cut the remaining fruit bunches and hang them from the roof wires in a warm shed or greenhouse.

LAND FOR DAFFODIL CULTURE.—S. M., Bangor: Under the circumstances it will be better to defer planting for a season, as it is practically impossible to bring the land into a fertile condition for bulb planting this season. At any rate, the risk of failure is too great. Have the ground thoroughly cleaned, manured, and trenched, and let it lay rough for the winter. Then, early next year, fork the ground over after dressing it freely with soot and sifted ashes from the rubbish heap fire. Plant a crop, such as first early potatoes, cos lettuce, turnips, etc., that can be cleared in ample time for the ground to be cleaned and forked over ready for daffodils. On poor land that has refused to grow potatoes it is impossible to grow either good bulbs or flowers until its fertility is restored. Further, freshly manured ground (and manure must be used freely in this case) is not suitable for bulbs.

FAILURE WITH GRAPES.—Kent: Unless one has the opportunity of inspecting the vineries and gaining full knowledge of the general conditions that prevail, as well as the particular conditions that have to be considered, there is very great difficulty in giving useful advice. In your case, however, we believe we can read the story aright. The vines were badly injured by the use of turpentine in the mixture used for cleaning in the winter of 1907-8, and this injury showed itself in the death of many spurs and the weakly growth from those that remained. The idea of training up new rods from the best basal growths was a good one, but it would have been better practice to cut back the old rods at once and take up one new rod from the base of each, as this would have given the new growth a better chance in every way. The progress of the new rods is evidence that there was little if anything the matter with the root system of the vines, but to heavily crop these young rods this year was a grave error. The rods should have been shortened, as in the case of young vines, and a bunch or two at most would have been a good crop this year. The cold, damp weather this season has not helped matters, and we can imagine that, as a result of overcarefulness, the vineries were not sufficiently ventilated (more artificial heat with increased ventilation would have been better), with the result that mildew appeared. The use of sulphur to counteract the mildew resulted in rusted berries, and the large amount of moisture in the border, due, not so much to overwatering as to a greatly reduced need, because of the smaller crop of fruit, leaves, and growth, caused splitting of the berries, and subsequent shanking. Remove the crop of fruit entirely, it is not worth bothering about; use fire heat, and ventilation, so as to ripen up the wood well, and secure a good resting season for the vines. Clean the rods with some well-known and safe mixture this winter, and shorten them back so that they will produce spurs the whole of their length. Crop very lightly next season; pay particular attention to ventilation, and remember that in cool, damp weather it pays to use fire heat and give increased ventilation rather than keep the vineries close and use little or no fire heat. Keep a close watch upon the borders, because, for another season, at least, it will be an easy matter to overwater, and thus severely damage the roots.

PRESERVING PEA AND BEAN STICKS.—C. C. D., Tenby: When the pea and bean crops are over and the sticks are removed, many of the latter will be found of little value except for firewood. The best may be retained, however, and used to help out the new supply next year; and when sticks are difficult to obtain it is economical procedure to stack the good sticks under cover in an open-sided shed, taking care to keep the lower sticks well above the floor. Failing a shed of this kind, the sticks may be roughly bundled and stood against a wall or hedge where they will be sheltered from rain. Either here, or stacked in the open, raised above the ground, a rough thatching should be given to throw off winter rains and snow.

NAMES OF PLANTS.

F. G., Hexham.—1, Colchicum autumnale; 2, Galtonia candicans; 3, Spiræa Douglasi.

G. S., Sherborne.—1, Salix babylonica; 2, Cotoneaster microphylla; 3, Daphne Cneorum.

H. M. A., Leicester.—1, Sambucus racemosus; 2, Montbretia rosea; 3, Eupatorium purpureum.

G. F. G., Lincoln.—1, Berberis stenophylla; 2, Leycesteria formosa; 3, Lycaste Skinneri; 4, Costus igneus; 5, Phrynium variegatum.

H. T. W., Orpington.—1, Cotoneaster horizontalis; 2, Hypericum Moserianum; 3, Pentstemon barbatus; 4, Eleagnus longipes; 5, Caryopteris mastacanthus.

F. C., Guildford.—1, Hesperis matronalis; 2, Quercus ilex; 3, Odontoglossum ardentissimum (very poor variety); 4, Jacaranda mimosæfolia; 5, Pteris tremula.

H. T. S., Barnet.—1, Cypripedium barbatum; 2, C. longifolium—very poor specimens, that are as named, so far as we were able to judge; 3, Helianthus multiflorus.

S. P., Essex.—No. 1, Spiræa Douglassi; 2. Olearia Haasti. The other specimens are insufficient for identification, and examples should be sent again when in flower; 3 is a hypericum; 5, a viburnum; and 7, a maple.

FORTHCOMING ENGAGEMENTS.

SATURDAY, September 18.—Arnold Horticultural Society.

MONDAY, September 20.—National Chrysanthemum Society; Floral Committee, Essex Hall, at 3 o'clock; General Committee at 7 o'clock, at Carr's Restaurant.

TUESDAY, September 21.—National Dahlia Society, at Royal Botanic Gardens, Regent's Park; two days.

TUESDAY, September 28.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture at 3 p.m. on "The Production of Horticultural Varieties," by Prof. Hugo de Vries; Scientific Committee at 4 o'clock.

MONDAY, October 4.—National Fruit Growers' Federation.

WEDNESDAY, October 6.—National Chrysanthemum Society: Conference on Chrysanthemums at Essex Hall, Strand, commencing at 3 p.m.

FRIDAY, October 8.—Carluke Chrysanthemum Show.

IMPORTANT NOTICE.

Telegraphic Address: "HORNE, CLIFFE-AT-HOO."

This is the secret to get a crop of apples every year: You must use

HORNE'S FRUIT TREE DRESSING.

W. HORNE & SONS, Farmers and Fruit Growers,

PERRY HILL, CLIFFE, near ROCHESTER, KENT.

HORNE'S FRUIT TREE DRESSING has stood the test of 20 years as the best remedy for capturing the Winter Moths. Thousands of pounds' worth of fruit have been saved by its use that would otherwise have been lost if left to the ravages of the Caterpillar pest. We are offering the same sort as we use for ourselves, and have succeeded in obtaining a mixture that is harmless to the trees, and effectual in killing, thus making it impossible for the Female Winter Moths to cross the band, which should be put on the trees six or eight inches wide with a sixpenny paint brush, as thickly as it will lay on, early in October. They do not come out of the ground at one time; we have noticed them ascend as early as the first week in October, and as late as the middle of December. The Female Winter Moth, having only abortive wings, is obliged to climb the trees, and, in trying to cross the band, sticks fast; the males, not finding them in the branches, join company with them where they are, and consequently share the same fate. We have counted as many as 3 and 40 on one tree. **They have the reputation of laying 200 eggs each.**

We would mention one Fruit Grower in Twydale, near Gillingham, who tried it by dressing every other row of Manx Codlin. The first thing that struck the visitor was every alternate row had leaves, while the others were nearly as bare as they are on Xmas Day. These trees are half-standards, about **20** years old, and have not had a crop for years; every season the leaves have been devoured by the caterpillar pests. We would remind our readers where they have trees that have suffered like the above, it will take them a year or two to recover; the first step is to keep the trees free from caterpillars, and the easiest way is to catch the moth as it ascends to lay its eggs; then you may hope for healthy leaves and bloom, and fruit to follow. If there were no moths there would soon be an end to the caterpillars.

These little insects are very persevering, they will climb over the bodies of the dead, and even lay their eggs on the band to lighten themselves in trying t gain their point. We find it pays to send a woman round about every three weeks, or a month, and freshen the band up, thus destroying the eggs, and making it impossible for one to escape.

As this is now being universally used, no garden or orchard, however small, should be neglected. This season it will be sent out, smallest quantity made in—

14 lbs.	£0 7 6	½-cwt.	£1 1 0
28 lbs.	0 12 6	1 cwt.	2 0 0

Special Quotation for Ton lots.

Orders given now can be delivered at once. 1 cwt. will dress 3 or 4 acres well, upon trees 15 to 20 years old. We are sending Grease-proof paper, already cut in strips, gratis with all orders (at the rate of 15 lb. to the cwt.; if more is required, price is 6d. per lb.), which should be put on with ordinary flour paste; when dry, apply the Dressing.

EVERY GARDENER knows that the XL-ALL SPECIALITIES are the best on the market. The time is at hand for housing Plants for the Winter. When these are arranged under glass a fumigation with XL-ALL COMPOUND, or a syringing with XL-ALL LIQUID INSECTICIDE will at once free them from insect pests and save lots of trouble later on. Any plants or fruit trees suffering from Mildew should be sprayed with XL-ALL MILDEW WASH, or with the newly-patented CUCASA, the finest preparation of Copper ever offered to Gardeners. RICHARDS XL-ALL FERTILIZER is unequalled for finishing off fine blooms and fruit. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink List, giving particulars of these and many other "XL-ALL" Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

CHOICE HARDY BULBS.
COLLECTION "F" FOR SPRING GARDENING

Contains **1,002** Bulbs.

48 Hyacinths, distinct colours.
50 Tulips, single early.
50 Tulips, double.
25 Tulips, single late.
20 Narcissus polyanthus.
30 Narcissus incomparable
24 Narcissus poeticus.
24 Anemones, double.
50 Anemones, single.
36 Gladiolus nanus.
300 Crocus, in four distinct colours.
100 French Ranunculus.
50 Snowdrops, single.
75 Spanish Iris.
18 Scilla sibirica.
4 Lilium umbellatum.
50 Eranthis hyemalis (Winter Aconite).
24 Ixias, best mixed.
24 Triteleia uniflora.

HALF OF THE ABOVE FOR **11s.**

Our Bulbs are Perfect Bulbs direct from Holland—THE Great BULB LAND.

The above Package may be had from our Agents,

MERTENS & Co.,
3, Cross Lane, London, E.C.,
On Receipt of Cheque or Post Office Order.

Our **DESCRIPTIVE CATALOGUE** of SPLENDID BULBS (100 pages in English), containing FULL CULTURAL DIRECTIONS, will be sent post free on application to our Agents, as above, or ourselves direct at

OVERVEEN, HAARLEM, HOLLAND.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Fall.

In adopting the term "Fall" for the autumn the Americans have certainly chosen a very appropriate one, for of all autumnal phenomena it is certainly the shedding of deciduous foliage which strikes us most as a preliminary to winter conditions. The four seasons, indeed, might be fitly named on similar lines, the Rise, the Rush, the Fall, and the Rest, as indicative of the flow and ebb of that vegetative activity which constitutes the one link between the sun, the direct source of all vital action, and the organic world. In the spring, as the sun's influence daily increases, we see the vegetative world, hitherto in a state of apparent dormancy, at first slowly and then rapidly bud out and burst into a wealth of leafage, which betokens a more or less sudden flow of sap, which finds a vent through the myriad channels initiated at the leaf bases of the previous season. The incipient foliage closely packed in the axial buds expands under the genial influence of sunbeam and shower, breaks the protecting sheaths which have hitherto enclosed it, and all at once, as it appears, the bare branches are clothed with innumerable types, according to the species, of delicate leaves, to be followed in many cases by the flowers which herald the formation of the fruits, the end and aim of vegetative life. Then as the noonday sun rises higher and higher, as the terrestrial pole inclines more and more towards it, the summer comes upon us, and the host of flowers follow with a rush as the solar energy approaches its maximum. Time goes on, the busy leaves complete their creative work, absorbing from air and soil the few elemental gases and salts which they work up into the innumerable products upon which the animal world, including man himself, is dependent for its existence and for the great majority of the luxuries which it is man's privilege to enjoy. Take, for instance, a luxurious home and study its contents, and it will soon be seen that, apart from the mere brick and stone used in its construction and the jewels and metals which ornament it and its owners, nine-tenths of its contents will have been fashioned directly or indirectly by the sunbeam acting on the chlorophyll within the leaves. Now, however, the leaves have finished their task, the fruits they have shaped is either already harvested or is ripening in the declining sunshine. Their work is done save, perhaps, the final perfecting of the bud at their base, which is destined to replace them the following season. They are no longer needed, and their further persistence through the winter may involve a serious risk of damage to the parent tree when snow may overload it or fierce storms assail it. The Fall is imminent, and more or less rapidly, their varied greens pale and assume all the colours present in the sunbeam which had created them, and the glowing hues of autumn greet our eyes, until the chilly breezes bring the dead leaves down in ever-increasing showers, and the branches grow barer and barer until finally the trees are but apparent skeletons, and the season of Rest has arrived. The Autumn, the Fall, superficially considered, seems a depressing season. It embraces in our climate a period of chill, fog, and other discomforting factors, while to the garden lover, it is a period of general decay and of disappearance of hitherto beautiful objects. The parterres, ablaze to-day with begonias, dahlias, and other late blooming flowers, are to-morrow a wreck of blackened foliage and dead blossoms and buds, due to a snap of frost. A persistent litter of brown and rotting foliage pervades the trim walks and lawns, and even the hardier evergreen plants become shabby and unpresentable in most instances. Happily, however, the philosophical gardener finds comfort in the fact that for six long months he has had a continual feast, and hence, like one who has enjoyed a substantial dinner, he is content, like the plants, to take a rest, and, like a gourmand, to cultivate a fresh appetite for the feast for which that rest is but a salutary preparation. A continuous meal leads but to a surfeit, an interregnum is an essential to fresh enjoyment. To the observant mind, too, the Rest season even presents its enjoyment, the garden proper is never without some attraction even though it be but the beauty of a fresh snowfall or that of a frosty morning when every twig is a string of sparkling gems; and finally, if there is nothing else to console him, he has at least the benefit of a truce with the plant foes which assail his pets at all other seasons of the year.

MR. THOMAS HAY.

Mr. Thomas Hay, whose portrait we have the pleasure of giving herewith, is one of the best known and most highly respected of Scottish gardeners, and the high keeping and the attractiveness of the gardens of Hopetoun House, the residence of the Marchioness of Linlithgow, afford unquestionable proof of his remarkable skill and administrative ability. It is a matter of some interest that Mr. Hay received the whole of the training by which he fitted himself for the high position he occupies, in gardens across the Border, which, by the way, he closely approached at one time. Mr. Hay is a native of Cullen, Banffshire, and served his apprenticeship in Duff House Gardens, under Mr. Brander, and subsequently was engaged in good gardens in Perth and Stirlingshire. Thence he went to Ayton Castle, Berwickshire, under Mr. McKinnon, and from the Ayton Castle gardens he accompanied the latter to Teregles, Dumfries, where he was a part of his time outdoor foreman and a part indoor foreman. From the last-named establishment Mr. Hay went to Hopetoun House as foreman, and on the retirement of Mr. Smith, who was then in charge, he was appointed head gardener. Long well known for their extent, distinctive characteristics, and high keeping, the gardens of Hopetoun House have, under Mr. Hay's management, become famous throughout the United Kingdom. Mr. Hay does not make a pretence of suggesting that the gardens enjoy a reputation higher than they deserve, he is too manly for that, but, with a loyalty that one can hardly too greatly admire, is not slow to make it quite clear that he believes whatever success he has achieved is largely due to the generous support he has received from his noble employers and the great interest they have shown in their beautiful gardens. As we hope to make some reference to them at no distant date and to illustrate several of the more noteworthy features, there is no occasion to say anything with regard to them now. In the making and management of herbaceous borders Mr. Hay has achieved a degree of success which has placed him in a prominent position among the authorities on hardy flowers; he has developed a method of using tender plants in the flower garden during the summer months by which effects of surpassing beauty are obtained; and in the cultivation and use of such subjects as antirrhinums, perennial phloxes, pentstemons, and East Lothian stocks, he gives annual practical demonstrations that should prove of great educational value to those who have the opportunity of visiting the Hopetoun House Gardens. In fruit and vegetable culture Mr. Hay is not less successful than in the cultivation of flowering plants. Mr. Hay is a member of the council of the Royal Caledonian Horticultural Society and a member of the committee of the Scottish Horticultural Association.

Our Autumn Planting Number will be published on the 16th inst., and, as it will be devoted to the important work immediately associated with the present season, it should prove of much interest and be a valuable guide to those engaged in planting operations. The contents will include articles specially written for the issue on weeping trees, flowering crabs, rhododendrons for grouping, and climbers for walls and trellises; making and planting herbaceous borders, and golden flowers; selecting and planting bush apples, plums for the garden, orchard-house fruits, summer and autumn raspberries, and gooseberries and currants; and standard roses, dwarf bedding roses, and dwarf single roses. The number will be freely illustrated, and the illustrations will be not less remarkable for their utility than for their attractiveness.

Dressing Roses.—The dressing of rose blooms has less justification than the dressing of carnations, chrysanthemums, and dahlias, for in the manipulation of these the operator endeavours to remove imperfections and give the blooms a more finished appearance, but in these endeavours he is not always successful. In the dressing of roses, on the other hand, the operator opens out and pulls the petals back in such manner as to destroy in some degree the individuality of varieties and to give the flowers a rough and a more or less objectionable appearance. Some blooms of roses were submitted to the Floral Committee of the Royal Horticultural Society on Tuesday last that bore evidence of "dressing," although they had not been manipulated to the same extent as many roses that are annually submitted to public notice. The committee, however, considered that a proper estimate of the merits of new roses could not be formed from dressed blooms, and passed a resolution to the effect that roses must be staged as grown. The National Rose Society has a rule relating to dressing, but, as one of the high officers of the society remarked, the judges do not give it sufficient consideration when awarding the prizes.

Wye Agricultural College.—The South-Eastern Agricultural College, Wye, will commence the 1909-10 session on October 4. The full complement of students, 120, will be in residence, and it is satisfactory to record that all the places reserved for Kent and Surrey ratepayers will be filled. Three scholarships have been awarded by the Kent County Council, and two of these have been won by East Kent farmers' sons, and in one case it is the third and in the other the second member of the family attending the college. The prizes and diplomas awarded during last session will be distributed on Saturday, October 9, 1909, at 2 p.m. by the principal of London University (Dr. H. A. Miers, F.R.S.), of which the college forms an integral part.

Trial of Pompon Dahlias.—During the past summer Mr. Charles Turner has, on behalf of the National Dahlia Society, carried out a trial of Pompon dahlias in his nurseries at Slough, the object being to determine the relative merits of varieties for garden decoration. All the pompon dahlias possess merit for producing bright colour effects in the garden, but some are much better than others, a fact which has been brought into prominence by the trial. The collection of pompon dahlias in the Slough nurseries has long been a comprehensive one, and as several plants of each variety were grown, and all were placed under much the same conditions as those which obtain in gardens, the test was a thorough one. On the 23rd inst., the committee of the National Dahlia Society, accompanied by Mr. E. Mawley, V.M.H., president of the society, and Mr. George Gordon, chairman of committee, paid a visit to Slough for the purpose of inspecting the trial, and were not a little surprised to find the collection in such splendid condition. The season has not been particularly favourable to the pompons, for the low temperature and frequent rains have encouraged leaf development instead of flower production, and in consequence some of the varieties that usually bloom freely enough in ordinary seasons were not flowering very freely. There were, however, a goodly number of each of the several colours that were blooming so freely as to produce a series of brilliant colour effects. The collection was carefully examined by the committee, and marks assigned the varieties according to their value for garden decoration, and the official report should prove of immense value as a guide to the selection of varieties for beautifying the garden. At the close of the inspection Mr. Turner was very heartily thanked for the great service he had rendered the society and dahlia growers generally, and the kindness shown the committee.

Pæony-flowered Dahlias, which are rapidly acquiring popularity in this country, were very strongly represented at the Royal Horticultural Society's meeting on Tuesday, and received a full share of attention from visitors. It was satisfactory to have evidence that English raisers have entered into the creation of new forms with much spirit, and have achieved so much success as to be able to present to public notice forms much superior to those received from Holland. Especially noteworthy were the collections of new varieties exhibited by Messrs. T. S. Ware, Lim., of Feltham, and Mr. J. T. West, of Brentwood.

Iceland Poppies are so highly attractive when they represent a good strain and have had the advantage of good cultivation that the box of flowers received from Messrs. Storrie and Storrie was much appreciated. The flowers are throughout of large size and fine form, and are remarkable for the substance of the petals, a point of importance when the Iceland poppies are used for decorative purposes. It need hardly be said that the gathering included orange, yellow, and white flowers, but it must be mentioned that there were also flowers of a pale rose colour, and these at once obtained attention by reason of their attractiveness.

Chrysanthemum Conference.—A conference on chrysanthemums will be held by the National Chrysanthemum Society at Essex Hall, Strand, on Wednesday, the 6th inst. There will be two sessions, the first will commence at 3 p.m., and the chairman will be Sir Albert Rollit, LL.D., D.C.L. The second session will commence at 6 p.m., and at this Mr. T. Bevan will preside. Each session will extend over two hours, and the papers that will be read at the afternoon session will deal with "Chrysanthemums as Annuals" and "Early Single Chrysanthemums," and at the evening session the papers will be on "Late Market Chrysanthemums" and "The Best Chrysanthemums for Cut Flowers" The readers of papers, so far as announced, will be Mr. W. Wells, Mr. P. A. Cragg, Mr. J. B. Riding, and Mr. D. B. Crane. There will be a special meeting of the Floral Committee and an exhibition in association with the conference, and the public will be admitted to the show and conference, a small charge being made for admission.

Eckford's Mammoth Exhibition Bean.—Mr. Henry Eckford, whose name is so intimately associated with the development of the sweet pea, devotes a considerable share of his attention to the improvement of vegetables. Of his successful endeavours in this direction we are reminded by receiving from Wem a gathering of pods of the fine scarlet runner Eckford's Mammoth Exhibition. The variety is fully entitled to the designation of mammoth, and it is certainly highly meritorious for exhibition purpose. The pods received ranged from twelve to thirteen inches in length, and an inch in breadth, and were thick and fleshy and very handsome in shape. While possessing much merit from the exhibitor's point of view, the variety has much to recommend it to those who grow vegetables simply for the supply of the table, for it crops heavily and the quality is high.

Leigh Woods, Bristol.—At the annual meeting of the Leigh Woods Land Company, the Chairman stated that the picturesque woodland scenery presented by Mr. G. A. Wills to the City of Bristol had been transferred to the National Trust for Places of Historic Interest or Natural Beauty. This body would be the legal owners, but the management of the property would be entrusted to a committee which would be appointed by Mr. Wills and several local societies. A fund of £4,010 had been raised for providing the amount annually required for the upkeep of the property.

THE WILD HEATH GARDEN.

The subject of the wild heath garden and its surroundings should provide an interesting study to those who have open spaces which require to be turned into interesting and charming garden scenes.

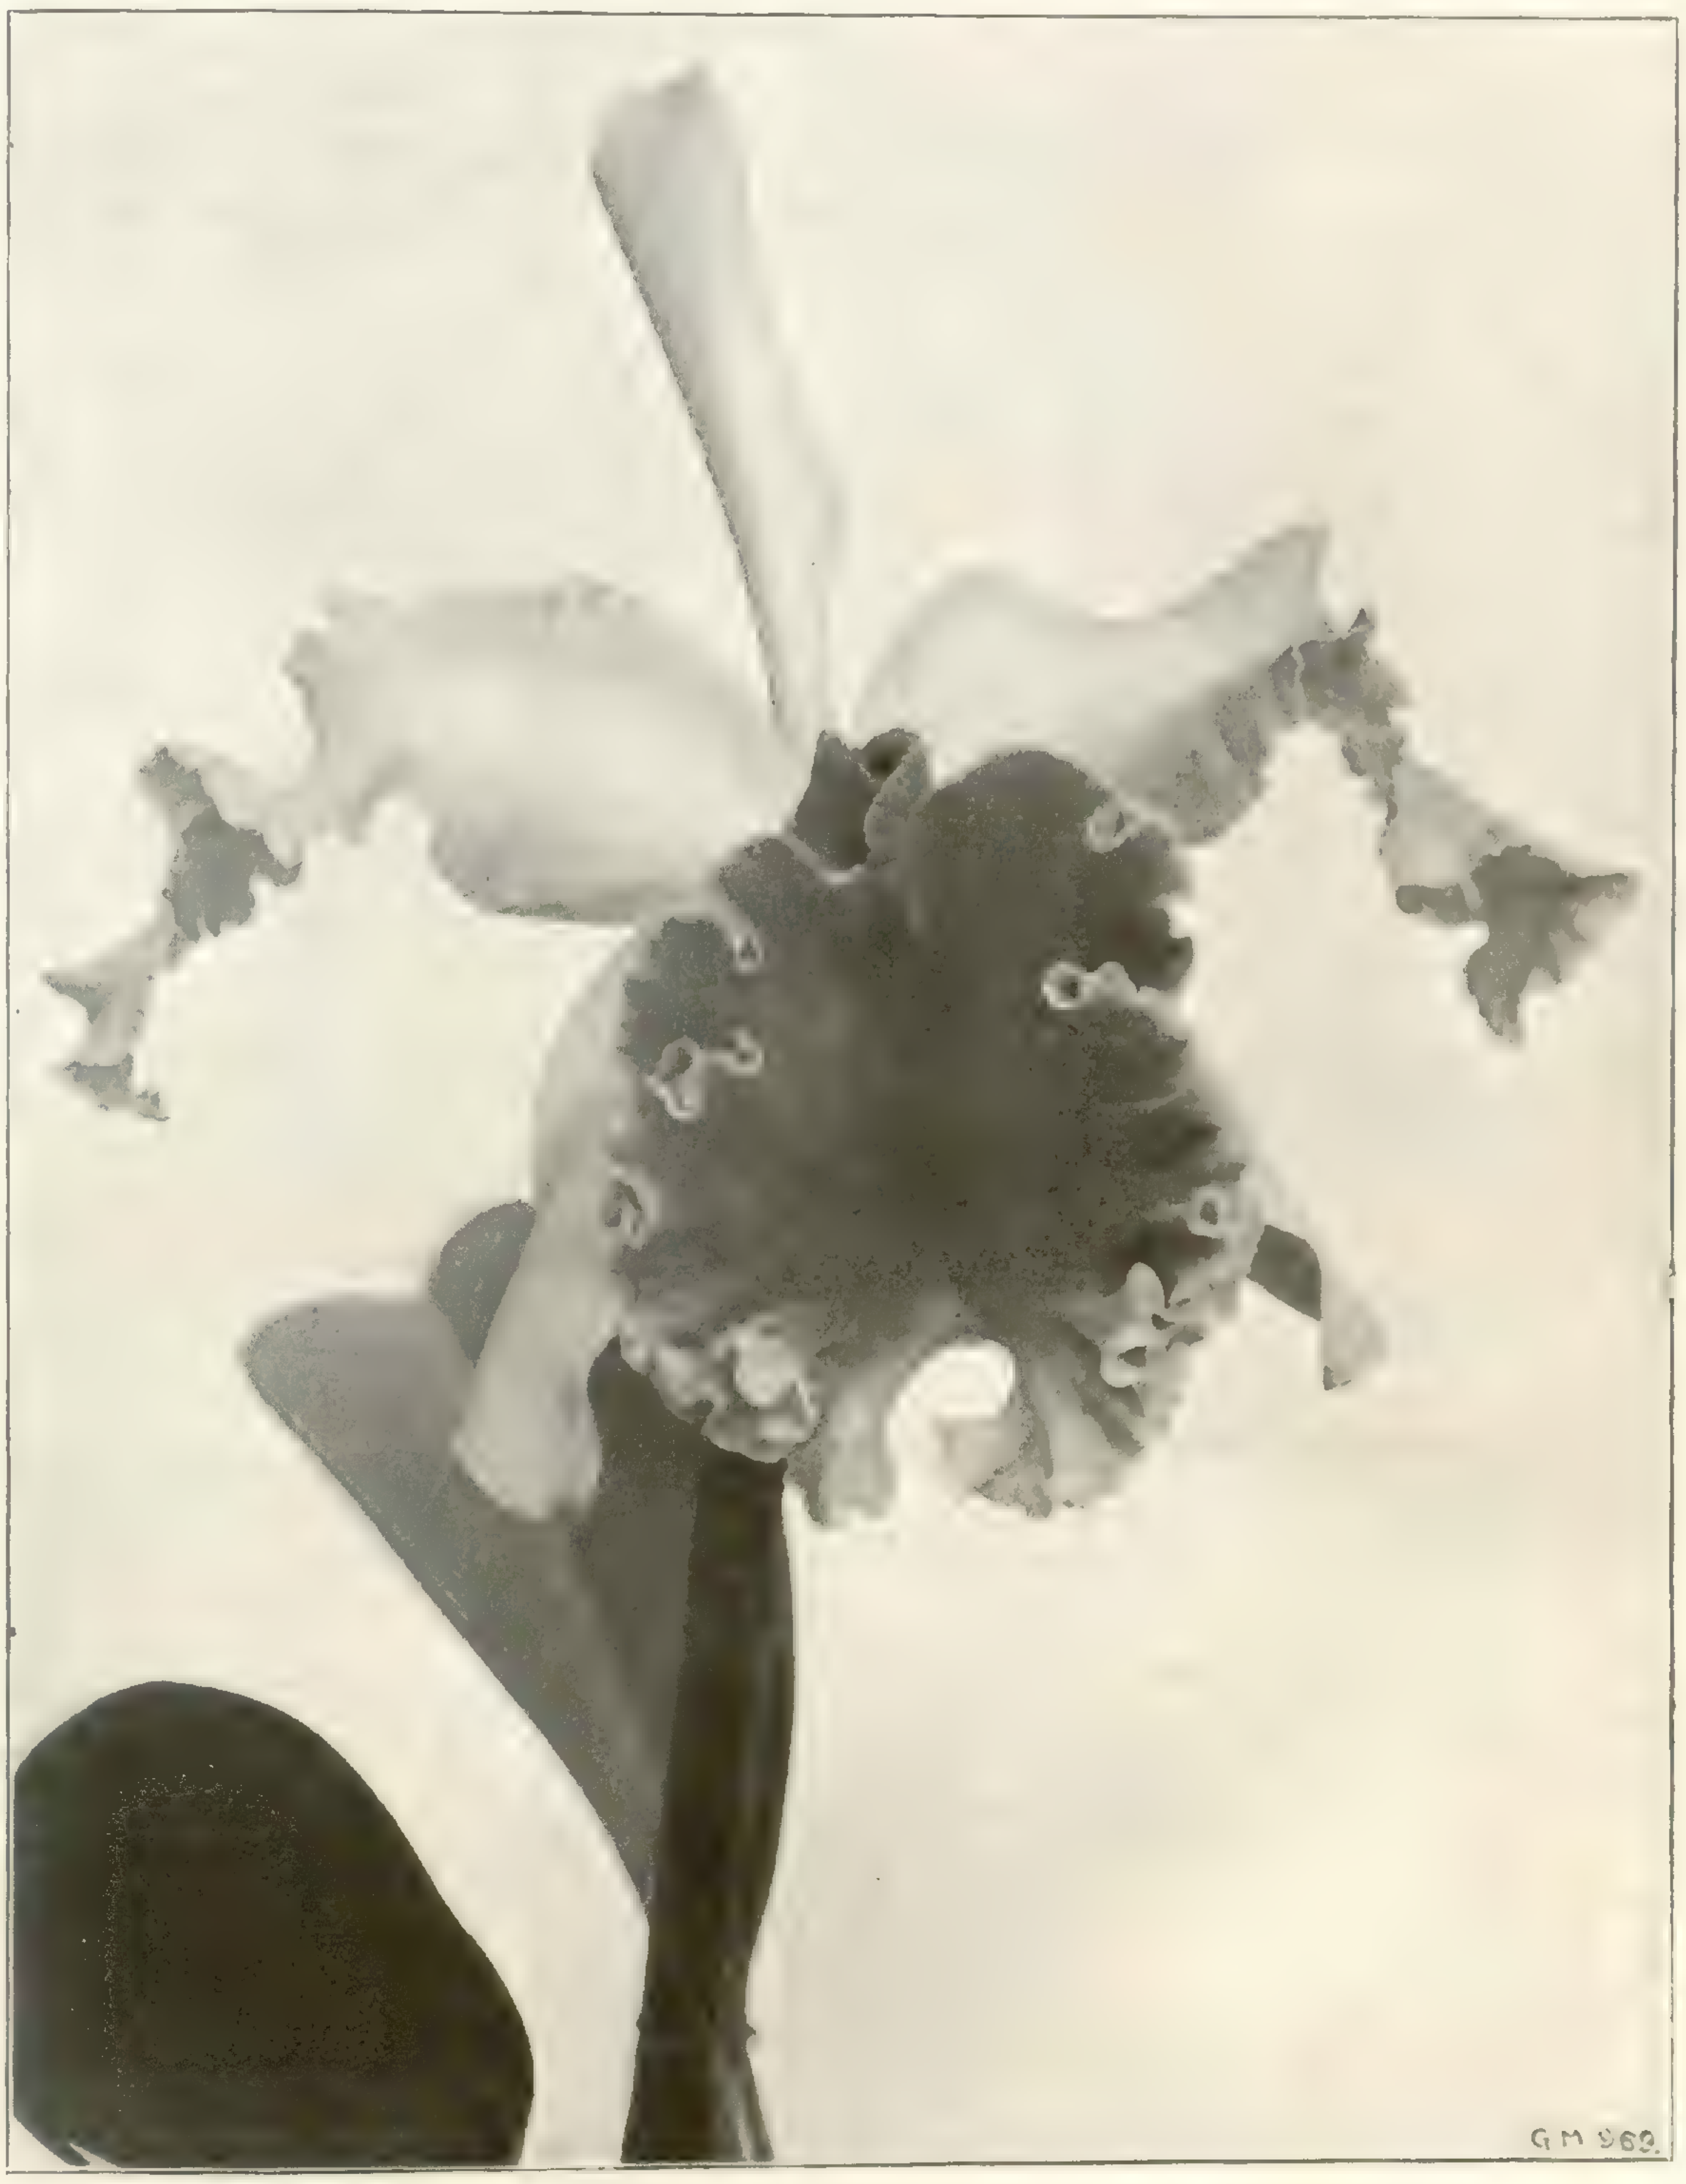
My purpose is to enthuse one with a desire for garden scenery which shall embody some of the most delightful aspects of Nature's own garden in the countryside, and thus it is that the call is given for the praise of the wild heath garden. This idea of the heath garden is pleasing by reason of its simplicity, and not less in the favour of the scheme is the facility with which it can be carried out at a small cost.

Picture, if you will, a slightly undulating stretch of ground, broken by a series of ridges, with here and there an outcrop of weathered rock, and you have an idea of the general outline of the heath garden. One or more winding paths should intersect the ground, rising and falling in accordance with the natural formation, anon losing itself among the rifts and depressions, and appearing again farther on, in just the same way that a beaten track would appear in nature. Here and there a broken weathered seam of stone may occur in the pathway, while the plant and shrub groupings should appear in as natural a manner as is possible under the circumstances. Here and there should be grouped masses of heaths of a hardy and attractive nature. Bold groups are very necessary on the crests of ridges, and on sloping banks, but diversity must be given, therefore other plants which thrive under similar conditions to the heaths should be allowed for.

In arrangement care must be taken to give the heaths a certain prominence, and then allow the groups to lighten outwards, until single specimens are seemingly lost among groups of other subjects. Here and there should occur pleasing groupings of our native linarias, particularly the taller forms, such as L. vulgaris, and L. genistæfolia. Masses of golden ragworts may appear in spots which seem to need tallish subjects of bright appearance, while fern groupings, in which even the common brake, Pteris aquilina, may be used, will be found of no uncertain value, both for their refreshing greenery of summer time, and the gold and bronze tints of autumn.

In the harebells, or campanulas, one finds additional charm, and the light habits, pendant, and sub-pendant bells, and delightful blue shades, one gets pleasing material, which will show to decided advantage either near the pathways or lightly waving from the higher ridges. Gentians, too, come to mind for the planting of spots by the track sides, and many other subjects, such as some of the lychnis, achilleas, wild lathyrus, with here and there a tangled mass of honeysuckle, or a group of double gorse, will give a bit of tone value to the scene.

Here and there the general effect will be enhanced by the inclusion of a few pines, such as cembra and montana. For large gardens one might go farther and add a few rubus, dwarf willows, hollies, and silver birches, which help to break the monotony of dwarf things. On the other hand, a more ornate garden might be modelled by allowing for the inclusion of azaleas, kalmias, dwarf rhododendrons, and a host of bright shrubby plants which will come to the mind of the garden lover. But in the idea of the wild heath garden one gets a wondrous appealing charm, which can be considerably added to by the grouping of a few cherries, rowans, or pyrus away toward the northern limit.



LÆLIO-CATTLEYA PIZZARO HOLFORD'S VARIETY.

A handsome form, rich in colour, and remarkable for its old gold and crimson lip. Exhibited by Lieut.-Colonel Holford at the Royal Horticultural Society's Meeting on Tuesday, when it received a First-class Certificate.

The wild bird cherry is infinitely charming, with its snowy clouds of blossoms in spring, and its wondrous orange-red shades of autumn leaf-colouring. The double cerasus (particularly the Japanese varieties) are of utmost value, and the pretty foliage and brilliant berries of the rowans, and the charms of some of the pyrus, are very delightful, and grouped toward the north, where they will not interfere with the range of the sunlight, they will prove of distinct service.

Among the heaths which are of service for the wild heath garden one notes the better varieties of our native Erica vulgaris. All are acquainted with the pinkish-lilac blossoms of the type, but the fine forms, aurea, a lovely golden-bronze foliaged gem; argentea, with its silvered tips; Alporti, a sterling crimson-flowered gem; alba, a neat white; Hammondi, a white with rich dark green foliage; and Serlei, a useful form, distinct in foliage and blossom, should be included if space permits, being sterling acquisitions.

E. tetralix, the mountain bell, or cross-leaved heath, with its rosy-red blossoms, is of surpassing charm.

The Cornish heaths, E. vagans, and its varieties, including the pretty white form, will be found serviceable in most places, while the Scotch heath, E. cinerea, and cinerea alba, are of great value for massing.

Others of note are the pale red Dorset heath, E. ciliaris, E. carnea, and E. carnea alba, which are invaluable for early spring blossoming. E. mediterranea and its varieties alba and glauca, which should be planted but sparingly, as they develop into magnificent specimens under favourable conditions, and E. codonodes, the lovely white shrubby species.

Several other ericas and similar peat-loving subjects may be grown, though the reader will realise that the foregoing are among the most serviceable.

In some places the natural soil will be found to possess the needful elements for success in heath culture, while in others a good dressing of moorland soil should be thoroughly worked into it. Planting should be carefully carried out, especially in regard to making the plants firm. Should a warm dry season follow that of planting care should be taken to supply with water until they are established.

Finally, a loamy bank, bowered with the graceful cytisus (brooms) will provide an additional feature of great beauty.

P. S. Hayward.

NARCISSUS CULTURE FOR PROFIT.

Until ten or twelve years ago the Dutch had almost a monopoly of the bulb trade of this country, but bulb cultivation has recently been successfully undertaken in various parts of the British Isles. Bulb culture is one of the chief industries in the Channel Islands, and during the spring months tons of bloom are thence daily despatched to London and other large centres, to be followed in the summer by the further despatch of tons of bulbs. In the South Lincoln and Cambridgeshire Fens many acres of bulbs are now planted, several of the larger growers having from twenty to fifty acres under cultivation. An ideal bulb soil is found here, which, with good culture, produces bulbs equal to those grown in Holland, and, in addition to supplying a home demand, a considerable export trade is now being conducted from this centre. It is probable, however, that there are many other parts of England where the soil and climate would also be found suitable, and as narcissus cultivation is an industry which can be begun on a small scale, it is one which appears to be well worth the attention of small holders and others.

The Board of Agriculture has issued a leaflet (No. 224) dealing with the commercial culture of narcissi, and in view of the importance of this subject we reproduce it in a slightly abridged form.

I.—GROWING BULBS FOR SALE.

Suitable Soils.

The soil best suited for narcissus cultivation is a deep friable loam. Stagnant moisture is detrimental to the plants, and where such a condition exists it must be remedied by draining and raising the beds above the level of the paths.

Preparation of the Soil.

Land from which an early crop of potatoes has been lifted furnishes a very suitable soil for narcissi. When preparing it for the potato crop, the land ought to receive a heavy dressing of farmyard manure, from fifty to sixty tons per acre, according to the condition of the soil. As soon as the potatoes are cleared off, at the end of July or beginning of August, the land should be deeply ploughed or dug so that the enriched top spit is placed in a position to allow the roots of the narcissi to penetrate freely. If the soil is infested with weeds, such as twitch, bindweed, thistles, docks, etc., these should be removed as the work proceeds, as it is impossible to eradicate such pests once the bulbs are planted. If the work has been done by the plough the ground should be broken up by harrowing and rolling, but if dug by the spade it should be broken up as digging proceeds. This accomplished, and a good tilth obtained, the land is then ready for planting. The soil should be uniformly level, as hollows in which water stands injuriously affect the bulbs.

Manures.

Fresh farmyard manure must never be used for narcissus cultivation; its ammoniacal constituents have an injurious effect upon the plants, and this is the chief reason for recommending that they should follow such a crop as potatoes, where the rankness of a heavy manuring has already expended itself. Sixty tons of farmyard manure per acre may appear to be an unnecessary large amount, but, unless the ground is in good condition, it is not an excessive quantity. Good bulbs, like most other crops, cannot be grown on poor land. If it be necessary to plant on land which has not recently been well manured, bone-meal is probably the best artificial manure to use at the time of planting—it should be applied at the rate of ten to fifteen cwt. per acre, and can either be harrowed or raked in before planting commences, or worked in as planting proceeds.

Time of Planting.

As a general rule, the shorter the period the bulbs are out of the ground the better. In some cases, such as in the Poeticus section, new roots are formed simultaneously with the drying of the old, and a decided injury is done by keeping such varieties out of the ground for a lengthened period. With few exceptions, however, narcissi may be planted as late as Christmas, and still give fair results; but the best time for general planting is during August and September, and all planting should certainly be finished during October. The ground should be dry and friable at the time of planting.

Methods of Planting.

Planting should be done at a depth of two to four inches — the larger bulbs at the greater depth, and the smaller ones proportionately shallower. Various methods of planting are adopted, and the area to be planted will influence the method decided upon. Many large growers use a one-horse plough to which is fixed a special share that works in the bottom of the furrow and makes the necessary impression for the reception of the bulbs, and on large establishments the work is expeditiously performed in this way. From twenty-four to thirty planters are necessary to keep the plough constantly at work, and an acre a day may be planted. The cost would be: Man and horse per day, 8s.; thirty planters at 2s., £3; man in charge, 4s.; total, £3 12s. per acre.

This method is suitable where a single variety of bulb is being planted in large quantities. The work proceeds in the ordinary way of ploughing, one furrow covering the bulbs already planted in the furrow previously made. The furrows are about nine or ten inches wide, and every seventh furrow is left unplanted, and this forms a path, which is necessary for getting among the bulbs when bloom-gathering, cleaning, etc.

Where small areas are planted, a different method must be adopted. The following is a useful plan: First divide the land into suitable divisions, say fifty feet wide, with eighteen-inch paths between. Then stretch a line across the end of the first division, and with a spade throw out a shallow opening in which to plant the first row of bulbs. This done, shift the line the width of the rows, say nine inches; then proceed to open the second furrow, covering the first and already planted row with the soil from the second. Proceed thus with succeeding rows, again leaving every seventh unplanted to form a path. By this method one man with a spade will keep two planters busy, and the cost will be about £6 per acre.

Another method for the small grower, after he has marked his land into fifty-foot divisions with eighteen-inch paths, is to mark each division across with beds 3ft. 6in. wide and with paths 12in. wide. The soil from the first bed is taken out to a depth of three inches and wheeled to the far end of the division; this first bed is then carefully raked, and marked across in rows six inches apart. The bulbs are then planted, and this bed is covered with soil taken from the second bed, and so the work proceeds to the end of the division. This method, although a little more expensive than the preceding, has advantages, especially where handling a considerable number of varieties in small quantities, as the danger of mixing sorts is less likely to arise.

The quantity of bulbs necessary to plant a given area will vary considerably, according to the size of bulb produced by the particular variety. From five to six tons may be taken as an average weight to plant an acre.

Cultivation Between Planting and Harvesting.

The chief labour involved is in keeping the ground clean, and the amount of labour necessary varies according to the condition of the land and the weather. When planting has been done early, say in August or September, weeds will soon begin to show. These can be kept in check by hoeing (large growers use horse labour), provided the weather is favourable. If it is showery, so that hoeing is not effective, the land must be lightly "pointed," i.e., shallow-dug, in order to bury the weeds. For this work a broad-tined fork is the best tool to use, and the most suitable time to perform this work is at the end of October or beginning of November. If performed earlier there is the risk of another crop of weeds appearing; if done later, the bulbs may be too far advanced, and damage may result in consequence.

During the winter months some growers protect their bulbs from frost by covering the ground with heather or other loose litter, but for the varieties to be recommended this labour is unnecessary. In February, before the foliage pushes through the ground, soot may be applied broadcast and lightly harrowed or raked in. This is especially recommended where bulbs have remained in the same position two or three years.

During the spring months weeds must be kept in check by hoeing and hand-weeding, care being taken that the least possible damage is done to the foliage. Treading on the beds is to be avoided as much as possible. When the foliage dies down, the whole area should be hoed over if the bulbs are to remain another year, and the operation should be repeated two or three times during the summer months, which is all the attention necessary until the period for autumn "pointing" again returns.

(To be continued.)

COLOUR NOMENCLATURE.

For many years the Royal Horticultural Society has been confronted with the difficulty of describing exactly the colour of any particular flower in terms which shall be distinctly and definitely intelligible in New York and Paris, Berlin and Quebec, etc., as in London. It is a difficulty shared by all who have in any way, or at any time, to represent colour in words. We determined, therefore, to endeavour to establish an international code, by which anyone, anywhere, could convey to anyone else at a distance of time or place exactly and precisely the colour and shade he is speaking of.

With this end in view we searched for a good colour chart, and have been successful in finding an excellent one containing 360 colours between white and black, with the name of each in French, German, English, Spanish, and Italian, together with four shades of each of the 360 colours, so that anyone wishing to describe to a friend at Calcutta the exact colour and shade of a flower, or a silk, or a painting, need only refer to the colour chart number, quoting, if for "apricot," e.g., page 53, shade 3; or if for "rosy-pink," p. 118, shade 4; and so on.

The cost of production of so beautifully printed and so large a chart was, of course, very heavy, and it was issued at one guinea net, but our society, by adopting it as an international standard, and purchasing a very large number of copies from the publisher, is able to supply it to our Fellows and others at 14s. 6d., or if by post 15s.

My excuse for asking for space in your valuable journal to make this widely known is the manifest utility which would accrue to everyone all the world over if this chart were adopted universally as a standard of colour nomenclature, not only (as it will be) for flowers, but also for all trade and commercial purposes which relate in any way to colour. How very vague, for example, are most people's ideas of the distinction between purple, crimson, and mauve, and how often is the word carmine used as an easy method of solving the difficulty without conveying any definite notion as to what colour exactly is meant. It would make it quite easy for mercers and drapers to match any goods for customers at a distance. In fact, if once we could establish this chart as an international colour reference, its subsequent use would develop in all directions.

I need hardly say that our society has no pecuniary interest in the matter whatever.

W. WILKS, Secretary.

Vincent Square, Westminster.

DAMSONS.

The Cheshire damsons are fairly well known throughout the country. Damsons are very profitable to grow where the trees are properly treated, though the latter certainly do well, as a rule, even when they are not attended to carefully after the work of planting is finished. I have had much to do with the cultivation of damsons in Cheshire, and strongly advocate a more extensive planting of the trees. Of course, tastes differ, but I think there are few kinds of jam to surpass damson jam when the latter is properly made; but it is not often that the fruits are allowed to remain on the trees long enough. They are gathered before they are perfectly ripe. The fruits should be left on the trees until they commence to fall off freely; then they are just right for jam making. If it is necessary to pull the fruit it is not ripe enough and never takes the sugar as well as falling fruit does. Where possible, tall steps should be used to enable the owner to gather the damsons, as ladders often crash through the branches and break off many of them.

Damson trees are grown in hedges and in the open fields, as standards, in some parts of Cheshire, and when they are in full bloom the sight is a very pretty one indeed. It does not matter much in which aspect the trees are planted, as they bear freely in all. I have seen many specimens quite overshadowed by large trees of other kinds, yet the branches nestling under those of the other trees were well laden with fruit.

The best position is an open one, and where there is an orchard of fruit trees in the open quarters, damsons should be planted on the outside to act as a shelter. I would certainly not advocate the planting of the trees in hedges if the very best is required of the former, as the roots of the plants forming the hedge rob the damsons of much nourishment, and the fruits are numerous enough, but small. If planted where cattle can gain free access to them the trees should be standards, so that the branches will be out of their reach, and some guard must be provided to prevent the animals rubbing against the trunks to the injury of the bark, and it may be, bending over the trunks. Sometimes much injury is done to damson trees owing to the main stems being without protection.

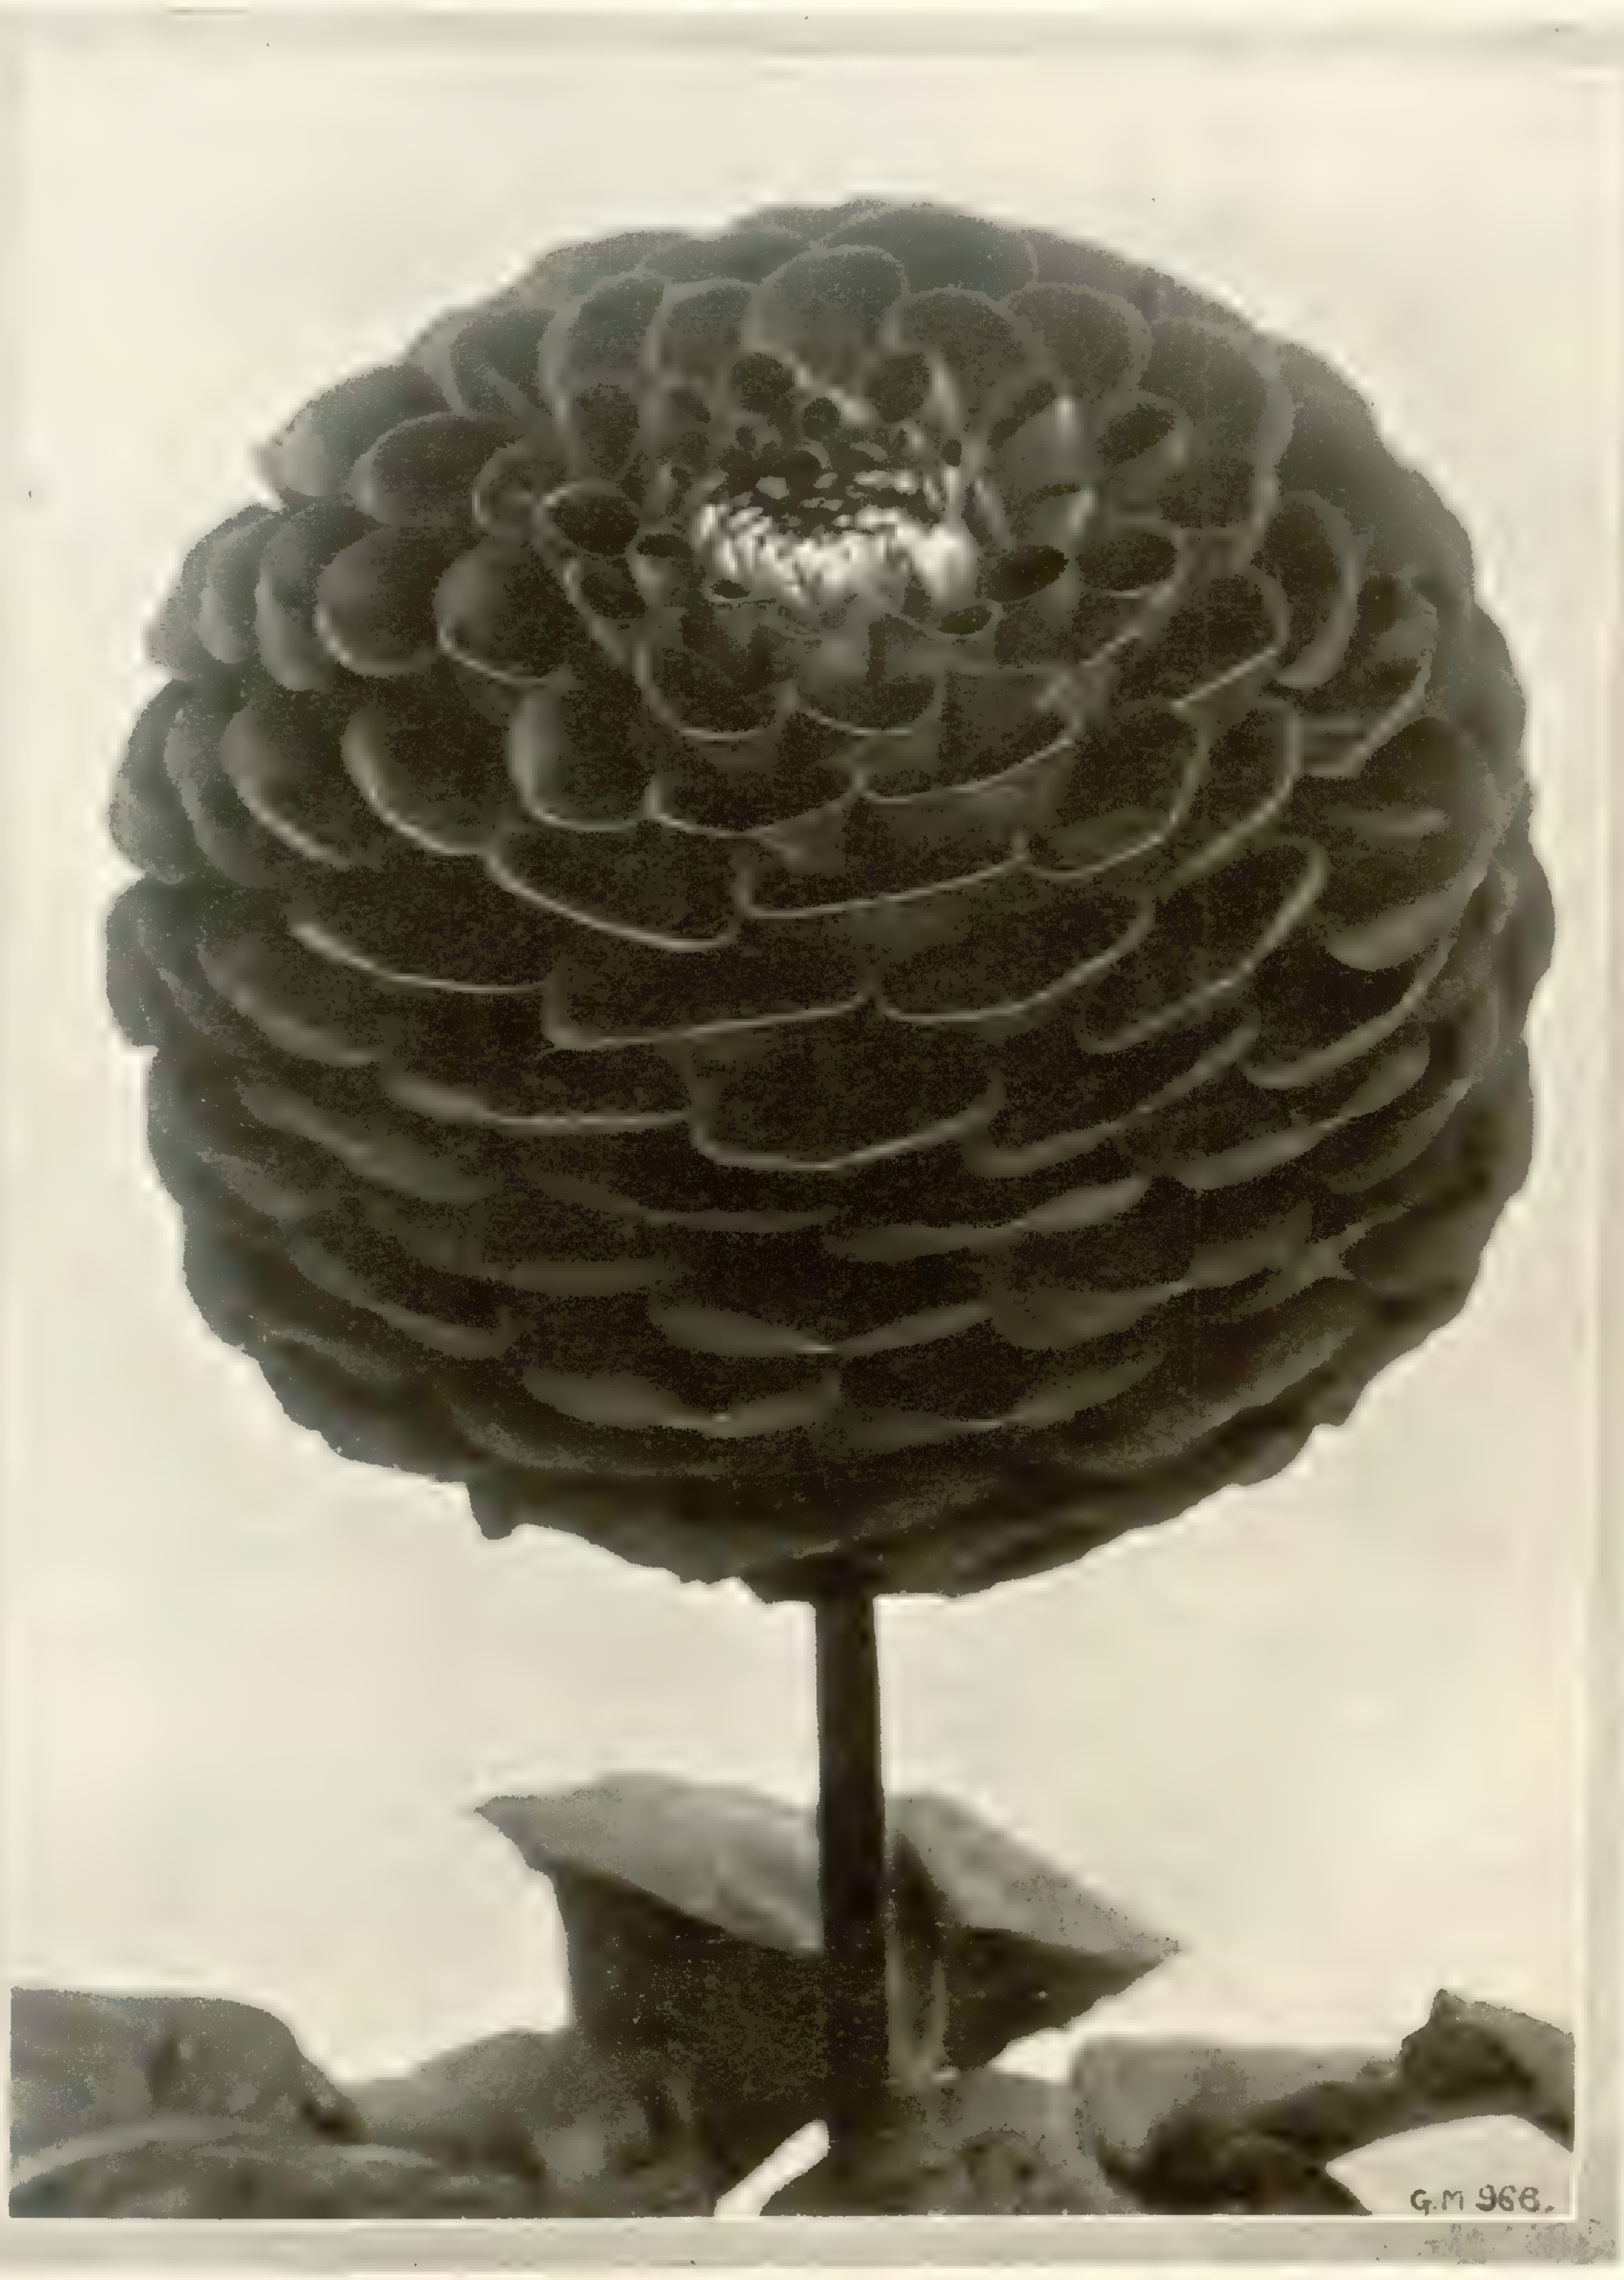
I do not know of any kind of fruit tree that is planted in as careless a manner, generally, as the damson is. The tree will thrive in a moderately clayey soil, for a time, but my experience teaches me that when the tree has attained full size or thereabouts, gumming and decay sets in. The soil, whether it be light or heavy, should be well trenched and drained, if necessary; but much feeding is not advisable, especially while the tree is young. Firm ground is essential. Early support must be afforded the trees, taking care to avoid any bruising as gumming sets in badly afterwards.

I have seen boys—myself among them—climbing the damson trees in search of gum from branches which had crossed each other and so got bruised. The gum was sweet (at least, we boys used to consider it so), and was chewed freely. In Shropshire and Warwickshire damsons are largely grown, but I have not seen many trees nor had much to do with their cultivation in the southern counties. Perhaps some contributors have such experience, and will give some information as to the way in which the trees thrive. I have frequently been told that damsons will not do well in the south.

Geo. Garner.

NEW SHOW DAHLIA EDWARD MAWLEY.

It is not often in these days of cactus and pæony-flowered dahlias that a new show variety jumps into prominence directly it is exhibited, and wins the favour even of those who have no special liking for the show section. But such has happened in the case of the fine new crimson show dahlia named after Mr. Edward Mawley, the president of the National Dahlia Society. This variety was raised, and has been exhibited by Mr. Charles Turner, of Slough, and it has gained the Award of Merit of the Royal Horticultural Society and a First-Class Certificate from the National Dahlia Society. The flower is a solid symmetrical one that would please the most fastidious florist of the old school, and yet it has a great additional merit, for, by reason of the fact that each bloom is borne erect on a very stout stem, well above the foliage, Edward Mawley is a first-rate garden dahlia. We have seen it growing at Slough, and express this opinion as the result of observation, and we are glad to find that other experts who have seen the variety at Slough also regard it as eminently suitable for garden decoration.



NEW SHOW DAHLIA EDWARD MAWLEY.
A.M., R.H.S., September 14; F.C.C., N.D.S., September 21. Mr. Chas. Turner, Slough.
Flowers rich crimson.

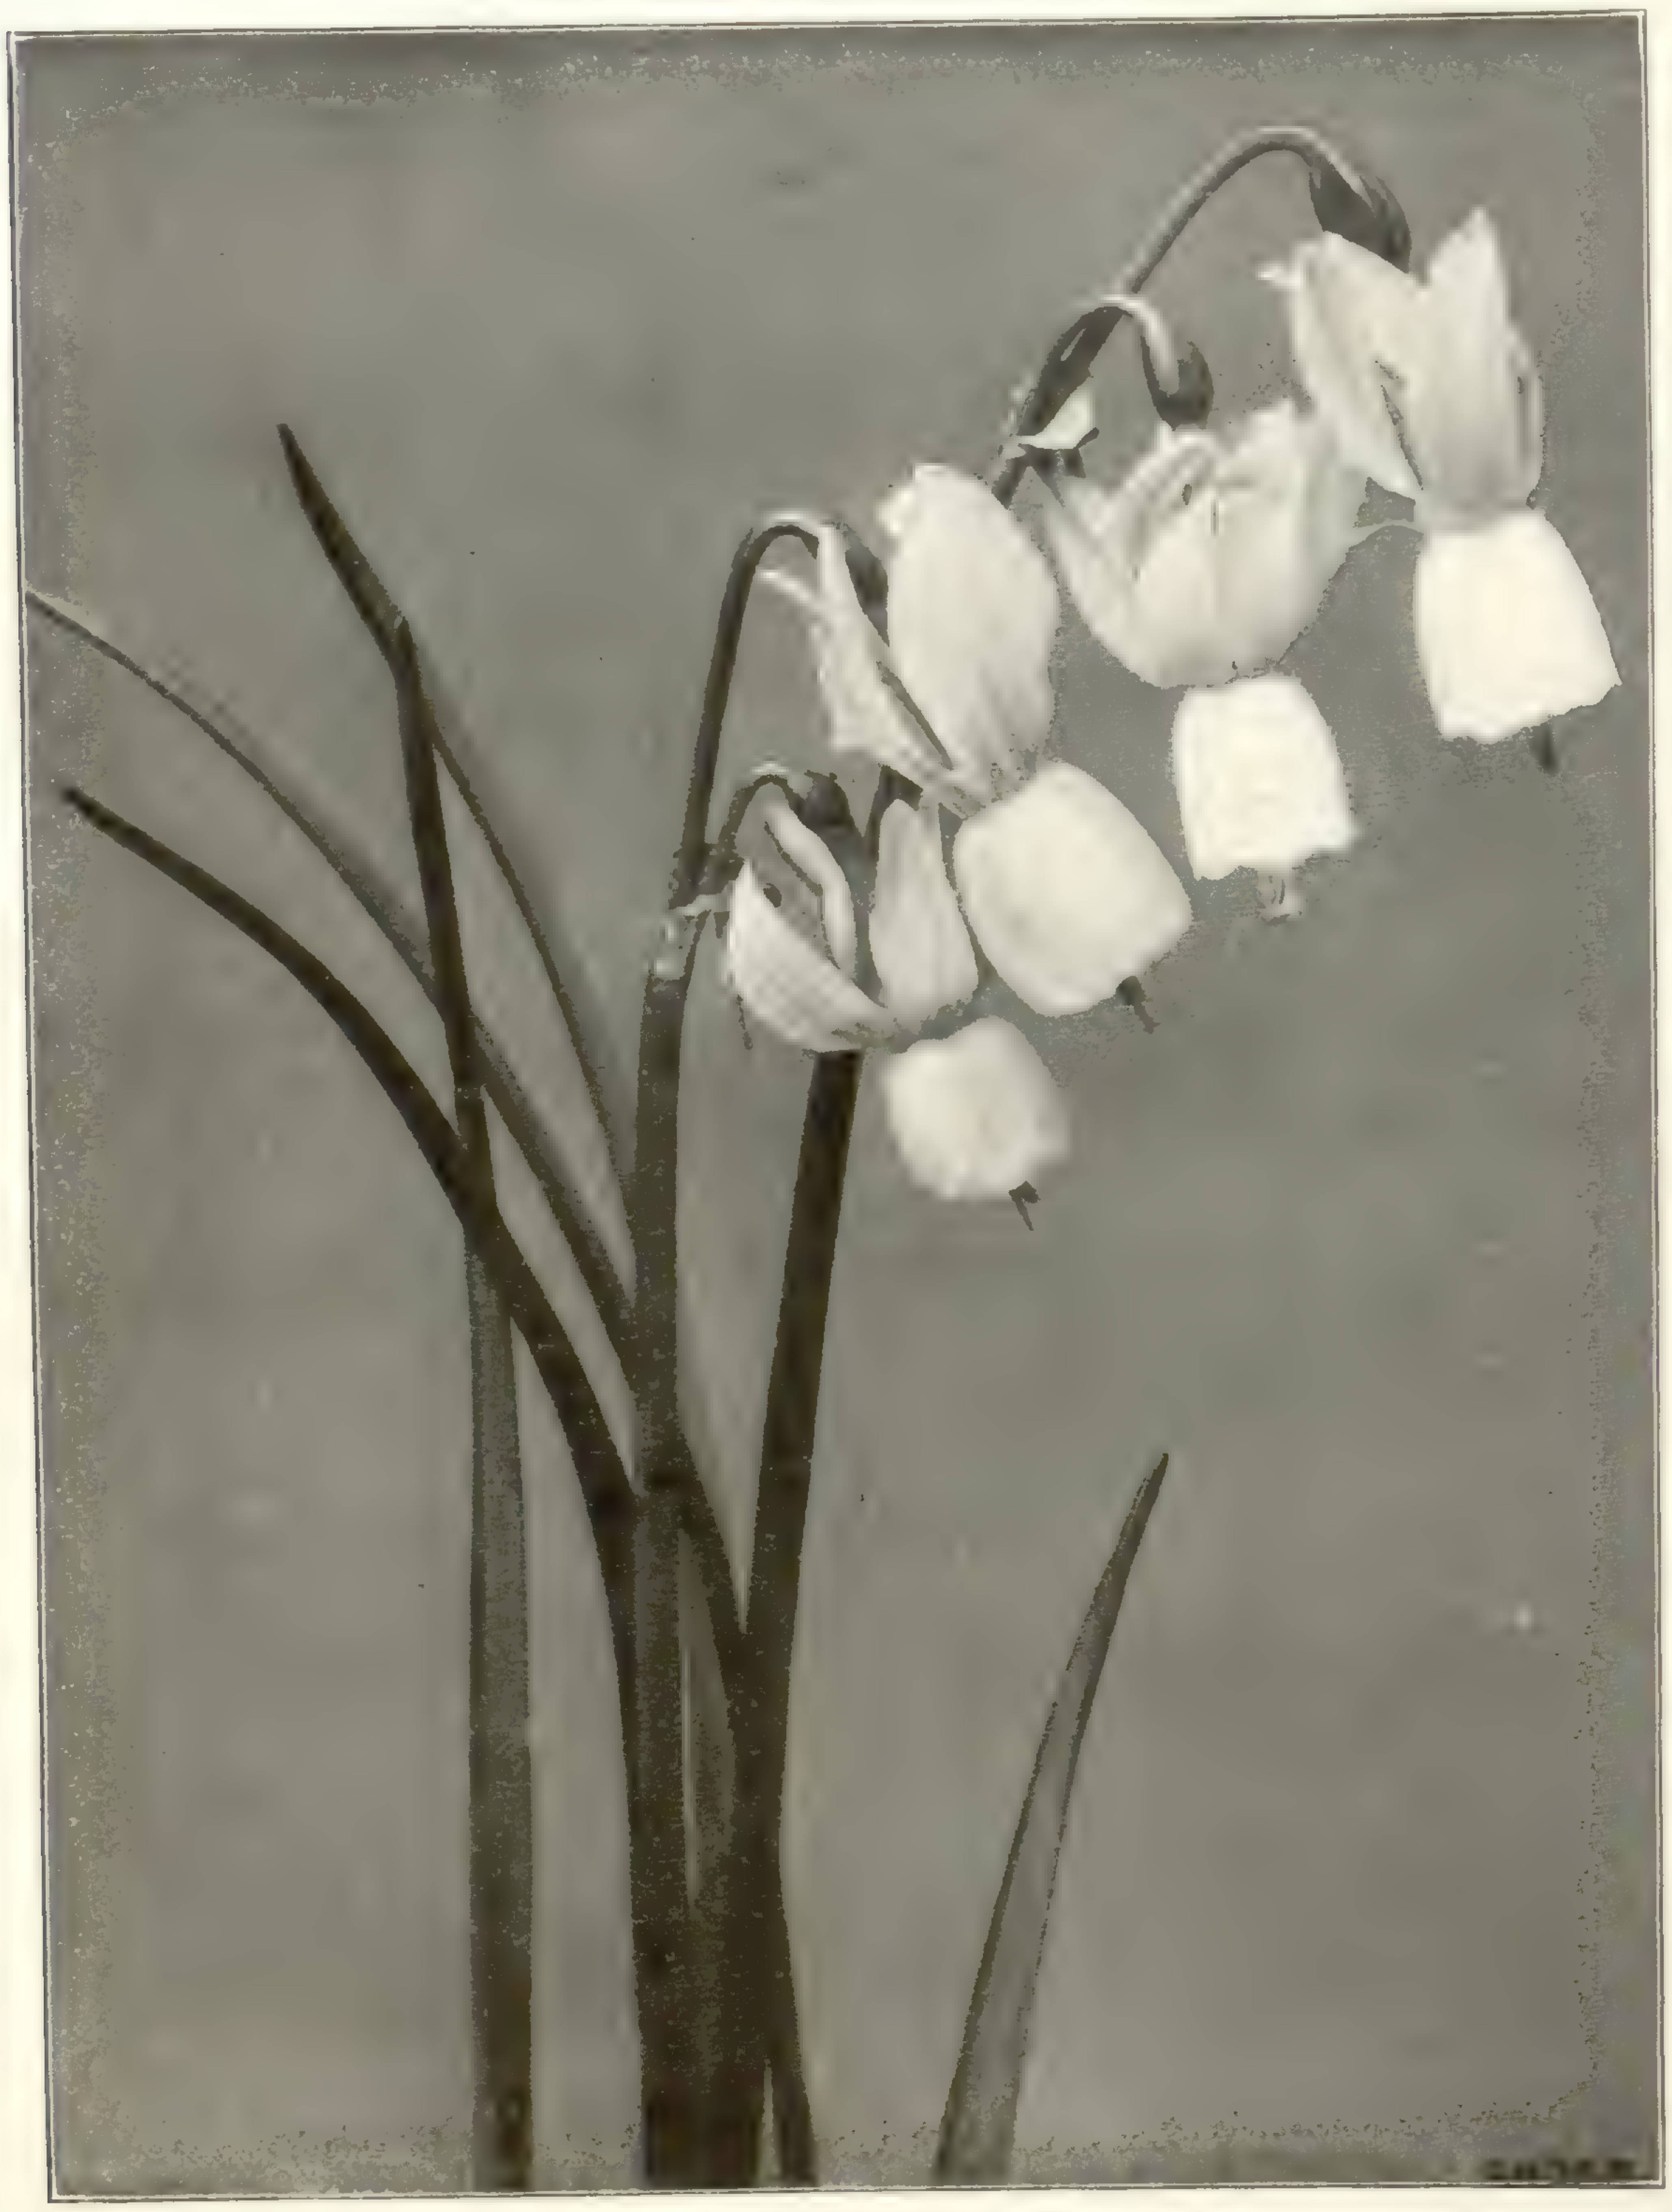
UNCOMMON HERBACEOUS BORDERS.

> "Massed in a stretch of border, sweet
> With lily scent and roses,
> Heartsease and violets we greet,
> As perfect for our posies.
> Tall hollyhocks to heaven tower,
> Beside the snowy daisies,
> And e'en the very smallest flower,
> Is worthy mighty praises."

Not a blossom in the herbaceous border but should be of value, not a shrub, climber, or foliage plant be visible but as adding to the beauty of the scene. Yet how often do we find hardy subjects that seem to have been flung together at random, and fit only as representatives of what poor forms there are of perennials. The cultivator who makes such a border must act either from indifference or ignorance.

Novelty in planting is not sufficiently sought after. Where space is ample a lovely effect can be gained by making horseshoes or half circles of hardy shrubs at short distances all along, and within each horseshoe massing flowers of one colour, mingled, perhaps, with white or cream ones, or silver, gold, or crimson foliage subjects. In a cold, exposed garden the shrubs used could be all evergreens, and then even delicate plants would be able to thrive in their welcome shelter.

Pillars set at intervals along a border give it an uncommon appearance, and serve to show off the innumerable hardy climbers that are seldom seen except on walls and trellises. Different varieties of roses, clematis, ampelopsis, ivy, tropæolum, and vitis should appear, together with calystegias, honeysuckles, jasmines, hops, lathyrus, passion flowers, and rubus. Wistaria sinensis in white, as well as lilac; Pyrus japonica in blush, red, and pink, should be employed; Polygonum Baldschuanicum is a charming, graceful, hardy climber, with sprays of pink and white bloom freely produced in summer and autumn. The Canadian Moonseed, Menispermum canadense, with its feathery yellowish-green florescence, will give a fine show on a tall pillar, either in shadow or sunshine. These supports had better be larch poles, or silver birch poles with the bark left on, and if they are well varnished before being put up their appearance will be longer maintained in its first excellence. The plants massed around these pillars should not be too high, so that the climbers can be fully seen; taller plants located behind them will give many a fair colour harmony, and especial care should be taken to make the carpet accord perfectly in tone.



NARCISSUS TRIANDRUS ALBUS (ANGELS' TEARS).
Flowers pure white.

Where herbaceous borders can be numerous, or at least not solitary, it is extra advisible to aim at boldly original effects: a pink border is the favourite feature of one estate, and an all white one attracts admiration in another case. This last border is exceptionally well carried out, for silver foliaged plants and shrubs are at the back of the flowers, and the ultimate background consists of an immense hedge of glossy dark laurels, which acts as perfect contrast. A scarlet border could be easily carried out, so could a golden one, in which, of course, the many shades between palest lemon and scarlet-orange would appear; a crimson border could contain a large number of plants backed by red-leaved trees and shrubs, but this, as would also a blue border, would require great art in planting, because shades of crimson and of blue are either absolutely shaded one into the other, or as absolutely antagonistic; brown-crimson and maroon, scarlet-crimson and carmine, should never be juxtaposed, neither should lavender and royal blue, purple-blue and azure.

A rockeried herbaceous border can be splendidly carried out if the supply of old-looking grey rocks is large enough; any introduction of coloured "burrs" or "clinkers" would ruin the natural loveliness associated with grouped hardy plants. The background could show a rockery wall of any height, while mounds, higher pillars, and low arches of the rocks might appear here and there along the border; the edging would be a somewhat high rock one, of course, while the majority of the ground would be merely strewn with the great stones, some grouped, others scattered, but all serving to well suit the health and beauty of the plants beside them. Myriads of primroses peeping out from rock clefts have a delightful effect; clusters of towering white foxgloves peering over mounds are purely fair; the rich purple and mauve of pansies will give warmth to the foreground scene.

A shaded herbaceous border may yet be a splendid one if the whole of the middle row is given up to phloxes of summer and autumn blooming; the effect will not be monotonous, for heights and colours among these are so different, but there will be lavish white, rose, carmine, lilac, mauve, purple, scarlet, and maroon flowers visible from June until December. In front of the phloxes there will be ample room for all the usual perennials of the shaded garden—hypericums, vincas, Solomon's seals, saxifrages, lysimachias, primroses, pansies, mimuluses, golden rods, honesty, foxgloves, aquilegias, spiræas, etc., for some tall groups look well situated quite at border edges.

Let everyone who has before him the enviable task of making a new herbaceous border remember that he plants, not for one year only, but for many; a collection of perennials will last a lifetime if properly treated, separated, increased by cuttings, as well as division, and furnished at all times with the requisite soil nourishment. M. H.

NARCISSUS TRIANDRUS ALBUS.

Although it is not one of the most popular of daffodils it is nevertheless a fact that Narcissus triandrus albus is one of the most exquisitely beautiful flowers we have in the spring time. It is seen at its best in the rock garden, as it delights in a well-drained position and gritty soil. A point to be remembered also is that a partially-shaded site is the most suitable one for this charming variety. The popular title of Angel's Tears for this flower is a pretty and appropriate one, as the white pendulous blossoms are so chaste and dainty that they possess a beauty suggestive of Eden or Paradise. Everyone who grows daffodils at all should plant at least a few bulbs of M. triandrus albus because of the fine contrast its flowers offer to those of the big trumpet varieties.

So popular have daffodils become now that we hardly realise N. t. albus was rare thirty years ago. In 1880 the late Mr. F. W. Burbidge was charmed by "a pure white-flowered form of Narcissus triandrus, sent to me by Mr. Gumbleton. Its lovely cyclamenlike blossoms are borne solitary on graceful scapes, and when cut, compare favourably with the choicest of orchids as regards delicate beauty." We now know that N. triandrus and its varieties mostly have twin-flowered scapes, and, also we know that the beautiful N. Johnstoni is a hybrid from N. triandrus, while each succeeding spring now brings into prominence new and beautiful varieties raised artificially by the use of N. triandrus as one parent, and one has but to mention such varieties as Countess Grey, Countess Visconti, Count Visconti, Earl Grey, Dorothy Kingsmill, Eleanor Berkeley, Cyprian, Cecil Rhodes, J. T. Bennett-Poe, Eileen Mitchell, Zoe, and others to conjure up in the minds of daffodil experts some of the wonderful varieties of this new class, but alas, varieties that, with but few exceptions, are not yet in commerce.

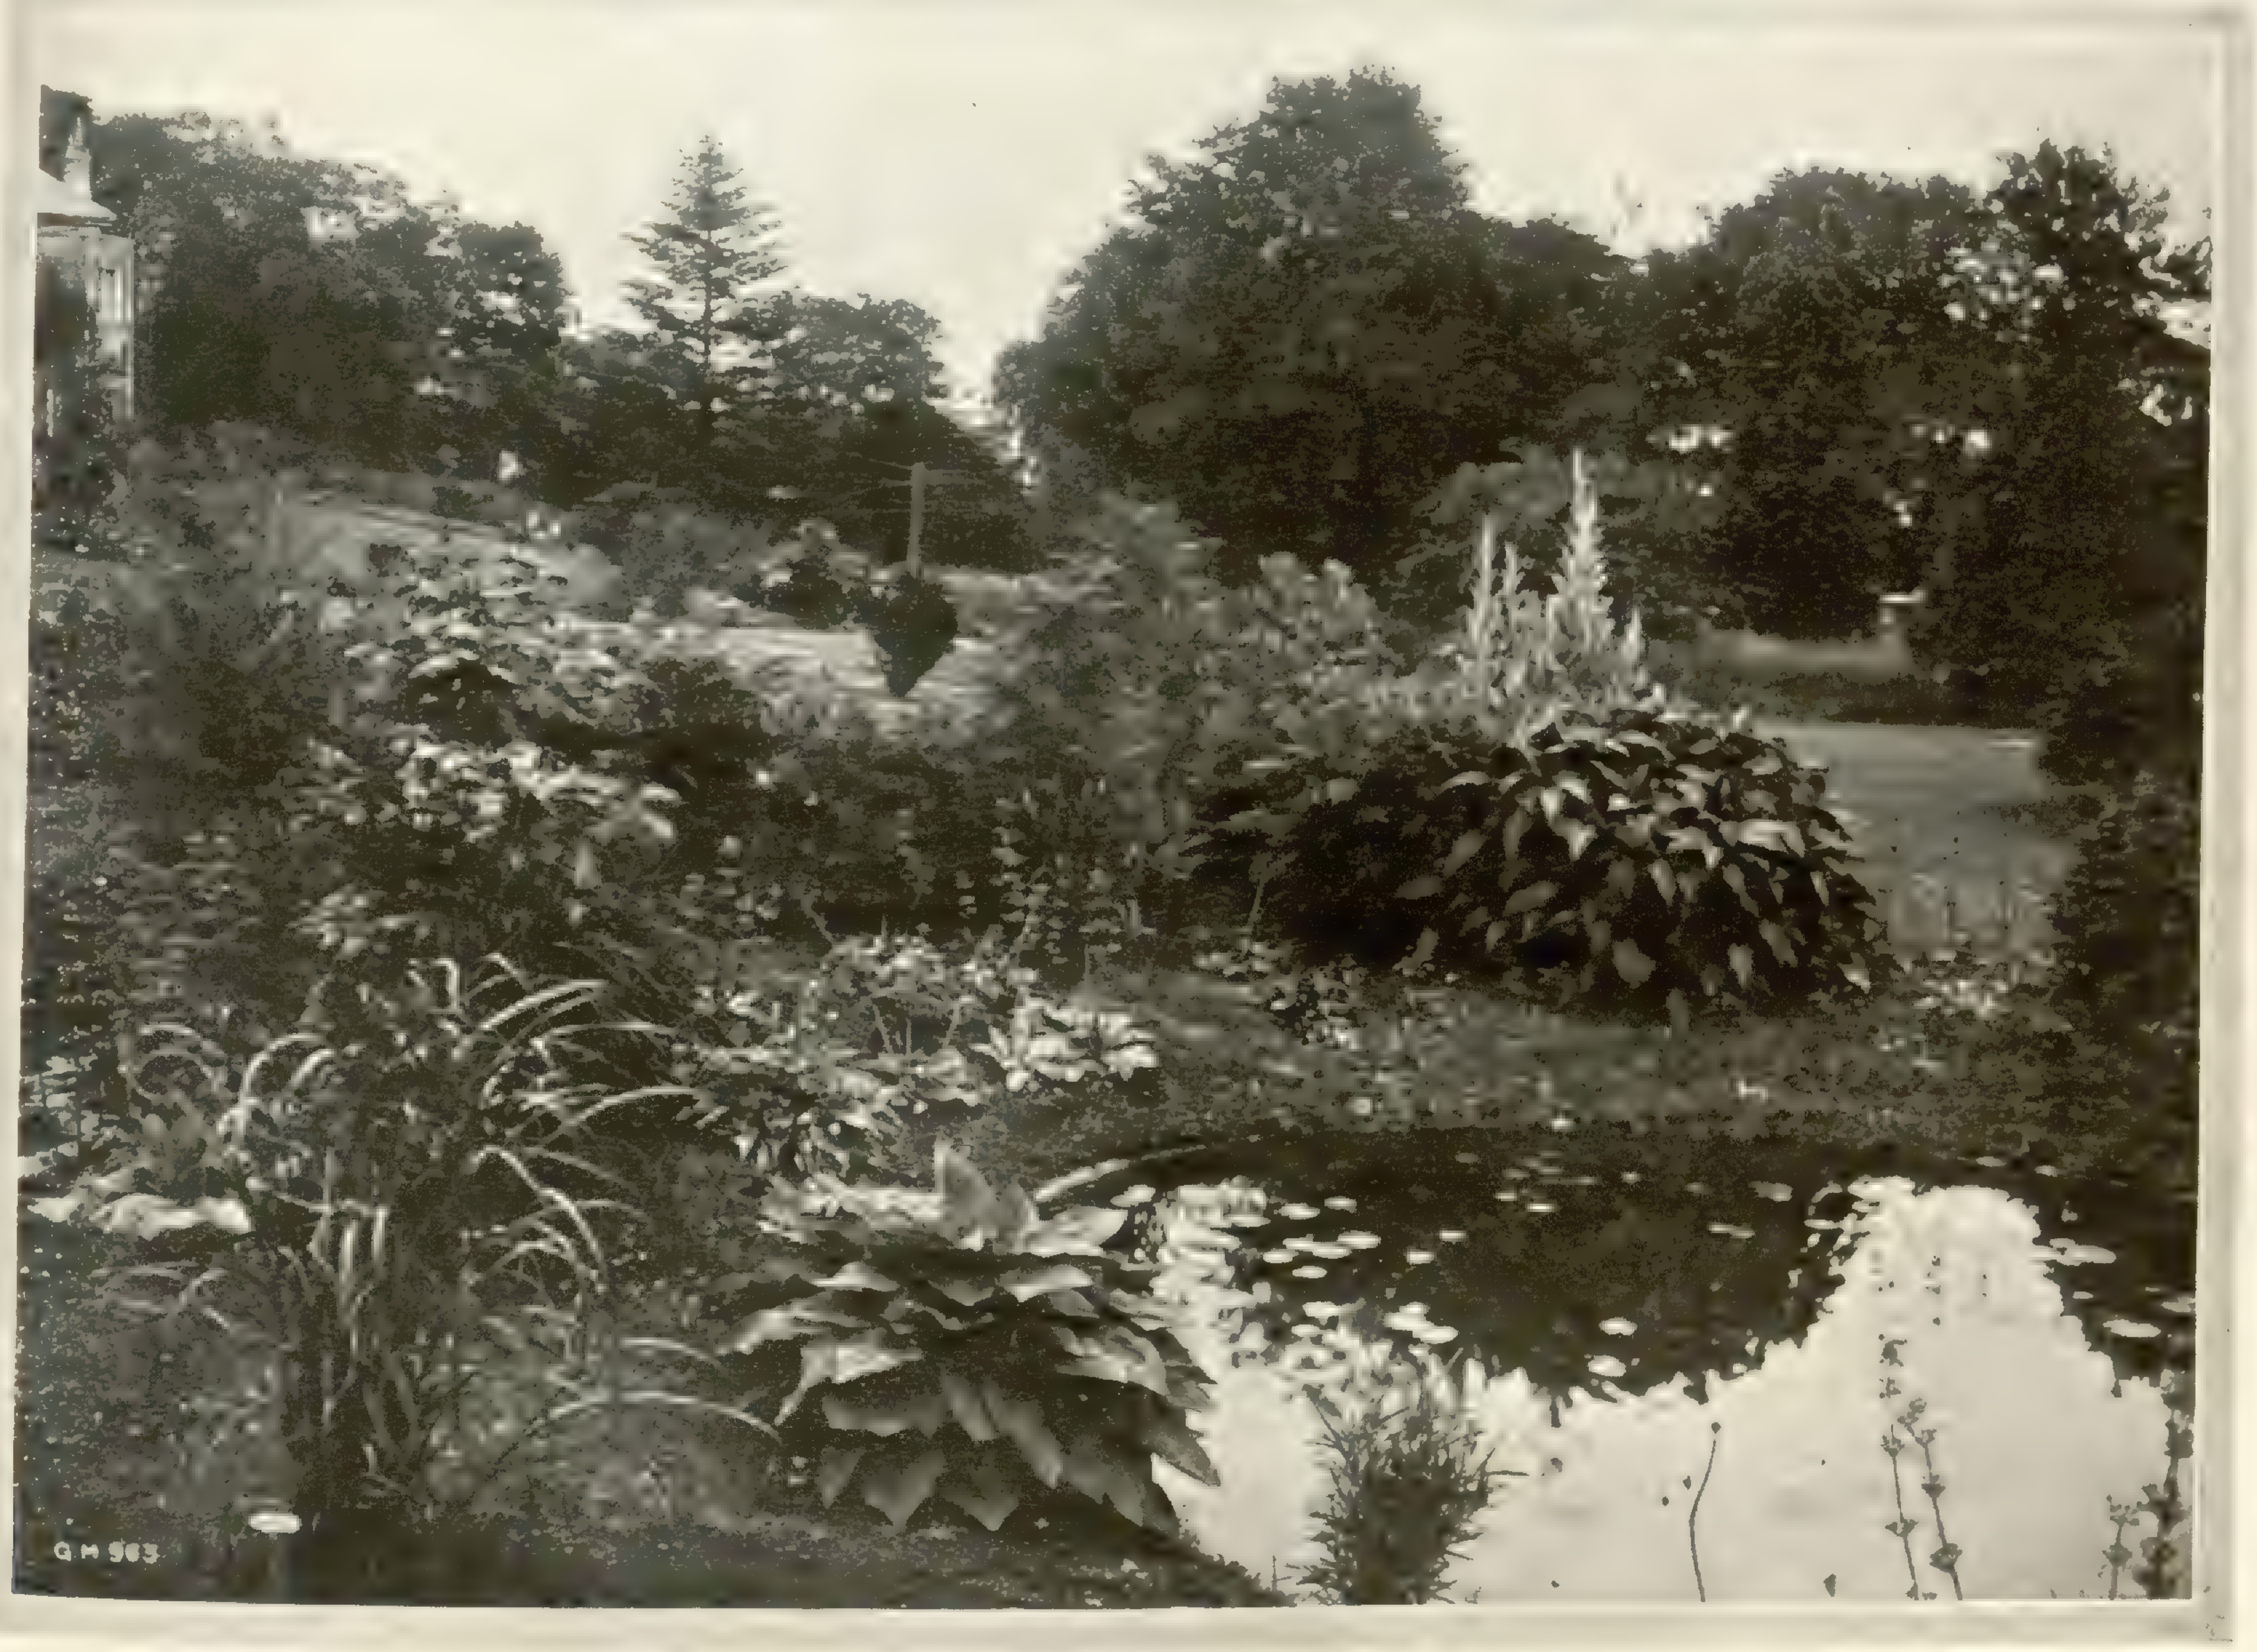
ASHBOURNE, COUNTY CORK.

Ashbourne, the residence of Mr. R. H. Beamish, has a most interesting garden, since it contains an extensive collection of rare and tender plants, the majority of which are in the best of health. The rock garden is formed out of a disused quarry, and is about 70 yards square. At one side is a cliff face sloping almost perpendicularly down for 40 feet, and about 50 yards in length. At the further end a streamlet falls over the brow, and, forming a little rock pool some 10 feet below, descends by a series of cascades to the lower level, where it flows into a little sheet of water about nine yards in length. The water runs thence under two bridges of rough stone to another long pool shaded by an ash, and on one side ramondias planted between stones in a perpendicular bank are flourishing to perfection.

The rugged face of the cliff is diversified by hundreds of members of the dianthus family, masses of aubrietia and arabis, dwarf campanulas, and other rock plants, interspersed with Kniphofia Northiæ. On the lower ledges of the cliff veronicas and sedums luxuriate. At the base of the rock Mandevilla suaveolens is planted, and evidently appreciates the intense heat refracted from the sun-baked stone, for it has made prodigious growth, and its blossoms are very large, fully three inches across, and are borne in profusion. By the mandevilla are growing Spinovitis Davidi, Actinidia chinensis, A. arguta, Bignonia radicans, and Vitis armata. By the pool at the foot of the cliff are Funkia Fortunei, very fine; Saxifraga telamonoides, Rodgersia podophylla, and the new astilbes Peach Blossom and Queen Alexandra.

The plants in the rock garden are excellently arranged, not being dotted about singly as is so often the case, but grouped in large masses, so that a bold colour effect is produced. Thus at the time of my visit a large colony of Aster Thompsoni was associated with a breadth of Erigeron speciosus on a higher level, the two shades of lavender-blue creating a very charming impression. One of the most beautiful sights in the garden in July was provided by three great masses of Campanula G. F. Wilson some yards in extent, forming a sheet of purple over and between the rocks. Near by Campanula cæspitosa spread a sheet of soft colour some feet in extent, and its white variety was also present in quantity. C. lanata, from Bulgaria, formed a handsome pyramidal plant over two feet in height, covered with white flowers, which are shown up well by the grey foliage. Unfortunately, this plant is not a perennial. There was a large group of strong seedlings of this campanula about three yards across. Anomatheca cruenta, of which self-sown seedlings spring up in quantity, showed a bright spot of colour on an elevated site. Saxifraga oppositifolia occupied a steeply-sloping rift over two yards in length between two rock ledges, and was evidently in the best of health, a large mass of crimson sweet williams, many yards in extent, was a sheet of glowing colour, and a very dwarf crimson sweet william was a pretty plant. Zauschneria californica covered a rocky slope four yards in length and three yards in width, and must be a glorious sight when in full bloom, and a large colony of Sedum cœruleum, which seeds itself, spreading over a high bluff, made a pretty picture. Convolvulus mauritanicus had a charming effect hanging over the rocks, and Mimulus glutinosus was attractive.

Other plants in the rock garden included large groups of Androsace sarmentosa and A. foliosa, Hypericum reptans, H. hircinum nanum, H. Moserianum tricolor, Campanula Mayi, C. Portenschlagiana, C. carpatica, C. mirabilis in flower, C. laciniata, fine groups of the splendid Salvia dichroa from the Atlas mountains, Grevillea alpina, Eryngium alpinum, Pentstemon heterophyllus, three feet high, a mass of Œnothera speciosa, Sphæralcea Munroi, Scabiosa Parnassi, Corydalis cheilanthifolia, Clematis involucrata, a small bush, Nierembergia frutescens, flourishing, Codonopsis ovata, Anemone Fannini from South Africa, with leaves over a foot in width, a mass of Aubrietia Dr. Mules, 18 feet in length, Daphne cneorum, D. Blagayana, Rehmannia angulata in flower, the rare Haplocarpus scaposa, with yellow flowers on stems two feet high, Antirrhinum Asarina, Iris tectorum, a brilliant double orange-scarlet nasturtium, and a single orange-scarlet raised by Henckel, of Darmstadt, Genista aspalathoides, the dwarf yellow G. dalmatica, fine bushes of Rhododendron hirsutum, the new Cotoneaster adpressa and C. alpina, Dianthus neglectus doing splendidly between the rocks, D. Knappi, yellow, D. alpina, D. a. alba, Cytisus proliferus, C. purpureus albus, Saxifraga Burseriana Gloria in vigorous health, Rubus



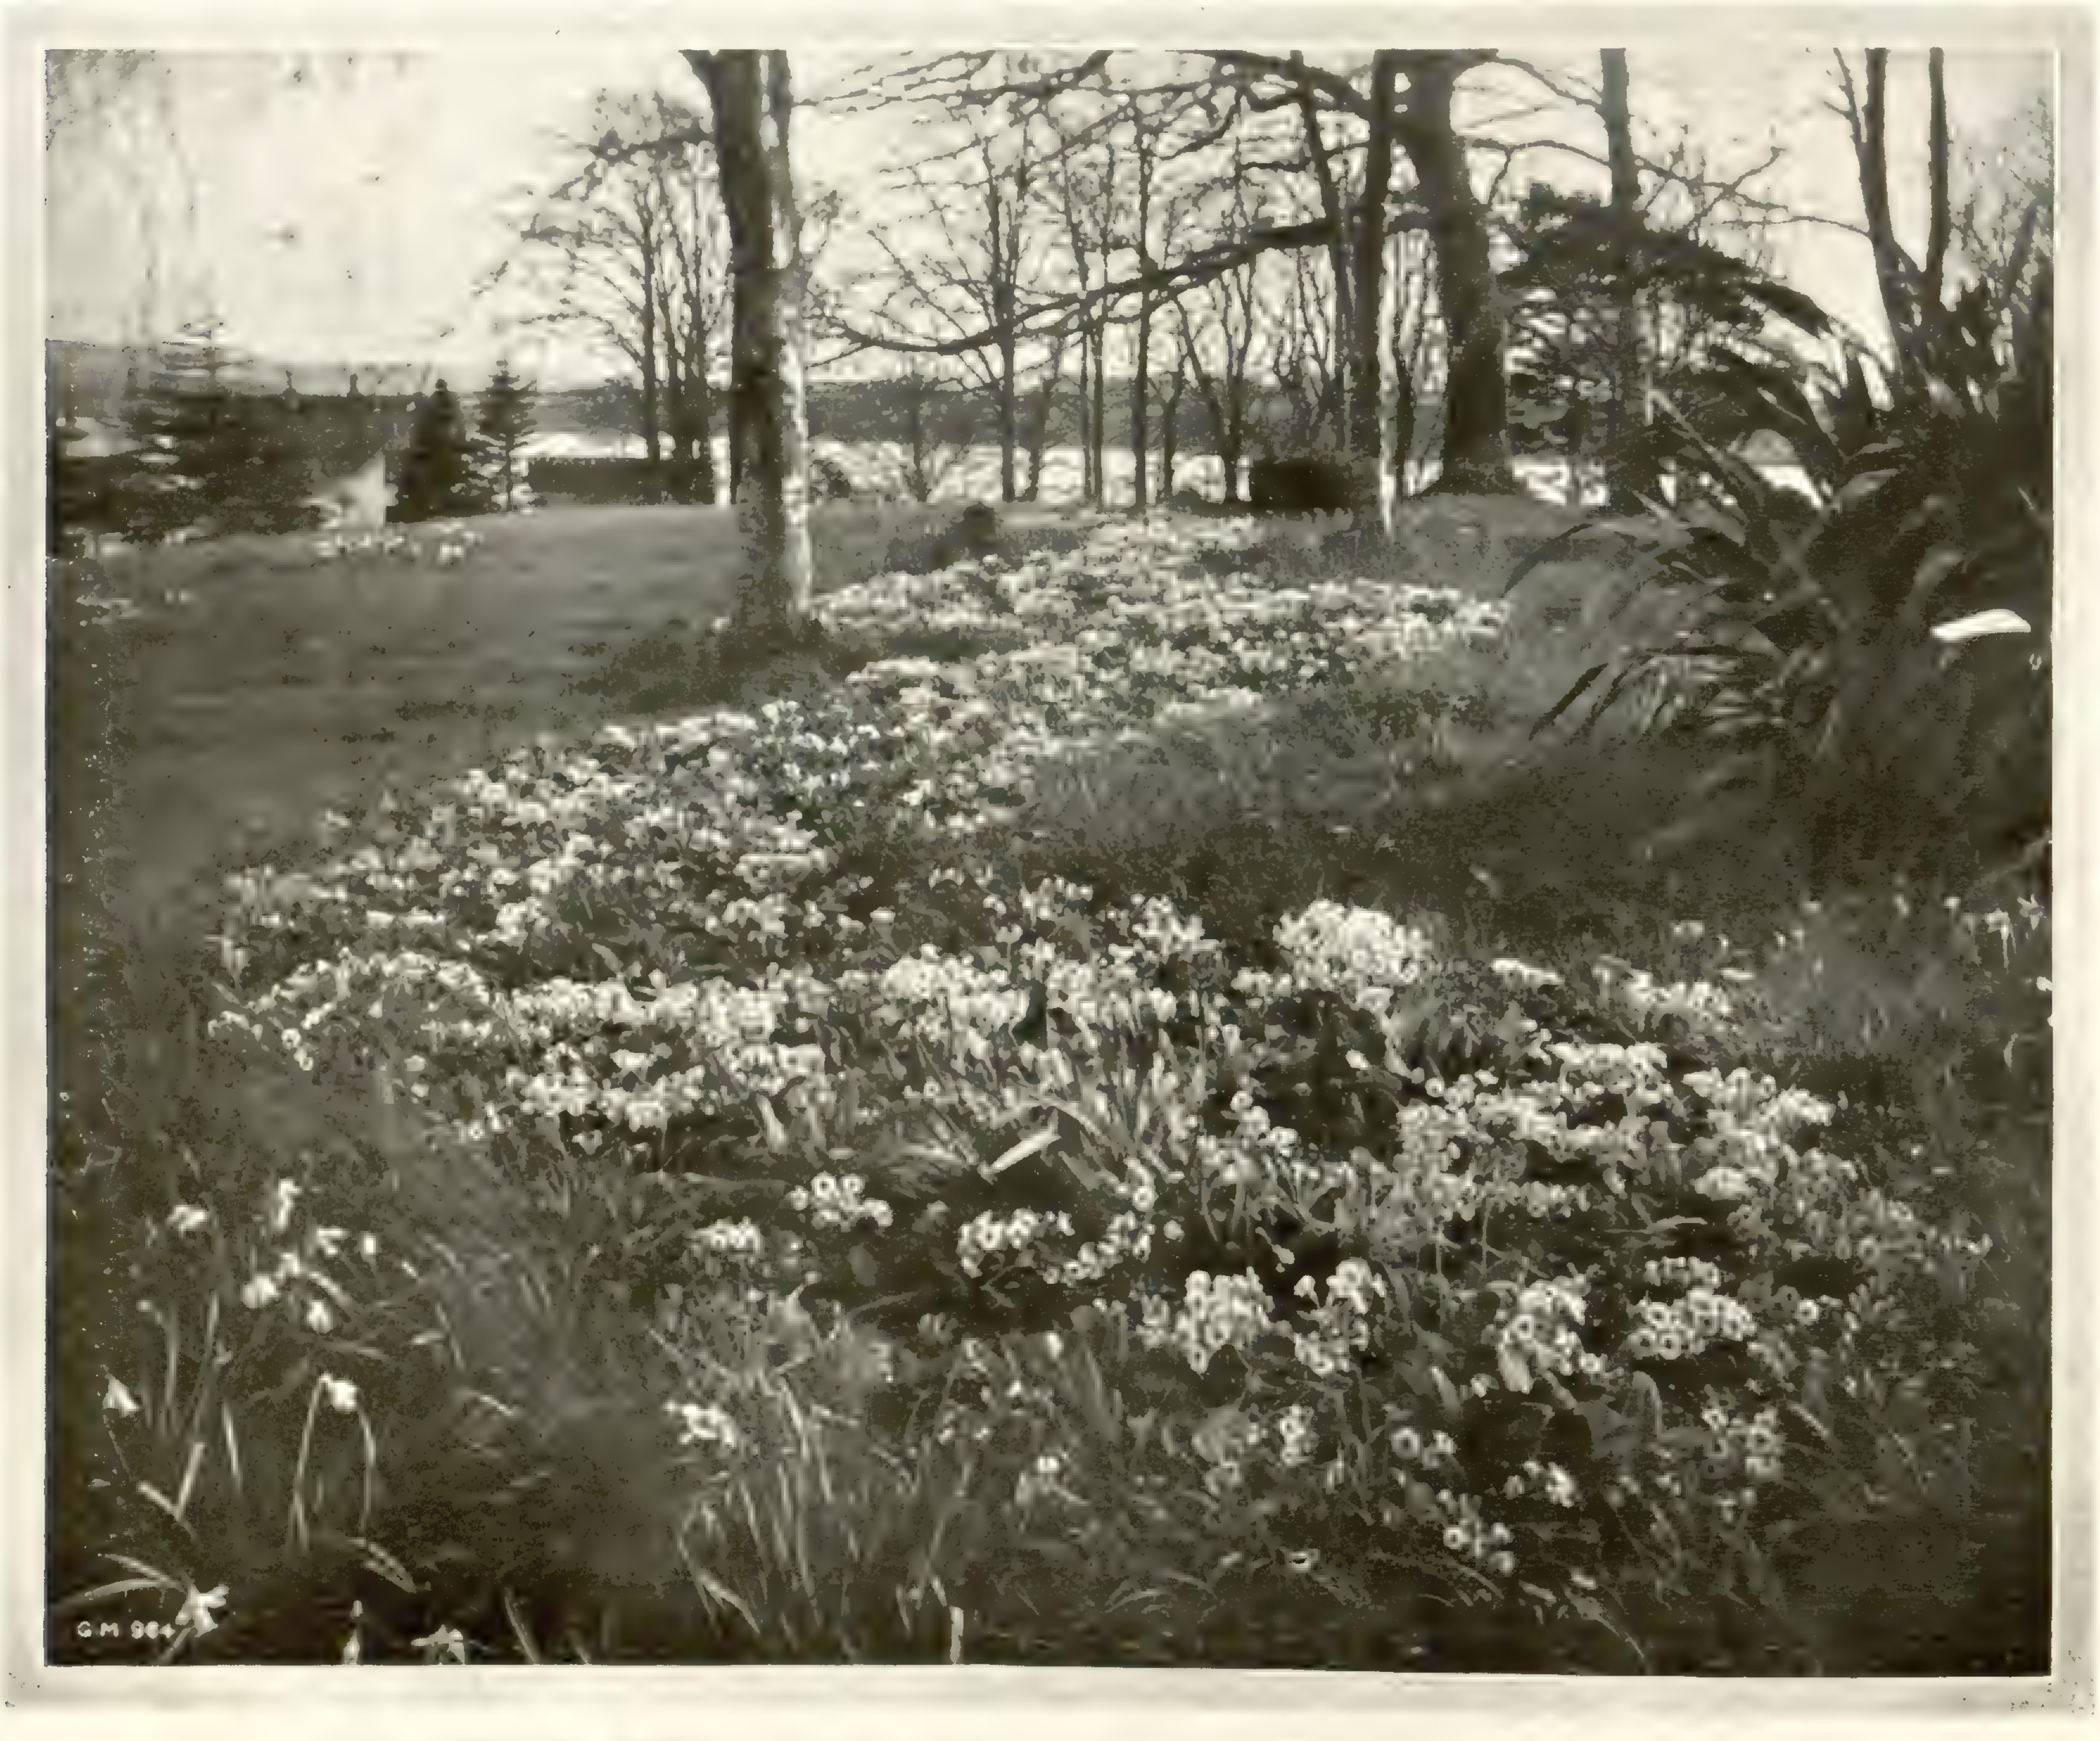
A BEAUTIFUL SCENE IN ASHBOURNE GARDENS,
Showing the blue-flowered Nymphæa stellata in the pool.

rosæfolius, R. australis, R. a. foliosa, and Acæna microphylla in flower covering the pathway and rough stone steps for many yards.

The collection of rare conifers includes Pinus Montezumæ, P. flexilis, P. oocarpa, P. patula, P. Merkusi, P. Hartwegi, P. omorica, P. arizonica, P. beuvronensis, P. palustris, P. Ayacahuite, P. Armandi, P. Teocote, P. khasya, P. pseudo patula, P. cembroides, P. Massoniana, P. excelsa var. virgata, P. Webbiana, Abies concolor violacea, A. lasiocarpa arizonica, A. pungens argentea, Cupressus macrocarpa compacta, C. cashmeriana, C. arizonica, Cryptomeria selaginoides, Picea pungens glauca, P. p. Kosteri, P. concolor, P. pungens pendula, Taxus japonica aurea, Taxodium mucronatum, Sciadopitys verticillata, Juniperus Cedrus, and Torreya myristica. Of hollies there is a fine assortment, comprising the rare Ilex insignis, the deciduous I. verticillata, I. castaneæfolia, I. Shepherdi, I. laurifolia, I. camelliæfolia, I. ciliata variegata, I. cornuta, I. Perneyi. There is a very complete collection of the berberis family, including B. dulcis variegata, B. applanata, B. acuminata, B. purpurea Egberti, B. sanguinea, a large group of B. langlevensis, B. stenophylla corallina, B. Talucaense, the old leaves of which become brilliant scarlet in spring, B. congestifolia, B. aristata, B. cerasina, B. macrophylla, B. Thunbergi, B. Wilsonæ, B. Hookeri, B. umbilicata, while a steep slope above a lawn, about twelve yards in height, is completely covered with bushes of B. Thunbergi, which in the autumn, when the foliage becomes bright crimson, produce a most briliant effect.

On the house are growing Vitis Henryana, Ampelopsis St. Pauli, Clematis Pratti, Clianthus puniceus, Cestrum fasciculatum, Vitis Coignetiæ, Solanum crispum up to the eaves of the house, Fremontia californica 15 feet, Actinidia kolomikta, Cæsalpinia Gilliesi, eight feet, Ercilla spicata, Lonicera Hildebrantiana, Cassia corymbosa, Jacaranda mimosæfolia, the very rare South African Smodingium argutum, the new Vitis Thompsoni, Mutisia decurrens, and Clematis montana rubens.

In a little pool about nine yards long, near the house, Nymphæa stellata is grown. In the autumn, as soon as the first frost occurs, the roots are lifted with a fork and placed in a tub, which is taken into a glasshouse. In the early spring the roots are extracted from the mud, all the eyes but one are cut out, and they are placed in 4in. pots in heat. Later on they are shifted into 6in. pots, and soon form good plants for putting out as soon as the weather becomes warm. When they are at their best the pond, which is surrounded by spiræas, mischanthus, funkias, rheums, verbascums, and other plants, is covered with their blue blossoms. Roses are well grown in the vicinity. In a long pond, which narrows in the centre, where it is crossed by stepping-stones, nymphæas are grown, these including Marliacea rosea, gloriosa, Ellisiana, Richardsoni, W. Doogue, gracillima alba, a very large pure white from America, pumila, and three Swedish species.



A CHARMING EFFECT PRODUCED BY POLYANTHUSES AT ASHBOURNE.

In the neighbourhood of this pond are numbers of rare shrubs, among which are Tricuspidaria lanceolata, T. dependens, Eucryphia pinnatifolia, Brachyglottis repanda, Lomatia ferruginea, Sophora Korolkowi, Viburnum lanatum pulverulentum, Cornus macrophyllus, Myoporum lætum, Hovenia dulcis, nine feet, Desmodium cyrtobotryum, Stuartia pseudo-camellia, Clethra arborea, C. alnifolia, Feijoa Sellowiana, five feet high and four feet through, flowering freely, the handsome blossoms, which are about two inches across, having pink petals which turn inward at the edges, showing the white reverse and long, spreading, crimson stamens tipped with gold. A fine specimen of the gutta percha tree, Eucomia ulmoides, ten feet in height, was present, as were Broussonetia papyrifera, Chionanthus maritima, Philodendron sachalinense, Gleditschia macrantha, Meliosma myriantha, Exochorda Alberti macrantha, Andromeda cassinefolia, A. speciosa, Corylus thibetica, Ginkgo biloba, Corokia cotoneaster, C. buddleoides, Philodendron amurense, Lonicera involucrata, Olearia Forsteri, O. insignis, O. lyrata, Plagiospermum sinense, Citrus trifoliata, Embothrium coccineum, Olea fragrans, Nandina domestica, Guevina avellana, Cercocarpus betulifolius, ten feet, Desfontainea spinosa, covered with its scarlet and yellow blossoms, a colony of twenty plants of Cordyline Banksi erythroracis, with red midribs to the leaves, backed by a line of the Dropmore variety of Anchusa italica, twelve yards in length, which formed a sheet of glorious colour.

On a lower level than the pond is a large bed of damp soil about thirty yards in length, where Iris Kæmpferi flourishes to perfection, some of the blossoms being fully ten inches across. The irises are associated with Lilium pardalinum, of which there must be some hundreds of bulbs, and in July both irises and lilies were in full bloom and created a beautiful picture. Earlier in the year Primula japonica flowers in the same bed. Near the bed is a plant of Gunnera Elwesi, said to bear leaves twelve feet across, and a fine group of over twenty flowering plants of Kniphofia Northiæ. By the side of a streamlet in damp soil the Californian Castilleja miniata is growing luxuriantly, the brilliant scarlet flower-heads being borne on stems nearly three feet in height. This plant is generally considered a most capricious subject, but here it is evidently happy

Hard by is a fine group of Primula Poissoni, some yards across, with flower-stems two feet high. A large mass of Linnea borealis was blooming freely, and Nertera depressa was carrying its little bright orange fruits. Plants of a hybrid between Meconopsis integrifolia and M. grandis had flowered, their blossoms being pale yellow with a purple blotch at the base of the petals. Kerengeshoma palmata Sprengeri was a handsome shrub with delicately cut foliage. All the best species of eremurus are grown, as well as many seedling forms. Lilies do well, Lilium auratum platyphyllum lasting for years, and L. Henryi, L. speciosum, L. excelsum, L. tigrinum, L. sulphureum, and others being in the best of health, while L. croceum makes a pretty picture, flowering in the grass under oak and walnut trees.

There is an excellent collection of kniphofias, including the rare K. præcox, and there is a fine assortment of Japanese maples. On a steep bank a space of about six yards square is covered with Dimorphotheca aurantiaca, one of the best of our annuals, which in the sunshine has a most brilliant effect, with its sheet of glowing orange. Close by is an enormous plant of the yellow Californian tree poppy, Dendromecon rigidum, about eight feet in height, and on the opposite side of the path is Musa japonica coming into flower. In one spot a large bank is entirely covered with Iris stylosa.

There are fine specimens of the golden and silver variegated forms of Dimorphanthus mandschuricus, and Hydrangea quercifolia is doing well. A pretty plant is Loasa vulcanica, an annual from the West Indies, with white flowers having a scarlet centre. Rhus typhina laciniata, the cut-leaved sumach, has very attractive foliage, and Fagus purpurea pendula Raygerloo, a weeping tree, is the darkest form of the purple beech. Complaints have been made that the new Cotoneaster angustifolia does not fruit freely, but at Ashbourne it was literally smothered with flowers that were beginning to set.

Other good things in various parts of the garden were the rare Crossosoma californica, Descainea Fargesi, fruiting well, Stenanthium robustum, bearing white spikes of flower, Viburnum rhytidophyllum, V. Carlesi, V. macrophyllum, Rubus trifidus, R. innominatus, R. bambusarum, Lonicera rupicola, L. thibetica, flowering and fruiting, the new blood-red Leptospermum Nicholli, Davidia involucrata, Mitraria coccinea, Vitis cantonensis, Pentapterygium serpens, Thibaudia acuminata, Psoralea pinnata, Anopterus glandulosa, the New Zealand Parsonia albiflora, Piper excelsum, the Mexican Amicia zygomeris, Myrsine Urvillei, the Japanese Stachyurus præcox, Zizyphus Giraldi, and the pretty autumn-flowering Perowskia atriplicifolia. One of the finest things in the garden was a magnificent specimen of the palm Cocos australis, seven feet in height, with a leaf-spread of ten feet, in the most perfect health.

WYNDHAM FITZHERBERT.

THE WATER-LILY POND AT ASHBOURNE.

Early-flowering Chrysanthemums.—These are very gay now, and disbudded plants have beautiful flowers in the open. Amongst some of the best are Harvest Home, Cranford White, Horace Martin, Marie Masse, G. Wermig, Miss Burnett, Carrie, Flora, and Le Pactole. These are now in full bloom, and, being disbudded, are more effective than they otherwise would be. When planted in good batches these cannot fail to give immense satisfaction, especially when cultural requirements have been well attended to.—W. A. COOK, Leonardslee Gardens.

THE SNAKE'S HEAD FRITILLARY.

Very many people who plant bulbs for spring effects confine their attention to daffodils, tulips, hyacinths, and crocuses, and while there is good reason for planting these kinds extensively, and for relying upon them for bold and broad effects, and for abundance of flowers for cutting, there appears to be no good reason why many other kinds of beautiful bulbous plants should be so frequently ignored. For instance, the delightful Snake's Head Fritillary or Common Fritillary is so useful, distinct, and graceful that there should be no need for anyone to press its claims. As a pot plant it makes a charming subject for conservatory decoration; but beautiful as it is when grown in pots its beauty is far greater when planted in large colonies in semi-shaded woodland glens in the grass. If large groupings of the various colours now available are planted, or even if the several varieties are mixed, the display will always be pleasing. The Snake's Head Fritillary (Fritillaria Meleagris) is undoubtedly one of the best of bulbs for naturalising in grass, but a more or less shady position is necessary to ensure success. Raisers have evolved numerous distinct forms, such as Cassandra, purple, silver-grey, and green; Sylvanus, white, with purple mottlings; Orion, deep claret purple; and Triton, bright purple. There is also a pure white form of great beauty, while the common variations of the type, with their wonderfully mottled and chequered flowers all have a quaint and graceful beauty. The cost can hardly be urged as a reason for not planting these fritillaries, because the prices range from 5s. to 10s. 6d. per hundred bulbs.

SNAKE'S HEAD FRITILLARIES (FRITILLARIA MELEAGRIS).
Flowers light rose beautifully reticulated deep rose.

Fritillaria Meleagris and its varieties should be planted six inches deep, and if the soil is a deep light one then eight inches will be all the better. F. Meleagris is found widely distributed in Europe, and may be found wild in Oxfordshire.

THE BEST RASPBERRIES.

Although the well-known varieties of raspberries are less numerous than those of most other commonly grown fruits, yet the number of varieties usually required in one garden is so small that the choice is much less difficult. As one sort is the best for one purpose and another sort for some other purpose, most of us have to be content with a compromise. If only one variety can be grown—and the raspberry is a fruit which needs space to insure success—probably most would agree that Superlative is the best. It crops heavily and for a long period, sometimes extending into the autumn, the canes are stout and almost self-supporting, and it appears to do equally well in various parts of the country, while the fruit is large and deep red in colour, and has a long foot-stalk which renders it easy to pick for dessert. It is, too, excellent for cooking and preserving. That is a good character. But its flavour is not first-rate, being too acid for a really first-class dessert raspberry, and on some heavy soils it is not a good doer.

There is no doubt that a great many canes have been sent out as Superlative not true to name, and that may sometimes explain its failure or only partial success, but I believe mine is true to name, and it is certainly a very poor grower.

Another very fine variety for general purposes is Carter's Prolific, which is of such sturdy habit that it scarcely needs any support. Its name is well justified. Those who have gardens in the country and are thinking of planting it may be interested to know that the canes are a special favourite with rabbits and hares. The fruit is almost round and very firm, which makes it good for preserving. It is a favourite sort with market growers. Norwich Wonder is another good variety, producing self-supporting canes, and is grown a good deal for market.

If a variety is to be grown for flavour only, Baumforth's Seedling is perhaps unsurpassed, the fruit being large, deep crimson in colour, and the canes very prolific. It is sometimes described as an improved Northumberland Fillbasket, the latter being an excellent variety for market, the firmness of its fruit enabling it to resist the usually damaging effect of carriage. It is very robust and prolific, and is specially adapted for the North. If a yellow variety is wanted for dessert, Yellow Antwerp is perhaps the best, being sweet and good, but the yellow varieties seldom bear so well as the red, and they are not so generally useful. If a second dessert variety is wanted, no better could be named than Red Antwerp, an old favourite, which is very sweet and rich.

There is one variety, for preserving only, which is well worth growing, and that is Semper Fidelis. It is a heavy cropper for a long period, and continues later than the others, August being its full season. The fruit is bright red and very firm, so that it retains its shape better than any other. It is more acid than most, and this gives a briskness to the preserve which does not generally characterise that made from raspberries.

Autumn-fruiting raspberries are rather precarious, owing to the differences of soil and season, but October Red and October Yellow are probably two of the best sorts for the purpose. ALGER PETTS.

THE BAY-LEAVED WILLOW.

Salix pentandra, or the "Bay-leaved Willow," as it is frequently called, is one of the stronger-growing species, forming, when mature, a tree 25 to 30ft. high, with a head of goodly dimensions. It is one of the best for planting to form an ornamental tree, for the leaves command more notice than those of most willows, from the fact of their being large, deep green, and glossy. The flowers are borne later than those of most species, being at their best when the leaves have attained full dimensions. The male catkins are conspicuous and composed of a large number of tiny flowers, which are usually made up of five stamens each, which is a distinguishing feature of the species. It is a widely distributed tree through Europe and North Asia, and is found in some parts of Britain. Like other willows, it thrives luxuriantly in moist ground about the margins of lakes or streams, but it may, however, be grown successfully in loamy soil away from water.

W. DALLIMORE.

Bamboos and Phyllostachys.—These have been suited remarkably well by the showery season, and I have never seen them throw up stems so strongly as they have done. Nearly all kinds have made exceptional growth, especially Phyllostachys fastuosa, P. nigra, P. nigra punctata, P. viridi glaucescens, Bambusa nobilis, B. aurea, B. flexuosa, B. mitis. This proves that a good supply of moisture is necessary to successful cultivation.—W. A. COOK.

NOTES FROM HERE AND THERE.

Like a good many other members of the British public, I have recently spent a few days by the briny ocean, at a watering-place of some repute, and there got a little insight into the difference in the value of fruit and vegetable products in such places compared to what the growers receive for them. The consumer pays, but who gets the difference between the original buying and the selling price? Is it the retailer, the railway company, the commission agent, or who? Perhaps they all get a picking, and, I suppose, they all have to live, but after paying a long figure for a few very second-rate plums, I wished that I could hire an aeroplane and transfer a ton or so of fruit from a district I know well. I could have paid the grower a price that would have made his mouth water, and made profit enough to pay my holiday expenses, and left a bit over.

What a popular fruit the "William" pear is in the holiday season, and during those few hot days we had in August it was pleasant to quench one's thirst with one of those luscious fruits even if you paid twopence for it! There appears to have been a big harvest of Williams' Bon Chretien this year, judging from the quantity offered for sale, but the majority of them came not from British fruit fields. They were foreign, like the early greengages which come in during August time. The home grower could hardly compete in this trade as his products are not early enough, but he stands to suffer on account of the fact that consumers get their fill of foreign pears and plums, and have got a little tired of them when the home-grown article arrives. In fairness to the foreigner, however, it must be said that he makes the most of his opportunities, and the fine, nicely packed specimens he sends have a taking appearance.

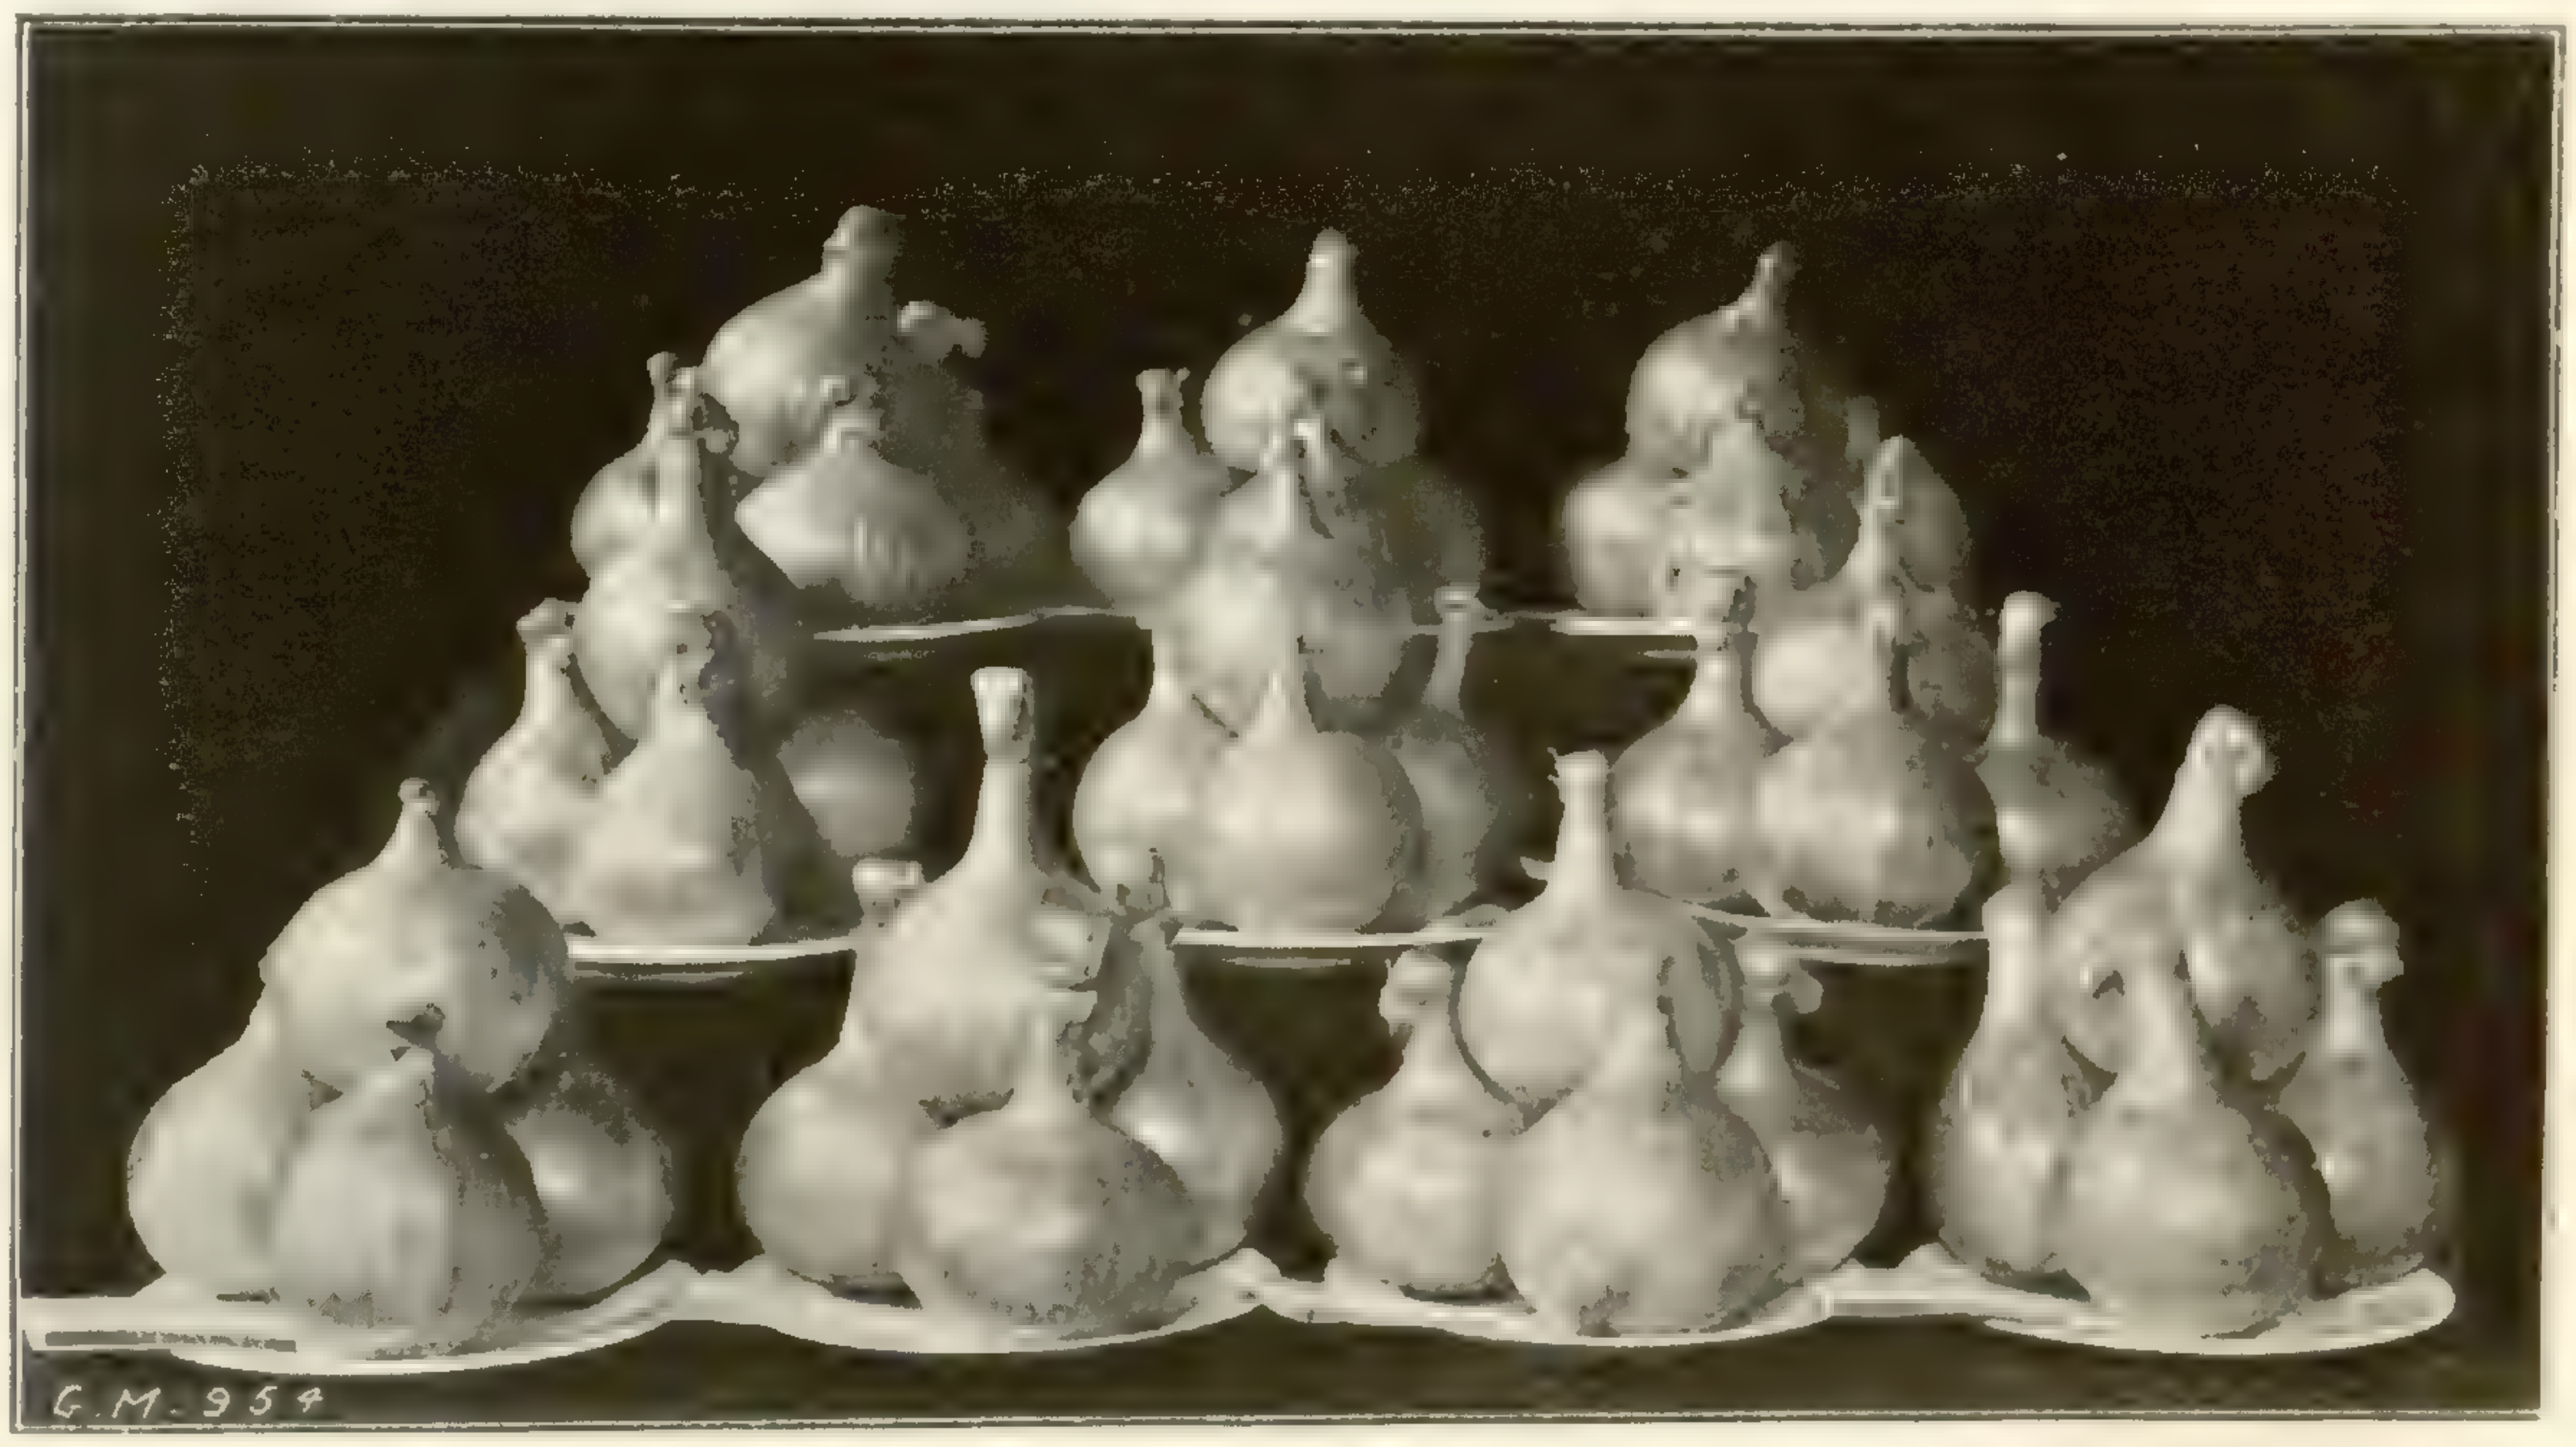
Is it possible to run a village flower show successfully without giving prizes? I judged at such a one the other day, and know another which has been running for twenty years, and the only award given is a medal or some trophy to the exhibitor who obtains the highest aggregate of points. But let me explain. At the shows in question there are the usual classes for fruit, vegetables, flowers, etc., and first, second, and third prize cards are given, but no prizes. Yet the exhibitors are numerous, the competition is keen, and at the end of the show the whole of the exhibits, which are given (excepting pot plants), are sold by public auction, and the whole proceeds, after paying expenses, are presented to the local hospitals. When I say that in the twenty years of its existence one of the societies referred to has contributed over a thousand pounds to local medical institutions, it will be agreed, I think, that it is possible to encourage horticulture and support a worthy cause at the same time.

The other day, in a market town some thirty or forty miles from the coast, I met an individual—evidently a son of the soil—with a staff over his shoulder, and dangling at back and front were long wreaths of onions. No, he was not a local cottager, allottee, or small holder, but one of the big fraternity of Breton peasantry who grow onions, ship them over the Channel, hawk them round the country, and, it is said, go back at the end of the season with a big lump of English money. It seems strange that there should be a market for those tons of foreign onions in a country that is favourable for onion culture, but doubtless there is, and, as a matter of fact, foreigners seem to find a market for anything in old England. Small holders, in the future, will have to hunt round for crops to grow at a profit, and perhaps onions will be one of them, but I wonder if the dignity of the British small holder will allow him to shoulder his wares and hawk them round as the Breton peasant does.

During the last week or two raids of wasps have made their unwelcome presence felt, and are doing their best to devour all the best of the apricots and plums on the walls, as well as the early apples and pears, and grapes in the vinery. They form a coalition with birds, and between the two of them fruit has a bad time of it. Various ways and means are devised for capturing the thieves, but if you lure one to destruction in a bottle of beer and sugar a dozen attend its funeral, and stop and have a fill of fruit before departing. The thing is to strike at the root of the evil by encouraging the capture of queens in the early summer. At a local show, quite recently, I saw several thousands pinned up on cards. How many nests did they represent, and how much fruit would their progeny have devoured had they been allowed to live? But it is impossible to catch all the queens, and when the wasp raid begins at fruit time searches should be made for the nests that can easily be destroyed in the evening.

It would perhaps be heresy after so many successful exhibitions this season to say that the popularity of the sweet pea is declining, so I will put it in another way, and say that a good many enthusiasts this year are disappointed, for reasons that are various in character. I have heard more than one complain about paying dearly for small packets of seeds of novelties, which, when they came into bloom, were unfixed, and sent up flowers of different colours. What may we conclude from this? Simply that if new varieties cannot be depended on to come true, the man in the street, or the garden, otherwise the amateur, will lose interest in the sweet pea, and it is this individual more than any other who has made it what it is. Again, there are the ravages of disease which have upset the calculations of more than one grower this season, and the weather in the spring was unfavourable for the development of the plants. Through these factors I am quite sure there are people about who are not quite so keen on sweet pea growing as they were.

Be the season dry or wet, sunny or gloomy, mildew seems to come with a regularity worthy of a better cause, and its presence appears to be due more to extremes and sudden climatic changes than anything. In many ways walled-in kitchen gardens are a convenience, but within such enclosures, particularly if the soil is light, one may now see late peas white with mildew, though the same varieties growing in open allotments round about are fresh and green. The reason is not far to seek, for there are few hotter places on a hot day than a walled-in kitchen garden, and there is a lack of that free circulation of air which crops in the open enjoy. Perhaps an outdoor crop which suffers more than any other through mildew is onions, and a good many bulbs have ripened off prematurely this season through the disease. It may be checked in an early stage by applying remedies, but if you let that time go past fungicides are of little use. H.



THE TEN PRIZE ONION EXHIBITS
At Messrs. Dickson and Robinson's Onion Show on September 15.

PRIZE ONIONS.

Our readers will remember that in the Gardeners' Magazine of September 18 we gave a full report of the interesting Onion Show held by Messrs. Dickson and Robinson at Manchester on September 15. We then gave the list of prizewinners, and we now have an opportunity of presenting an illustration of the ten prize-winning dishes, the variety in each case being The Premier.

Reading from left to right in each case, the exhibits were from the following: Bottom row—First prize, Mr. Edwin Beckett, Aldenham House Gardens, Elstree; second, Mr. Bowerman, Hackwood Park Gardens, Basingstoke; third, Mr. Wilkinson, Tyntesfield Gardens, Bristol; fourth, Mr. Johnson, Duffield House Gardens, Slough. Middle row—seventh, Mr. W. Folkes, Ampthill; sixth, Mr. Avery, Loudwater Park Gardens, Rickmansworth; fifth, Mr. Duncan, Merstham House Gardens. Top row—eighth, Mr. Tysoe, The Lodge Gardens, Bedford; ninth, Mr. Fraser, Ottershaw Park Gardens, Chertsey; tenth, Mr. Parrott, Brockhampton Court Gardens, Hereford.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

AMONG THE SEEDLINGS.—As it is at this season that we are called upon to give attention to so many stages of growth development among the established plants, it is often difficult to find time to turn our attention to the pressing requirements of seedlings in their early stages of growth, yet seedlings that are ready should be removed from their seed beds and encouraged by every possible means to become somewhat established in their new surroundings before the winter sets in.

CATTLEYAS AND ALLIED GENERA.—Where the early summer sowings have made satisfactory progress, the young plants will be found developing new roots. While these are in this state, the sooner they are attended to the better. They may either be planted singly in small pots, or several together in store pots. I prefer giving all seedlings separate pots as soon as possible, and consider they can be better accommodated when treated individually than where several are grown together in the same pot; there may not be that marked difference for a few months, but when the store pot seedlings have to be potted singly it is then that the individual treatment is found to have the greatest advantages. Select clean pots, and fill them to about two-thirds their depth with clean broken crocks. The compost we use at this early stage is made up of equal proportions of finely-broken leaves, peat, and sphagnum moss. If the surface is covered with sphagnum, finely chopped, this will assist in preventing the flies from working so readily into the potting compost. Make the compost firm after the seedlings have been pricked out. It is most desirable that the compost should be firm to prevent rapid evaporation of moisture. As soon as the seedlings have been pricked out, place them in a warm, moist position where they may be shaded from strong light for a few days until the roots get hold of the compost. When water is required, use a fine sprayer or syringe, being careful to use rain water only at about the same temperature as the house.

CYPRIPEDIUMS.—There are few orchids that make greater progress during the autumn and winter months than cypripedium seedlings. It is a good plan to leave these until the second leaf has formed, as they are then more easily handled; and, if potted when in an active rooting state, they quickly become established at this season of the year, and make good progress. A warm, moist atmosphere is essential for cypripedium seedlings, and a position near the roof glass, such as a shelf or stage raised to within 18 inches of the glass, is desirable, especially so during the dull winter months. Care must be taken that the plants do not remain dry for any length of time. Keep a sharp look out for small yellow thrips, as these often attack the lower sides of the leaves, and are sometimes overlooked until considerable damage has been caused. Frequent and close examination must therefore be made.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

BOUGAINVILLEA GLABRA.—In order to have the showy bracts of this plant freely produced, it will be necessary at the present time to give special attention to the plants, whether in pots or planted out, so as to thoroughly mature the wood. Plants kept in a cool house while in flower should have been transferred to the stove, and every means taken to ripen the wood, otherwise blooms are scantily produced. Water should only be given in sufficient quantity to keep the roots from injury, and a night temperature of about 55 deg. should be maintained until new growth is started next year.

IXORAS.—Careful treatment of the plants is necessary during the winter months, for too much or too little water is injurious. In a temperature of 65 degrees the syringe may be freely used; a mild bottom heat will benefit young plants intended to flower in small pots, and water a few degrees warmer than the temperature of the house should be used.

DIPLADENIAS.—As these plants cease to flower plenty of air may be given, with full sunlight. Gradually reduce the supply of water at the roots—indeed, very little will be needed during the winter months. Keep the plants perfectly free from insect pests.

BEGONIA GLOIRE DE SCEAUX.—Keep this fine begonia in a temperature of about 60 degrees, and afford a fair supply of moisture; fumigate regularly to keep thrips in check. If at all pot-bound, a further shift will be beneficial before growth is completed, but should the pots be considered large enough and getting well filled with roots, give liquid manure and soot water occasionally.

BEGONIA GLOIRE DE LORRAINE.—The early batch of this beautiful begonia will now be well developed, and commencing to bloom freely. Shelves near the glass, or stages in low houses, are best suited to its requirements. To keep the plants symmetrical, stakes will be necessary; we use but one stake in the centre of each. The roots having now taken full possession of the soil, assistance will be necessary in the form of weak liquid manure, used in a clear state. Late propagated plants may still be potted into larger pots, but beautiful plants can be secured in comparatively small ones.

GESNERAS.—Assistance should now be given by occasional applications of weak liquid manure, to encourage the plants to continue in bloom as long as possible. Provide a fairly dry atmosphere, and do not give an excess of water at the roots. When flowering is over, gradually withhold water, and store in a dry place in a temperature of about 55 degrees.

PROPAGATION.—Such plants as acalyphas, pandanus, crotons, dracænas, abutilons, etc., root readily at this season, and by propagating them now time and space is gained. Use small pots and insert singly. When rooted they can be kept in their cutting pots until the turn of the year, with no disturbance.—W. Fyfe, Lockinge Park Gardens.

FRUITS UNDER GLASS.

FIG TREES still in bearing should be given liquid manure each week, but the house should be now closed, plenty of air being admitted continually, so that the atmosphere shall be dry. Trees from which the fruits have all been gathered should have the branches untied, so that sun and air will have full opportunity for ripening the wood; any shoots that are of no further service should be cut out at once. The foliage should still be syringed on fine days. Root pruning, if desirable, may now be begun, or any lifting may be done if the trees are rank and have not given a satisfactory supply of fruit. The fig tree does not require a large border of rich material; on the contrary, it does best in a small border, and one in which the roots can be kept in check and food afforded by surface feeding. If the border is too large a small wall can be easily built to confine the roots.

FIGS IN POTS, and plunged out of doors, should be laid on their sides, or placed under cover in an unheated house, if frosts or heavy rains prevail.

MELONS.—Push forward the ripening of melons, and let the fruits be well exposed to all light and sunshine; the last few weeks have not given good weather for late melons. Keep the temperature 75 to 80 degrees by day and 70 degrees at night, and be very careful not to overwater. When the fruits begin to ripen give a little ventilation to assist in developing a good flavour.

PEACHES AND NECTARINES.—Trees in the early house will be fast losing their foliage now, and when this is all down give a thorough cleansing before making use of the floor for chrysanthemums, etc. These early fruit houses are often used for this purpose, and very often the loss of a fruit crop can be traced to it. Do not put the lights on till the last possible moment, and on no account allow any heat to be turned on, as the fruit buds must not be excited, or there will be bud dropping later on. See that the borders are not dry, and do not allow them to become dry at this season. These remarks will also apply to succession houses, in fact to all trees under glass. Syringe late trees well to keep the foliage clean.

VINERIES.—All grapes should be rapidly approaching ripeness now, and where late varieties are not quite ripe some fire heat must be used to assist them. This has not been the best of seasons for the thorough development of grapes in cool houses. Should any of the borders require water choose a fine bright morning for the operation, so that a good deal of the surplus moisture will be evaporated before nightfall. Keep a sharp lookout for decaying berries, and cut them out as soon as detected. Care must be taken in watering when grapes are ripe, or the berries will decay quickly, especially of some varieties. Yet very often a certain amount of watering must be done, especially in shallow borders. Admit a little air day and night, and when the weather is damp turn on a little fire heat to dispel damp. It is a good plan to relieve vines of heavy crops as soon as possible after the grapes are really ripe, so that the strain is not so great on the rods; the bunches can be viewed just as well in a good grape room, and will keep there a reasonable time.

BORDERS.—Continue to carry out additions to the vine borders, renewing any that are exhausted, and making additions to those of two and three years' planting, using soil of the best quality, such as chopped turfy-loam, with some vine manure or bonemeal mixed, at the rate of about half cwt. to a ton of loam and lime rubble. The whole should be thoroughly mixed by turning it several times.

PAINTING THE HOUSES.—Now is a good time to have the houses painted, especially the outsides of fruit houses. The insides can be painted later, or any time during the autumn previous to starting. The inside should be painted every second season, as this will preserve the woodwork, and keep the house free from pests.

POT FRUIT TREES.—All pot trees that have finished fruiting should be removed into open quarters. See that these do not become dry at the roots; this is most important as they are now making up their buds for next season's crop. Any lifting or root pruning may be done now in order to keep trees fruitful and restrict their size.—W. A. Cook, Leonardslee Gardens.

THE KITCHEN GARDEN.

CAULIFLOWERS.—Seeds sown as advised will have produced plants large enough to be pricked out in frames, where they will be protected through winter. Allow about six inches between each plant, and keep the lights off the frames as long as it is safe to do so. The hardier the plants are kept the greater their chance of going through hard weather without harm. There will now be a glut of cauliflowers of the Autumn Giant class. Do everything possible to keep them from damage by frost, and to carry on the supply into the winter lift batches of plants and place in cool positions where they can be protected.

WINTER SPINACH.—This is making good headway, and will require to be thinned out to at least nine inches apart. Periodically dusting the quarter with soot, and working the Dutch hoe between the rows about once a week will materially assist growth. The perennial spinach beet will be of great value from now onwards if a large batch was sown any time about midsummer.

CELERY.—The main crop of celery has made its chief growth, and is about ready to be blanched. Remove all small growths that may have formed round the base of the plants, and apply liquid manure before commencing to earth up. Utilise care in keeping the centre free from dirt. It is much preferable to earth the stems by degrees than apply a great amount of soil at once, allowing about a fortnight between each earthing.

CABBAGE.—If the chief plantation of cabbages has been made from the largest plants there will probably be a quantity of useful small plants left. These, if pricked out in nursery beds, about six inches apart, will prove very valuable for transplanting in the spring to permanent beds, and also for filling up any gaps that may occur through plants running to seed and other causes.

OUTDOOR TOMATOES.—There will be quantities of fruit on these plants approaching ripeness, and it will not be safe to leave them long or damage from frost may cause considerable loss. A vinery or peach house that is resting, and has a dry, airy atmosphere, will form a suitable place to finish the fruit off in. The produce may not be of first-rate quality, but it will be of great value for the rougher culinary purposes.

SALADING.—A lesser variety of suitable kinds of plants for salads will naturally occur as winter approaches. Therefore, forethought in providing against scarcity is very necessary. Lift and protect lettuces that are completing their growth, and place them in frames facing north. Considerable sowings of mustard and cress will be helpful and appreciated. A commencement must be made with the blanching of endive in large quantities by placing slates over their crowns or introducing them to the mushroom house.

GENERAL REMARKS.—Protecting material of different kinds will need to be made ready for use, as frosts severe enough to damage many plants may be expected at any time. Vegetable marrows may often be carried on for several weeks by placing mats or boughs over the plants at night. Runner beans may also be similarly treated. Have manure turned and assisted to rot in readiness for wheeling on the ground next month.—Charles Flack, Cholmondeley Castle Gardens.

THE LATE MR. PETER BARR.

Having enjoyed the acquaintance of the late Mr. Barr for forty years, may I suggest that the memory of a man so remarkable should be fittingly perpetuated? Moreover, if this could be done in a way by which great permanent good might accrue, without appreciable sacrifice by those sharing in it, would it not be worth the doing? Assuming there would be a large measure of concurrence on those points, in what way could the object be realised? This leads to a definite proposition, and not the less worthy of consideration, as being based on Mr. Barr's own efforts in the realisation of an object which all believe to be good. The fact cannot in the nature of things be known to all, or even half the readers of these lines; but a fact it assuredly is that Mr. Barr's name stands first on the list of the first committee of the Royal Gardeners' Orphan Fund, which he assisted in establishing, and only those who acted with him, including the present writer (in 1887), can know how zealously our deceased friend worked for the accomplishment of that object. Would it not, therefore, be especially appropriate, if, by a large number of small gifts, an adequate sum were secured to endow a memorial in perpetuity in connection with that beneficent charity, and thus commemorate—in a way we know he would rejoice in—the honoured name of Peter Barr?

John Wright, V.M.H.

GREENHOUSE MANAGEMENT.—The Amateur's Greenhouse, the popular book by the Editor of "Amateur Gardening," not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d. from The Gardeners' Magazine Office, 148, Aldersgate Street, London.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The Hall was full, crowded, overflowing with exhibits on September 28, and, in spite of cold, wet weather, there was a large attendance during the afternoon. Fruits and vegetables were largely shown, and were excellent; while dahlias, hardy flowers, and orchids were superabundant.

Professor Hugo de Vries gave the second of the Master's Lectures during the afternoon, but there was not a large attendance, and, unfortunately, the noise of motors and heavy traffic outside the hall was so great that some difficulty was experienced in following the lecturer. Professor de Vries showed a series of slides representing the peloriate variety of Linaria vulgaris, a variation that came spontaneously in a very small proportion of any large number of cultures of the type, and was not gradually evolved by selection. On the other hand, he showed what he called "mutants," practically species, evolved from Œnothera Lamarckiana, one, a dwarf free-flowering form that, if self-fertilised, would afterwards give a fixed race of dwarfs. His description of how he secured a double variety of the corn marigold, by first saving seed from a garden flower head that contained twenty-one ray florets, as against the average of twelve florets in a wild flower. He then found the average of ray florets raised in the succeeding generation, and, finding one head with forty-eight florets; seed from this again gave a higher percentage, and seed from a hundred rayed head was saved, and from this generation came a flower with two hundred florets, and so, in five years, from the single garden form he obtained a good double variety that could be kept constant. The Professor also showed how a five-leaved clover could by selection be made to produce a ten-leaved one, and said that if he had an order for a thousand plants of this variety, he could produce them in a reasonable time. The illustrations of the Professor's garden, and the methods followed in his extensive experiments; the beds of plants, the netted-in garden, and the fine gauze-wire greenhouse for excluding insects, all proved wonderfully interesting and instructive.

FLORAL COMMITTEE.

Messrs. Barr and Sons, Covent Garden, submitted a collection of Michaelmas daisies, early chrysanthemums, kniphofias, phloxes, montbretias, etc. Pæony-flowered dahlias were shown by Mr. J. T. West, Brentwood, who showed his new seedlings Vandyke, Burne Jones, Titian, and Turner, all very fine in size and colour. The lovely Colchicum speciosum and C. s. alba was beautifully represented by Messrs. J. Backhouse and Son, Lim., York, who always show these autumn flowers finely. Stately gladioli, all seedlings, from bulbs flowering for the first time, were submitted in quantity by Messrs. J. Burrell and Co., Howe Nurseries, Cambridge, and they, by reason of their fine flowers and colouring, attracted a great deal of attention. This firm also showed some charming roses and a handsome set of cactus dahlias.

Dahlias were largely and finely shown by Messrs. Carter Page and Co., London Wall, E.C., this firm filling a length of tabling with a grand display of cactus, single-flowered, pompon, and pæony-flowered varieties. The former varieties were very prominent, notably Dreadnought, Wm. Marshall, Rev. G. W. Jamieson, Celia, Nisi Prius, Rev. A. Bridge, Brigadier, and Nelly Riding. Phloxes and Michaelmas daisies were extensively staged by Mr. Frank Brazier, Caterham Valley, the former being especially bright; Hilda Morris and Mrs. F. Brazier were two good Michaelmas daisies.

Ornamental vines, as shown by Messrs. Jas. Veitch and Sons, Chelsea, were a fine feature of the meeting, the elegant foliage and deepening leaf colours all attracting a great deal of attention. There is no doubt a great future for such fine kinds as V. Coignetiæ, V. aconitifolia, V. tomentosa, V. flexuosa major, V. Thunbergi, V. Thomsoni, V. Labrusca, V. armata Veitchi, V. Romaneti, V. Wilsonæ (A.M.), and the exquisite V. Henryana. An interesting collection of heaths came from Mr. L. R. Russell, Richmond. The Rev. A. Chalmers Hunt, Willian Rectory, Hitchin, set up a few bunches of good autumn roses. Mr. E. P. Cooper, gardener to Miss Abethall, Colney Hatch Lane, N., showed a very large specimen of the old Platycerium alcicorne.

Pompon dahlias were delightfully shown by Mr. Chas. Turner, Slough, and his display of these charming little flowers should do much to further popularise the section for garden decoration. The bright golden Geisha, a big pæony-flowered dahlia, was also grandly shown by Mr. Chas. Turner. Mr. W. Leggett, West Bergholt, Colchester, contributed a few bunches of roses, and Messrs. Frank Cant and Co., Colchester, submitted a very beautiful bank of roses, in which Frau Karl Druschki, Mons. Paul Lede, Peace, Mdme. Melanie Soupert, Countess of Derby, Betty, Chas. J. Grahame, Edu Meyer, George Nabonnand, Mdme. Pierre Cochet, Earl of Warwick, La Tosca, and Kaiserin Augusta Victoria were extremely beautiful, clean, and fragrant.

A display of roses, and show and cactus dahlias, was made by Mr. Wm. Treseder, of Cardiff, and a dahlia bouquet in the exhibit was very pretty. Messrs. Jas. Stredwick and Son, St. Leonards, had beautiful flowers of their new cactus dahlias, such as Quimbo (A.M.), W. N. Thomas, Gold Crest (A.M.), Mrs. A. Willis, Dr. Kindal, W. H. Wenham, Indomitable, Orion, Iolanthe, etc. Messrs. S. McGredy and Son, Portadown, Ireland, had some lovely roses in the entrance hall, but all their other varieties were eclipsed by the brilliant H.T. Mrs. Arthur Coxhead, a rose of great beauty, wonderful breadth of petal, and delightful fragrance.

Cactus and pompon dahlias were finely displayed by Mr. J. T. West, Tower Hill, Brentwood, the bank of blooms providing a splendid bit of colour. Mr. West always shows neat and refined flowers. On a low staging Messrs. Dobbie and Co., Rothesay, displayed early flowering chrysanthemums in large vases, and these made a striking exhibit; Market White, Polly, Ethel, Leslie, Lilie, Agnes, Caledonia, Goacher's Crimson, Roi des Blancs, Harry, Crimson Marie Masse, and Horace Martin were among the best. The Rothesay firm also contributed a few sweet peas, including Masterpiece, Evelyn Hemus, Mrs. H. Dickson, and several seedlings.

In their group of hardy flowers Messrs. G. and A. Clarke, Dover, showed the graceful Cimicifuga simplex finely. Messrs. Paul and Son, Cheshunt, contributed many interesting shrubs, but the exhibit was rather too crowded; Catalpa bignonioides purpureis, Viburnum rhytidophylla, Cotoneaster nummularia, Pyrus foliosa, the parsley-leaved bramble, and the variegated tulip tree were a few of the good things. Mr. M. V. Seale, Sevenoaks, filled a table with a bold and brilliant display of dahlias; the background consisted of large stands of cactus dahlias associated with eulalia foliage, and in front were bowls of miniature cactus dahlias with vases of single pompon varieties between. Messrs. Wm. Paul and Son, Waltham Cross, were represented by a beautiful exhibit of roses, and it was also a large one and daintily set up. Prominent varieties shown in quantity were Mdme. Abel Chatenay, Pharisaer, Le Progres, La France, Corallina, Hugo Roller, Ecarlate, F. K. Druschki, Mdme. Jeany Guillemot, Mdme. Ravary, Betty, and Richmond. Conspicuous in Mr. G. Reuthe's exhibit, from Keston, was a batch of the strikingly handsome Lilium auratum rubro-vittatum, and hybrid hardy lobelias. Messrs. W. Cutbush and Son, Highgate, were represented by a large display of hardy flowers and cut carnations. Bouvardias, salvias, and dwarf and standard veronicas in full bloom, and a collection of varieties of Polypodium vulgare, including the elegant P. v. cambricum and P. v. pulcherrimum, were shown by Messrs. H. B. May and Sons, Edmonton.

Messrs. Benjamin R. Cant and Sons' exhibit of roses contained excellent bunches of Killarney, Queen Mab, G. Nabonnand, the new H.T. Claudius, F. K. Druschki, Aurore, Hugh Dickson, Mdme. Charles, etc. An elegant exhibit of Michaelmas daisies, set up by Mr. H. J. Jones, Ryecroft, Lewisham, showed a fine style of staging these flowers; Framfieldense, Mrs. D. Mann, Finchley White, Margaret Matthews, Hilda Morris, Distinction, Mrs. F. Brazier, and Mrs. S. T. Wright were the leading varieties. Mr. Clarence Elliott, Six Hills Nursery, Stevenage, had a group of Michaelmas daisies, anemones, etc.

Baskets of the very free-blooming Viola cornuta, V. c. purpurea, and V. c. alba, from Messrs. Gunn and Sons, Olton, were conspicuously good. Messrs. T. S. Ware, Lim., Feltham, displayed cactus and pæony-flowered dahlias in fine style, and they set up large vases of their new double Michaelmas daisy Beauty of Colwall. Messrs. W. Wells and Co., Merstham, contributed a collection of phloxes, and a selection of early-flowering chrysanthemums, among which were fine groups of Leslie, Connie, Carmelite, Roi des Blancs, J. Bannister, Perle Chatillonaise, Wells' Scarlet, Firebrand, and Tapis d'Or. Messrs. J. Cheal and Son, Crawley, set up a very charming set of single dahlias, together with pompon and cactus varieties also, but the former were especially bright and good. Mr. S. Mortimer sent a few dahlias, and gained an A.M. for Little Donald, a deep crimson pompon variety.

ORCHID COMMITTEE.

Messrs. Charlesworth and Co., Haywards Heath, Sussex, had a very bright exhibit, wherein the most conspicuous plants were the handsome Lælio-cattleya Etna, Cattleya Vulcan superba, C. Acklandiæ, Odontoglossum crispum, O. grande, O. Warnhamense, O. Phœbe—a fine form, Vanda cærulea, Sophro-cattleya Marathon, and the vivid S.-c. Gratrixæ, Phalænopsis Esmeralda, Cattleya Basil (A.M.), and Cattleya Mrs. Pitt superba (A.M.). Some very interesting orchids were shown by Messrs. Sander and Sons, St. Albans, and included Epi-cattleya Lilianiæ, Dendrobium velutinum, Cœlogyne Micholitzi, the fine new Dendrobium Sanderæ, Cattleya Thayeriana, L.-c. Baroness Schroder, and fine forms of L.-c. Bletchleyensis.

Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, showed Lælio-cattleya Pizarro Holford's var. (F.C.C.) with grand old gold and crimson lip; L.-c. Golden Fleece, with golden and red-brown flowers; and Cattleya Rhoda conspicua (A.M.), the latter very like a white-petalled C. Hardyana. Messrs. J. Veitch and Sons, Chelsea, sent the curious yellow, long-spiked Disa polygonoides (B.C.), from Australia. Odontoglossum crispum Ethel, with splendid red blotches, was shown by Mr. E. Rogerson, Oakdene, West Didsbury. Mr. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford, contributed several fine cypripediums, including C. Thalia New Hall Hey var.

From Messrs. Stanley and Co., Southgate, came the new Cattleya iridescens, a new hybrid that presents considerable variation, C. St. Gilles, C. minucia, L.-c. Bletchleyensis, and Cattleya Gaskelliana alba. Mr. J. Collier, gardener to Sir Jeremiah Colman, Bart., showed numerous varieties of Dendrobium Phalænopsis, the rare D. Taurinum, Brasso-cattleya Mary, Cirrhopetalum appendiculatum, and the quaint Dendrobium bicaudatum. Messrs. Mansell and Hatcher, Lim., Rawdon, Leeds (formerly Moore, Lim.), were represented by a large group of orchids, in which prominent subjects were Cattleya Iris, Cypripedium Wiertzianum Potter's var., C. Morganiæ Burfordense, Cœlogyne Massangeana, Mormodes unicolor, Cattleya Fabia, and various interesting odontoglossums, etc. Messrs. Stuart Low and Co.'s exhibit contained Oncidium oblongatum citrinum in fine form with large spikes of bloom; O. incurvum, Bulbophyllum Godseffianum, Cycnoches chlorochiton, Cattleya Iris, Cycnoches maculatum, and Dendrobium formosum giganteum.

FRUIT COMMITTEE.

A particularly fine display of fruit trees lifted from the open ground and staged in pots, came from Messrs. Jas. Veitch and Sons, Chelsea. It was a grand exhibit, showing how well the trees are managed and how clean and abundant the fruit. The bush trees of Lane's Prince Albert, Grantonian, Chas. Ross, Bismarck, Tyler's Kernel, Mrs. Barron, and Bramley's Seedling apples were splendid; while the trained trees of Beurre Van Geert, Beurre Fouqueray, Louise Bonne of Jersey, Verulam, and Beurre Clairgeau pears were unusually good; and the figs were excellently cropped. The trees of the Langley bullace, a fine late, heavy-cropping variety, gave ample evidence of the usefulness of this introduction. The Chelsea firm's display of clean, well-grown vegetables, proved a great attraction, and especially good in their large collection were the specimens of Hackwood Park runner beans, Ailsa Craig onions, Hollow Crown parsnips, Red Globe turnips, Matchless carrot, Ham Green tomato, Lyon leeks, etc.

A very fine display of magnificently grown fruit, both picked examples, and trees carrying famous crops, was set up well by Messrs. T. Rivers and Son, Sawbridgeworth. The oranges were striking, as were the baskets of orchard-house fruits of Cox's Orange Pippin, Gascoigne's Scarlet, Ribston Pippin, Peasgood's Nonsuch, and Worcester Pearmain apples; Golden Eagle peaches; Golden Transparent, Autumn Compote, Admiral, and other plums; and Alicante, Black Hamburgh, Gros Maroc, and Muscat grapes. The heavily laden peaches, apples, pears, vines, plums, and figs were a great feature, and gave evidence of splendid culture.

Good apples and pears, and well-finished clusters of Appley Towers, Madresfield Court, Mrs. Pince, Black Hamburgh, Gros Maroc, Lady Downes, and Alicante grapes were shown by Mr. E. Neal, gardener to J. A. Nix, Esq., Tilgate, Crawley. From the same gardener came first-rate samples of nectarine Princess of Wales, and Walburton Admirable peaches. Mrs. V. Banks, 102, Park Street, Grosvenor Square, W., put up a particularly fine collection of bottled fruits; the fruits were all whole, and beautifully clean and clear.

Messrs. H. Cannell and Sons, Swanley, contributed a very fine exhibit of fruit, filling up a large space with excellent apples, pears, plums, etc. The exhibit was also an attractive one, and contained fine samples of Allington Pippin, Ecklinville, Warner's King, Bismarck, Lady Sudeley, Worcester Pearmain, Jas. Grieve, Peasgood's Nonsuch, New Hawthornden, Chas. Ross, Grenadier, Potts' Seedling, The Queen, and other apples, and Goliath, Transparent Gage, Reine Claude de Bavay, Kirke's Blue, Grand Duke, Coe's Late Red, Black Diamond, Pond's Seedling, Monarch, and Burbank's Mirabelle plums. Altogether there were 280 dishes and varieties of fruits in this interesting and striking display. About three dozen dishes of apples and pears, backed by heavily fruited young apple and pear trees, were set up by Messrs. Stuart Low and Co., Bush Hill Park, Enfield. Messrs. S. Spooner and Son, Hounslow, filled one of the tables in the annexe with large baskets of well-grown apples representing popular varieties.

Mr. George Hobday, of Romford, put up a splendid amateur's collection of vegetables, all grown by himself. Mr. Hobday is not new to vegetable culture, and such exhibits as his cannot help but stimulate observers to take greater interest in kitchen garden produce.

Several collections of vegetables were staged in competition for the society's prizes for nine kinds, and here Mr. Edwin Beckett, V.M.H., Aldenham House Gardens, was first with one of his wonderful exhibits, in which everything was first-class, the Prizetaker leeks, Ailsa Craig onions, and Early Giant cauliflowers being unusually fine; Mr. Gaiger, gardener to H. T. Tatham, Esq., Hendall Hall, Elstree, was second. In the class for six kinds, Mr. A. Basile, gardener to the Rev. Oswald Turner, Woburn Park, Weybridge, Surrey, was a fine first with produce of high quality, but he was run closely by Mr. G. Hobday, Romford, who won second place. Mr. Beckett was first for peas with Sutton's Late Queen, and Mr. Staward second.

In a class for salading Mr. Beckett and Mr. Staward were first and second respectively.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Lælio-cattleya Pizarro Holford's var., from Lieut.-Colonel Holford, Westonbirt, Gloucester; to apple St. Everard (Cox's Orange Pippin crossed with Margil), from Messrs. Jas. Veitch and Sons, Chelsea.

Award of Merit.—To Pentstemon Middleton Gem, from Messrs. R. Wallace and Co., Colchester; to carnation O. P. Basset, from Mr. A. F. Dutton, Iver, Bucks; to rambling rose Flower of Fairfield, from Messrs. Stuart Low and Co., Bush Hill Park; to Vitis Wilsonæ, from Messrs. Jas. Veitch and Sons, Chelsea; to pompon dahlia Little Donald, from Mr. S. Mortimer, Rowledge, Farnham; to cactus dahlia Lancer, from Mr. H. Shoesmith, Woking; to cactus dahlias Gold Crest and Quimbo, from Messrs. J. Stredwick and Son, St. Leonards; to Lælio-cattleya Rhoda conspicua, from Messrs. Stuart Low and Co., Enfield; to Cattleya Basil and Cattleya Mrs. Pitt superba, from Messrs. Charlesworth and Co., Haywards Heath.

MEDALS.

Gold.—To Messrs. Jas. Veitch and Sons, Chelsea, for fruit trees, and one for a collection of ornamental vines; to Messrs. T. Rivers and Son, Sawbridgeworth, for fruit.

Silver-gilt Flora.—To Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Frank Cant and Co., Colchester, for roses; to Messrs. Wm. Paul and Son, Waltham Cross, for roses; to Messrs. Paul and Son, Cheshunt, for ornamental shrubs.

Silver-gilt Knightian.—To Mr. J. A. Nix (gardener, Mr. E. Neal), Tilgate, Crawley, for fruits; to Messrs. H. Cannell and Sons, Swanley, for fruits; to Mr. G. Hobday, Romford, for vegetables.

Silver-gilt Banksian.—To Messrs. J. Burrell and Co., Cambridge, for gladioli and dahlias; to Mr. Wm. Treseder, Cardiff, for dahlias.

Silver Flora.—To Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. Mansell and Hatcher, Rawdon, Leeds, for orchids; to Messrs. Carter Page and Co., London Wall, for dahlias; to Messrs. Wm. Cutbush and Son, Highgate, for hardy flowers; to Messrs. Dobbie and Co., Rothesay, for early chrysanthemums; to Mr. H. J. Jones, Ryecroft, Lewisham, for Michaelmas daisies; to Messrs. H. B. May and Sons, Edmonton, for flowering plants and ferns; to Mr. M. V. Seale, Sevenoaks, for dahlias; to Mr. Chas. Turner, Slough, for dahlias; to Messrs. S. McGredy and Son, Portadown, Ireland, for roses.

Silver Knightian.—To Messrs. Jas. Veitch and Sons, Chelsea, for vegetables; Messrs. S. Spooner and Sons, Hounslow, for fruit.

Silver Banksian.—To Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. J. Cheal and Sons, Crawley, for dahlias; to Messrs. Gunn and Sons, Olton, for violas; to Mr. J. T. West, Brentwood, for dahlias; to Messrs. W. Wells and Co., Merstham, for phloxes and chrysanthemums.

Bronze Flora.—To Messrs. T. S. Ware, Lim., Feltham, for dahlias; to Messrs. G. and A. Clark, Dover, for hardy flowers; to Messrs. J. Stredwick and Son, St. Leonards, for dahlias.

SCIENTIFIC COMMITTEE, September 14.

Present: Mr. A. Hall, M.A., F.L.S. (in the chair), with Dr. Voelcker, and Messrs. J. Fraser, W. Hales, J. W. Odell, and Geo. Gordon, V.M.H.

PRUNUS CHAPRONI.—Mr. Odell submitted the fruit and leaves of a Prunus growing in a plantation at Henley. A comparison with the description and plate of the "Revue Horticole," 1881, p. 467, of Prunus Chaproni, showed apparent agreement, except that the fruits of the sample were a little smaller. Mr. Hall undertook to see whether he could determine anything further regarding it from the Kew records.

ŒNOTHERA SP., ETC.—Mr. Fraser showed a specimen of Œnothera Lamarckiana in flower, which he had found in his garden, and was self-sown. He took the form to be that of the primitive species named Œ. rubrinervis by de Vries. Last year the veins of the leaves were reddish, whilst this year they were almost white, due possibly to the sunless season. The fruits, however, were red streaked. Mr. Fraser thought that this variety was taking the place of Œ. biennis in Surrey in both the garden and the wild state.

A flesh-coloured specimen of Echium vulgare, collected in 1901 by Mr. Fraser, was shown still retaining the flesh colour. Mr. Fraser showed further sprigs of Calluna vulgaris, var. glabrescens, and Erica cinerea, gathered in Surrey, growing on a chalk cliff at an elevation of 700ft. The difficulty of growing heaths and rhododendrons on chalky soils is generally known, and Mr. Fraser was surprised to find the present specimens. The soil was about 18in. deep, with a further 6in. of decayed chalk. As 5in. of soil would be a sufficient depth for the ericas, it was thought possible that the upper stratum was free from lime, and Dr. Voelcker undertook to analyse a sample if sent to him.

PEACH DISCOLOURED.—Rear-Admiral Goodridge, of Rudgwick, sent a peach for inspection. It was found to be not diseased, but covered with the excrement of aphis, upon which a species of fungus was growing. It was evident that the tree needed cleansing and fumigating.

DISEASED PEARS.—Mr. Wigley, of Whitehill, Gravesend, sent some pears attacked by the fungus Glœosporium fructigenum. The trees should be winter-sprayed with copper sulphate solution (1lb. to 25 gallons of water), and with Bordeaux mixture in summer.

LETTUCE DYING.—Cos and cabbage lettuces, both young and old plants, were received from Mr. Haskins, of Bournemouth, the leaves of which were browned and decayed at the edges. Mr. Gordon said that he had experienced the same trouble, and he thought it was due merely to the excessively wet season and cold weather, and was not attributable either to soil conditions or disease.

CATALOGUES RECEIVED.

WM. PAUL AND SON, WALTHAM CROSS.—The rose catalogue issued by this firm is one to keep on the book-shelf as it contains a mine of information relative to the sections and varieties of roses. The present issue is freely illustrated, and contains coloured plates of the new roses, Margaret and Albatross, both Waltham Cross varieties.

AMOS PERRY, ENFIELD.—A comprehensive list of bulbous plants and flowering roots, the lilies and irises receiving special attention. Also a list of delphiniums that gives some idea of the remarkable collection at Enfield.

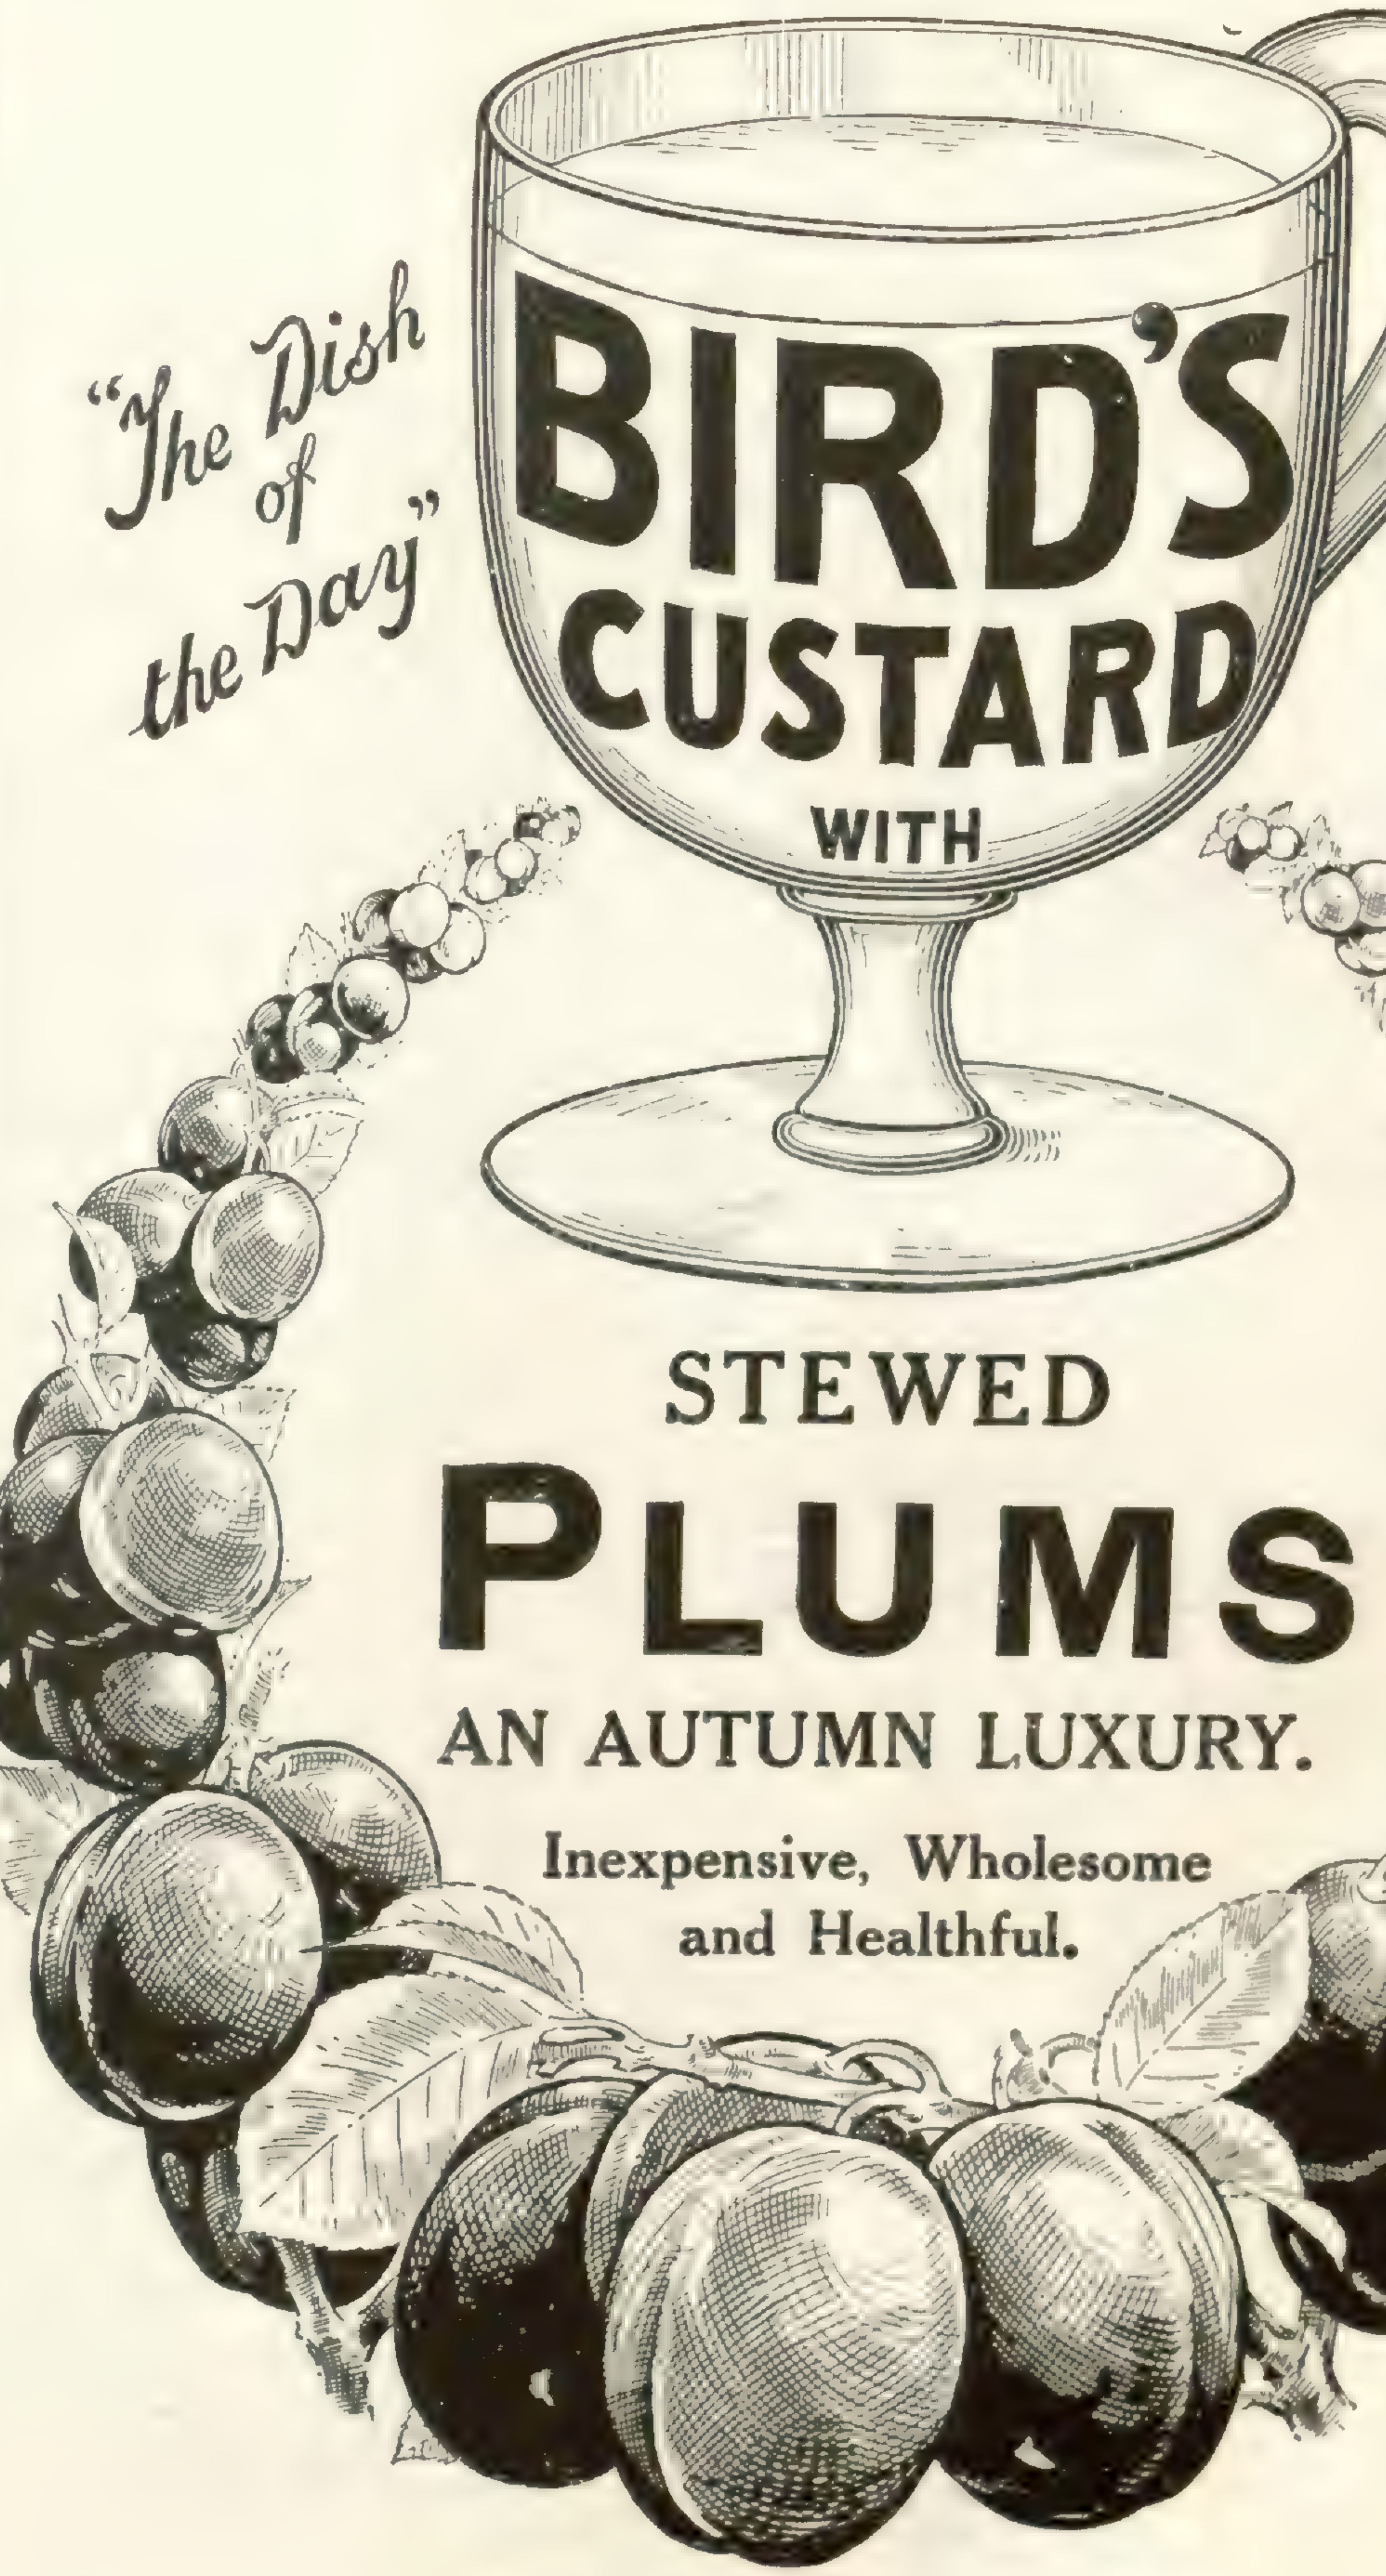
ANT. ROOZEN AND SONS, OVERVEEN, HOLLAND.—From Messrs. Mertens and Co., Cross Lane, St. Mary-at-Hill, London, E.C., the London agents of the Dutch firm, we have received a copy of their comprehensive list of Dutch and Cape bulbs, etc.

JOHN K. KING AND SONS, COGGESHALL.—Under the title of "Beautiful Heralds of Spring," the Essex firm issues an attractive catalogue of bulbs, plants, roses, and seeds.

DICKSONS, CHESTER.—Bulbs and flowering roots, and sundries, are listed in this catalogue, and the daffodil section is freely illustrated.

CHARLES TURNER, ROYAL NURSERIES, SLOUGH.—A catalogue of useful bulbs for garden and conservatory.

EDWIN MURRELL, SHREWSBURY.—A capital catalogue of roses, well arranged, descriptive, and well got up.



UMBRELLAS FOR ROSES.

Made in Wood or Wire, very strong.
From 6/9 upwards.

Price Lists of our Artistic Garden Trellis, Seats, &c., and Appliances for Training Climbing Roses, sent free by return of post.

Prices on application to
EPPS & Co., Ringwood, HANTS.

ANSWERS TO CORRESPONDENTS.

NAMES OF ROSES.—R. W., Selby: The most complete list of names of roses with which we are acquainted is the one entitled "Nomenclature de tous les Noms de Roses," compiled by MM. Léon Simon and Pierre Cochet, and published at the Librairie Horticole, 84bis, Rue de Grenelle, Paris. The second edition, now before us as we write, is dated 1906, and it is just possible there is a later edition. This list consists of 178 pages, and contains no fewer than 11,016 names of roses. Of course, there are scores of synonyms, but even then a huge list remains. The class, raiser, date of introduction, and colour, follow each name.

MEADOW SAFFRON.—S. F. W., Redruth: We have on several occasions pointed out that a sure method of rapidly exterminating the meadow saffron in land where cattle, cows especially, feed, is that of removing the leaves in spring directly they appear, and burning them. The Board of Agriculture, in a recently issued leaflet, points out that: Where meadows are infested with the meadow saffron (Colchicum autumnale) in very small numbers, the corms may be dug out by hand, and the whole plant burnt. Where, however, the weeds occur in extensive patches, the best method is to pull off all leaves by hand as fast as they appear in spring, and burn them. It has been stated that if this practice is repeated for one or two seasons there is no necessity to dig up the corms, the plants being readily exterminated. The effects of heavy dressings of such soluble manures as superphosphate, sulphate of ammonia, and kainit, might be tried, both alone and in combination.

FAILURE OF FRUIT TREES.—E. N., Worksop: Deep planting is a frequent cause of failure with young fruit trees, and the only way to remedy the evil is to lift the trees directly the leaves turn colour this autumn, and replant them so that the stems stand two or three inches higher out of the ground than hitherto. In almost every case it is an easy matter to find evidence of the position of the soil level on young trees from the nursery, and every care should be taken to plant in such a way that, when the trees and soil have settled down, the trees shall not be lower in the soil than when in the nursery quarters.

POLYANTHUS FOR SPRING DISPLAY.—L. C., Retford: There is no getting away from the fact that polyanthuses enjoy liberal treatment, and only give the very best results when planted early in the autumn in deeply worked, well-manured soil, and if the upper layer of soil has plenty of leaf-mould added to it, this will be a further advantage. A point worth remembering is that in the early spring, after treading over the bed so as to make the plants firm, a good top-dressing of gritty leaf-mould will help the plants wonderfully. This should be given just as the plants appear to be restarting into growth and bloom.

SOURED SOIL.—S. E. T., Heygate: If the border is well drained, either naturally or artificially, the sourness is due to an excess of manure. We shall be better able to advise you what to do if you send us further information as to the kind of soil, position, drainage, etc. Soot fresh from the flues should not be used at once upon land fully occupied by plants.

SHORTAGE OF SWEET PEA SEED.—H. B., Bradford: We have heard a somewhat similar complaint made by those who know little or nothing about the difficulties that have attended the cultivation of sweet peas for seed this season. Observations made in many seed-growing districts prove to us that the plaint of "short crop" or "no crop" on the part of growers and seedsmen is in no sense to be represented as a desire to raise prices. There is no manner of doubt whatever that English sweet pea seed will be very scarce this year in the case of all the Spencer varieties. Some idea of the scarcity of seed may be gathered from our own experience, which is that from about fifteen hundred plants, representing, of course, a considerable number of varieties, we have saved only about a dozen pods of seeds. The old grandiflora varieties and the Unwin varieties have seeded fairly well, but the Spencers dropped their flowers wholesale and refused to set seed. The fault lies, chiefly, with the climate of the year.

POOR QUALITY OF HELIANTHUS FLOWERS.—G. E. M., Folkestone: The poor quality of the blooms, and the character of the stems and leaves, afford ample evidence that the helianthuses have been starved. It is probable that the plants have been in the same position for many years, and that tree roots have also taken possession of the land, and no manure has been given. It would not be difficult to resuscitate the plants in a year or two, but a better plan would be to buy or beg a few stools of plants that have been well cultivated, divide these, and plant them in a new site on good soil. These remarks may also apply to other herbaceous plants in your garden, because if the helianthuses have failed, it is almost certain that other things have been neglected.

INSECTS ON ROSE AND ANEMONE LEAVES.—S. E. T., Cambridge: The rose leaves give ample evidence of the work of the leaf-cutting bee (Megachile centuncularis), which is sometimes so persistent in its attentions that roses are almost defoliated by it. It takes away the portions of leaf it cuts out for nest building purposes. Catching the bees in butterfly nets and killing them; tracking them to their nests and destroying the nests; and frequent spraying of the rose foliage with clear soot and quassia solutions, all help to reduce the attack, but there is no method of wholesale destruction. The perforations in the anemone leaves suggest the work of the Antler Sawfly. The little grubs of this fly are found on the undersides of the leaf, close to the cut or perforated portions, and if white paper or cloth be placed carefully under affected plants and the leaves are briskly shaken, the grubs will fall, and may be gathered up for wholesale destruction. This work must be taken in hand directly the cutting is noticed. Earwigs would hardly do so much damage.

NAMES OF PLANTS.

L. D. J., Wicklow.—Stigmaphyllon ciliatum.

J. H., Loughborough.—Athyrium filix-fœmina.

W. S., Taunton.—1, Cypripedium A. de Lairesse; 2, Oncidium varicosum Rogersi; 3, Sternbergia lutea.

S. B., Morecombe.—1, Rubus phœnicolasius; 2, Phlomis fruticosa; 3, Iris fœtidissima; 4, Stipa pennata.

A. H., Wickham.—1, Polygonum cuspidatum; 2, Cupressus Lawsonianus; 3, Ceanothus rigidus.

F. E. J., Saffron Walden.—1, Helianthus decapetalus; 2, Chelone barbata; 3, Hippophæa rhamnoides; 4, Lilium sulphureum; 5, Pinus cembra.

T. E. M., Colchester.—1, Salix viminalis; 2, Populus tremula; 3, Cupressus obtusa; 4, a Hypericum, probably Moserianum, flower wanting; 5, Pinus Strobus; 6, Spartium junceum.

TRADE NOTE.

Messrs. Clibrans, of Altrincham, Cheshire, have been granted a Royal Warrant of Appointment as nurserymen to his Majesty the King. For some years the Messrs. Clibran have supplied plants to the Royal gardens at Sandringham and Windsor, and have executed large orders for the Crown and his Majesty's Commissioners of Woods and Forests.

M. Paderewski is evidently a successful fruit grower, for at the horticultural exhibition recently held at Geneva, he was successful in winning prizes for apples and pears.

OBITUARY.

Mr. George Stacey.

We have to record the death of one of Birmingham's well-known and highly respected gardeners in the person of Mr. George Stacey at his residence in Harborne, on the 20th inst., after several months' illness. The deceased, who was in his seventy-eighth year, was a native of Surrey. In his younger days he was intimately connected with two or three of the large London nurseries and private gardens, having served under more than one of the leading exhibiting gardeners of the period; he also assisted in laying out the grounds of the Crystal Palace, Sydenham. When, about forty years ago, the late Mr. Alfred Osler, of Chad Hill, Edgbaston, commissioned Mr. Milner to lay out the grounds of his residence, Mr. Stacey came as one of his assistants, and on the completion of the work Mr. Osler retained his services permanently as head gardener, and there he remained for about twenty years. For many years he was a successful exhibitor at the Birmingham Chrysanthemum and Fruit Society's exhibitions, and other local ones. For several years previous to his death he had served on the committee of that body, and he was a member of the Birmingham Gardeners' Mutual Improvement Association from its initiation upwards of twenty years ago.

The funeral of the deceased, which took place at the Parish Church, Harborne, was attended by several members of his family and friends, including deputations from the associations above mentioned.

KELWAY BORDERS.
A perfect picture in your garden to last for years will be the result if you allow us NOW to plan a scheme, whether of contrasts or of harmonies, to be carried out this Autumn. Our "Artistic" Border, 50 yards by 10ft., costs £12 10s. only.
Consider what is "saved" in heat and labour by this system, and what is gained in true beauty.
KELWAY and SON, The Royal Horticulturists, Langport

NOW IS THE TIME TO PLANT KELWAY'S GLORIOUS PÆONIES, the finest hardy plant possible to obtain. For every garden, large or small. Hardy, everlasting, beautiful. It is necessary to plant KELWAY'S varieties! Collection D. 36s. per dozen splendid named varieties. Everything paid for remittance with order.
KELWAY and SON, The Royal Horticulturists, Langport, Somerset, England.

GARDEN IRON AND WIRE WORK and Ornamental Wood Work of every description, Espaliers, Rose Trainers, Archways, Pergolas, etc. Now is the time to consider your Garden Improvements. Send for Illustrated Catalogue. BOULTON and PAUL, Ltd., Dept. M5, Norwich.

EVERY GARDENER knows that the XL-ALL SPECIALITIES are the best on the market. The time is at hand for housing Plants for the Winter. When these are arranged under glass a fumigation with XL-ALL COMPOUND, or a syringing with XL-ALL LIQUID INSECTICIDE will at once free them from insect pests and save lots of trouble later on. Any plants or fruit trees suffering from Mildew should be sprayed with XL-ALL MILDEW WASH, or with the newly-patented CUCASA, the finest preparation of Copper ever offered to Gardeners. RICHARDS XL-ALL FERTILIZER is unequalled for finishing off fine blooms and fruit. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink List, giving particulars of these and many other "XL-ALL" Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Early-flowering Chrysanthemums.

Much has been said and written about the usefulness of the chrysanthemums flowering in advance of the forms of the Golden Flower that attain to their highest state of development during the month of November, and their cultivation has received consideration. The attention that has been given to them has contributed materially to an extension of their cultivation, and to a higher appreciation of their merits for yielding a supply of flowers for decorative purposes in a cut state. Notwithstanding these facts, it can hardly be said that they are cultivated to an extent their merits would warrant, or that they are, generally speaking, grown in a manner that admits of their contributing their full share to the attractions of the garden and conservatory. It may be that they have failed somewhat in their mission owing to a misconception on the part of some with regard to the place they should occupy in a well-devised scheme of garden ornamentation, and a failure to appreciate the merits of varieties for the several purposes. We now and again read of the merits of chrysanthemums that are so precocious as to be in full bloom early in August, and it is sometimes suggested that because of this early flowering propensity they should be given a prominent position in the hardy plant border. With those who hold such views we are by no means in agreement. The varieties blooming thus early are not wanting in attractiveness, but they are not equal in beauty to a considerable number of other plants suitable for the mixed border that bloom in August, and therefore they should not be allowed to usurp their place. The period during which the early-flowering chrysanthemums are of the greatest value is from the beginning of September till the end of October. The beauty of the summer flowers commences to wane from the opening days of the first of these two months, and with the aid of a good stock of well-grown plants the brightness of the flower garden may be maintained until the damp-laden atmosphere and dense fog compel the flower lover to turn to the occupants of the glass structures for the gratification of his taste. To obtain the best possible results the cultivator must adopt a practice differing materially from that usually recommended by writers on chrysanthemums and their culture. To arrange groups in the mixed border in accordance with the advice so freely given is a simple matter, and if the groups are of some size, and at no great distance from each other, the effect will be bright and satisfactory in the autumn. There is, however, a strong objection to this, and the display of chrysanthemums should not be confined to the mixed border. If there is a sufficient number of chrysanthemums to produce a rich colour effect, the borders will be shorn of much of their beauty during the summer months, because the chrysanthemum groups will be so many masses of greenery. We suggest as an alternative to the grouping of chrysanthemums in the herbaceous borders their preparation in the kitchen garden or reserve ground. This method of procedure will involve considerably more work, but where the strength is available it will have ample justification. Where it is adopted spaces that have been occupied by annuals or half-hardy subjects can, as soon as these have lost their beauty, be filled with chrysanthemums in bloom, and the borders be again made to present an attractive appearance. In like manner flower beds that are near the mansion can be cleared of their summer occupants immediately they have lost their beauty, and be refilled with chrysanthemums. Those, it need hardly be said, who may be induced to act upon our suggestion must proceed in a systematic manner, and grow the plants specially for the purpose. It would be an advantage to grow them in pots throughout the summer, as, when so grown, they make a stiff, short-jointed growth, and can be transferred to the beds and borders without disarrangement of the shoots or their losing a leaf. But—and this is important—the repotting and watering of a stock of plants large enough to produce a bright effect will entail much labour—sufficient, in fact, to prevent in many gardens chrysanthemums being utilised in the manner indicated, were there no other method of procedure by which the plants could be prepared. Fortunately, there is one which has the advantage of being simple and of entailing a comparatively small amount of work in proportion to the results obtained. This method we recommend as the one best adapted to the majority of gardens, and, as a good beginning, we would strongly advise those who are not well acquainted with varieties to at once visit nurseries and gardens in which the early-flowering chrysanthemums are made special features, and take note of the varieties that in their respective colours are remarkable for their compact habit, freedom of flowering, and effectiveness of colour. The varieties selected should possess these attributes in a marked degree, for an abundance of brightly-coloured flowers is essential, and, as so well known, it is far more difficult to remove tall spreading plants from one part of the garden to another and arrange them neatly than to transfer those having a moderately dwarf and bushy habit. For the preparation of a stock we suggest that an open position in the kitchen garden be selected, and that in the course of the winter it receive a moderate dressing of manure from the stable or farmyard, and be broken up to a depth of not less than twelve inches. On the prepared plot strong plants should be put out as early in the spring as practicable, and have their growths stopped two or three times, as may be necessary, during the earlier stages, to promote the production of lateral shoots. They must be allowed sufficient space to enjoy the full advantage of light and air, and if they are put from 18in. to 2ft. apart in rows, with a space of 3ft. between them, this condition will be complied with. The many beautiful varieties with somewhat spreading habit, and producing their blooms on long stems, if not suitable for transplanting, possess much value for the supply of cut flowers, and one or more beds, according to requirements, should be devoted to them in gardens of all classes. Beds about 6ft. wide will contain room for

MR. H. MARKHAM.

three rows of plants, and these, if the bed is from 30ft. to 40ft. in length, will yield an immense quantity of bloom, and at a time when flowers are difficult to obtain without the aid of glass. To prevent injury to the flowers from damp, fog, and frost, which in some seasons do so much damage as to render them unfit for decorative purposes, protection must be resorted to. This can be readily extemporised with the aid of a few stout poles, galvanised wire, and strong calico or light canvas. We need not say how these materials should be dealt with to give the required protection, but we would strongly advise the more general use of shelter in the case of early-flowering chrysanthemums required for furnishing supplies of cut flowers at this season of the year.

Mr. H. Markham, of Wrotham Park Gardens, High Barnet, is one of the stalwarts in the horticultural world, and a familiar figure at the leading Metropolitan exhibitions. He is a first-rate gardener, with a special leaning towards fruit culture, hardy fruits in particular, and on these subjects he is a well known authority, and deservedly holds a place on the Fruit and Vegetable Committee of the Royal Horticultural Society. Mr. Markham's early experience was gained chiefly in the North of England, at Hornsea House, Yorks; Loudbeck Park, Rotherham; Ivy Bank, Lancs ; Bodrhyddan, North Wales; and at Burghley, Stamford. Mr. Markham was for some time with the late Mr. Gilbert, at Burghley, and from thence went to Longford Castle, near Salisbury, where he stayed three years, and then, on the recommendation of Mr. H. W. Ward, he took charge of the gardens at Mereworth Castle, Maidstone, where the late Lord Falmouth took so keen an interest in choice fruits, and gave him an opportunity for getting together a splendid collection of the best varieties, peaches and nectarines being taken in hand very largely. After cultivating these fruits for thirteen years at Mereworth it was generally agreed that Mr. Markham had produced some of the finest trained trees to be found in the country. At Wrotham Park, under the Earl of Strafford, Mr. Markham is again given ample opportunity for cultivating hardy fruits to perfection. Like many other gardeners, Mr. Markham has a hobby, and his is the violin, on which instrument he is no mean performer.

Our Autumn Planting Number will, in accordance with previous announcements, be published on the 16th inst., and will contain an immense amount of information relating to the various planting operations that are carried out at this season of the year. Useful and ornamental trees and shrubs, roses, and hardy herbaceous plants will receive a full share of attention, and as the several articles have been written by well-known experts, the issue will serve as an excellent guide to both the selection and planting of the various subjects that will be dealt with. The number will be freely illustrated, and as the illustrations have been selected with due regard to their usefulness as well as to their beauty they will be found of much value in the elucidation of the text.

Exhibition of Home-bottled Fruits and Vegetables.—The annual bottled fruit shows of the Royal Horticultural Society have been increasing and improving year by year since their inauguration. This year the dates fixed are December 1 to 4, i.e., a four-day show instead of one of two days as formerly. The society has determined to do its best to popularise the making of, and the use of, bottled fruits, especially in the home, whereby so great an economy can be effected (securing the fruits when the market is low), and the table kept always supplied with wholesome fruit during the winter months. Their object is a worthy one, and gives much encouragement and instruction year by year to exhibitors, and to visitors to their show. In recent years fruit bottling has been gradually coming again to the fore, and, incidentally, it might be mentioned here that a cottage industry is being made of it, with very pronounced success, in several villages in England. The schedule for the coming show is a great advance on that of last year. Its classes for trade and amateurs are divided into: Division A.—Fruits Bottled in Pure Water; Division B.—Fruits Bottled in Syrup; Division C.—Preserved Vegetables; Division D.—Jams, Jellies, etc. The classes for amateurs are within the scope of the most unpretentious of households, the smallest class requiring only six bottles of four kinds of fruit. To the trade the society award their medals, but money prizes have been allotted for the recognition of amateurs. One important regulation of the competitions is that "Metal lids disqualify." We are glad to find that the society are thus determined to discourage metal lids, inasmuch as these have been found frequently to lead to the presense of ptomaine in the bottled productions. We warmly commend this exhibition to our readers. The secretary of the Royal Horticultural Society, Vincent Square, Westminster, will be pleased to send a syllabus of the show to any applicant. No charge whatever is made for space or tabling.

The Horticultural Club Meeting of October 11 will be the opening one of the 1909-10 session, and on this occasion, following the house dinner, Mr. H. Inigo Triggs, A.R.I.B.A., will give a lecture on "Italian Gardens."

Royal Parks in London.—We are requested to announce that the Commissioners of his Majesty's Works and Public Buildings will distribute this autumn among the working classes and the poor inhabitants of London the surplus bedding-out plants in Hyde and the Regent's Parks, and in the Pleasure Gardens, Hampton Court. If the clergy, school committees, and others interested will make application to the superintendent of the park nearest to their respective parishes, or to the superintendent of Hampton Court Gardens, they will receive early intimation of the number of plants that can be allotted to each applicant, and of the time and manner of their distribution.

"**Some Gardens of the Later Renaissance**" is the title of the lecture to be given before the Royal Horticultural Society on Tuesday next, at 3 p.m., by Mr. Thomas H. Mawson, Hon. A.R.I.B.A.

September in the North.—The weather during September, writes our Aberdeen correspondent, has been mostly quiet, cool, cloudy, and damp, with frequent drizzly rains. The most serious effect of the continuous damp weather has been to protract the harvesting operations, thus rendering the work more costly, as well as causing deterioration in the quality of the grain. The north-westerly winds accompanying the rains also beat down and twisted the heavier crops, and gave almost the whole a lean to the south; so that good work with the reaper could only be made on one side. The occasional dry afternoons experienced towards the end of the month were eagerly taken advantage of by the husbandman to get the crop into stook, though few fields were in a sufficiently dry condition for this to be done satisfactorily. The potato crop is spoken of as excellent both in yield and quality. There are heard, however, complaints of disease making its appearance. Favoured by the moist weather, turnips and mangolds have progressed well during the past month. The turnip crop is reported as especially promising, but finger-and-toe has been making its appearance in several districts. It is in a very dry September that mildew is apt to affect the leaves of this crop, but this is a disease we rarely suffer from in the North-east of Scotland, but we have had it. In England it is often much more serious. It was nearly a whole week before matters righted themselves on that occasion. The rainfall for September amounted to about 2.65in., just a trifle below the average for the last forty years.

Royal Gardeners' Orphan Fund.—The treasurer of the Royal Gardeners' Orphan Fund gratefully acknowledges the receipt of the sum of £5, left from her small estate by the late Mrs. Anne Clayton, wife of Mr. H. J. Clayton, Wharfe Bank, Ulleskelf, and formerly of Grimston Park Gardens, Tadcaster, "in remembrance of her husband's early connection with the fund."

Secretaries of Horticultural Societies are reminded that the "Gardening Year Book" is in an advanced stage of preparation, and that it is important they should return the forms sent to them some time since with as little delay as possible. The directory of "Horticultural and Botanical Societies," which forms so useful a part of the work, is annually subjected to a thorough revision to ensure it being thoroughly trustworthy, and societies of which no information has been received are consequently omitted. We shall be glad to receive notification of the formation of new societies, and the names of officers. These, as in the case of the forms, should be at once sent to the Editor of "Gardening Year Book," 148 and 149, Aldersgate Street, London.

United Horticultural Benefit and Provident Society.—The twenty-third annual dinner of this society will be held at the Waldorf Hotel, Aldwych, W.C., on Thursday, October 28, at 6.30 p.m. J. B. Slade, Esq. (of Messrs. Protheroe and Morris) has kindly consented to preside on this occasion, and the musical arrangements will be under the direction of Mr. Thomas Winter.

The Potato Crop.—In reporting on the present state of the green crops of the farm the agricultural correspondent of the "Times" writes, with reference to potatoes: "Disheartening accounts reach us concerning the health of the potato crop in Lincolnshire and adjoining counties. The crop is being harvested, but the results fall short of expectation; while, owing to the dismal conditions during the past few weeks, the quantity of marketable tubers is being further reduced by disease, which is rampant throughout the whole district. Recognising that the only chance of minimising the effects of the scourge is to harvest the crop, farmers are digging the tubers with all possible speed, though the late varieties are not yet fully matured. The value of the Bordeaux mixture as a safeguard against disease has been demonstrated this season, as the few growers who sprayed their crops while there was still no appearance of the enemy have been amply rewarded, the dressed crops having escaped attack in significant degree. The Scottish crops have not suffered so severely, and the season altogether has been more favourable north than south of the Border. The yield, however, promises to be under average, and the gross production will be less than last year, in spite of the increased area planted."

British Gardeners' Association.—A public meeting of gardeners will be held on Wednesday evening, October 13, at half-past seven o'clock, at Pitt's Restaurant, Kew Green, Surrey, when the aims and objects of the British Gardeners' Association will be explained by Mr. John Weathers, general secretary, and other members of the association. Mr. D. Campbell, head gardener at The Priory, Roehampton, will occupy the chair, and full discussion will be invited.

Perpetual Carnations in the Flower Garden.—With reference to the cultivation of perpetual carnations in open beds and borders, Mr. L. J. Lipscombe, of Sandy Bay, Hobart Town, Tasmania, writes: "In your issue of May 29 one of your correspondents refers to the cultivation of perpetual carnations out of doors. With us in Tasmania they do wonderfully well, and we obtain good blooms all the year round. Under separate cover I am sending you a photograph of a perpetual variety, Heather Keep. The bloom photographed was cut on July 21 (our shortest day) from a plant in full bloom, and it measured 4in. across, grown in the open, without any protection whatever, and this is one of the wettest winters we have had for many years." The bloom, as shown in the photograph, is quite perfect in development, and no stronger proof could be desired of the suitability of perpetual carnations for outdoor cultivation in Tasmania.

Spraying Fruit Trees.—The Rev. W. Wilks writes, calling attention to the fact that the time for winter spraying of fruit trees is at hand, and mentions that the report of the Conference on the Spraying of Fruit Trees, held under the auspices of the Royal Horticultural Society in the autumn of 1908 may now be obtained in book form. The work deals with methods of spraying for both entomological and fungoid pests, and gives much information respecting washes, spraying machinery, etc.

Rapid Growth of Mahogany in Nigeria.—Mr. H. N. Thompson, the Conservator of Forests in Southern Nigeria, refers, in a recent report, to the forest tracts of Ijaye and Ilesha; the former is known to be only sixty years old in the matter of forestation, and yet it contains splendid mahogany trees with a girth of 10ft. and over, these showing a far more rapid rate of development than is indicated by the annular rings. Mr. Thompson suggests that the mahogany may make four rings of wood growth each year, these corresponding to the four distinct seasons.

Eucryphia cordifolia, a rare Chilian shrub or small tree, does not flower with great freedom or regularity in this country, but it is extremely beautiful when producing its large pure white flowers singly, from the axils of the leaves at the ends of the growths. The deep green leaves are oblong, and with but a faint evidence of the cordate character at the base. Mr. T. H. Slade sends us a small flowering shoot from Horsham, which makes one wish E. cordifolia flowered more freely.

CHRYSANTHEMUM CONFERENCE.

◆

On Wednesday last a conference on chrysanthemums was held under the auspices of the National Chrysanthemum Society at Essex Hall, Strand, W.C., and was a decided success. Mr. Thomas Bevan, in the absence of Sir Albert Rollit, presided at the afternoon meeting, and briefly opened the proceedings. There was a really good attendance, and considerable interest was shown in the subjects brought forward. The first paper read at the afternoon meeting was on

Chrysanthemums as Annuals,

by Mr. C. H. Curtis, who expressed regret that some members who had had considerable practical experience of the subject had declined to deal with it on this occasion, because they felt it impossible to contribute a valuable or interesting paper. In other words, there appeared to be a mistake in the selection of the subject itself, and therefore he had been left to introduce it himself. It was, he said, two years ago next November that his interest in the cultivation of chrysanthemums as annuals was keenly aroused by a wonderful display made at the Reading Chrysanthemum Show, both by Messrs. Sutton and Sons, and by private growers. This display consisted of specimens and groups of elegant, highly-decorative, and very freely-bloomed plants all raised from seeds sown in the spring of that year. He also visited Messrs. Sutton and Sons' nursery, and found there a large house filled with free-flowering plants thus raised, and it had occurred to him that here was a novel, and distinct feature of chrysanthemum culture that deserved to be encouraged and made more widely known.

Mr. Curtis gave several reasons why, in his opinion, there should be a great future for this phase of culture. Firstly, it was cheap, as a packet of seed could be purchased for less than the price of a young plant of a good new variety, and whereas the one plant would yield from three to a dozen flowers, the packet of seed would give sufficient plants to fill a fair-sized conservatory. Secondly, as the seed was selected from the best single and decorative varieties, the latter including Japanese and incurved sections, the resulting plants afforded a wonderfully wide range of colour and immense variety of form, while the natural exuberance of seedlings ensured an enormous quantity of bloom eminently suitable for association with other plants and flowers, or for cutting. Thirdly, the treatment of chrysanthemums as annuals did away entirely with the tedious business of propagation by means of cuttings, and saved the labour and care and room that must necessarily be devoted to the retention of old plants and the creation of new ones from early November until January or February. At least two months of care was saved by raising plants from seeds as compared with propagation from cuttings.

Seeds sown in a temperature of about 60 degrees in January or early February gave plants that, gradually hardened off, and grown freely throughout the season, with the same care as is usually devoted to cutting-raised stock, would provide a first-rate display from the end of October right on through November, and though there would be variation in height, the average stature would be about 3ft. The treatment usually accorded to "decorative" plants was recommended, with very little, if any, disbudding.

In conclusion, Mr. Curtis pointed out that this new phase of chrysanthemum culture was not likely to supplant the present one of reproducing fixed and proved varieties from cuttings, but it offered great possibilities in the extension of chrysanthemum culture among amateurs, and by those who, having to supply flowers in quantity during November, found it difficult to keep large numbers of stock plants, and care for cuttings during the winter. He also urged the encouragement of chrysanthemums as annuals by the various chrysanthemum societies, pointing out that a properly arranged competition would soon be the means of adding a novel and interesting feature to November shows.

Mr. D. B. Crane opened the discussion, and said that he had had great success with chrysanthemums as annuals by sowing seeds in April on an old hotbed, planting the seedlings in a cold frame, and putting them out of doors in June. The result was a fine lot of excellent plants now in bloom, and likely to continue for some time. He also urged that the society should lend its encouragement to the exhibition of chrysanthemums as annuals.

Mr. P. Cragg raised the question of the value of seedling chrysanthemums for bedding purposes, and asked whether it would be possible to produce seedlings of fairly even height for the purpose. Mr. E. F. Hawes heartily supported the remarks of Mr. Curtis and Mr. Crane, and pointed out the great interest that always attaches to the raising of seedlings. He pointed out that seeds saved from dwarf-flowering kinds gave, as a rule, fairly dwarf plants, and, though it did not seem possible to secure a set of seedlings of equal height, the effect would be good.

Mr. Norman Davis said that twenty years ago he grew chrysanthemums as annuals, but the time had not then come to popularise the culture, and Mr. Wells deserved congratulations for reintroducing the culture. He was surprised to find recently that there was much more uniformity now than formerly in the height of seedlings. The culture was one well worth taking up, because of the great interest it afforded, but he thought the probabilities of finding first-rate novelties would be few.

Mr. Godfrey took the opposite view, and urged that the culture of chrysanthemums as annuals was a retrograde movement, and the phase was likely to fill one's gardens with varieties of very little more value than weeds. He thought seedling raising would prove disappointing, for from a 3ft. variety one might obtain seedlings 10ft. high. He advised culture of fixed varieties from cuttings. Mr. Oliver also gave his experience of seedlings, and said the height varied considerably, as did also the time of flowering. He felt that later on it would be possible to obtain seedlings of similar height and habit. Mr. J. H. Witty referred to the great interest that attaches to seedling raising. Mr. A. Hemsley and others also spoke.

Early Single Chrysanthemums.

Mr. W. Wells gave credit for the first early single chrysanthemums to Mr. Goacher, who raised Mabel Goacher, a variety Mr. Wells introduced. From this and a few other varieties, cross-fertilised with each other, came the race that he had endeavoured to popularise. Mr. Wells detailed the history of this family, and we hope to give the paper in full at a later date.

In the discussion that followed Mr. N. Davis objected to the idea that the treatment of chrysanthemums as annuals was new, and he pointed out that all raisers grew and flowered their plants within the same year. Mr. Crane suggested that there were really a few other early-singles when Mr. Wells started with these flowers. Mr. J. H. Dick asked if Mr. Wells had noted any early varieties that were specially hardy, and frost-resisting without any protection during winter.

In his reply Mr. Wells said that, treated as annuals, by amateurs, chrysanthemums grown like asters and stocks would often flower earlier than the asters in autumn. He objected to the observation that "chrysanthemums were annuals," and very definitely stated that he said chrysanthemums "could be treated as annuals," but not that they "were" annuals. He said early single varieties stood frost better than the other varieties. Seedling early-singles did not all show their best characters the first year, though, as a rule, they did show their general character.

A hearty vote of thanks to Mr. Curtis and Mr. Wells concluded the afternoon proceedings.

EVENING SESSION.

After an interval of an hour for tea, the evening session of the conference commenced, at six p.m., Mr. Thos. Bevan again presiding, and there was an excellent attendance of both ladies and gentlemen. The proceedings were opened with the following paper by Mr. J. B. Riding:

Late Market Chrysanthemums.

The popularity of the chrysanthemum as a winter-flowering plant has undoubtedly increased during the past ten years. This is no doubt due to the fact that the flowers last for a long period when cut, far longer than any other winter flower that we have, while at the same time they can be purchased at a price that brings them within the reach of everyone. All this has doubtless been brought about by the enormous increase in glass houses during the past decade.

Now what constitutes an ideal market variety? I should say, one that produces flowers of a clear decided colour, be it white, crimson, mauve, yellow, or bronze, for however beautiful the softer tones may be in a private collection, they are not wanted in our markets. Again, the ideal variety should have good, stiff, erect stems, should carry its foliage well, must not fade quickly, and, of necessity, must have a good constitution, while, in the section under notice, it should not produce its terminal bud flowers before the middle of December. This then constitutes an ideal market flower, but I am sorry to say we have not many varieties that come up to these requirements.

Fashion, too, has to be reckoned with; a few years ago the loose-petalled reflexed varieties were most in favour with the public, but the tendency to favour the incurved Japanese varieties has been most marked during the past few seasons, and no doubt this has been brought about chiefly by our large decorators, who have employed much bolder designs, thus creating the fashion for them; at the same time they have secured a flower that is much stouter in the petal, with the result that these last long. This, I maintain, has made it better all round, for the grower has a more substantial flower to deal with, and a better packer. The florist obtains a subject that will not bruise easily, but which keeps in good condition longer, while the purchaser obtains a more lasting flower.

A comparison of the well-known late market varieties of twenty years ago with those of the present day will show the advance that has been made. The majority of my hearers well remember the following varieties that were grown for late flowering: Meg Merrilees, Ralph Brocklebank, Ethel, Madame C. Audigeur, Princess Teck, Hero of Stoke Newington, Putney George, L. Canning, W. H. Lincoln, and similar old-time favourites. Compare these with the varieties we grow at the present day, and we cannot but admit that great strides have been made in the selection of suitable late-flowering varieties. But it does not seem to me that this advance was made before the decline of the large Japanese varieties, for while the exhibition varieties were mostly in request, new ones were tested for purely exhibition purposes, and, if found wanting, were promptly consigned to the rubbish heap. How many really good decorative varieties have been lost through this procedure it would be impossible to estimate, but there must have been dozens. I remember buying Mdlle. L. Charvet the first season it was out, but as it did not come up to exhibition standard it was thrown away after flowering. A friend of mine was much smarter, for he worked up a large stock, and was on the market first with it, and, as you know, it became popular at once, and, I hope, proved profitable. This is merely one instance, and no doubt such could be multiplied considerably.

I venture to say that the majority of new varieties are now thoroughly tested for their decorative value quite as keenly as from an exhibition point of view. I think all will readily admit that the chrysanthemum, as a decorative plant, has never been grown better in this country than we see it to-day, neither have more time, skill, or money ever been devoted to its culture, while the number grown is past calculating. We do know, however, that there are growers who handle sixty to eighty thousand plants each year in pots, to say nothing of the legion who plant chrysanthemums out by the acre, though, as far as the late-flowering varieties are concerned, this phase of their culture counts for little, for, I think it will be conceded by all growers that it is necessary to grow the late ones in pots throughout the season, at least for the production of best quality flowers. Those planted out may do for small blooms or sprays, but they cannot compete for quality with the pot-grown plants.

Cultural details in a paper like this, and before a gathering of experienced men, would be altogether out of place, so I shall confine myself to what I term the cardinal points in securing late chrysanthemums. A long season of growth is undoubtedly essential, therefore the cuttings should be rooted early in the season, as late-rooted plants mean soft sappy growth in most years, and weakly, thin-stemmed flowers that are of little use for high-class work. If the plants are pinched when about six inches high, or even less, this will lay the foundation of a plant large enough for all purposes, but this pinching should be done when the plant is quite soft so that it will break freely. Before the young plants become stunted or starved they can be placed in their flowering pots, and, assuming the pots employed are 16's, then three plants in each will produce a splendid bush the following autumn. As firm, well-ripened wood is the object of the cultivator, every means to that end should be used. Light and air are essential, and these can only be secured by allowing the plants ample room throughout the summer months, and not only during the summer, but right up to their flowering period; and when we remember that they are at least ten or twelve weeks under glass before they bloom it will be obvious how important it is that they should not be crowded.

Other cultural details may be passed over. We now find ourselves dealing with perhaps the most important point, viz., that of varieties. I give just a few of each colour, but the list could be considerably extended: Whites: Cannell's Late Prolific, Mrs. Thompson, Queen of the Exe, Princess Victoria, Heston White, Madame R. Oberthur, Snowdrift, and Mdlle. T. Panckoucke. Yellows: Golden Mrs. Thompson, Market Gold, Allman's Yellow, Mrs. G. Beech, True Gold, and Nagoya Crimson: Violet Lady Beaumont, W. A. Crossley, and Matthew Hodgson. Bronze: Tuxedo, and Lord Brooke. Pinks: A. J. Balfour, Mdlle. L. Charvet, Winter Cheer, and Framfield Pink.

The discussion was opened by Mr. Norman Davis, who urged that a variety should not be recommended for very late use unless it was proved beyond doubt that the variety naturally flowered late. Often, he contended, the horticultural Press conveyed a wrong impression, by recommending some variety that had been sent at a late date in, perhaps, an unusual season. He suggested that the work of selecting and recommending really late varieties should be relegated to the society's committee, and the combined wisdom of that body would then make the recommendations authoritative. Mr. F. Ladds asked whether the lecturer could give advice in connection with striking, housing, etc., as means of retarding the flowering period. He said he did not care whether the variety was naturally late or not, so long as, by culture, it could be flowered late. He preferred a 24-sized pot to a 16-size for late varieties; he believed in growing four plants in a pot, and securing three good flowers from each plant. Mr. Prickett made a few remarks. Mr. Tully preferred small pots, and referred to Mdlle. T. Panckoucke as a variety that needed considerably less water than others. He also condemned the wholesale recommendation of varieties for late use, simply because these had come late once in a way. He approved of Mr. Davis's suggestion for an authoritative list of late varieties. He spoke highly of Nagoya, and condemned the use of Mrs. Beech as a late variety.

Mr. Wells said it was up against the market men to test and recommend the real late varieties. The nurserymen could hardly be expected to test their new varieties on a large scale, and, also he stated that the real habit of a variety in relation to its time of flowering could not be determined until it had been grown several years. He made some interesting remarks respecting some of the very old late sorts, used in the 80's. He also thought the committee should take up the matter of late sorts, but he thought a large and independent trial was necessary. Mr. Davis contended certificates for decorative and market varieties should only be given after growing plants had been seen; he showed Mrs. Scott, and said its long neck made it a bad market variety, but Mr. Godfrey said there was no better variety for October or the growers would use another. Mr. Ladds spoke of Framfield Pink and Nagoya as first-rate and ideal market varieties. Mr. Godfrey thought highly of Heston White and Winter Cheer for late use, and said the size of the pot used must be governed by the skill of those who did the watering. He thought Queen of the Exe should be deleted from the lecturer's list of late varieties. Mr. Davis said that Mdme. Felix Perrin was sent out by Calvat, this came white, and sported a pink with him, and this pink sport was named Framfield Pink. He considered Roi des Blancs the best market white for either early, mid-season, or late use. He said Nagoya was raised in America, and sent out by him about fifteen years ago.

Mr. Riding replied to the several points raised, and said that on the test of Covent Garden Market his list of varieties would prove a really good one.

It was unfortunate that not a little cross-questioning led the discussion into by-paths, and occupied rather too much time, and it was 7.15 before the later papers could be read.

Best Chrysanthemums for Cut Flowers.

Mr. P. A. Cragg read the first paper on this subject as follows:

It was with a great deal of diffidence I undertook to read a paper on "Chrysanthemums as Cut Flowers for Market," for it is a difficult theme to handle, difficult to make it something more than a string of names, and difficult to give reliable information upon, for varieties that do well one season may often be only disappointments the next.

I will start with the early varieties, a class in which probably the greatest advance has been made in the last ten years. In order to refresh my memory I have turned up our stock books, going back for twelve years, and it is rather surprising to find that out of 75 varieties of all classes that we grew then we have now only three left.

I do not intend to mention varieties unless they are good croppers, as well as good flowers. Taking those that give good sprays and long stems, I would give the following selection: Pink Marie Masse, with its sports, Horace Martin or Elstob Yellow (the latter a slight improvement), Crimson

(Continued on page 792.)

THE BOLLWYLLER PEAR.

The wild pears offer a number of distinct and curious trees for garden decoration, and the one under notice is one of the most interesting. It was first brought to notice about 1599, and a figure and description of it appeared in 1650 in Johanne Bauhin's "Historie Plantarum," p. 59, under the name of Pyrus Polwilleriana. It has attracted the attention of scientists on many occasions since, and numerous names have been given to it, including Lazarolus Pollveri of Medicus. The two names, however, which appear to have clung most closely to it are Pyrus Bollwylleriana and P. auricularis, the latter being most frequently adopted in gardens. A very good figure of it may be seen in Decaisne's "Jardin Fruitier," fig. 31, while, in addition to other illustrations, figures 76, 77, and 78 in the "Revue Horticole" for 1885 are devoted to it.

A REMARKABLY INTERESTING GRAPE VINE (BLACK HAMBURGH) AT BIRCH HALL.

Even in its early days it was recognised as being of hybrid origin, and Bauhin describes it as being between pyri and mali. It has, however, been determined to be a hybrid between the White Beam Tree (Pyrus aria) and the Wild Pear (Pyrus communis), instead of the latter tree and the Crab Apple (Pyrus malus). It is evidently of accidental origin, and was first noted in a wild state at Bollwyller or Pollwyller, on the banks of the Rhine, on the estate of a local baron.

Left unpruned whilst young, it forms a low tree of ten to twenty feet high, with a comparatively small number of main branches thickly beset with long, spurry growths. With a little attention to pruning and training, however, during early life, a better proportioned tree is produced, which attains greater dimensions. The leaves resemble those of the pear in shape, but they have some of the silvery character of Pyrus aria, with a little of the broken leaf margin. The inflorescences are similar in shape to the flattened heads of the White Beam Tree, while the fruits are in clusters. Each fruit is pear-shaped, and one to one and a-half inches long, and an inch in diameter, bright red on the sunny side, and golden on the reverse, with a decided pear flavour. Very few good seeds are produced, but it is possible to find a few if the fruits are examined carefully. Though rarely met with in a large state, it is decidedly a tree to encourage, and is well worth planting amongst other ornamental trees. W. Dallimore.

AN INTERESTING OLD VINE

At Birch Hall, Essex, the residence of the Right Hon. James Round, there is a most interesting vine. It is a Black Hamburgh, sixty-three years of age. It completely fills a 70ft. lean-to greenhouse. This season, as in all former ones, it is in perfect health, and carrying a crop of 812 bunches. All the bunches are of good size, and the fruit is now finishing off beautifully. There is no artificial heat in the house, and the vine has never been known to be subject to blight or disease of any kind. Its origin is said to be from the same stock as the Hampton Court vine. Mr. Bishop, the gardener, takes great pleasure and interest in this remarkable vine, and we have pleasure in reproducing a photograph of it, taken a fortnight ago by Mr. F. G. Cuthbertson, of Marks Tey.

Smilax.—Young plants that may have been raised late in the season should be potted on, and placed in an intermediate house, where they can be kept growing all the winter; they will be found most useful for decoration when the earlier batches are over, and there is a general scarcity of trailing stuff.—Thomas Stevenson.

SHRUBS IN THE ROCK GARDEN.

The planting of a rock garden will give the gardener an opportunity of exercising his selective skill in the widest degree; indeed, few phases of garden decoration call for the amount of discretion and good judgment as does the planting of a typical rock garden. No two rock gardens offer the same facilities for the planter. The diverse formations, the varied aspects, the differing soils and positions, all call for extended knowledge and artistic skill, if the most is to be made of the opportunities given.

If this truism is correct as regards the acquisition and planting of rock plants, it is even more closely applicable to the use of shrubs in the rock garden, and it is to emphasise the importance of this feature that I pen these notes. It will be seen that differing formations and areas found in various rock gardens will call for different treatment as far as the furnishing is concerned, and it is in pursuit of this subject that the limitless range of rock garden shrubs is entered upon.

Bacon, in his famous series of essays, devoted one to the subject of "Gardens," and in it he speaks enthusiastically in favour of "rising mounds set about with heaths, thymes, etc.," a seeming forerunner of the low rock garden. Following this idea of the philosopher, we arrive at "the undulating mounds, broken by low ridges of rock, and intersected with winding pathways" that makes the moorland rock garden. A garden where low herbs can mingle with wild thymes, helianthemums, and ericas in gay profusion. Hardy orchids of the dry loving type can be associated, while dwarf pines, like cembra and montana, dwarf gorse of the double type, and other hard, bushy shrubs of a like nature will serve to break up any flatness in the picture.

To carry the matter further one might introduce with charming effect some of the dainty brooms (cytisus), the better kalmias, dwarf hardy rhododendrons, pernettyas, skimmias, and many allied subjects, which give one greater diversity, and add much to the effect. But if there is one feature of the rock garden which needs close attention in planting it is the highest summits of the bolder formations, and indeed the whole of such bold formations should be very carefully considered (a hurried choice is certainly not always a wise one), so it must be "care in consideration."

NEW TULIP THE PRESIDENT.
A handsome variety, awarded A.M., R.H.S., May 18, 1909. Messrs. R. Wallace and Co., Colchester. Flowers red and orange.

A very wise plan is to take the existing background into consideration. If the summits lie open, clear against the skyline, then by all means introduce a bold effective planting of dark evergreen subjects, which are shown in vivid relief against sky and cloud. The topmost ridges crowned with sombre pines, cypress, etc., will gain in height, appearance, and importance; but if the background itself be dark, such as is attained when the scenery is dominated by mighty trees in the background, then it is of the highest importance to bring light and brighter colourings into the picture.

In this we are following the wise precepts of those nature copyists the Japanese, who by their exquisite treatment of the bold rock heights, have left us indebted to their ingenuity.

Grand, bold masses of fiery red, glowing orange, bright rose, and spotless white azaleas, gleam in wondrous beauty from dark dominated rocks. Japanese maples, in all their beauty of design and magnificent colourings, contrast amazingly well with the bronze and grey boulders. Snowy deutzias and philadelphuses drape the crown of the formations with mounds of wondrous beauty if desired, and over the massive rock face one can allow a covering of Wichuraiana roses, Wistaria multijuga, cotoneasters, which, with the added grace of some of the rubus, and trailing cytisus, will beautify the rock face to a high degree.

I do not wish to particularly emphasise the planting of any special range of subjects, but rather to indicate the decorative charm of many things, and if one bears in mind the snowy grace of the olearias as they crop out from bold stone groupings, or the brightness of golden forsythias and berberis, one realises the immensity of the "subject choice" available.

If one might be permitted to speak of the diverse interest and delight of the New Zealand veronicas, the utility of the many beautiful cistus, the charm of hardy fuchsias and bamboos, the lovely daphnes, the ever useful andromedas, cydonias, Prunus triloba, and shrubby spiræas, in addition to many other fine shrubs, the reader will have no difficulty in understanding the part shrubs should play in rock garden adornment.

And if one desires to go further in the search of suitable subjects, then the whole outlook is appreciably widened. Roses like Pyrenaica and the best rugosas, the lovely Romneya Coulteri, the exquisite tree pæonies, the better ribes, Rhodora canadensis, Raphiolepis japonica, polygalas, Potentilla Friedrickseni, Limonia trifoliata, hydrangeas, hypericums, genistas, gaultherias, and a whole host of other charming shrubs may be included.

The great idea is to plant sparingly and effectively. Close planting is utter waste unless one has positions for growing specimens as they require moving. Crowding is not to be suffered, as well-grown specimens are of paramount importance in the rock garden, where of all places individuality and clearness of design must tell its own story. Soil should be thoroughly prepared before any planting is carried out, as rock garden shrubs, like all others, must have sustenance, and it is of the greatest importance to thoroughly prepare and manure the ground, as the nature of the rock garden renders it necessary, for afterwards one has to depend largely on top-dressings for conveying extra nutriment to the roots of growing plants and shrubs.

P. S. Hayward.

TULIP THE PRESIDENT.

Very few new tulips gained official recognition last season, but among the few one outstanding variety was The President. This gained an Award of Merit on May 18, when exhibited by Messrs. R. Wallace and Co., Colchester, at a meeting of the Royal Horticultural Society. The President is a fine May-flowering tulip, with large, shapely blooms of a bright red colour, beautifully suffused with orange. The basal colour is very deep and dark, and the expanded blooms are as handsome as the unexpanded ones. The President is certainly a most effective tulip, and one likely to become very popular in the near future.

NOTES ON NEW GLADIOLI.

I have this year grown a number of new varieties of gladioli here raised by Messrs. Frijlink and Zonen, Sassenheim, Holland. This firm is becoming well known as raisers of new gladioli. The beautiful and now popular variety named Hollandia was raised by them. It is doubtful if any of the new ones here described will surpass Hollandia, but they all have good points to recommend them, and some of them will, I believe, come to the front rank of public favour.

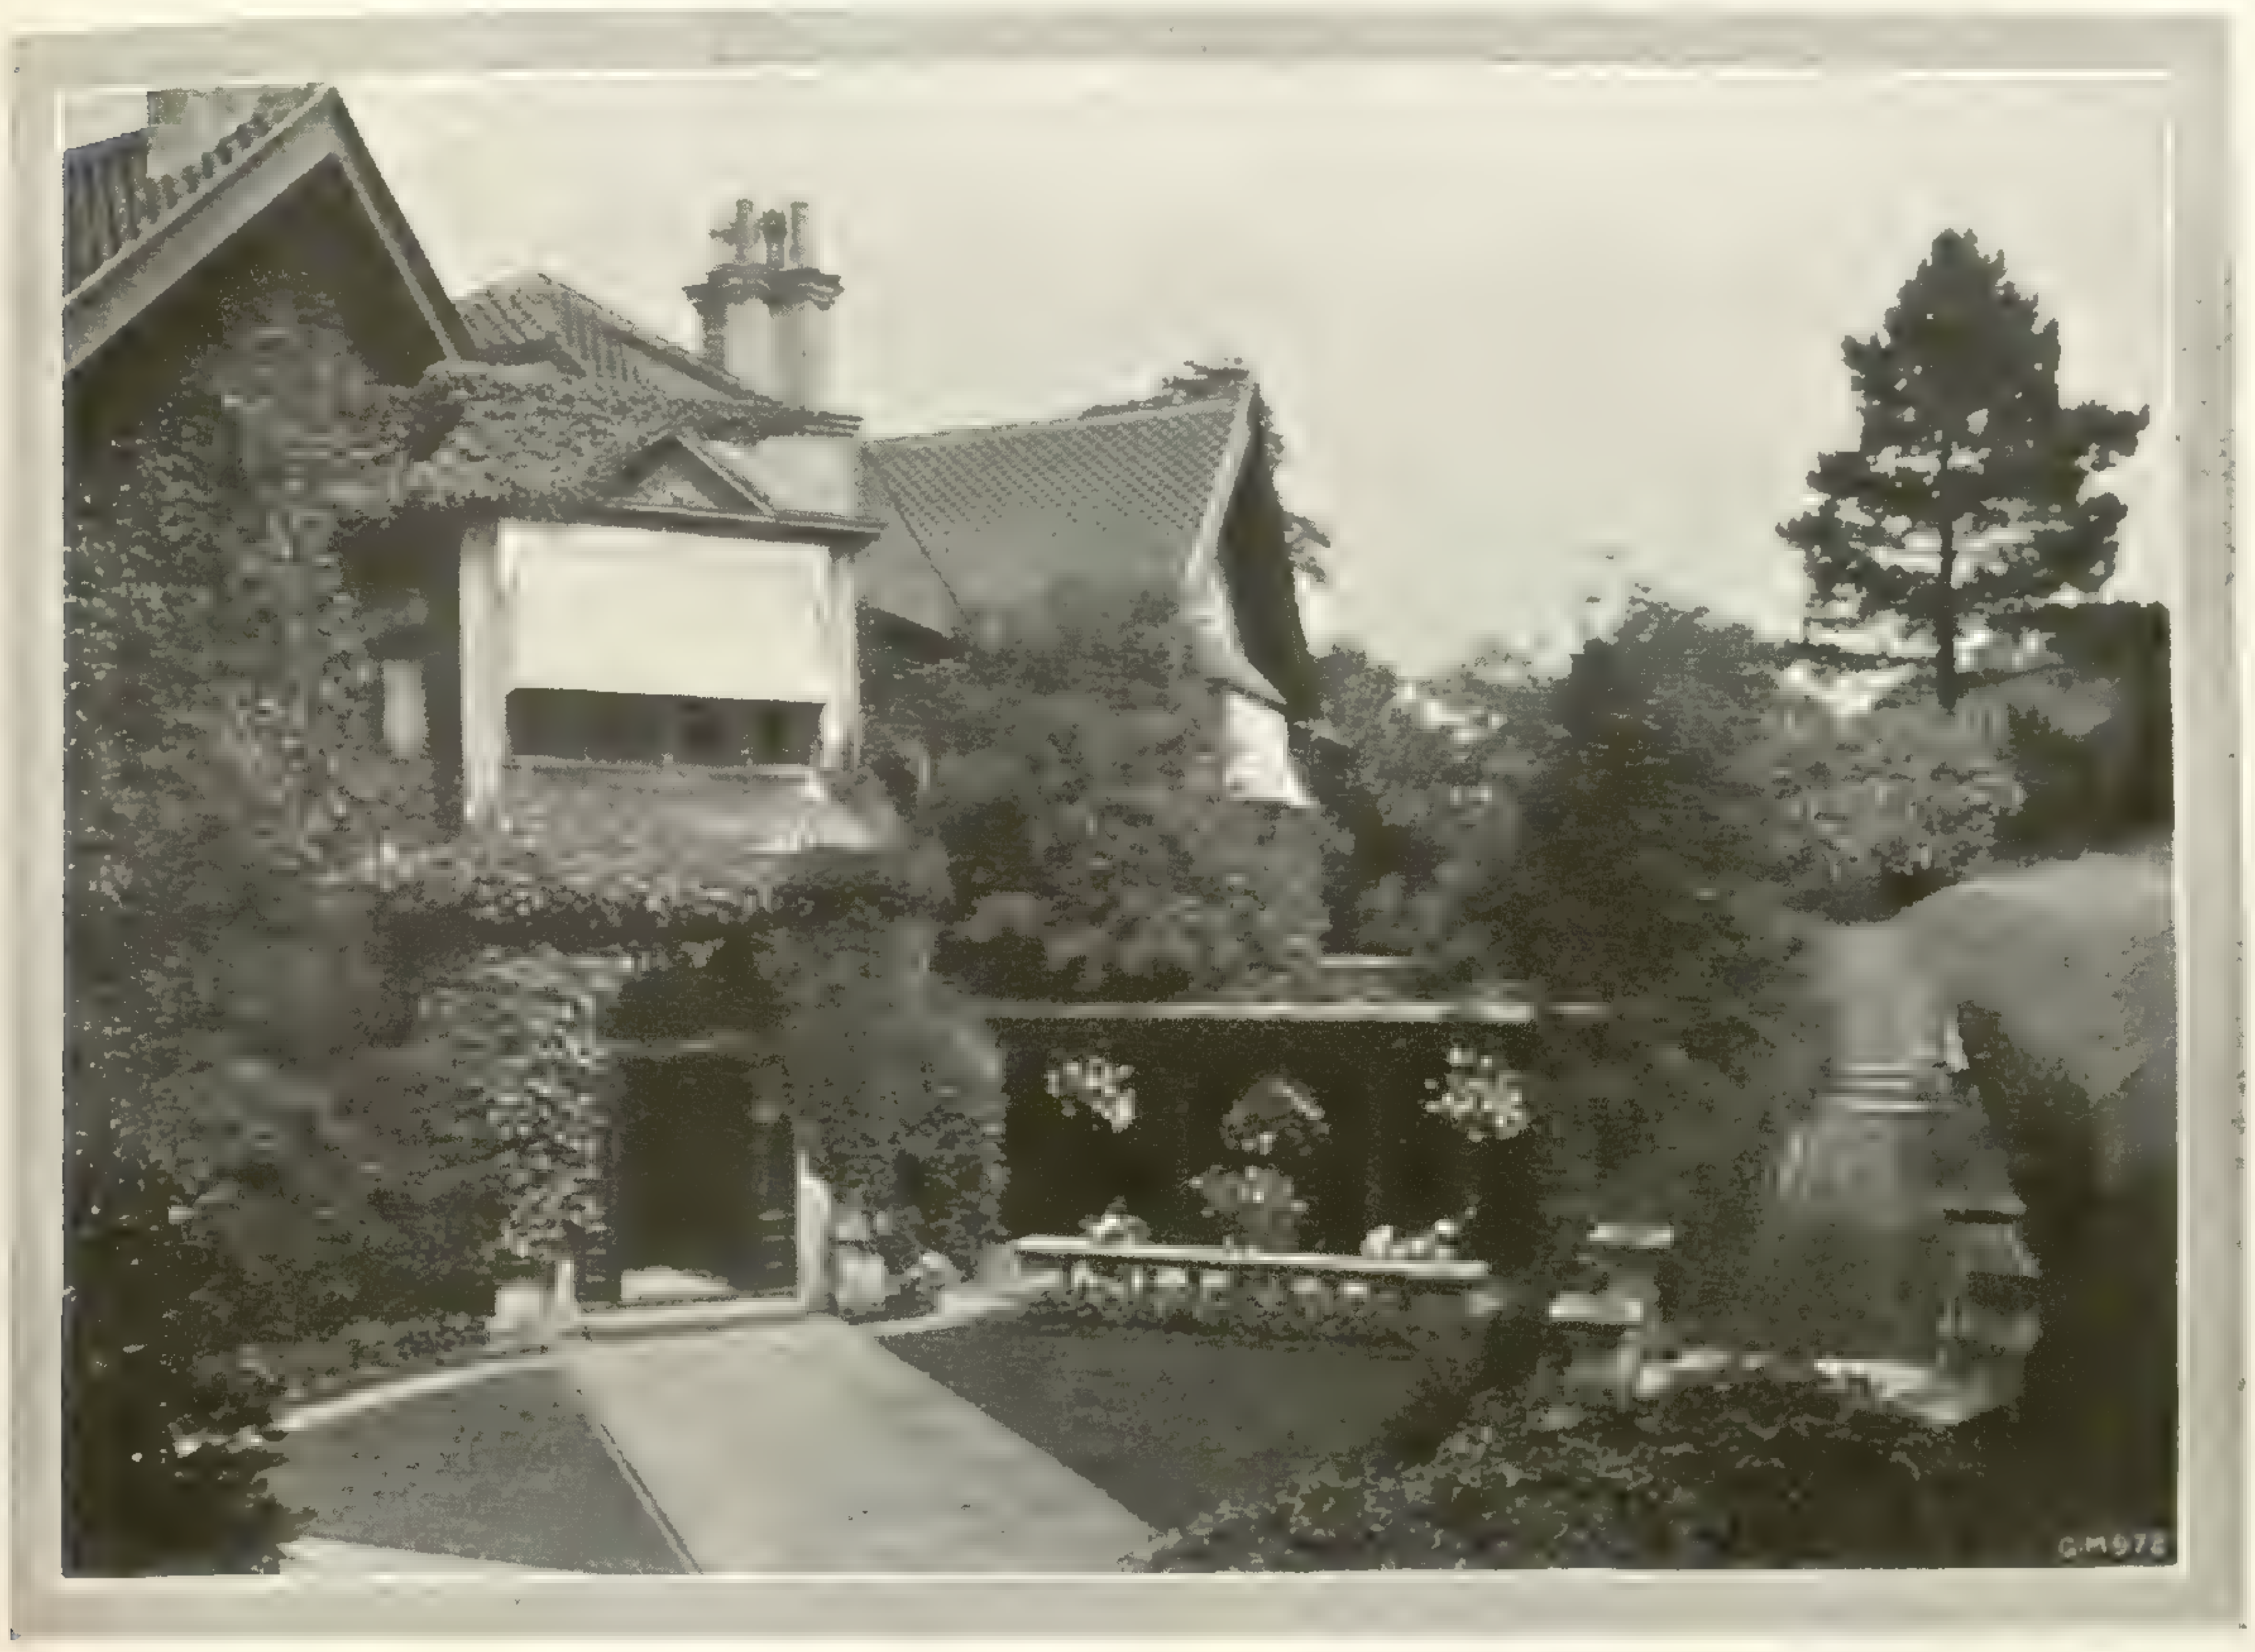
Queen of the Yellows is a particularly dainty variety. The flowers are small, but most gracefully set on the spike, and it is strongly recommended for forcing. Eureka is a seedling from the above, and is of a clear yellow shade, with a crimson blotch in the centre—rather a striking flower. Nanne has distinct traces of princeps blood in it, and is a gigantic flower of reddish-crimson. It is a very strong grower—the tallest in a border of several thousands. As an effective plant in the flower garden this is a valuable variety.

Ida is another remarkable flower, being white, with a telling crimson blotch. This is so striking that it was repeatedly singled out by visitors. Those interested in gladioli will find all the above of much merit.

Hopetoun Gardens, Thos. Hay.
South Queensferry, N.B.

KEVERSTONE, BATH.

Keverstone, the residence of T. R. Murray, Esq., is one of the prettiest residential seats in the vicinity of the ancient city of Bath. Charmingly situated on a commanding eminence, and possessing a splendid outlook over and around the city, it nestles very cosily amidst handsome sylvan surroundings, the magnificence of the trees, both deciduous and otherwise, being one of the many features of interest which it possesses. Within recent years Keverstone has undergone many improvements, more especially in the general arrangement of the extensive grounds near the mansion and in the gardens. The lawns near the house are studded with many tall and stately firs, and well grown and comely examples of pinus, cupressus, etc., while among flowering shrubs the rhododendrons are specially noticeable, the varieties being of the very best, and the specimens, which during the flowering season give the surroundings such a delightful colour effect, would be difficult to surpass. Many other notable flowering shrubs are to be seen, and on the walls of the mansion the magnificence of the magnolias is most remarkable. The flower beds near the house and in the flower gardens are always very chastely and tastefully laid out both in spring and summer. Begonias are favourite summer bedders here, and the lovely and handsome flowers speak of excellent treatment bestowed under the care of Mr. H. M. G. Robb, the head gardener.



KEVERSTONE, BATH, THE RESIDENCE OF T. R. MURRAY, ESQ.

The gardens proper are extensive, and are kept in the very pink of condition. Roses are extensively cultivated, and thrive exceedingly well, all the latest favourites of H.P., H.T., and tea sections being noticeable in the many luxuriant rose beds. The herbaceous borders make a beautiful picture, and contain many and valuable specimens of these most serviceable flowers.

Adjoining the large tennis and croquet lawns there is a lovely and extensive pergola, covered with a wealth of exceedingly fine rambler, polyantha, Wichuraiana, and other roses, vitis, ivies, ampelopsis, etc., which have been planted in a skilful way, and give most charming and picturesque effects from every point of observation. The walled garden is well stocked with fruit trees and bushes; apples, pears, and plums are largely grown, and the shapely, well-laden trees betoken careful culture. Figs also luxuriate in this favoured garden, and the quantity of fruit seen by the writer on the fig trees in the open, was quite exceptional.

The glass houses contain many treasures, and a glance is all that is necessary to see that much care is bestowed on the cultivation of the indoor plants as well as on those already referred to in the garden, and throughout the policies. Begonias and gloxinias are remarkable for their exquisite beauty, and Mr. Robb has secured cultural certificates for specimens of the latter, while the other plants, such as pelargoniums, carnations, hydrangeas, ferns, etc., are all that even the most fastidious could desire.

The fruit houses also abound with luscious specimens, specially noteworthy being the melons and tomatoes. An unusually fine lot of winter-flowering chrysanthemums is grown, and at the local shows last season the leading honours for these were easily obtained by the specimens sent from Keverstone.

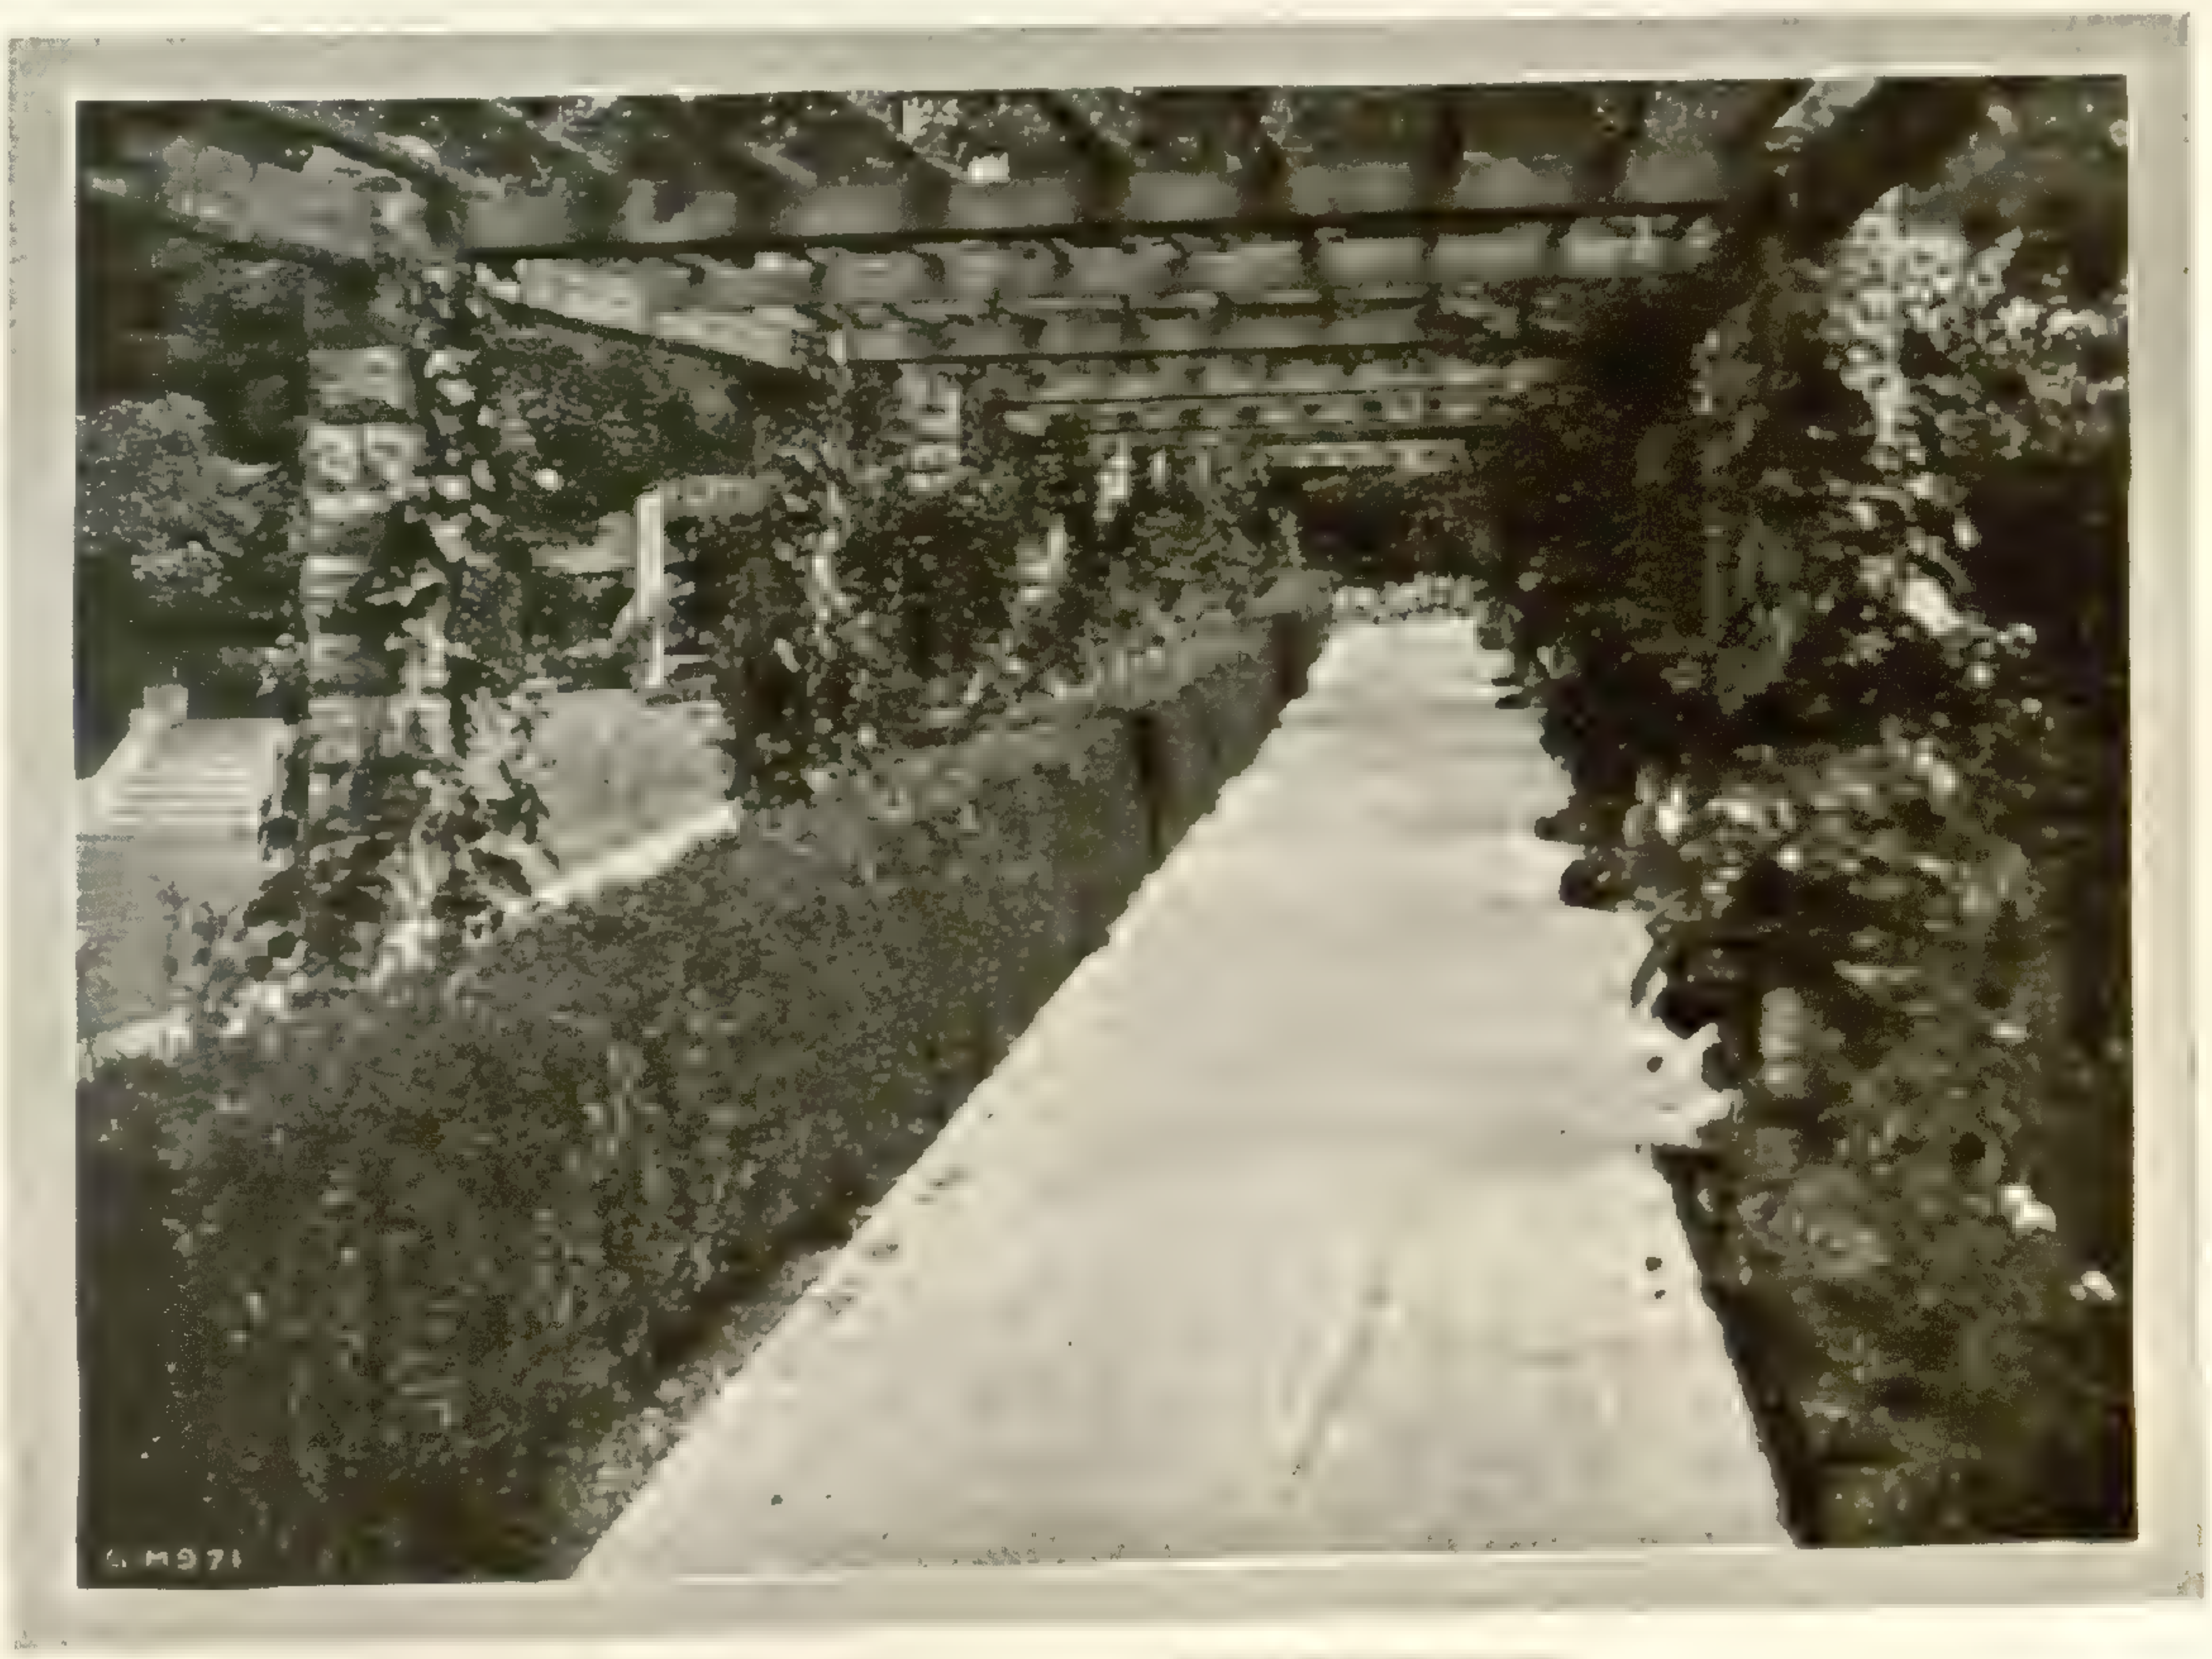
A word may also be said concerning the excellence of the vegetable garden, which, in common with the other departments, is kept in a most efficient condition: indeed, in every respect, these charming and beautiful gardens bear evidence, not only of skill and taste on the part of those in charge, but also of more than an ordinary interest on the part of Mr. and Mrs. Murray. M. H. Sinclair.

LITTLE KNOWN HARDY BULBOUS PLANTS.

The reader who is engaged in his study of the bulb catalogues is apt to pay special attention to the flowers he knows, and to pass over certain others either because he knows nothing about them or because they are more expensive than those he can purchase for a few shillings per hundred. He often forgets that these out-of-the-way flowers are very beautiful, and that his garden would gain more in interest from the possession of a single bulb of this kind than from its being the home of a clump or mass of well-known subjects. Not that I despise these, but my plea is for the inclusion in the "Paradisus" of the reader of some of the many beautiful bulbous plants known to the few who are daring enough to break away from the everyday plants, and who seek for something distinct or specially good.

Tulips.

Picking up a bulb catalogue more than usually comprehensive as a guide and a reminder of flowers I know, I am reminded first of the tulips. Passing over the "cottage garden" tulips, the species attract my notice, and one must advocate a trial of the lovely little australis or Celsiana, yellow and red, the new and fine Fosteriana, the dazzling Greigi, scarlet or yellow, but varying in beauty a good deal, the glorious Kaufmanniana, like a water lily when opened, and gorgeous in its colour in the best varieties. The scarlet linifolia is a great beauty of dwarfest



THE PERGOLA, KEVERSTONE.

habit, while the bright persica, the late Sprengeri, and the fine triphylla are all representatives of a class of flowers far from being known to the bulk of flower lovers.

Anemones.

Thence we pass to the anemones, and here one would suggest the purchase of the pretty light blue Anemone apennina fl.-pl., and a delightful variety of the single form called purpurea. In the allied but earlier A. blanda we have a capital little-known variety, called scythinica, white, with blue outside. Lovers of our wood anemones should procure A. n. Alleni, a beauty, and still scarce, and a pale yellow one is called A. intermedia, and is much the same in character.

IVY-COVERED BOWER, KEVERSTONE.

Calochorti.

The calochorti are too little known, but their permanent culture in our gardens is attended with so much disappointment that the reader is recommended to try his skill upon more amenable subjects.

Chionodoxas.

Chionodoxas should still receive a little more notice, and those little acquainted with the genus, besides those who think they know it well, should think of the white variety of C. gigantea, and the white and the rose varieties of C. Luciliæ. Another form not well known is C. Luciliæ of Boissier—a great beauty, and finer than the ordinary Luciliæ as we have known it for long. C. Tmoli or Tmolusi is still little known, although a good thing and later than most of the others.

Colchicums.

Colchicums, or meadow saffrons, afford us some good things, and truly C. Bornmuelleri is one of the finest things we can have in the autumn garden. It, and C. Sibthorpi, with the deepest coloured varieties of C. speciosum rubrum, are valuable for the same season, in addition to the spring-blooming little C. crociflorum.

Crinums.

Crinums are wonderfully hardy if planted 8in. to 12in. deep, even in cold places, and the best are C. longifolium or capense, rose or white, and C. Powelli, rose or white.

Crocuses.

Crocus species afford us some little-known flowers, but they are too numerous for our present space. One may mention the new C. caspius, autumnal blooming, and white in colour. Marathoniseus, also white, is good at the same season, and the lovely white variety of speciosus may be commended to lovers of the rare in the way of autumn bulbs. The spring species all require consideration at greater length than is now possible.

Cyclamens.

In the way of hardy cyclamens, besides the lovely little C. Coum, which cannot be said to be well known, when it comes with the first dawn of the year, we have the fine C. libanoticum, with its rosy flowers, and the new C. pseud-ibericum, crimson-violet, which flower in spring, and, for autumn we have C. cilicicum as a smaller companion to the fine C. neapolitanum, not rare but not too well known.

Erythroniums.

American erythroniums give us many lovely things far from being well known, and many go into ecstasies as they see in my garden the delightful E. Johnsoni, salmon-pink, which is one of the most beautiful of a whole galaxy of such flowers.

Fritillarias.

Fritillaria species give us some curious flowers, such as the reddish-purple pluriflora, the lovely yellow pudica, and the handsome coccinea, scarlet, as well as the uniquely green-coloured citrina. These, however, are not flowers for everyone.

Galanthuses.

In the galanthuses, or snowdrops, we have some choice things in G. Fosteri, the November-flowering G. cilicicus, and the noble G. Imperati Atkinsi, with a few others of much grace.

Gladiolus and Irises.

I think few know the pretty little hardy gladious called atroviolaceus, and in the ranks of the iris we have quite a host of flowers few people know well. Among the bulbous section one would mention Bakeriana, a lovely gem, but not too long lived in the one; Bornmuelleri or Danfordiæ, of which the same may be said; orchioides, the exquisite, but short-lived in the open Rosenbachiana, the lovely warleyensis, and the exquisite Willmottiana.

Muscaris and Narcissi.

I pass over the lilies, although there are a good many not much known, and remind readers of the rose-coloured muscari, called M. Masseyanum. In narcissi one may remind them of N. cyclamineus, as a quaint flower well worth establishing.

Alliums and Antholyzas.

Alliums give us some uncommon things, but their odour is not acceptable to some. Yet A. albo-pilosum and A. Schubertworth are among others of the race few people know. Antholyza paniculata is a noble scarlet-flowered plant in autumn, with handsome leaves, and few people are acquainted with it.

Brodiæas, etc.

Brodiæas afford us some good unknown flowers for the many, and among these are the pretty B. Howelli lilacina and the handsome B. ixioides splendens. Few know the variegated-leaved form of Bulbocodium vernum, and it is not generally known that Hyacinthus azureus is one of the earliest of hardy bulbs in the open.

Leucojums and Pancratiums.

Leucojum autumnale is one of the most delightful of little autumn bulbous flowers, and hardly anyone is aware that the fine Pancratium illyricum has been well established in the open North of the Tweed. It is very beautiful with its white flowers in summer.

The Chilian Crocus.

Still another out of many other plants must be mentioned, so great is its beauty. This is the Chilian crocus, Tecophylæa cyano-crocus, a lovely little bulb of varying shades of blue. It is a gem, but, unfortunately, subject to the attacks of slugs, and, in most places wanting the protection of a frame. Such flowers as these, hardy as they are, with the exception of the last, give special features to the garden, and make it indeed more than ever a place of pleasure. S. Arnott.

FUCHSIAS.

The great fascination of scientific fuchsia culture is known to but a few gardeners, for, though the flower continues deservedly popular, it is past the zenith of its fame; however, in the floral world new births are frequent, and this plant will have a renewed youth some day and a yet greater period of approbation. As long ago as 1876, in a volume entitled, "The Propagation and Improvement of Cultivated Plants," Mr. F. W. Burbidge wrote on this subject, averring that fuchsias are so easy to grow, so easy to fertilise artificially, and the result is known so quickly, that they are well adapted for trial by the amateur; and, if good varieties are carefully crossed, the result is sure to give some good flowers. He added, "There is yet plenty of new ground to be broken up in this genus; many of the Chilian species have not been hybridised, and the newly-introduced Fuchsia procumbens, with its upright or erect flowers and slender drooping habit, fruits freely, and will probably give a new race in the hands of the hybridiser. We have erect-flowered gloxinias, and, let us hope to see more erect-flowered varieties of fuchsias, with large flowers, since much of the beauty of the fuchsia is lost at present unless its drooping flowers are seen from below, just as used to be the case with the pendant-flowered Gloxinia speciosa."

Perhaps the lively hopes of the author raise regret in our minds to-day, for, though more than thirty years have elapsed the large blooming, erect fuchsia is not with us. Further suggestions were offered. "During the past ten or twelve years, great improvements have been effected by Mr. Banks, Mr. Cannell, and other well-known raisers. We have very fine forms with white corollas, others trumpet-shaped, and numerous double varieties, yet there is room for a gracefully habited race of the F. gracilis type, and the pretty little F. microphylla is distinct, and might be improved. Besides F. coccinea there are several other species and old varieties now at Kew, among them F. apestris, globosa, microphylla, fulgens, corymbiflora, radicans, splendens, thymifolia, and others, all valuable to the hybridiser for crossing with some of his newer forms, so as to infuse fresh life and vigour into them, and perchance obtain some novelty in form or colour at the same time. The distinct race of which F. fulgens is the type, deserve careful attention on the part of the hybridiser, since they are easily grown, and, having tuberous roots and herbaceous stems, can be stored away in sand or dryish soil just as readily as gloxinias."

It is not general now to find greenhouse pillars and roofs fully draped by fuchsias, yet where fine old tree specimens do exist their value is fully proved. The cleanliness of the plant is a great merit, and the only fault I have ever heard roof fuchsias charged with is their habit of dropping their fleshy blossoms upon the pavement which leave a stain when crushed by the foot, an evil that is easily avoided by the tidy gardener. Mr. F. W. Burbidge fully described the quickest and readiest way of increasing well-known varieties, which counsel may, I hope, induce floriculturists of all ranks to once again take up the pursuit either for fame, pleasure, or profit.

"New varieties are easily raised from seed, and as nearly all the cross-bred forms seed freely, any desirable variety may be selected as the seed parent, its flowers being emasculated as soon as the buds open, and fertilised with pollen from another good variety which has bright colour or other qualities to infuse into the seed of the female parent. The fertilisation of fuchsias is easy to effect, as the stigma is prominent, and the anthers of nearly all the species and varieties furnish a copious supply of fertile pollen grains. Many varieties, indeed, produce a copious supply of seed without any artificial fertilisation, and if a house or frame full of good varieties is grown, the bees or other insects, or the wind, do the work of the hybridist, and often very successfully. It frequently happens, however, that fuchsia seed is hollow or otherwise defective, but the good seed is readily known, after it is separated from the pulp and dried, by its being firm or plump, and of larger size than the sterile or barren seeds. When the fruits are ripe, cut them open, and lay the produce of each cross on a clean towel or linen cloth, between the folds of which rub the seeds until dry. A fine cloth is best, as the seeds are small. Sow at once in pots or pans of leaf-mould and sand, placing them on a gentle bottom-heat until germination takes place, when they should be placed on a sunny shelf in a warm pit or greenhouse until large enough to be separately potted. If well-grown seeds are sown in the autumn as soon as ripe, they bloom the following summer. Some prefer, however, to sow in the spring, which is best, unless a heated house is at command. Good fuchsia seed, saved from fine varieties, is worth £50 per ounce."

Although much has undoubtedly been done since 1876, still more remains to be accomplished. A more decided gold than Swanley Yellow, and double white salmon, and rose-pink selfs are yet absent. Why, too, should not the dark blue, mauve, or purple of some corollas be persuaded to appear also in sepals some day, or monster double blooms be coaxed to accompany variegated foliage? Finally, Mr. F. W. Burbidge remarked in his volume, "It should be generally known that fuchsias may be grafted as readily as camellias, or even more so, since stocks are to be raised in a week or ten days. Grow the stocks in heat, and take the apex of a young shoot of any desirable variety as a scion. Splice and whip grafting are the best methods; and if the operation is performed in a close case, not one in twenty will fail if young wood in an almost herbaceous state be operated on. I have grafted seedlings when only an inch or two in height on cuttings as stocks plunged in a close case, and so treated seedlings flower a month or two earlier than when left on their own roots."

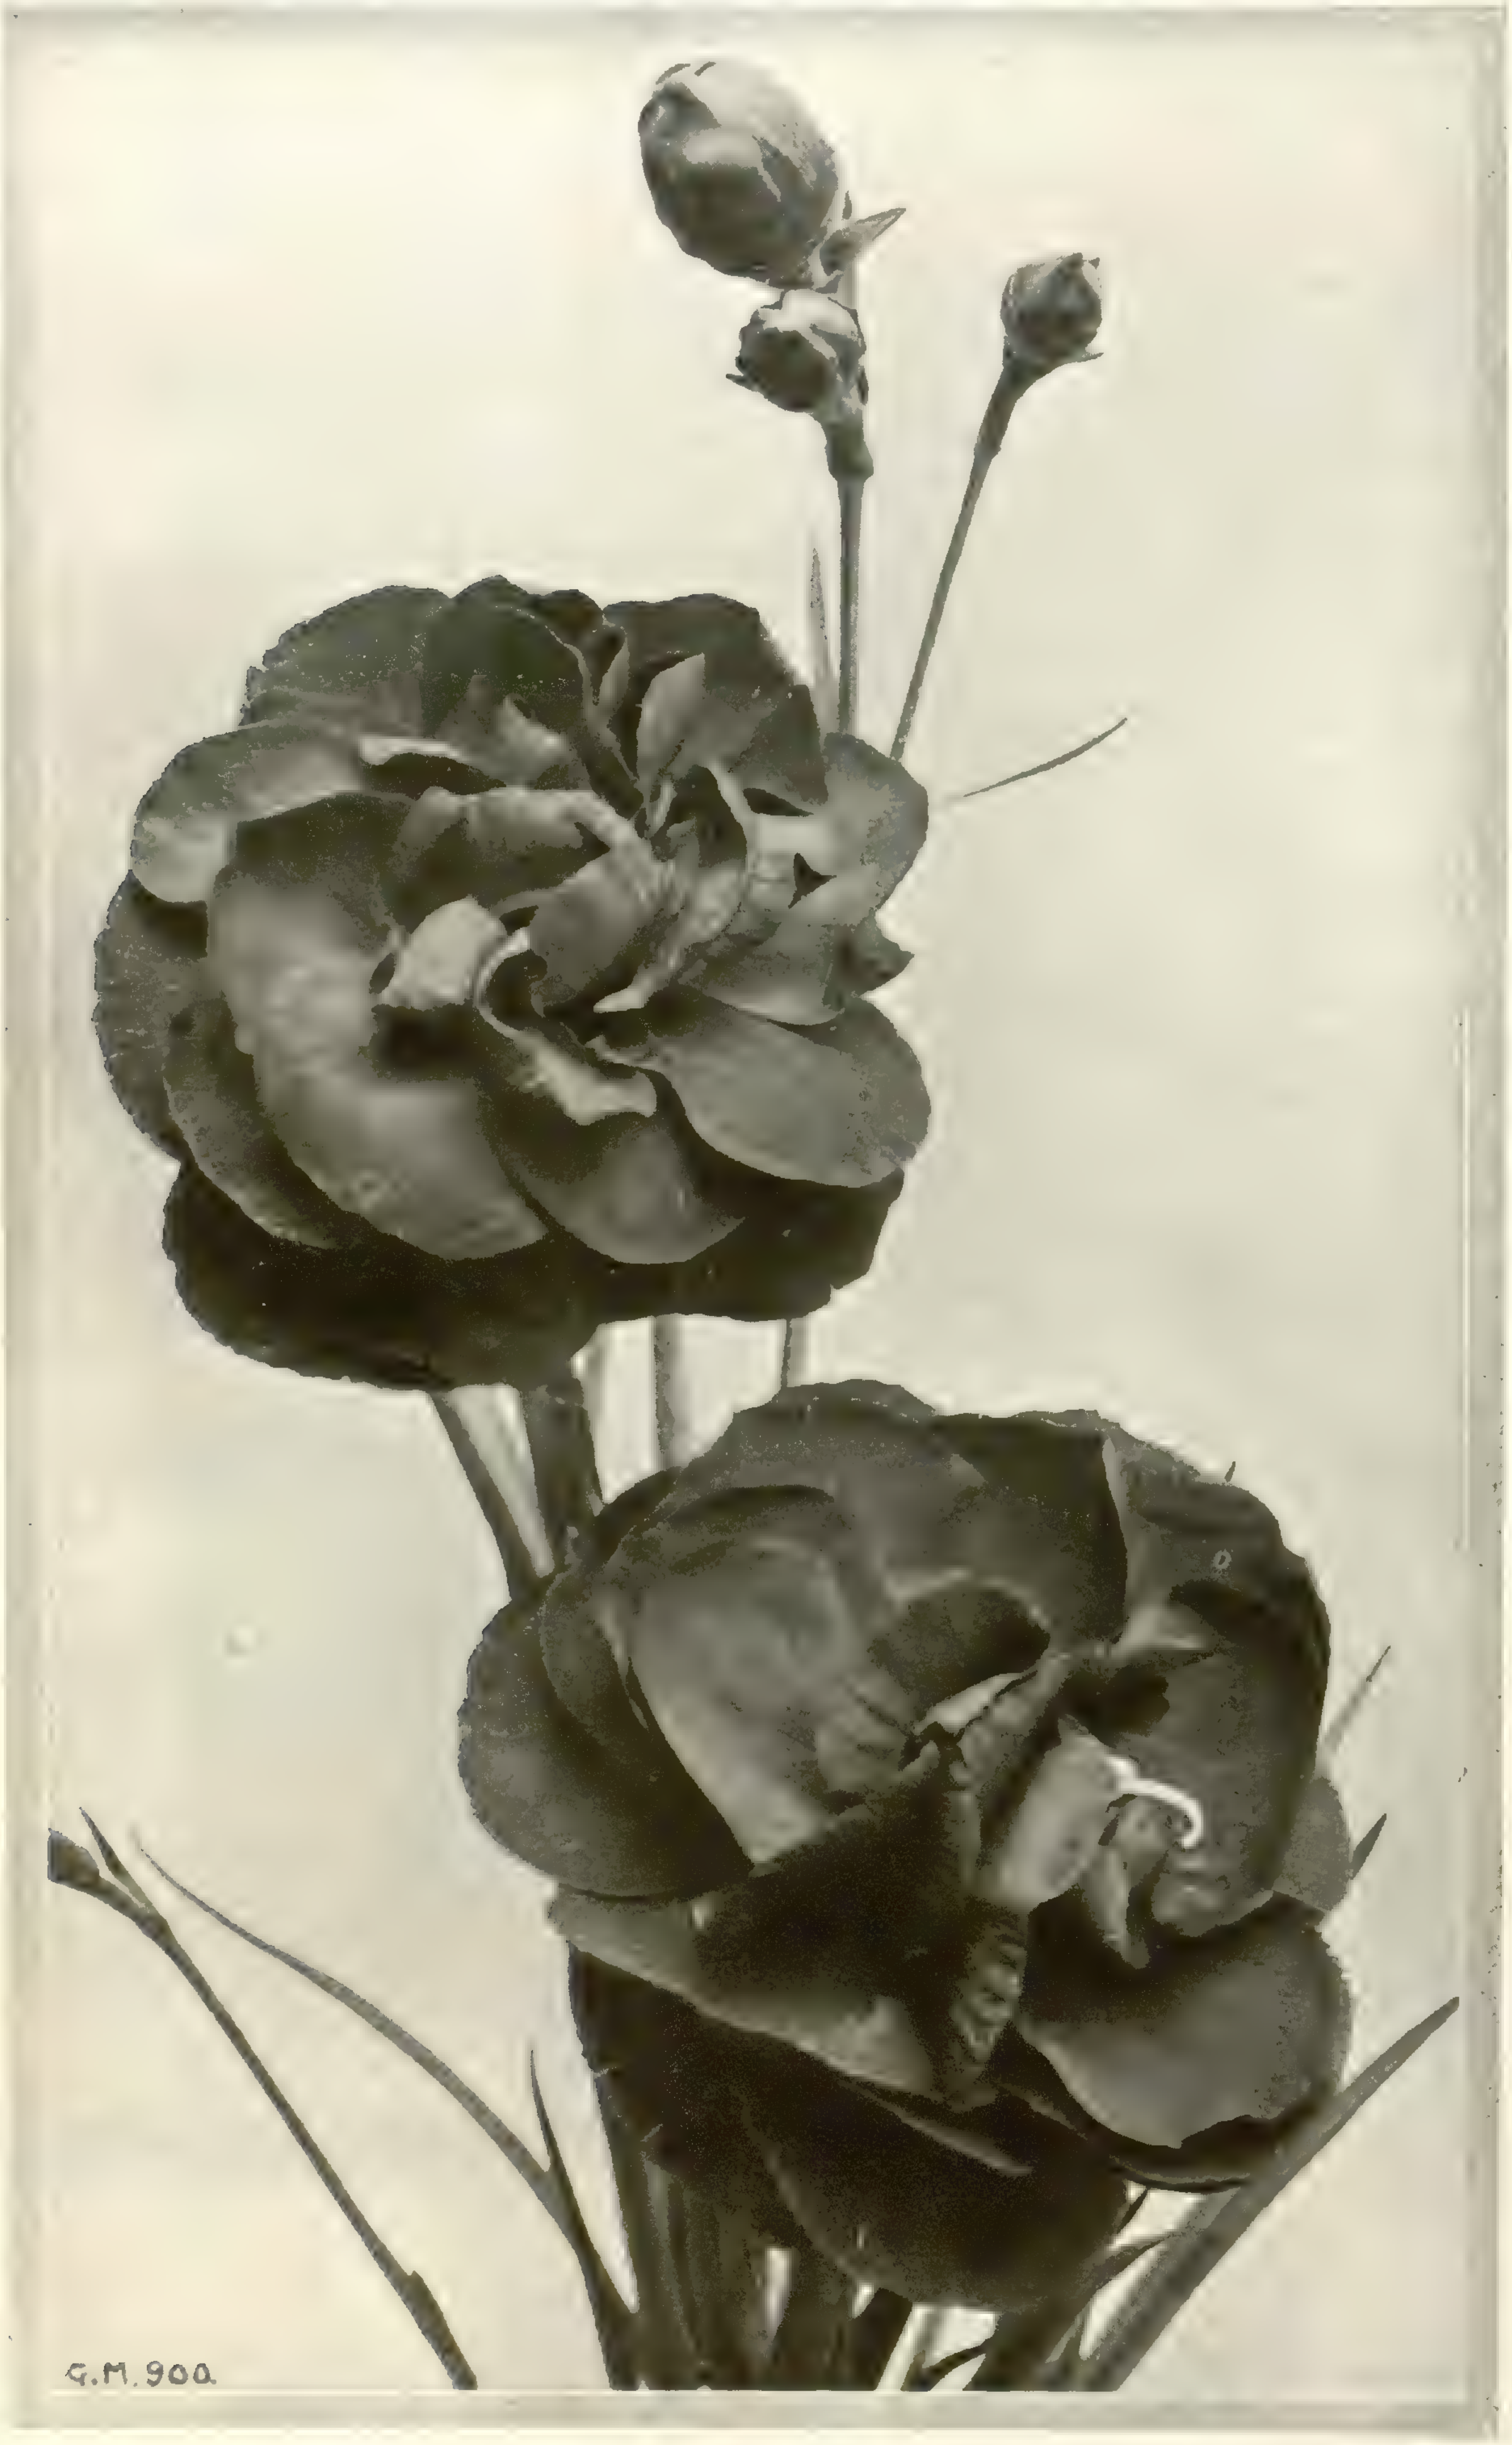
It should be realised that standard fuchsias, grown in large ornamental tubs, are admirable for decorating terrace walks or other portions of the formal garden during summer, as well as for balconies and verandahs. Weeping fuchsias can be gained by grafting F. procumbens and F. microphylla upon strong stocks.

M. H.

IN THE AVENUE, KEVERSTONE.

SELF CARNATIONS.

In referring to the carnations with self-coloured flowers one is strongly tempted to direct prominent attention to their delightful fragrance, their attractive colours, and their remarkable capabilities in flower production, but the temptation has to be resisted. It would, indeed, be superfluous to dilate upon the attributes of beauty possessed by the carnations, for they are well known and appreciated by all who take an interest in the occupants of the flower garden. They are not grown in some gardens so largely as their beauty and usefulness would warrant, and they are not always cultivated with a full measure of success; but they enjoy a high degree of popularity, and there has of late years been a material improvement in the practice adopted by the general body of cultivators.



SELF CARNATION CARDINAL.

A magnificent variety with finely-formed flowers of a rich glowing scarlet. At the exhibition of the National Carnation Society held at the Horticultural Hall in July last Mr. James Douglas was awarded the silver medal for the best carnation in the show, and the blooms illustrated were from Mr. Douglas's exhibit. They are reproduced rather below their natural size.

A long essay might be written on the cultivation of these fragrant flowers. Many, indeed, have been penned, and there can be no doubt that, if somewhat tedious, the endeavours of the writers to brush away difficulties, and place cultivators in possession of the information necessary to achieve successful results have materially assisted in bringing about the improvement that has been effected in cultural methods. Whatever may have been the effect of the lengthy dissertations on carnation culture, it may be distinctly stated that the conditions essential to success in the growth of carnations in the open borders can be described in comparatively few words. To state the case in the briefest terms, the soil must be deeply cultivated, moderately enriched with a suitable manure, and well drained; and the plants must be nicely rooted and in a healthy state when bedded out. A somewhat fuller statement of the details will be useful to those who know but little of the requirements of carnations. The soil should be sufficiently drained to allow the superfluous moisture to pass away readily, for if the soil moisture remains in a stagnant condition for any considerable period many of the roots will perish, and the plants be seriously injured. For light soils sufficient well-rotted manure to form a layer about three inches in thickness will be the best dressing. On the other hand, heavy soils should have leaf-mould, coarse grit, old mortar, and partly rotted manure spread over the surface to a depth of five or six inches. In each case the soil should be dug over to a depth of twelve inches. If it has been previously well cultivated the soil may with advantage be well broken up to a depth of eighteen inches, and the bottom spit brought to the surface.

The character of the soil must receive full consideration when the time for planting is being determined. In all ordinary good garden soils that are fairly well drained, the planting should be done in October. The plants will then become nicely rooted before the winter, and will be in the best possible condition for making a vigorous growth when the activity of vegetation is resumed in the spring. Should the soil be heavy and indifferently drained, put the plants in pots, winter them in an unheated frame, and bed out early in March. During the winter the frame must be freely ventilated except in wet or frosty weather. They should be planted about fifteen inches apart in rows, with eighteen-inch spaces between them. If they are to be grown in mixed borders arrange them in groups, each group should consist of three plants of one variety arranged in the form of a triangle, with twelve-inch sides.

The selection of varieties requires care because of the number of beautiful flowers now at the disposal of growers. There is not much risk of obtaining flowers that are indifferent in quality, but it is rather difficult to avoid having too many of a somewhat similar colour when the purchaser has but little knowledge of the many forms without some guidance from the trade grower or other experienced cultivator. The following may be suggested as especially suitable for those who require a small selection. Ann Hathaway, rich yellow; Beauty of Exmouth, pure white; Benbow, buff; Cardinal, rich glowing scarlet of perfect form. This was splendidly shown by Mr. James Douglas, of Great Bookham, at the exhibition of the National Carnation Society at Westminster in July last, and was awarded the silver medal for the best carnation in the show. Comet, rich maroon; Cupid, rose colour; Goldfinch, apricot-yellow; King Arthur, crimson; Lady Linlithgow, bright rose; Miss Schiffner, rich pink; Raby Castle, salmon-pink; and Splendour, purple. All the foregoing are of high quality, have a good constitution, and are free in blooming.

The best of the fancy varieties possess much merit, but as they do not come within the scope of these brief remarks, their consideration must for the present be deferred. **Florist.**

NEW PLANTS, ETC.

◆

APPLE ST. EVERARD.

This is a very fine new apple, derived from the intercrossing of Cox's Orange Pippin with Margil. The latter is fairly well known, and much resembles Ribston Pippin, while Cox's is our best dessert apple. St. Everard is a very highly flavoured, and fairly early apple, partaking very largely of the style and flavour of Cox's Orange Pippin, but with rich red colouring. The yellow flesh is juicy, sweet, and of particularly rich flavour. If the variety is as excellent in habit of growth and freedom of fruiting as it is in flavour, the popularity of St. Everard is assured. F.C.C., R.H.S., September 28. Messrs. Jas. Veitch and Sons, Chelsea.

CATTLEYA BASIL.

A finely shaped flower of considerable size, resulting from C. Enid crossed with C. Mantini. It apears to be a very strong growing variety, and it carries broad, richly-hued flowers. The sepals and petals are rich rosy purple, and the fine royal purple lip has two large golden blotches. A.M., R.H.S., September 28. Messrs. Charlesworth and Co., Haywards Heath.

CATTLEYA MRS. PITT SUPERBA.

This is a beautiful form of the hybrid from C. Harrisonæ and C. aurea. The flower is of good size, and particularly substantial, bright rose, with a great deal of bright and light yellow colouring on the lip. This latter organ has a rosy margin. A.M., R.H.S., September 28. Messrs. Charlesworth and Co., Haywards Heath.

LÆLIO-CATTLEYA PIZARRO HOLFORD'S VAR.

This is a magnificent orchid, and its parents are Lælia Jongheana and Cattleya aurea. The flower shown was of very large cattleya size with remarkably broad petals and lip. The sepals and petals are all of a rich and intense rose-purple colouring, and the lip is of similar hue with a profusion of old gold veins in the throat, and some orange shading. It is a splendid hybrid and a fragrant one. F.C.C., R.H.S., September 28. Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester. An illustration was given of the specimen exhibited in our issue of the 2nd inst.

CATTLEYA RHODA CONSPICUA.

In this hybrid from C. Iris and C. Hardyana, the influence of the latter is very evident—indeed, the flower may be aptly described as a C. Hardyana with cream-coloured sepals and petals. A.M., R.H.S., September 28. Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

CARNATION O. P. BASSETT.

We believe this is a new American variety. It belongs to the tree or perpetual section, and produces large blooms of bright and deep scarlet hue, with fringed edges to the petals. A.M., R.H.S., September 28. Mr. A. F. Dutton, Iver, Bucks.

ROSE FLOWER OF FAIRFIELD.

Yet another addition to the list of rambling roses. It is a vigorous grower, and carries clusters of soft crimson flowers. The chief merit of the variety is said to lie in its perpetual flowering character, and it has been called a perpetual Crimson Rambler. A.M., R.H.S., September 28. Messrs. Stuart Low and Co., Enfield.

DAHLIAS.

Little Donald.—A very neat and shapely pompon dahlia of deep rich crimson colour. A.M., R.H.S.; F.C.C., N.D.S., September 28. Mr. S. Mortimer, Farnham.

PENTSTEMON MYDDLETON GEM.

A very fine and wonderfully effective pentstemon, that has the special merit of being exceptionally hardy and very profuse in flower production. It is a strong growing variety, each spike carrying a very large number of pendulous, medium sized, rich rose-red blooms. As a border plant for autumn flowering this pentstemon is deserving of the strongest recommendation. A.M., R.H.S., September 28. Messrs. R. Wallace and Co., Colchester.

VITIS WILSONÆ.

A large-leaved ornamental vine, with thick foliage, that assumes a bright crimson-purple colouring in the autumn. It is a handsome species, and should find a place in gardens for covering walls, trellises, and pergolas. A.M., R.H.S., September 28. Messrs. Jas. Veitch and Sons, Chelsea.

RAMBLING ROSE FLOWER OF FAIRFIELD.
A.M., R.H.S., September 28. Messrs. Stuart Low and Co., Enfield.
Flowers soft crimson.

RUNNER BEAN WHITE EMPEROR.

This very fine runner bean is a white-flowered Emperor, and is even more prolific than its forerunner. At the Wisley trials it has proved a first-rate variety, carrying an abundance of foot-long, fleshy, tender pods. A.M., R.H.S., September 28. Mr. Edwin Beckett, V.M.H., Aldenham House Gardens, Elstree.

STRAWBERRY AITKINS' CONTINUITY.

We could not find fruits of this variety, but we learn that the variety has large scarlet berries, is an excellent autumn fruiter, and of good flavour. A.M., R.H.S., September 28. Mr. J. Aitkins, Croydon Road, Beckenham.

CŒLOGYNE VENUSTA.

A pretty and pendulous flowered species from Yunnan, and one that promises to become popular if obtainable in quantity. The flowers are about an inch across, pale yellow, with a bright yellow disk on the white lip. The pendulous scapes are from ten to fourteen inches long, and carry as many as five-and-twenty flowers. The species was introduced by Messrs. Sander and Sons, St. Albans, and first flowered in 1904. Bot. Mag. t. 8262.

PYRUS RINGO.

This beautiful Japanese tree is probably a hybrid between P. spectabilis and some form of the common apple. It makes a small tree, and grows readily in almost any soil and situation, and bears abundance of flowers in the spring time, these being red in the bud and opening nearly white. But the greatest period of beauty is the autumn, when the abundant fruits hang thickly from the branches, and as these become bright yellow when ripe, and are an inch and a quarter long, they produce a brilliant effect. Bot. Mag. t. 8265.

GRAPES AND HOW TO GROW THEM.—An illustrated guide to propagation, culture, and management in vineries, greenhouses, and in the open air. By J. Landell, F.R.H.S. Price 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SEASONABLE NOTES.—The want of sunshine during the summer, and the continuation of dull weather through the later months, has naturally had the effect usually expected under such unfavourable conditions. With but very few exceptions the plants have produced green and sappy growths. It is therefore essential that those in charge should endeavour to use every means possible to aid the plants in hardening their growths before winter sets in. Only in the next two or three weeks can we with any confidence anticipate material assistance from the sun, so as little shade as possible should be used, and on every division all permanent shading should be washed off the glass.

DAMPING AND WATERING.—No inducement to commence secondary growth should be given, and one of the chief factors in retarding growth is the reduction of the moisture supply, both in watering and damping. Only sufficient is necessary to keep the pseudo-bulbs plump. I find some difficulty in getting our young men to realise how much depends on the effectual damping and ventilating of the different departments, both in the early spring and during the autumn. The work is so frequently done because we have been in the habit of doing it for months past, and insufficient thought is given to the existing conditions or the state of the weather outside. It is desirable to reach the normal temperature of the houses before damping or watering is commenced. Care should also be observed that all the necessary moisture is afforded sufficiently early in the day to permit of its evaporation before the night temperatures are reached. This can only be done by discreet use of the ventilators, and a gentle warmth in the hot-water pipes when we have several days in succession of misty or dull weather, such as we have experienced recently.

MILTONIA VEXILLARIA, and other plants that are benefited by cool house treatment during the warm months of the year, should now be transferred to their winter quarters. A cool intermediate house temperature is desirable for all such tender subjects. The low temperature, combined with the moisture necessary for the odontoglossums, is generally detrimental to their wellbeing. The Chimæra section of masdevallias and the small-growing M. Estradæ and M. simula sections, should now be suspended at the warm end of the odontoglossum house, or in a position where the normal temperature of the house is about 53 to 55 degrees. Any of the Chimæra section still flowering should be kept in an active state, but no encouragement to growth should be given to the other sections mentioned, but they must not be permitted to remain long dry, or the foliage will quickly shrivel.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

SHADING.—All blinds may now be removed from the roofs of greenhouses and the conservatory, but they should not be stored away till they have been opened out and thoroughly dried. Particulars should be taken of those that may require renewing or mending before next season, otherwise they may be forgotten until the time for putting them up again. Any permanent shading that may have been painted or syringed on should also be removed, choosing a damp morning for the work. If time can be spared all the glass and paint outside of the greenhouses will benefit by a good wash down, as the time is fast approaching when every bit of extra light will prove of great benefit to the plants.

WATERING should at all times be carefully done, but now, with cooler weather and shorter days, the plants will require nothing like the quantity that they have been having, and it is quite wise to keep a sharp eye on those entrusted with the watering. Though the winter is fast approaching, there are still many plants growing freely, such as salvias, chrysanthemums, forward cinerarias, Coleus thyrsoideus, cyclamens, etc., that will be benefited by liquid manure, so where it is necessary use this at every watering, as there are not many plants in the greenhouses that will need water more than two or three times a week, though they require to be looked over every day.

SYRINGING must also be less heavy than it has been, and the afternoon syringing overhead may be entirely stopped, a thorough damping of the stages and floor being quite sufficient in most cases.

PELARGONIUMS.—Old plants of the show, fancy, and regal types that were cut down in August will now be breaking nicely, and before new growth is too long they should be carefully shaken out and repotted, as it is usual to pot these on once or twice during the growing season. The ball of roots may be considerably reduced, so that really good-sized plants may now go into 32-sized pots. These plants do not care for very light soil, so with good loam it is necessary to add but very little leaf-soil or sand. At the same time, pot off into 60's any cuttings that may have been put in earlier in the season, and, after potting, place in a house or pit where just a little warmth is kept in really cold weather; keep the plants damped for a few days, and they will soon lay hold of the soil, but air must be given freely in fine weather.

CINERARIAS.—If large specimens are required, no time should now be lost in putting the most forward plants into their flowering pots; if already in 32's, large 24's and 16's will be the sizes to use, and these should give very fine plants indeed. Use a fairly rich light compost, and pot rather firmly. If a house is available for them so much the better, as here, after the first few days, they may have all the air possible; if left in a pit too long at this time of the year they are apt to grow very fast and make very large leaves, which are soft, and often turn yellow, so when they have to be left in a cold frame for some time, stand them up on pots as far off the ground as possible, and give as much air as is consistent with the state of the weather.

HUMEA ELEGANS.—These plants must on no account become pot-bound, or loss of foliage will quickly result; so if they are in a fit condition pot them into 48's or 32's, whichever will carry them nicely through the winter. Treat like the cinerarias, for too close an atmosphere will produce very soft foliage, which is very difficult to keep healthy.

FREESIAS.—Early batches are now nicely in growth, and if wanted early, a few may be put on a shelf in a slightly warm house, and as growth progresses give them weak liquid manure, and stake the growths before they begin to fall, or distorted flower stems will be the result.—THOMAS STEVENSON, Woburn Place Gardens.

THE FLOWER GARDEN.

IMPROVEMENTS AND ALTERATIONS.—Where it is intended to improve or alter any part of the flower garden or pleasure grounds, or to add thereto, it is well, in order to facilitate the work, that definite plans be now settled. All trees or shrubs intended for removal should be marked by tying a piece of raffia in a prominent place. Conifers may now be removed at any time, though the early spring is preferable; but alteration in the course of paths, etc., may now be made, and the present affords a good time for relaying turf, as this will establish itself and present a good appearance through the winter months.

PREPARATION FOR SPRING BEDDING.—When it becomes necessary to remove the existing subjects, steps must be taken to prepare for a floral display in the spring. In order to secure this it will be necessary to well manure and work the ground. Apply a good dressing of farmyard manure, and thoroughly incorporate this either by deep digging or trenching. Choose a fine day for this work, and see that it is done in a clean and methodical manner. Avoid making dirty tracks upon the grass or gravel, and any beds in turf which have become unshapely should be neatly cut into shape with the edging iron before digging.

THE FRAME GROUND.—Attention must now be paid to the various occupants of the frames to keep them in a thoroughly healthy state. All stocks of cuttings should be periodically examined, and all weeds and decaying leaves be removed. The contents will be much benefited if the lights be thoroughly washed both inside and out, and removed entirely whenever the weather allows. Use great care in watering at this season, and especially in the case of plants plunged in ashes.

VIOLAS.—This is the best time to propagate violas, and where large quantities are required for bedding it is best to set aside a frame for the purpose. The cuttings at this season are much to be preferred, as they strike readily, and are not pithy. A shallow frame is the best. Prepare a good fine soil, and add to it a liberal addition of road sand. Care should be taken to keep the varieties distinct and true to name.

BORDER CARNATIONS.—Where it is customary to transfer the newly-rooted layers direct to their flowering quarters, the sooner this work is now pushed forward the better. The ground these are to occupy must, however, be well tilled, and enriched with rotten manure, and should be allowed to settle before planting takes place. It is a good plan to sever the young plants a few days previous to lifting. Rake the bed down level and remove all coarse stones, plant to a line, and make the plants firm. Keep a sharp look out for slugs, and if these are in evidence, protect with sifted cinder ashes, placing a few round the base of each plant; and, during showery weather, light dustings of soot will be found efficacious.—EDWIN BECKETT, Aldenham House Gardens.

HARDY FRUITS.

BLACKBERRIES AND LOGANBERRIES have done fairly well this season, but the fruits have not been so well flavoured as usual, owing greatly to so much wet weather and consequent absence of sunshine. As the fruit is by this time practically all gathered, cut out all the old fruiting canes, and tie in to the supports about four of the strongest of the young ones to take their place for next season's fruiting; remove any canes not required.

PICKING FRUITS of the late-keeping varieties of apples and pears will require more attention than usual, or much loss by the shrivelling of the fruit will be experienced later on. Owing to a most uncongenial season, the maturing of the fruit is much later than usual; to note one instance, Williams' Bon Chretien pear was in use this year from the middle to end of September, which is nearly a month later with us than in other seasons. Another peculiarity of this season is the irregularity of the ripening of fruits on the same tree; it is advisable, therefore, to remove only those fruits which part freely at the stalk and leave the others for a few days longer.

FRUIT ROOM.—This should be kept as cool as possible, maintaining it at an even temperature of 40 degrees. Keep the room shut up during the day, but open the ventilators at night to let in the cool air. Choice fruits of pears and apples may be laid out on a thin layer of wood wool, but for the general crop the open lattice-work staging is preferable.

GREASE BANDS.—Although it is said that spraying has done away with the necessity of using grease bands, still, I think the time taken to fix the bands round standard trees, and apply the grease, is well worth the trouble. These trees are often of good height, and it is not always convenient to have a spraying apparatus of sufficient power to reach the top of them. I am a strong advocate of spraying, but I also think it unwise to neglect any other means whereby the enemies of the fruit grower may be kept in check. For grease bands to be effective they should be placed on the trees early in October, and have fresh grease applied as often as required during the winter months. In placing bands on young standard trees having supports, one should also be placed round the stake. Place the grease-proof paper round a smooth part of the stem, and fix with a couple of ties near the edges of the paper, and apply the grease well over the centre of the bands, but do not put on sufficient to run off the paper on to the bark, but rather apply a little and often.

ROOT PRUNING, where necessary, should be undertaken as soon as the leaves have matured and began to fall. When operating on large trees it is advisable to extend the work over two seasons, doing one half this year and the other portion the following season, so as not to give the tree any serious check. In commencing the work of root pruning, dig out a circular trench round the tree about two feet deep, and from three to five feet distance from the stem, according to the size of the tree; then, with a garden fork, carefully remove the soil from the "ball," preserve all the small fibrous roots, laying them on one side until sufficient soil has been removed to expose all the coarse main roots which have penetrated down into the subsoil; these latter should be pruned back by a clean cut from the underside. When sufficient of the large roots have been severed, replace the soil and lay the remaining roots out evenly, working some fine soil amongst them and making the whole firm by well treading or ramming, finishing off by placing over the surface a mulching of some light strawy manure.—GEO. WOODGATE, Rolleston Hall Gardens.

VILLAGE FLOWER SHOWS.

In your issue of October 2, page 771, "H" asks: "Is it possible to run a village flower show successfully without giving prizes?" and then answers the question in the affirmative by giving instances. May I be permitted to add an instance also. The show I now refer to was held successfully for a number of years, but was on somewhat different lines to those quoted by "H." At the time I refer to, I was giving a course of lectures in a village, and, noting the keen attention of the audiences, and the fact that some of them brought specimens of vegetables, fruit, and flowers freely at my request and on their own account, I suggested that an evening exhibition be held in the public hall, in conjunction with a concert, and invited the members of the audience present to form a committee themselves to carry out the project. This was done the same evening, and a few copies of a written schedule issued forthwith. A charge of threepence was made, admitting the public to the show and concert, the exhibition being open to inspection one hour prior to the concert. The exhibits were arranged on tables on each side of the hall and in front of the platform.

It was agreed that the money taken at the door was to be used for paying small prizes to the winners, for the use of the hall, and any other expenses incurred. By the free consent of the exhibitors the produce was packed in hampers and sent to the local hospital. Many exhibitors brought produce to be staged as honorary exhibits only, but to be afterwards sent to the hospital. The hall was a typical village hall as regards size, but it was much too small to accommodate the visitors. The shows were held in November each year, and afforded a vast amount of pleasure to hundreds of residents and a bright hour or two for the inmates of the hospital. GEO. GARNER.

Sir Thomas Elliott, Secretary to the Board of Agriculture, has been awarded a Companionship of the order "du Merité Agricole" by the French Government.

NARCISSUS CULTURE FOR PROFIT.

(Continued from page 764.)

Harvesting.

As soon as the foliage has died down, a start must be made to raise those bulbs which it is desirable to lift. No time must be lost in this work, as in the event of showery weather fresh roots will very soon be produced, and the aim of the grower is to get his bulbs out of the ground whilst root-growth is dormant.

Many large growers use the plough for lifting as well as planting. By its use a careful and experienced ploughman and a sufficient number of pickers can lift large areas very expeditiously at a lower cost than where forks are used, while less damage is done and fewer bulbs are left in the ground. The small grower, however, must resort to the fork. The bulbs as lifted should be put in shallow trays or baskets, and, if possible, be placed in a cool, airy shed to dry. If such shelter cannot be given them, they may be allowed to lie on the ground until they become dry and clean. They must not, however, be allowed to remain too long, in case they get scorched by strong sunshine. The length of time necessary must depend upon the condition of the bulbs when lifted and the weather experienced, but once they are in a fit condition no time should be lost in getting them under cover, as if showery weather sets in root-growth will very quickly commence, and this must be prevented. All lifting should be finished by the end of July at the latest.

The weight of produce lifted must necessarily depend upon the fertility of the soil, the variety grown, and the length of time the crop has been planted; but ten to twelve tons per acre may be regarded as an average yield, or about double the weight planted.

Preparation for Market.

Various methods of marketing are employed. Bulbs may be sold as lifted, large and small together, by the cwt. or ton, and many people (especially planters) prefer to buy their bulbs in this way. Retailers, however, and wholesale dealers who supply retailers, require first or second-size, shapely bulbs only. It then becomes necessary to clean and size the produce, making four different sizes, viz., first or "heads"; seconds; thirds or "planting" size; and "chips." First-size bulbs of the popular varieties can be readily sold to bulb merchants by the 1,000, and the other sizes should be kept for planting purposes.

In growing for bulb production a more frequent course of transplanting is necessary than when bloom is the chief object, and nice, shapely bulbs, such as are wanted for shop sales, can only be obtained by regularly transplanting. When first-size bulbs are planted they multiply and give increased stock, and it is well to let such remain two or even three years undisturbed. Second-size bulbs, if carefully sized, should yield "heads" (or firsts) after one year's growth. Thirds and "chips" require two years before attaining saleable size, and then half only may be fit to be classed as "heads."

This sizing requires the exercise of some discretion, as by its careful performance much unnecessary labour may be saved. Thus the grower who sizes and plants what he hopes to lift as first-size bulbs after one year's growth incurs needless labour and expense if only fifty per cent. of the produce attains first size. A little experience, however, will suffice, and the cultivator will be able to estimate from the bulbs planted approximately what quantity of different sized produce he will have for disposal each year.

Varieties to Cultivate.

The following varieties may be recommended for the production of outside bloom and for forcing under glass. The prices given afford some indication of the average value of the different kinds, but they will naturally vary according to season and other circumstances. The demand which has arisen in recent years for flowers for house decoration has created quite a large industry in bulb forcing, and as the demand for varieties suited for this purpose is greater than for the numerous varieties grown by the bulb specialist, these are more likely to prove remunerative to the small grower. When growing for bulb production the bloom is also marketed in spring, so that profits both from bloom and bulbs are obtained.

1. Golden Spur.—A deep rich yellow trumpet. It is the first to bloom of those recommended in this leaflet, and is a variety extensively grown for forcing. Wholesale price for first-size bulbs varies from 30s. to 35s. per 1,000. All sizes as lifted from £25 to £30 per ton.

2. Incomparabilis Sir Watkin.—A large handsome flower with primrose perianth and yellow cup. A strong grower and a good forcer. Wholesale price for first-size bulbs from 25s. to 30s. per 1,000. All sizes as lifted from £20 to £25 per ton.

3. Emperor.—A large flower having a deep primrose perianth and yellow trumpet. It is a very strong grower. Wholesale price for first-size bulbs from 25s. to 30s. per 1,000. All sizes as lifted from £15 to £20 per ton.

4. Bicolor Horsefieldii.—A free flowering variety with white perianth and yellow trumpet. Wholesale price for first-size bulbs from 15s. to 25s. per 1,000. All sizes as lifted from £10 to £15 per ton.

5. Bicolor Empress.—This is a very similar variety to the preceding one, but flowers about a week later. Wholesale price for first-size bulbs, 30s. to 35s. per 1,000. All sizes as lifted, £15 to £20 per ton.

6. Barri conspicuus.—A flower with a broad yellow perianth and yellow cup edged with orange-scarlet. This variety is much admired, but unfortunately it is apt to lose its colour in bright sunshine. To obviate this it is well to plant it in partial shade. Wholesale price for first-size bulbs, 12s. to 16s. per 1,000. All sizes as lifted, £6 to £8 per ton.

7. Poeticus Ornatus.—This white narcissus is probably the most profitable variety that anyone can handle, and it is grown in large quantities for cut flowers both in the open and under glass. It blooms very freely, and, being a small bulb, can be planted closely, thus giving a much larger yield per acre than any other variety. Wholesale price for first-size bulbs, 10s. to 15s. per 1,000. All sizes as lifted, £20 to £25 per ton.

8. Bicolor Grandis.—This is a late trumpet narcissus which flowers after the majority of the others, and usually sells well as a cut flower. Wholesale price for first-size bulbs, 12s. to 15s. per 1,000. All sizes as lifted, £6 to £8 per ton.

9. Pheasant Eye.—This is grown chiefly for cut-flower purposes; like the preceding, it flowers when the majority of narcissi are past, and in some years yields the grower a good profit. In other seasons, however, prices may be lower, and as the bulb is cheap it is not advisable to plant it very extensively. Wholesale price for first-size bulbs, 5s. to 7s. 6d. per 1,000. All sizes as lifted, £3 to £5 per ton.

10. Poeticus plenus or Double White.—This is the last of all the narcissi to flower. It blooms towards the end of May, and usually realises good prices. Like the preceding, this is recommended for the value of the bloom rather than for the bulb crop, and may remain three to four years without transplanting. It also likes a rather heavier soil than the majority of narcissi, and does best when deeply planted, say, from 6in. to 8in. Wholesale price for first-size bulbs, 10s. to 12s. 6d. per 1,000. All sizes as lifted, £10 to £12 per ton.

(To be continued.)

New Park for Friern Barnet.—Mr. S. Simmonds, of Friern Park, North Finchley, has presented to the Friern Barnet District Council a cheque for £7,500 with which to pay the purchase money for the "Friary," an ancient residence and picturesque park, to be used for public recreation.

CHRYSANTHEMUM CONFERENCE.

(Continued from page 782.)

Masse, Red Masse, Mrs. Bailey, a white, and Ralph Curtis, a creamy-white. Holmes' White is a very good variety. Nina Blick, a lovely red-bronze, does well if kept well watered, but if allowed to become dry it goes dingy brown. Carrie, a good yellow, is not such a favourite as Horace Martin. Goacher's Crimson is good if cut back the last week in July. Roi des Blancs is the best of all whites for decorative purposes, although it does not grow so freely as some others. Polly is quite the best of all the earlies, in my opinion, either for garden or for cutting; it is a lovely bronze. Charles Jolly is a pink that does well if struck in the first week of April; if struck before then it comes too late. All these are September bloomers, continuing into October.

Among October-flowering varieties I would recommend the following: Tuckswood Bronze, a very good spray flower; Mrs. Cragg, old gold; Etoile d'Or, a yellow; Le Pactole, bronze; Bouquet Rose, rose; Source d'Or, and its sports; and Mrs. Scott, a white. It is better not to propagate any of these bebefore the end of March or the beginning of April, and they should not be stopped at all, or they will flower too late. These are all good varieties, and will stand a fair amount of wet.

For disbudded blooms to cut outside the following give us good results: All the Masse varieties mentioned, if cut back the last week in July, and the shoots that come up from the bottom are disbudded, will give blooms five inches across, with stems two feet long. Then the old favourites, White and Yellow Desgranges, are good doers if cuttings can be obtained of good stock; in hot, dry seasons it may be found that the stems become too hard, and that the flowers wilt when cut, but if the ends are scraped and split up a little way, and put straight into water no further trouble will be experienced. Nina Blick is specially good in wet seasons, and looks well if disbudded to three blooms on a stem. Nelly Blake, a bronze seedling from Madame Desgrange, is also good if grown well. The Source d'Or family are admirable on some soils, but do not seem to like heavy land. Sunshine, a bright yellow, is a good keeper, and throws off the rain well. Ryecroft Glory is another that crops well, although it has only a small bloom; we have cut it from outside until November.

Some varieties need protection from damp, and then they give good returns. These include Mrs. Scott, a white; Le Pactole, a large bronze, that must be put into water as soon as cut; Mrs Cragg, old gold, and Etoile d'Or, a fine yellow. Large blooms of the last three will not stand wet, although sprays which we have cut from them in the open until November do not seem to mind the wet a bit. I must remind you that the varieties I mention are only selected from those that do well with us; there are doubtless many others equally good in other districts.

I think pompons follow the earlies most naturally, so I will deal with them. We have grown a large number of varieties of this section, but have not found many that are specially good for cutting, though the following will be found good in all ways: Piercey's Seedling, a bronze, flowering in August, comes a good colour if kept moist. Madame E. Lefort, a yellow, and its bronze sport, are good, and flower in September, as do Orange Pet and Veuve Clicquot. The latter is probably the best of all, as unstopped cuttings give a good supply of long-stemmed sprays. J. B. Duvoir is a quite good pink. These are all outdoor varieties, and I am unable to recommend any of the indoor varieties, as these appear to have some faults.

I now come to the most important section, and the most difficult to select from, i.e., the ordinary Japanese and incurved varieties. Soil and atmospheric conditions make such a difference that a variety which does well on one kind of soil may be very indifferent on another. I shall only mention varieties that may be relied on to give nine to twelve good blooms per plant, with good foliage. Blooms large enough for exhibition are, I think, outside the scope of this paper, although, no doubt, some show favourites will be recognised in this list.

I have thought it best to put the varieties under their different colours, giving the months in which they flower with us, and I start with the most unsatisfactory colour, generally called pink, although I must confess I have never seen a bloom that answers to my idea of that colour. Practically the first pink that we have under glass that is at all satisfactory is the old La Triomphante, which comes in about the middle of October; although rather subject to mildew, and to damping in wet weather, it lasts well when cut, and crops well. Miss Olive Dumsday is our next, and if grown well is a lovely thing and "sells on sight"; it is a softer pink than the majority, and an excellent keeper. Mr. F. McNeice is a deep coloured bloom, with good foliage; it starts the second week in November, and is accompanied by Gracieuse, a lovely incurved Japanese which, if kept cold and grown well, is the best pink of all; soft shell-pink describes it best. I have kept it for nearly a month in water. A lovely pink for decoration is Rose Poitevine, provided a little trouble is taken to keep it in a dry, cool atmosphere; it damps badly under ordinary conditions, but is well worth a little extra trouble. It is a December variety, and comes in about the same time as Mdlle. Louise Charvet, which I have included, as it makes a good bloom, and keeps well if grown hard. The pink sport from Princess Victoria is of fair colour, and sells readily. Framfield Pink, and its sport, Winter Cheer, come in at Christmas, and will last until February. These last two must not be allowed to stand still for lack of feeding if satisfactory results are expected.

Taking the bronzes next, we have a fair but not continuous selection. In October we have to rely on the outdoor varieties. In the beginning of November we have Hortus Tolosanus, a medium sized but very bright flower. Lady Lennard follows, and carries six to eight large blooms. Mikado has a small bloom, of Japanese effect, and carries a large crop. The only December bronze that is really good is the Bronze Princess Victoria.

Reds are not numerous, and I can only recommend a few. Market Red and T. Humphreys are excellent for the end of October and the beginning of November, lasting till Exmouth Crimson starts. This last is really good, and continues until Matthew Hodgson comes along in December. In hot seasons the latter is inclined to come a brownish red, but it is very useful.

Of whites, I can recommend a greater number. Money Maker, a creamy-white with a long-stemmed full bloom, starts the first week in October, and lasts till December; it is good, but subject to mildew. Mrs. Roots, an incurved white, comes in about the end of October. Miss A. Byron, a pure white, is ready the third week in November, and is good. Mrs. J. Thompson and Mrs. Judson, both incurved; Mdlle. T. Panckoucke, a shaggy Japanese, and Princess Victoria, are all good varieties for December. Then, last of all, for districts free from fog, there are Heston White, the White Framfield, more vigorous than its parent, and a fine thing.

Then we have the yellows.

Starting with the October varieties, Yellow La Triomphante is very good; but the sport with quilled petals is better, as it keeps well, and can be cut with 4ft. stems. The next reliable variety, at the end of October, is Embleme Poitevine, which can be made to last till mid-December. It is a heavy incurved form, slightly hairy, and with good foliage. Le Peyron, an incurved, is the best of the lot at the beginning of November; a certain cropper, with good long stems. Nagoya arrives at the beginning of December, and although not carrying a large crop is good, but is very shy of cuttings. Golden Mrs. Thompson and Golden Victoria are good companions to the white forms, and carry the succession well over Christmas. The majority of these are well known in the market, and each has some little characteristic that is worth studying.

Last, but not least, there are the single varieties. These do not suit everybody, and the demand is not excessive nor the supply abundant. The doubles, as a rule, give greater returns per house. The first variety we have is Mary Richardson, a salmon-bronze, good in all ways, starting in mid-October. Following closely comes Reine des Roses, a charming soft pink, and its bronze sport. It is a little stiff, but it is the best of its colour that we have. Rosie Bell, a pink, is also good. The Pagram family, white, pink, and bronze, for early November, are exceedingly good, whether disbudded or as sprays. Gaiety is a very fine bronze, and Kitty Bourne is the best yellow I know. The following are also good: Sylvia, bronze; Mrs. Roberts, pink; Irene Cragg, the best white we have; Sir George Bullough, yellow; Delicatissima, a pinkish-fawn; and Elizabeth, Phillis, and Evelyn, pinks. For the rest of our stock I find that we rely chiefly on seedlings of my own raising.

In all these sections we have many other varieties, but each of these has some drawback, and the varieties I have mentioned are the chief money-makers. In conclusion, I hope that my paper may be found to be of some service, and that it is not altogether "an old tale."

Mr. Cragg said also that they were using the "fire pots," as used in American orchards, for the purpose of combating frost among the chrysanthemums they grow in such quantities at Heston. At present the matter was experimental, but he had good reason to hope it would prove successful.

Mr. Cragg was immediately followed by Mr. D. B. Crane, who dealt with the same subject, but from an æsthetic and decorative instead of from a market point of view. We hope to give this paper in extenso shortly.

Mr. Godfrey pointed out that Exmouth Crimson was not a good market variety. Mr. Ladds said he agreed that there was plenty of difference between Winter Cheer and Framfield Pink when both were grown alike; he also thought Scalarandis would not prove better than Nagoya. Mr. T. Williams deplored the fact that singles, pompons, and anemones could not be obtained at florists' shops. He thought Mr. Crane had done well to emphasise the value of these varieties, and said that the growers were too conservative, and would not place them on the market. Mr. Ladds said growers had to grow what the florists would sell, but he was sorry to say that the florists would not push the charming varieties Mr. Crane had referred to. Mr. Wells deplored the fact that florists and market growers did so little with the singles and pompons, although these were so delightful. Mr. Godfrey thought the growers left these varieties alone chiefly because they could not be grown successfully from a commercial point of view. Several other growers added their experience, and helped thereby to make the conference a success.

Mr. Ladds suggested that singles to match or go with the leading market Japanese varieties should be grown and marketed at the same time, so that these could be used together. By this means, he thought, the singles would sell the more readily. Mr. T. Bevan referred at some length to the decorative value of chrysanthemums, and urged the use of various sized flowers in any floral combination.

Mr. P. A. Cragg replied to various points.

Votes of thanks were accorded to the readers of papers, and to those who had organised the conference, and to Mr. Bevan for presiding.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read the Second Edition of CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE, by D. EXHIBITIONS AND MEETINGS.

◆

National Chrysanthemum Society.

Essex Hall, Strand, W.C., was quite gay on October 6, when the usual Floral Committee meeting was developed into an exhibition, and a conference was held in conjunction with the display.

Messrs. W. Wells and Co., Merstham, put up a charming group of early-flowering chrysanthemums, setting these up in vases and stands of various sizes. The chief attractions were the tall stands of the golden Leslie, the bronze Ethel Blades, the white Roi des Blancs, the single Snowstorm, and the seedling singles. Other good things in vases were Perle Chatillonaise, Carrie, Wells' Primrose, Brightness, Nellie Riding, Firebrand, Nellie King, and Eden. This was a very bright exhibit for this time of year, and the season. (Large silver medal). Mr. J. B. Riding, Chingford, put up pæony-flowered dahlias in tall bamboo stands, associating those with sprays of Polygonum cuspidatum. In front of these he had vases of popular cactus varieties, and a small collection of early-flowering chrysanthemums in vases, these latter including Roi des Blancs, Carrie, Polly, Nina Blick, Perle Chatillonaise, Champ d'Or. (Silver medal).

A wonderfully fine exhibit of first-rate blooms, very prettily set up by Messrs. Norman Davis, Framfield, Sussex, was greatly admired. With graceful Michaelmas daisies and solidagos for a setting he put up stands of grand full-sized blooms of Tom Edwards (F.C.C.), a bold yellow incurving Japanese; Empress (F.C.C.), lemon-yellow; Mrs. J. W. Scott, Norman Davis, Exquisite, and several fine new seedlings. High quality characterised the whole display. (Silver-gilt medal). Mr. W. J. Godfrey, Exmouth, Devon, submitted a set of well-developed blooms of Ella Ainsley, Jas. Threlfall, Frank Molyneux, J. W. Molyneux, E. J. Jones, Superb, and Market Favourite, many of them novelties for the forthcoming year. (Silver medal).

A small and bright collection of early-flowering chrysanthemums was submitted by Mr. J. H. Witty, Rose Nursery, Highgate, and Mr T. Williams put up a table of floral arrangements. To both of these a vote of thanks was accorded. Mr. F. Brazier, Caterham Valley, put up a large and bright group of chrysanthemums, Michaelmas daisies, pentstemons, solidagos, etc. (Large silver medal).

Mr. Martin Silsbury, Shanklin, Isle of Wight, showed a beautiful new Japanese chrysanthemum, named White Queen (F.C.C.), with lovely cream-white drooping petals.

Good prizes were offered by Messrs. W. Wells and Co., for six bunches of single varieties, distinct, raised from seed, and here there were five competitors, these making a most interesting display. Mr. C. Payne, Sandhill Gardens, Betchworth, secured the gold medal as first prize; Mr. E. F. Hawes, Royal Botanic Gardens, second, silver-gilt medal; Mr. W. Newton, Little Heath Road, Potters Bar, third, silver medal.

Reading Gardeners' Association.

After the usual "long vacation" during the summer months, which was only broken by the pleasant meetings at Sandhurst Lodge, Sutton Place, Guildford, and Hillside, Reading, the members of this flourishing association met on Monday evening, September 27, for the inaugural meeting of the 1909 autumn session. The president (Mr. Alderman Parfitt) occupied the chair, and was supported by the vice-president (Mr. Leonard Sutton), and a very large gathering of members.

Before calling on the lecturer for the evening (Mr. H. Wilson, The Gardens, Lower Redlands, Reading), the President informed the meeting that a movement had been set on foot that the "Coming of Age" of the association, which happened this autumn, should be celebrated in a becoming manner, and he had much pleasure in proposing that the celebration took the form of a non-competitive exhibition of fruits, flowers, vegetables, etc., to be held in the Small Town Hall, Reading, on Wednesday, November 17. This proposal was seconded by Mr. Powell, supported by Mr. Tunbridge and several other members; and, after a lengthy discussion as to details, carried unanimously and with acclamation. Assistant secretaries and a sub-committee were appointed to carry out all arrangements.

The President then called on Mr. Wilson to introduce his subject, "Experiences and Observations on Fruit Growing during 1909."

In a very able paper, Mr. Wilson dealt with his subject in a most systematic fashion, first relating the many vicissitudes his various crops had experienced from vagaries of the weather and the depredations of insects, etc., during the record season of 1909; strawberries and raspberries being ruined by the continued heavy rains, while cherries and plums suffered from the persistent plague of black aphis. Peaches were a good crop, but received many checks, and for want of sun failed to ripen outside. Apples, a poor crop compared with 1908, with scab very prevalent, but pears were a fair crop though deficient in flavour.

Mr. Wilson then proceeded to detail the measures he took to combat the disadvantages encountered owing to the disastrous weather experienced, giving many useful hints which were quickly noted by many of the audience.

A brief but excellent discussion followed, among those taking part being the President, Messrs. Powell, T. Judd, Drew, Tunbridge, Exler, Martin, etc.

A splendid exhibit of apples in pots was staged by the president, while the vice-president (head gardener, Mr. F. Townsend) sent a beautiful group of Nicotiana Sutton's Hybrid. The society's certificate was awarded to Mr. G. Durrant (gardener to Miss Cripps) for a fine exhibit of Best of All and Prizewinner runner beans. Seven new members were elected. Votes of thanks to the lecturer, the president, and the exhibitors concluded the proceedings.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, Sept. 28.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Messrs. A. W. Hill, W. Cuthbertson, J. Fraser, J. T. Bennett-Poë, W. Hales, E. M. Holmes, R. Hooper-Pearson, and F. J. Chittenden (hon. sec.).

SOLANINE IN SOLANUM NIGRUM.—The following communication was read: Solanum nigrum is included amongst poisonous plants in works on toxicology, but cases of poisoning by it are rare, and relate chiefly to children; but its active principle, solanine, undoubtedly possesses poisonous properties in large doses. Solanine was originally discovered by Desfosses, of Besançon, in 1821, in the berries of Solanum nigrum; and to it and to atropine possessing mydriatic properties its physiological effects are believed to be due. Solanine also occurs in young sprouts of the potato, in tomatoes, and other species of solanum. S. nigrum contains about 0.3 per cent. of solanine. Mature healthy potatoes are said to contain none, but Kassner separated 30-50 milligrammes from 150 grammes of diseased potatoes. Orfila found that the extract of Solanum nigrum had a very feeble effect as a poison, but rabbits are killed by doses of 0.1 grain of solanine per kilogramme of weight of the animal. The symptoms commence in ten minutes, with apathy, low temperature, and slow breathing, and convulsions set in before death, and the pupils become dilated. Dogs are not easily affected by it, as it is usually rejected by vomiting. Blyth, in "Poisons, Their Effects and Detection," p. 398, remarks: "Poisoning in all recorded cases (i.e., in cases of accidental poisoning of human beings) has not been by the pure alkaloid solanine, but by the berries of different species of solanum. The symptoms, in about twenty cases, have varied so greatly that the most opposite phenomena have been described as the effects of poisoning." The recorded cases of poisoning by the berries of S. nigrum are not numerous, and have usually occurred in children. The death of three children is recorded by Hirtz, Gaz. Med. de Strasbourg, in 1842, and other cases by Maury, Gaz. des Hôp., 1869, J. B. Montaine, Chim. Méd., 1862, and by Manners, Ed. "Med. Jour.," 1867. The facts concerning cases of poisoning by the berries of S. nigrum require confirmation. Even the statement concerning the poisonous action of solanine and its dose need careful revision, for it is highly probable that much of the solanine used by investigators has been impure, and may have contained decomposition products, since solanine is easily split up by various re-agents. Doses of more than ¼ grain, to commence with, would be considered unsafe for medicinal purposes. An excellent summary of what is known of its physiological action will be found in Dupuy, "Des Alcaloides," pp. 503-521, and in the "United States Dispensatory," 1907 (19th ed.), pp. 1,654-5. Reference may also be made to "Kobert Lehrbuch der Intoxihationen," pp. 759 and 1,057, regarding the recorded cases of presumed poisoning by solanine in potatoes. With reference to the use of the berries of Solanum nigrum as food: first, it is quite possible that in a luxuriant cultivated form of the plant the amount of solanine might be reduced considerably, and the fruit prove edible. Secondly, the fruit, when boiled, especially in the presence of vegetable acids, might be less likely to produce unpleasant symptoms than the raw fruits, since the decomposition of solanine might take place and solanidine, which is usually set free, is reported to be non-irritant. Thirdly, the berries have no doubt been largely eaten in the United States, and so far as I am aware, no dangerous results have followed. Fourthly, some persons are unusually sensitive to the alkaloids of belladonna, and it is quite possible that cases of idiosyncrasy may occur with regard to solanine. That solanine itself can produce distinct physiological action there can be no doubt, but how far the symptoms attributed to it are due to pure solanine has not yet been proved. Fifthly, it is also possible that, as in the potato, the percentage of solanine present in Solanum nigrum may vary according to the age and condition of the fruit, whether ripe or unripe, and to other circumstances of difference in season as regards light and heat. But there is no need apparently to add a fruit of such doubtful utility and lacking good qualities to the list of much more palatable fruits already in the market.

HYBRID WILLOWS.—Mr. J. Fraser, F.L.S., showed six hybrid forms of willow, recorded in British floras and other botanical works as Salix ambigua. Most autherities are agreed that S. ambigua is a hybrid between Salix aurita and S. repens. No two of the forms are exactly alike, but four of them approach S. aurita more closely than the other parent. He explained this by the fact that the parents in the wild state are extremely variable, and consequently one might expect the hybrids to be equally variable. Two of the forms approached more nearly to S. repens in shape, variation, and character of the hairs. While the leaves of the six forms showed affinity with one or other parent, the catkins were most nearly like those of S. repens in size and other particulars. All of the above he preferred to name by using the names of the parents, namely, Salix aurita x repens. He also showed another hybrid named Salix cinerea x repens, with forms of the suppcsed parents most nearly like them.

PRUNUS SP.—Mr. A. W. Hill, F.L.S., stated that the plant shown at the last meeting under the name of Prunus Chaproni proved to be a form of P. cerasifera.

FURCATE INFLORESCENCE OF TYPHA SP.—Mr. Hooper-Pearson showed a specimen of the inflorescence of a species of Typha which had four branches of about equal size, a very unusual character in this genus.

GIANT PUFFBALL.—From C. C. Paine, Esq., of Haverstock Hill, N.W., came a specimen of the giant puffball (Lycoperdon bovista), having a circumference of 38½in.

MUSEUM PREPARATIONS.—Dr. Voelcker showed a heart set up as a museum preparation, which without dissection showed the whole of its structure. The liquid in which it was preserved was a mixture of various ethers, etc., and portions were rendered transparent owing to the refractive index of the liquid being the same as that of the material preserved. The discovery of this preservative was due to Dr. Spatterholz, and it promises to be of great use in preparing museum specimens.

FORMS OF IMPATIENS ROYLEI.—Mr. E. A. Bowles showed a white-flowered form of Impatiens Roylei, which has been called var. pallida. It is rather smaller than the type, and has paler, narrower leaves. He also showed a variegated form which had appeared in his garden. The seedling had shown the variegation, and it had been maintained throughout the life of the plant.

LINARIA MAROCCANA SPORT.—Mr. Bowles also showed a sport of Linaria maroccana with the corolla split to the base and without spurs, which had occurred in his garden. The flowers failed to produce seed, the ovary being absent.

NARCISSUS TAZETTA VAR.—He also showed leaves of a form of Narcissus tazetta which had persisted until the present time. They were quite green and healthy looking, and about 18in. in length.

TRADE NOTE.

We are informed that the partnership heretofore subsisting between Mr. Alfred Watkins and Mr. Charles David McKay, carrying on business as seed merchants as "Watkins and Simpson," at 12, Tavistock Street, Covent Garden; and 13, Exeter Street, Strand, London, has been dissolved by effluxion of time as from the 10th day of May, 1909, and that Mr. Alfred Watkins will continue the business alone as Watkins and Simpson in the same manner as heretofore.

CATALOGUES RECEIVED.

TOOGOOD AND SONS, SOUTHAMPTON.—A freely illustrated catalogue of bulbs.

HOGG AND ROBERTSON, MARY STREET, DUBLIN.—A very handy list of bulbs issued under the title of "Holland in Ireland." Home-grown tulips and daffodils are a speciality.

ANSWERS TO CORRESPONDENTS.

MARKETING HARDY FERNS.—L. W., Chard: There is usually a moderate trade in hardy ferns in the spring time through the markets, but we have no knowledge of its real extent or its profitableness. If you apply to the Superintendent, Covent Garden Market, he will no doubt put you into communication with salesmen who sell hardy ferns on commission.

FAILURE WITH CRIMSON RAMBLER ROSE.—F. B., Hornchurch: You should remove all the old useless wood, and secure the strong new growths to the trellis work, so that they do not become damaged by wind and rain storms. This will give them a chance of ripening up, and they will then be the better able to bloom and resist mildew next season. It is evident that your chief trouble is mildew, and one of the means of combating this pest is good cultivation. Manurial dressings must not be forgotten, nor must good soakings of liquid manure be omitted, especially as the roots are, by reason of their position, liable to suffer from lack of moisture. Mildew usually makes its appearance in spring, just at the time the early foliage is full grown, consequently a sharp look-out must be kept for its appearance, especially as Crimson Rambler is rather predisposed to attack. If this early attack is disregarded the foundation for a severer attack as the flower buds are developing is laid. It is a good plan to spray as a preventive, and if sulphuric acid is used once a week there is little likelihood of mildew appearing. The sulphuric acid must be used at the rate of one part to each thousand parts of water. If spraying is not done until mildew is very obviously present, then it is necessary to spray three days in succession to check the disease. Another good spraying mixture is made by dissolving half an ounce of liver of sulphur (sulphide of potassium) in a gallon of water.

EMPLOYMENT AT WISLEY.—S. E. H., Leeds: The society admits young men, under 22 years of age, to study gardening at Wisley. The curriculum now includes not only practical garden work in all the main branches of horticulture, but also lectures, demonstrations, and elementary horticultural science in the laboratory, whereby a practical knowledge of simple garden chemistry, biology, etc., may be obtained. The laboratory is equipped with the best apparatus procurable for students. The training extends over a period of two years, with a progressive course for each year. Students can only enter at the end of September and at the end of March. Selected students have also the advantage of attending certain of the society's shows and lectures in London.

WOOD WITH INSECT BORINGS.—No Name or Address: We found no grubs or beetles in the specimens sent, but the damage done to the wood suggests at once the work of the Pine Weevil (Hylobius abietis), a pest that is particularly injurious to larch, spruce, and Scotch fir. It feeds on the tender bark of the young shoots, and the maggots work long tunnels in the soft wood beneath the bark, producing an abundance of "wood-meal" by their steady gnawing. Cleanliness is one of the best cures and preventives. All dead branches and bark should be removed as speedily as possible and burnt; there is no doubt that the accumulation of decaying wood and bark in and near conifer plantations is answerable for a great deal of trouble from various pests, as in these accumulations they hybernate and propagate.

THE COMMON WOOD WASP.—W. M., Welwyn: This is called the common wood wasp or common sirex, to distinguish it from the giant wood wasp (Sirex gigas). The latter has yellow bands on a blackish body, whereas S. juvencus is smaller, and of that blue-black colour suggestive of a blue-bottle fly. It is not a very common insect, but sometimes it is present in considerable numbers in and near conifer plantations, and it is capable of working a great deal of mischief. Each female is provided with a strong ovipositor, and with this the bark is easily pierced, the soft wood reached, and the eggs laid one by one. The maggots feed in the solid timber and do a great deal of damage. The late Miss Ormerod pointed out that "for general purposes, the only practical way of preventing the spread of sirex infestation appears to be timely removal of infested timber, whether in the form of standing or felled trees, or fallen trees, or infested limbs."

WHITE GROWTH ON PINE BRANCH.—J. H., Belfast: We have not received a specimen from you, and can find no trace of any package arriving either at our Kew or Aldersgate Street address. Please let us know to which address it was forwarded, and, if possible, send another specimen and particulars to the Editor, Endsleigh, Priory Park, Kew, Surrey.

NAMES OF PLANTS.

W. L. L., Derby.—1, Swainsonia galegifolia; 2, Lilium tigrinum; 3, Vitis Coignetiæ; 4, Cypripedium Roezli.

A. G. E., Bodmin.—1, Viola cornuta; 2, Sedum telephium; 3, S. Sieboldi; 4, Veronica Andersoni variegata; 5, Desfontainea spinosa; 6, Virburnum Lantana.

A. M., Barnet.—Crotons, or Codæiums, are difficult to determine from small leaves such as those sent. You had better take specimens with you when visiting a nursery and compare these with the growing plants. We do not recognise any of the varieties from the specimens sent us. No. 5 is Abutilon megapotamicum.

NAMES OF FRUITS.

M. E., St. Heliers.—1, Chaumontel; 2, Beurre Diel.

S. W., Silloth.—1, Lane's Prince Albert; 2, Gascoigne's Scarlet.

G. G., Durham.—1, Louise Bonne of Jersey; 2, Ecklinville.

P. R. J., Ross.—1, Tyler's Kernel; 2, London Pippin; 3, Souv. du Congres.

F. B. L., Hornchurch.—1, Lane's Prince Albert; 2, Dumelow's Seedling; 3, King of the Pippins; 4, Warner's King.

E. M. D., Drayton.—1, King of the Pippins; 2, Blenheim Pippin; 3, Peasgood's Nonsuch; 4, Worcester Pearmain.

W. H., Lincoln.—1, Bramley's Seedling; 2, Beurre Rance; 3, Cellini; 4, Josephine de Malines; 5, Adam's Pearmain; 6, Dutch Mignonne.

GARDEN IRON AND WIRE WORK and Ornamental Wood Work of every description, Espaliers, Rose Trainers, Archways, Pergolas, etc. Now is the time to consider your Garden Improvements. Send for Illustrated Catalogue. BOULTON and PAUL, Ltd., Dept. M5, Norwich.

EVERY GARDENER knows that the XL-ALL SPECIALITIES are the best on the market. The time is at hand for housing Plants for the Winter. When these are arranged under glass a fumigation with XL-ALL COMPOUND, or a syringing with XL-ALL LIQUID INSECTICIDE will at once free them from insect pests and save lots of trouble later on. Any plants or fruit trees suffering from Mildew should be sprayed with XL-ALL MILDEW WASH, or with the newly-patented CUCASA, the finest preparation of Copper ever offered to Gardeners. RICHARDS XL-ALL FERTILIZER is unequalled for finishing off fine blooms and fruit. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink List, giving particulars of these and many other "XL-ALL" Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Planting Season.

The season in which the more important of the planting operations that immediately concern owners of gardens, and those engaged in their management, should be carried out, has once more opened, bringing with it plenty to engage the thoughts and occupy the time of those who contemplate the making of alterations on a comparatively large scale. To achieve success in planting, whether it be of useful or ornamental trees, shrubs, or hardy border flowers, it is necessary to carefully consider well in advance the work to be carried out, that the needful preparations may be made and injurious delays and serious loss of time be avoided. The importance of an avoidance of delays cannot be too strongly insisted upon, and the necessity for having everything in readiness that the operations may be carried on with due expedition will be all the more readily appreciated when it is remembered that, owing to the variability of the British climate, the weather may put a stop to the work at any time before the month of November is far advanced. It may be an excessive rainfall, or a severe frost, and the delay caused thereby may be sufficient to prevent the work being done under the best possible conditions. Ornamental trees and shrubs, fruit trees and bushes, and hardy border plants may be, as indeed they are, planted with more or less success between the latter part of the present month and the end of February, provided the weather is open and the soil in a condition that will admit of it being readily worked. But as already pointed out, we cannot be certain of a continuance of favourable conditions for any considerable period after the autumn season has run its course. In any case, there is no period in the whole year in which planting operations can be so successfully carried out, provided the weather conditions are normal, as the second and third months of the autumn quarter. Last year the weather in October was so abnormally hot and dry that planting could not be proceeded with so early as usual; but this year the conditions are such that it may be commenced at once. One of the several reasons why trees and shrubs should be planted as early in the autumn as practicable is the relatively high temperature of the soil. This, at between two and three feet below the surface, is, in October, 60 degrees; in November 55 degrees, a decrease of 5 degrees; in December, 49 degrees; and in January, 46 degrees. In the two following months there are small increases, the earth temperature in March being 50 degrees. We need not, in giving these figures, dwell upon their significance, as it will be evident to all who have had experience in the garden that a difference of between 5 and 10 degrees in the temperature of the soil will have a material influence in promoting root production. As a matter of fact, trees planted now will be found pushing their roots freely into the new soil before the end of next month, and be so well established by the spring that they will grow away vigorously on the resumption of activity in plant growth. Early planting may be regarded as an essential point in good practice, and a thorough preparation of the soil is not less necessary. The old practice, which still obtains in some quarters, of making holes just large enough to receive the roots, should be abolished, as even in the most friable of soils the results are more or less unsatisfactory. We advise that where any considerable area has to be planted with fruit or ornamental trees, or with shrubs, that the whole area be trenched to a depth of two feet. The character of the subsoil will determine whether it should be brought to the surface or not, and unless it be in a friable condition the soil forming the bottom spit should be well broken up with a fork and allowed to remain there, and the top spit from the next trench be turned over upon it. The quarters to be devoted to fruit trees should certainly be trenched and the additional cost, as compared with simply opening out holes for the roots will be repaid a hundredfold. Where the trees and shrubs are few in number the stations should be marked, and holes opened out of a sufficient diameter to take the roots and give a little space to spare when they are spread out horizontally. The depth at which to plant is an important point, and the soil mark on the lower part of the stem will be a good guide in the case of trees received from the nursery. Trees and shrubs removed from one part of the garden to another should, as a rule, be planted at the same depth as before. To cover the roots with the finer part of the soil, and to carefully work it between them is a detail so well known that there is no occasion to do more than merely mention it in passing; but the firm treading of the soil as the holes are being filled is of far-reaching importance, and we would direct special attention to it. Soil cannot well be rammed too firmly about the roots of newly-planted trees, as so conclusively proved by the experiments made by Mr. Spencer Pickering, F.R.S., at the Woburn Experimental Fruit Farm. In these experiments the soil about a certain number of the trees was rammed until it was converted into a paste, and, to the surprise of all concerned, these made a much better growth than trees which had the soil trodden about them in the usual way. We do not suggest that the soil

[Photo: J. Bacon and Sons.

MR. ARTHUR J. ALLSOP.

should be rammed until it passes into a pasty condition; but we advise the soil being made much firmer than is usually considered necessary, and, as an encouragement to planters to act upon this advice, it may be stated there is very little danger of the soil being rammed too firm. There is one other detail of general application that should receive close attention, and that is securing newly-planted trees to stakes in such manner that they will not sway about with the wind, or have their bark injured by abrasion. There are other details of more or less importance, but our object is not to give a lengthy treatise on planting, but to direct attention to the points on which success chiefly depends.

Mr. Arthur J. Allsop, who is parks superintendent at Leeds, is one of the best-known gardeners in the broad shire of York. Mr. Allsop's earliest instruction in matters horticultural was received from his late father, then head gardener to Lord Hotham, at Dalton Hall, near Beverley. From Dalton Hall he went to Trentham, and eventually took charge of the decorating department there under Mr. P. Blair, and attended the great shows at Shrewsbury, Manchester, York, etc. At this time Mr. Allsop was yet in his teens, and he had only just reached man's estate when he was appointed head gardener to Viscount Portman, at Bryanstone, Dorset, where he prepared plans for, and undertook the laying out of the grounds around the new mansion then in course of erection. It was here that Mr. Allsop must have felt deeply grateful to his father for the care and interest taken with him when still a schoolboy, as he at that early date had to keep the trees and plants properly labelled, and measure up portions of the garden, and place these, to scale, on paper, after measurement. By the time he left school he knew more plants and more about the fundamental work of landscape gardening than most young men of twenty-one. After ten years with Lord Portman Mr. Allsop left Bryanstone with the intention of commencing business as a landscape gardener, but the post of superintendent of parks at Leeds was then vacant, and he applied for it, feeling that perhaps here was an opportunity for his taste in laying out public parks. There were two hundred applicants, and he secured the position in 1901, and has retained it ever since with great credit to himself and advantage to the town, as everyone will admit who has seen the Leeds parks in spring and summer.

Geographical Distribution of Plants.—It is with great pleasure we learn that a free course of ten lectures on the Geographical Distribution of Plants has been arranged by the University of London, and will be delivered by Professor Percy Groom, M.A., D.Sc., Assistant Professor of Botany at the Imperial College of Science and Technology, and Mr. A. W. Hill, M.A., Assistant Director, Royal Gardens, Kew. These lectures commenced on Wednesday, October 13, and will be continued on succeeding Wednesdays at 5 p.m. in the Botanical Department, Royal College of Science, South Kensington, S.W. No tickets are required.

Chrysanthemum Prospects.—Mr. W. J. Godfrey writes from Exmouth: "If one may judge at this early period, the prospect of a good chrysanthemum season is a very rosy one. Generally, the plants are stronger, cleaner, and healthier than has been the case for several seasons past. The buds are swelling freely and are of bold form, while those expanding are giving blooms, in most instances, of large size, with rich colourings in the bronze, purple, and crimson tints. Last season the buds did not swell with that freedom most growers desire, and the resulting blooms were very deficient in colour, so much so that many really good varieties came into bad repute. Damp, so far, has not been so destructive as usual. Much has tended, in recent years, to discourage even expert growers of the big exhibition Japanese blooms, and this, combined with the constant disparagement of this section by many writers in the Press has, in some measure, diminished the popularity of chrysanthemums. However, the present prospect may result in such a way that new life will be infused into the 'fancy.' Some growers insist that without 'ripened wood,' it is difficult to produce good blooms. It looks as if this idea will prove to be fallacious, for there certainly has been little or no chance of ripened growth this season."

Secretaries of Horticultural Societies are reminded that the "Gardening Year Book" is in an advanced stage of preparation, and that it is important they should return the forms sent to them some time since with as little delay as possible. The directory of "Horticultural and Botanical Societies," which forms so useful a part of the work, is annually subjected to a thorough revision to ensure it being thoroughly trustworthy, and societies from whom no information has been received are consequently omitted. We shall be glad to receive notification of the formation of new societies, and the names of officers. These, as in the case of the forms, should be at once sent to the Editor of "Gardening Year Book," 148 and 149, Aldersgate Street, E.C.

The National Sweet Pea Society will hold a two days' show in 1910, at the Royal Horticultural Hall, Westminster, and the dates fixed are Tuesday and Wednesday, July 12 and 13.

Foreign Fruit Supplies.—The total value of raw fruits imported into this country during the month of September was £765,487, as compared with £701,706 and £681,840 in the corresponding month of 1908 and 1907 respectively. There has been a falling off in apples, grapes, bananas, and cherries, but very considerable advances in plums, pears, oranges, nuts, and lemons. Apples cost us £60,559 for 104,564 cwts., as compared with £98,810 for 178,532 cwts. in September of last year. Grapes amounted to 123,587 cwts., costing £103,264, while 592,216 bunches of bananas were valued at £169,558, as against 682,276 bunches, valued at £187,828, in September of last year. We imported 30 cwts. of cherries, instead of 132 cwts., and these cost £30. It is difficult to account, in such a good plum season, for an advance of 48,747 cwts., the total amount being 92,591 cwts., valued at £65,952, the latter figures being £34,824 in advance of the cost of imported plums in September, 1908. Grapes advanced in quantity from 110,091 cwts., costing £106,652, in 1908, to 123,587 cwts., that only cost £103,214 during the recent month. Nuts showed a big advance from 48,159 cwts., valued at £87,766 in the corresponding month of last year, to the recent returns of 68,159 cwts., valued at £137,292. We imported 164,748 cwts. of pears, compared with 134,847 cwts., the values being £141,268, and £119,268 respectively. Oranges advanced in quantity from 17,335 cwts. to 28,009 cwts., and in value from £13,516 to £18,481, while lemons advanced from 45,262 cwts. to 67,119 cwts., and from £19,678 to £30,896. It is interesting to notice that in September, 1908, 54 cwts. of currants cost £66, whereas this year 32 cwts. cost £67. No strawberries or gooseberries were imported during the month, but apricots and peaches cost £486, an advance of £100, and unenumerated fruits cost £37,684, or nearly £1,300 more than in the corresponding month of 1908.

Ornamental Trees and Shrubs formed the subject of an interesting and instructive paper read before the members of the Scottish Horticultural Association at their monthly meeting, in the Goold Hall, Edinburgh, by Mr. W. Smith, of the Holyrood Gardens. In his opening remarks Mr. Smith directed attention to the beautiful trees and shrubs recently introduced from Western China, and advised planters to take full advantage of them when forming new gardens and making additions to old ones. He suggested that in all schemes of planting winter effects should receive full consideration, and that coniferous trees should be freely utilised in providing shelter for choice subjects, and shutting out unsightly objects. Mr. Smith also advised the inclusion in selections of a proper proportion of trees remarkable for the beauty of their foliage in autumn.

Flower Gardening in Battersea.—For the sixth year in succession the Battersea Borough Council, with a view to encouraging the cultivation of flowers and plants by the tenants of their houses and tenements (351 in number) on the Latchmere and Town Hall Estates, invoked the aid of the Battersea and Wandsworth Amateur Chrysanthemum and Horticultural Society in arranging, under certain conditions, competitions for the best kept outdoor and indoor flower, etc., gardens. The society willingly undertook to make the necessary arrangements, and the competitions were arranged as follows: Class A, Upstairs window sill gardens; Class B, Indoor window gardens; Class C, (a) Centre; (b) Gardens nearest houses. The total number of entries were 43. Under these conditions the society have awarded prizes and certificates as follows: Class A, 3 prizes and certificates; Class B, 3 prizes and certificates; Class C, (a) Centre gardens, 7 prizes and 11 certificates; (b) Gardens nearest houses, 7 prizes and 8 certificates. The judges appointed by the society were Mr. J. Brown, Mr. W. Flood, and Mr. S. J. Saunders. The presentation of prizes and certificates by the Mayoress (Mrs. W. Willis) took place on Thursday, October 14, in the Small Hall, Latchmere Road Baths, Battersea, at 8 o'clock, and the presentation was made the occasion of a public meeting.

Botanical Appointments.—Dr. Jessie S. Bayliss has been appointed lecturer in botany at the Birmingham University. Mr. F. T. Brooks, of Emmanuel College, and Mr. D. Thoday, of Trinity College, have been respectively appointed senior and junior demonstrator of botany at Cambridge University.

Imported Vegetables. — Our vegetable importations during the month of September were valued at £236,019, while in the corresponding month of 1908 the value was £248,505. Onions showed an advance from 819,719 bushels to 823,096 bushels, valued at £97,219 and £103,369 respectively. Potatoes amounted to 168,228 cwts., costing £21,735, as compared with 167,250 cwts., valued at £27,791 in 1908, and, as usual, France sent us the largest quantity. Tomatoes have declined from 119,224 cwts., valued at £113,729, to 108,427 cwts., valued at £103,573. Unenumerated vegetables show a decline in values from £9,766 to £7,342.

BUSH APPLE TREES.

The better acquaintance with, and the consequent extended use made of the paradise stock as a host for apple trees in gardens, has been largely responsible for the present popularity of bush-trained trees. Apart from this, the usefulness of such trees, when planted either in the open garden in plots, or upon borders bounding the vegetable quarters, alongside the pathways, is evident, while in spring the beauty of the many tinted blossoms delight the eye to a degree scarcely less than that of the crops of fruit in autumn.

Preparation for Planting.

Soil that is in good heart, or that for a number of years has produced satisfactory vegetable crops, and has received the usual dressings of manure, together with deep working annually, requires but little labour and expense to put it in fit condition for the reception of the roots of fruit trees. In the open garden trenching of the whole space to a depth of two feet, or even more, should the nature of the subsoil permit of this being done, must be practised, but in no case should a cold, inert, and previously unworked subsoil be brought to the surface, or into immediate contact with the tree roots. The breaking up of this latter, and the addition of liberal supplies of farmyard manure, together with any corrective substances that may be at hand, as leaf-mould, burnt ash, or lime rubble, will tend to improve it.

Separate stations are best prepared by marking out a space about five feet in diameter, and therefrom digging out and placing aside the surface soil, after which the lower strata may be dealt with, as already indicated. In every case it is advisable to use a portion of quite fresh soil to each tree when planting, or, if plentiful, new soil may entirely replace the old.

Planting.

This is best done in November, as early as the trees can be obtained, if transplanted from a distance, and although most of the leaves will have been shed before removal, a few still adhering to the branches is helpful to root action. In low-lying or very moist situations the stations should be raised to nearly the level of the surrounding ground. The base of the tree being placed thereon the roots may be evenly spread around at a slight incline from the main stem, all broken or damaged parts being cut away. The soil should be of a necessary degree of fineness, to enable it to be comfortably worked among the fibrous roots, until these are hidden, when that of coarser texture may be added to a depth, when finished, of at least four inches. The operation of planting should be performed when the soil is in a fairly dry state, when it may be trodden freely, and should water be thought necessary afterwards it may be applied, and a mulching of litter or long grass should be given if severe frosts follow.

Form of Tree.

The mere mention of a bush-shaped tree conveys a fair idea of what should be aimed at in the way of pruning and training. One-year-old or partly-trained trees may be employed; the former, when received from the nursery, will probably consist of a bunch of fibrous roots and a long straight stem, and as such it would be best planted, and in the following spring, before growth perceptibly commences, this stem may be reduced in length to about twelve inches, when three or more shoots will start below the point of severance. This number of shoots is sufficient to form the base of the future tree, and care should be taken that they are as evenly situated as possible, and have an outward tendency. From these other vigorous shoots will spring, some of which may point towards the centre of the tree, and such should be removed as soon as observed, and any others likely to cause undue crowding be similarly treated, thus enabling the main branches to get full benefit of sunlight and air to ensure maturity. The outline of the future tree having been thus formed, most of the pruning required can be done in summer by means of pinching the growths while yet soft, merely shortening the spurs to a few buds in the winter season.

Trained Trees.

When planting these at the outset much trouble, if such it may be described, is saved, but supports of some kind to prevent injury from wind storms may be necessary until roothold is again established. Pruning for a few seasons until the foundations of the trees are laid will require careful attention, to keep the stems and branches well furnished with fruit spurs. Some varieties lend themselves to this particular form of training more kindly than others, but being the most natural form of any there are very few that cannot be coaxed into handsome and fruitful trees without much effort. The main point in the culture of bush trees is to keep the centres clear of useless growths, and if very shapely specimens are anticipated, a few stakes and some cord to secure refractory branches to the desired positions is time and material well expended.

Culture in the Fruiting Stage.

It may be mentioned that trees of this kind that invariably fruit early, and often very freely, require somewhat different treatment in regard to manurial supplies than do others grafted upon the crab stock, the roots of which ramble far and wide in search of food supplies, which those of the paradise are, to a great extent, incapable of doing. Hence stimulants in some form should be applied, according to the seeming necessity of the case. Drainings from stables and cattle sheds, diluted if necessary, and applied to the roots at any season, but more especially during the autumn and winter months, are very beneficial, or artificial compounds given similarly during growth assists the current year's crops to maturity, while sustaining the health and vigour of the trees for the future. Adequate moisture at the roots is at all times necessary, and should a scarcity of water at any time during the growing season be probable, a mulching of stable manure three inches in thickness, placed as far around the tree as the roots extend, will considerably check evaporation, and mitigate the evils that arise from drought.

Varieties Well Suited to Bush Culture.

The following list comprises sorts that, while being the best in their respective divisions, are also compact growers, forming prolific bush trees: Dessert.—Beauty of Bath, Mr. Gladstone, Devonshire Quarrenden, Worcester Pearmain, James Grieve, King of the Pippins, Allington Pippin, Mannington Pearmain, Scarlet Nonpareil, Adam's Pearmain, Ribston Pippin, and Cox's Orange Pippin. The last two will not succeed in cold districts, but are well worthy of a trial. Culinary varieties are: Early Victoria, Pott's Seedling, Stirling Castle, Warner's King, The Queen, Loddington, Lane's Prince Albert, Bismarck, Norfolk Beauty, Queen Caroline, Bramley's Seedling, and Newton Wonder.

James Day.

Galloway House Gardens,
Wigtownshire.

CURRANTS AND GOOSEBERRIES.

These hardy fruits rank among the most wholesome and popular kinds grown, and within the last two or three decades vast improvements have been brought about both in their culture, training, and the introduction of improved varieties. So numerous are the varieties now that it is somewhat difficult to make a selection of the best kinds for each particular garden, but if the cultivator is observant he can generally discriminate before planting.

I believe some of the older varieties are still the best in a general way, but they may well be supplemented by a few of the newer introductions, but it is best not to grow too many varieties, for while some give large and fine fruit, yet one does not always procure the same bulk from a given number of trees. I am induced to make this statement as my remarks apply to the growing of these fruits for commercial purposes, or in large gardens, where quantity as well as quality is needed. When one wants exhibition fruits some of the newer varieties should be grown as well as the best of the older ones.

Any fairly good garden soil will grow currants and gooseberries, provided it be well drained; at the same time, a somewhat retentive soil is best. In dry seasons on a dry, porous soil the trees suffer considerably, and where such exists a heavy mulch of half-rotted stable or cow manure should be put on in spring, and remain throughout the summer. I am not in favour of mulching during summer on heavy soils. The necessary manure should be forked in during winter or early spring, or occasional dressings of soot and approved artificials be applied when the roots become active.

Every means should be resorted to in private gardens to maintain a supply of fruit over as long a period as possible, and to ensure this desirable end some trees must be planted in a partially shaded part of the garden, and then by selecting late varieties and covering the trees with netting before the fruit is fully ripe the crop will hang for a long time. Planting may be performed at any time after the fall of the leaf, from November and onwards. No time should be lost in preparing the ground by manuring and trenching.

Although currants and gooseberries are generally grown as bushes, with a clear stem of about six inches above the ground level, I have a great regard for the cordon system of training them, especially gooseberries for private gardens, as a far greater weight of fruit of extra fine quality can be gathered from a given area by this means than from bushes, and the trees can be easily protected from the ravages of birds. For covering walls the plants should have been specially prepared, as either single, double, or triple cordons. Single cordons may be planted one foot apart, and the others two feet and three feet respectively. Wires should be strained horizontally some six or eight inches apart, and two or three inches from the face of the wall, as this is far preferable to nailing the shoots closely to the wall.

Red currants are in great demand for tarts and preserves, especially so while raspberries are to be had for mixing with them, and when these latter are past it is seldom red currants are in request in private establishments, except for making jelly. A point to bear in mind is the need for planting a certain number of young, vigorous bushes occasionally, to replace any that are becoming worn out. When the newly-planted trees are well established and yielding fruit, grub out the worst of the older ones. This remark applies equally to all bush fruits. In gardens where sufficient space is at command it is good practice to thoroughly manure and trench a plot for a young plantation quite away from the old one, and when this is planted and in full bearing, grub out the others and consign them to the rubbish fire.

Pruning may be performed at any time after the fall of the leaf, and the main points to bear in mind are to keep the centre of each bush open for the admittance of abundance of sun and light in order to mature the wood and perfect the fruit. The leading shoots of this season's growth should be shortened to about six inches, and all lateral growths emanating from the spurs must be cut to within three or four buds of their base. White currants require exactly the same treatment. These are seldom grown in quantity, but the fruits are sometimes liked for dessert, as they are less acid than the red, and afford a useful addition and change on the table.

Good varieties are Fay's Prolific, Raby Castle, Scotch, White Dutch, and American Wonder.

Black currants are invariably grown as bushes, and the fruit used for culinary purposes only. As the fruit is borne upon the wood of the current year's growth it is obvious that the trees should be encouraged to make long and stout growths every year, and this cannot be ensured except on young, healthy bushes. Some of the older branches may be cut clean out at the base to encourage a few of the sucker-like growths springing from the stool. It will thus be seen that the methods of pruning the black currant are totally different to that practised with the red. Good varieties are Baldwin, Lee's Prolific, and Boskoop Giant.

The method most generally adopted for growing gooseberries is as bushes, and for the general crops the bush system is best. I have cultivated these very successfully as cordons on north walls, having been able to put excellent dishes of fine, full-flavoured fruit upon the table as late as the last week in October. Our plan is to shorten the current season's growths in July to within three inches of the main spur, and in winter cut back to three or four buds. The leading shoot may be left six to nine inches, according to the strength of the plant. When pruning cut out entirely all weak shoots from the base, thin out the weaker of the upper branches to admit light, and retain all leading and well-placed branches their full length.

The best varieties for cordons are Lord Derby, Crown Bob, Massington, Whinham's Industry, and Pitmaston Gage. For bushes, Crown Bob, Whinham's Industry, Langley Beauty, and Massington.

Both currants and gooseberries are subject to the ravages of several insects, viz., the caterpillars of the magpie moth, the gooseberry sawfly, aphides, and red spider. As a deterrent the trees should be occasionally well syringed before the fruit is far advanced with an approved insecticide, of which there are plenty effectual ones on the market.

When badly attacked with caterpillars hand picking must be resorted to. Immediately after pruning in winter the soil under the trees should be raked off to a depth of two inches and burnt, adding in its place some good loamy soil and decayed manure. This will effectually destroy the larvæ that secretes itself there for the winter months. Red spider and aphides can generally be kept in check by syringing with an approved insecticide alternately with clear rain water.

H. T. MARTIN.

GREASE BANDING.

The time is fast approaching when those who intend to grease band their fruit trees should commence the work, and all the things necessary—the grease and paper, raffia, paste brushes and pails, should be in readiness.

The grease used is required to remain tacky in at least a slight frost, certainly during very cold weather; to remain sticky and not run off, or harden like varnish during warm weather, such as was experienced during the autumn of 1908; and it must not easily be washed off by rain. In addition to all these, it must not contain anything injurious to the health of the trees, if, by chance, it should run off the band on to the bark.

A great many people are applying the grease directly to the bark of the trees without any grease-proof paper band, but we are sure that this is dangerous, and absolutely unnecessary, as it takes very little time, and costs little, to provide and fix the paper bands.

We once, in the very infancy of grease banding, lost many fine trees, killed by the grease which we put direct on the trees, and this proved a very deadly preparation. We use the ordinary grease-proof paper, which is sent out by the grease makers, and which comes cut into strips, six to eight inches wide, and about twenty-four to thirty inches long. Some of these it is necessary to use of whole length, some three-quarter, and some half length, while the portions cut off the middle size will often come in for the young trees which have very small stems. We cut our paper beforehand into these sizes, keeping them separate in the basket, which contains the paste pail and board, and the workers soon become skilful in judging the size of paper any tree requires.

The pasteboard is shaped at the bottom end so as to fit in a pail, and is capable of taking a piece of the paper full length. Ordinary flour paste is all that is needed in the way of adhesive compound, care being taken to mix quite cold water with the flour at first, the boiling water being stirred in afterwards; by this means the paste will be made of thick consistency and without lumps. In addition to the paste, we take the precaution of tying the top and bottom with raffia, to prevent rain getting between the tree and the paper. The band should be placed well up the trunk of the tree in the case of standards and half-standards, but below the lowest branches. Within reasonable limits the higher the band the better. We do not believe much in the danger suggested in certain quarters of moths laying on the trunk below the band if the latter be placed very high. It is important to prevent any bush fruit tree from touching the branches above the band, as there is a probability that the moths might crawl up into the tree by that means. The same is true of the stakes which are used to support the trees, and for this reason the latter should always have a little grease put round them.

We have tried several devices to prevent the grease from running off the bottom edge of the paper, and with varying success. On one occasion we twisted thick cord, of about half an inch diameter, round the bottom of the paper, no knot being used, but just a twist over and under with the end, the whole being drawn tight, and thus kept in position.

It was difficult to get the men to pull these taut enough, and the cost also of the cord, which could only be used once, was considerable, so that this scheme was finally abandoned, though we did many acres in this way one year. For the past season or two we have been forming a sort of collar round the bottom edge of the paper by creasing it in the following manner: The paper is laid on a flat table, and a girl folds over about an inch of one edge of the paper, running the flat of a knife, or a presser of some sort, along it to crease the edge. She then turns it again in the same manner, also pressing it lightly, and with a pair of scissors nicks this last edge at distances of about three inches all along, the cuts being a quarter to half an inch deep. The paper is cut into lengths, put in the baskets, and pasted on the trees in the same way as the ordinary unprepared paper, except that care must be taken to keep the folded side outside. When the raffia is tied round the necessary trouble must be taken to see that the bottom tie is just below the bottom of the cuts referred to which the scissors have made, and this will bring it about into the middle of the folded portion. Upon the careful carrying out of this depends the success of this method.

When the papers are nearly dry the cut edges are turned back, until they are nearly at right angles to the trunk of the tree, thus forming a paper shelf all round, though interrupted at every three inches or so by an opening produced by the cuts of the scissors. In practice we find that this paper trough remains fairly stiff during all the wet weather, and catches a considerable quantity of grease and oil running down the band, while the rain water flows away easily through the cuts in the edge. The grease which accumulates here remains sticky when all the rest of the surface of the band is dry and like varnish in appearance.

The grease is applied with a paint brush when the papers are quite dry, sufficient being put on to make a quite thick coat on the band; it is very short-sighted policy to stint the first coat, as this entails a large amount of work touching up, when it is ofttimes a very difficult job, owing to the papers seldom being dry enough. The grease should not come nearer than within about an inch of the bottom of the band.

During the time we have been grease banding we have used materials of varying stiffness, but, as a general rule, it has been necessary to churn up the grease first with a wooden rammer, finishing it off when in the paint pot which is used to carry it about in the plantation with an iron stirrer. A few turns with this latter tool, when the grease is in the pot, suffices to render it sufficiently soft and fluid to be easily applied with a brush, but it is necessary to stir again after about half the material has been used, for the constant drawing of the brush over the top of the grease serves to consolidate it.

Many of the greases which are upon the market are much softer and easier to use than those we formerly had to deal with, doubtless due to improvements in the machinery used for their manufacture, so that considerably less trouble is found now in making the grease fit to put on with a brush than was the case ten years ago. At the risk of seeming repetition, we would urge the absolute necessity of putting a good coat on at the first application, for never afterwards can the work be done half so successfully. It will doubtless be necessary to touch up the bands during the winter, but it is quite certain that the extent of this labour will be considerably curtailed by thoroughness at first.

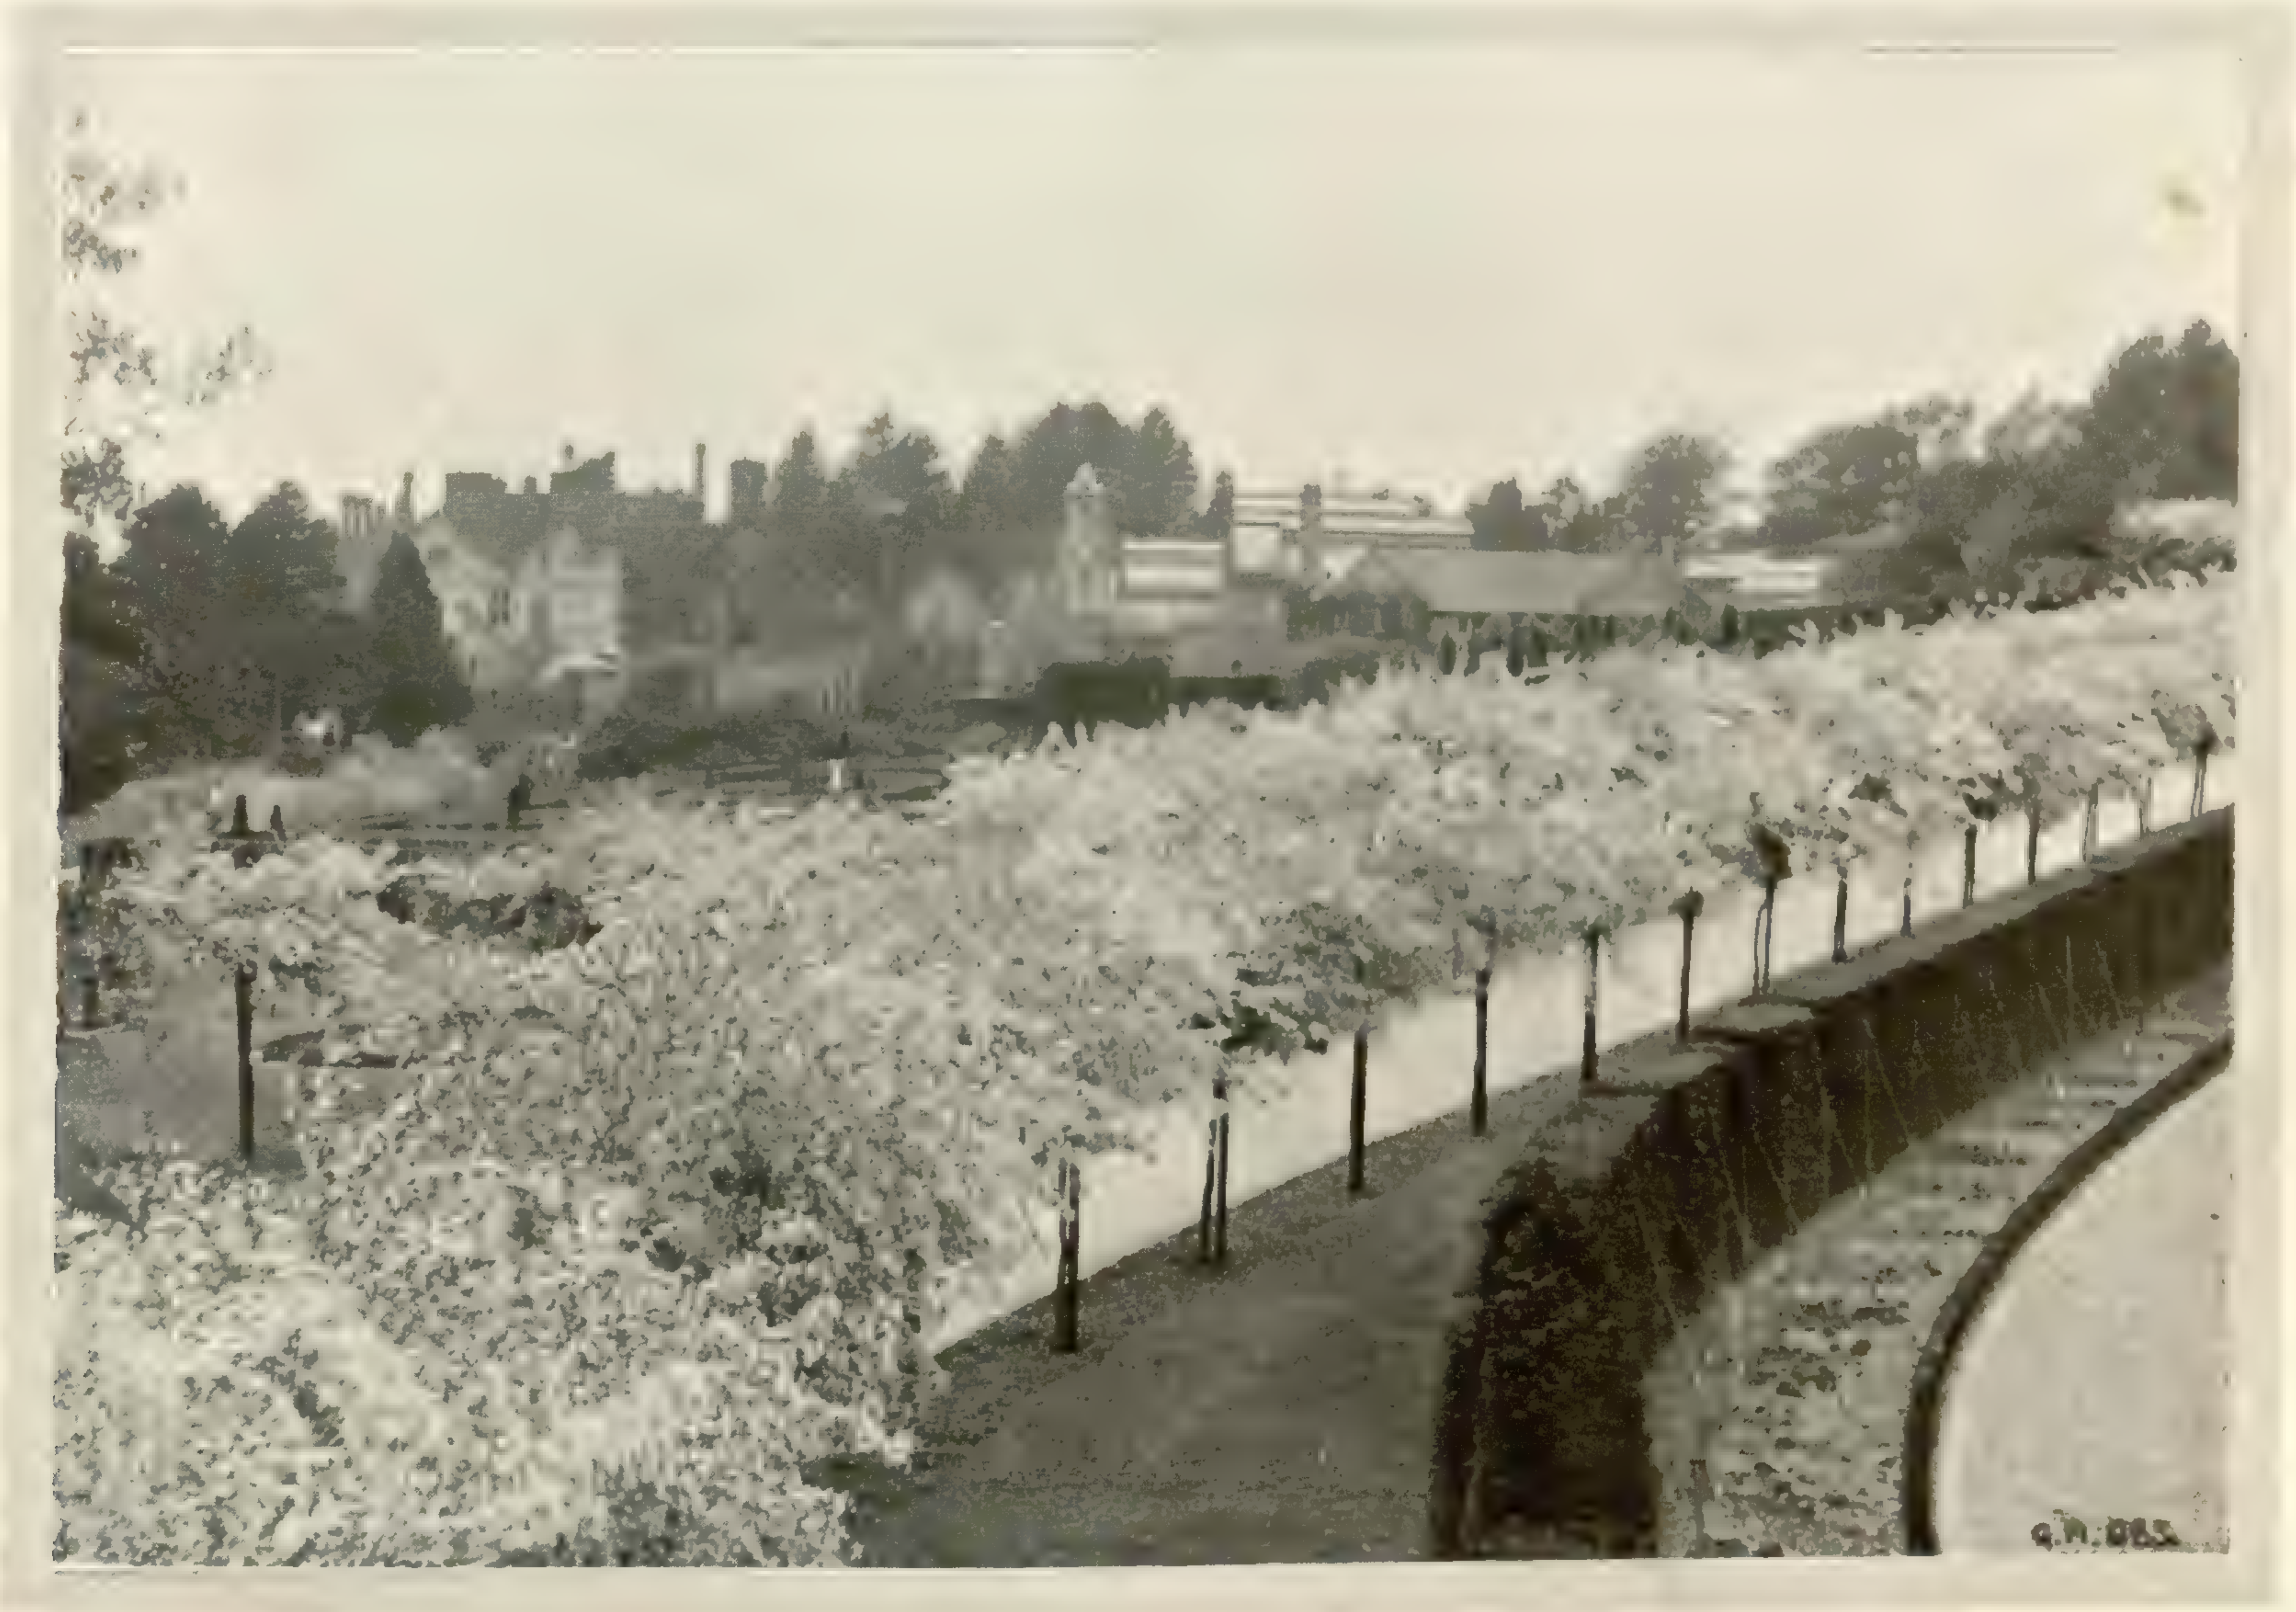
(To be continued.)

THE FLOWERING CRABS.

Few trees adapt themselves more readily to planting in various positions than do the many beautiful forms of Pyrus Malus now in cultivation. It is almost impossible to overestimate their worth, and certainly not their beauty, when, in the spring of the year, these are literally clothed with their wealth of flowers, the grandeur of which it would be difficult to surpass. Many other crabs are now producing fruit of a highly decorative character, thus considerably enhancing their value. Whether planted in the shrubberies, amongst other subjects (providing there is sufficient space for the tree to extend its long, semi-pendulous growths), or as isolated specimens on the grass or by the margins of streams or any form of water, these crabs will readily establish themselves, and develop into good specimens.



AVENUE OF PYRUS MALUS FLORIBUNDA AT PADDOCKHURST, SUSSEX.
The home of Sir Weetman D. Pearson, Bart.

At Aldenham we have several fine examples of Pyrus Malus floribunda on clean stems almost six feet high, with a spreading head of thirty to forty feet diameter, and these, when in full bloom, just as in the case of the avenue of those at Paddockhurst, create a sight which cannot fail to be appreciated.

Another feature connected with Pyrus Malus, and a valuable one, is the length of time the flowering period covers. Long before the flowers fully expand the buds, as they swell, assume a dark colour, and these, seen from a distance, are equally as pretty as the fully expanded flowers, which, when revealed, are of a more delicate colour in the interior.

P. M. floribunda atrosanguinea is a variety equally as vigorous in every way as the type, and it possesses the same character, but the flowers are of a more intense colour, being of a bright red, and perhaps in this respect, is a great improvement on the foregoing, though this is a matter of taste. The floribunda varieties produce fruit, but these are not so large or handsome as these of other kinds, though they are bright, and retained by the tree longer than is the case with many of the more showy flowering kinds.

P. Niedzwetzkyana, of more recent introduction, is a valuable addition, destined to take a foremost position amongst early-flowering trees and shrubs. The flowers are of a beautiful deep carmine colour, and the fruits almost black. P. Parkmanni is another exquisite crab, producing semi-double flowers of a rich colour, and is one which ought not to be overlooked.

P. spectabilis is another handsome flowering shrub or tree, commonly known as the Chinese crab; it produces a wealth of pink flowers in April. This forms an ideal subject for massing in the pleasure grounds, and creates a bold effect, both when in flower and later, when carrying the scarlet fruits in autumn. There are several varieties of this species, including one with double flowers, and also a white form. P. Scheideckeri is of garden origin, and the result of a cross between P. prunifolia and P. Malus floribunda. It is one of the most beautiful crabs we have, the flowers being freely produced, and of a delicate blush pink colour. It flowers early in May.

Among others which are more significant when fruiting than when in flower, perhaps the showiest and best is Beauty of Montreal, a greatly improved variety of P. baccata, the Siberian crab, which has this season carried a good crop of large highly coloured fruits, with a most agreeable flavour, so far as crabs go. The Siberian crab is itself frequently met with in gardens, and is a free and handsome fruiting tree. The Dartmouth crab is one of the oldest, and also one of the best of the ornamental fruiting class, and another variety, John Downie, is a fast-growing variety, producing very fine fruit, which is eagerly sought after for preserving, while two others I might mention are P. prunifolia fructu-luteo, and P. Ringo fastigiata bifera, which makes a fine pyramidal bush, and bears handsome double flowers and highly coloured fruits.

The best time for transplanting these crabs is the autumn, immediately the leaves have fallen. They will thrive almost anywhere, providing the ground is moderately well drained. At the time of planting, if a moderate supply of good manure be worked into the ground, this will do much to promote a free growth, and to more quickly establish the specimen.

E. Beckett.
Aldenham House Gardens, Elstree.

Pines and Abies Coning.—Doubtless many will have noticed the very large number of cones that have been produced this season, more especially on Picea nobilis. The cones on these trees are extraordinary, and large, too, from 9 to 10½in. long, and these look very handsome, especially when the sun is shining on them in the morning. Pinus strobus, Picea brachyphylla, Pinus picea, Pinus excelsa, Pinus sylvestris, Pinus muricata, P. Pallassiara, P. laricio, Abies Webbiana, A. nigra, A. excelsa, A. Nordmanniana, A. Veitchi, and Picea morindoides are all fine, and it is interesting to see how hard the small tits and other birds work to get the seeds out as soon as ripe. Their particular favourite, however, seems Pinus Pinea. The cedars are also coning very freely this season, and very handsome they look. It is sometimes said that when trees cone so freely growth is arrested, but in the cases of the trees I have quoted they are fine young healthy specimens.—W. A. Cook.

USEFUL SINGLE ROSES.

In the making of a selection of single roses of dwarf habit for garden decoration the cultivator whose knowledge of varieties is somewhat limited experiences some difficulty in the avoidance of mistakes. He will not have any trouble in obtaining a considerable number of single roses that are extremely beautiful, but he may, and probably will, include some that are of comparatively little value for the decoration of the garden, owing to the short duration of their season of flowering. There are a few of the summer-flowering varieties that are distinct in character and colour, and, moreover, so attractive when in bloom that they cannot well be excluded from a small selection, but they should form a small proportion of the number. The cultivator of single roses should endeavour to have a succession of flowers extending over as long a period as possible, and select from the hybrid teas and hybrid perpetuals.

Of especial value are the four single teas raised in Ireland, and introduced to cultivation some years since. They are, comparatively speaking, strong in growth, bloom profusely from early in the summer until the autumn is well advanced, and their large and elegant flowers are remarkably attractive. When cut at an early stage of development they are of much value for the filling of vases in the drawing-room, and for the decoration of the dinner table. With reference to their use in the dining-room, some of the most beautiful arrangements that have yet come under the notice of the writer were formed with these roses. The varieties referred to are Irish Beauty, an exquisite variety with pure white flowers having prominent yellow anthers. Irish Elegance, a highly effective variety, attractively coloured apricot-yellow and rose. Irish Glory, rose-crimson, very effective, and Irish Harmony, rich saffron-yellow, passing to cream-white, a most pleasing variety. A comparatively large bed devoted wholly to these varieties, in about equal proportions, would contribute greatly to the attractions of the gardens throughout the summer.

As a contrast to the foregoing, Cheshunt Scarlet is most desirable, for, unlike so many other of the hybrid perpetuals, it blooms freely and continuously throughout the season. The flowers are produced in good clusters, and the colour is deep rich scarlet. VIATOR.

The seat of the Duke of Portland.

DWARF BEDDING ROSES.

When planting rose beds the dwarfer growing bedding kinds must not be forgotten, for it is precisely these kinds which add refinement and finish to the rose garden. A mistake which is made in many cases is to plant beds of dwarf roses exclusively with varieties of much the same height and habit. I was much struck recently with a rose garden which, some two years ago, had been planted in this way. The colour scheme was good and effective, the varieties hardy, vigorous, and continuous blooming, and yet there was something lacking. Some experience in the arrangement of rose groups for exhibition, and also of rose gardens, enabled me to suggest the addition of some of the smaller growing kinds, and the suggestion was adopted and improved upon, with a result that is now very attractive. The existing beds were somewhat reduced in size, and smaller beds interposed at stated intervals between them. The addition of a few half-standards to each bed also helped. The new, smaller beds are either oblong, about 4ft. by 2ft., or circular, 2ft. across. The oblong beds were each planted with one variety of China or China-tea; the little round beds with pompon polyanthas. Also, round the outside of the roses in the original beds there were planted, as an edging, kinds corresponding to those in the new beds. As the result was so good, it may be useful to briefly record the names of those which were used to attain this effect.

The China variety, Madame E. Resal, the best bedding rose, was, of course, there, and her companion, Laurette Messimy. Souvenir de C. Guillot gave brightness, while Fabvier and Princesse de Sagan supplied the crimsons. The yellows presented some difficulty. Finally Queen Mab and Beryl were adopted. Queen Mab will have to come out, for it grew too tall, and it is proposed to replace it with Chin Chin, a very good new China. Beryl, on the other hand, is only partially vigorous. It may yet improve.

The above-named kinds were all more or less highly coloured, and as a relief the little round beds were planted with polyantha roses of lighter shades. These were Anna de Montravel, white; Rosalind, bright pink; Maman Levavasseur, bright pink; Eugenie Lamesch, yellow; Schneewitchen, white; and Frau C. Walter, canary and white.

It has been already said that some of the older existing beds were also edged with dwarfer kinds. One effect proved remarkable in its unexpected success, i.e., a large bed of Caroline Testout edged with Le Progres. But surely such effects may certainly be expected from the garden roses where colour, habit, and endless variety lend themselves to limitless possibilities. Only, in conclusion, let me add that small-growing kinds must be planted thickly, sometimes not more than 1ft. or 15in. apart. G. L. PAUL.

Cheshunt.

HERBACEOUS BORDERS.

It is the Editor's wish that I should say something about herbaceous borders. It is a large subject, and when he says that the article must be short there is some difficulty in making up one's mind what aspect to deal with.

Much has been written about herbaceous borders, and the most fantastic schemes expounded—I venture to say many of them not very practical. It is, however, true that in the making of a herbaceous border there is abundant scope for freshness, novelty, and effective arrangement. When one thinks of the vast number of plants now available, the ease with which they can be grown, and their comparatively small initial cost, it is safe to prophesy that this method of garden decoration will steadily increase. The true lover of herbaceous plants will always have his full pleasure out of a border which to those who aim at effect solely would be an eyesore.

The statement has been often made that a herbaceous border, to be effective, must be planted in bold groups, and that the mixed border is out of date. I know of one garden owner who was so convinced of the truth of this statement that he had it carried out in the most approved method, only to tire of it, and return to the mixed arrangement. Undoubtedly the mixed border has much to recommend it, for one of the chief charms of a herbaceous border is its infinite variety, and where the "big group" idea is carried out the variety must be greatly curtailed, as in most private gardens the space devoted to the class of plants grown in such borders is limited. The mixed border can also be made quite as effective, much freer, and more graceful than any system of grouping that I have yet seen.

I would say then to any about to plant herbaceous borders, have everything that is good and beautiful. Let your border be a treasure store of all that is worth having in hardy plants, and if effectively arranged it will be as bright and showy as the most effective bed of tender bedding plants you can possibly devise.

If there is a choice of position in the garden the border should be a winding one, and it should be fronted with a broad belt of grass, as is shown in the photo of a portion of one of the fine borders recently planted at Welbeck, and appearing in this issue. If the background should be of high trees or shrubs the position may be considered ideal. These conditions, however, in many cases, do not prevail, and one has to be content with a gravel path in front and a fence of roses or sweet peas as a background.

The soil to grow hardy plants well must be rich and of a fairly retentive character. The grower who has a light or gravelly soil will not obtain the same results as one who has a deep moist loam to deal with. The preparation of the border consists merely in trenching the ground and working in a good supply of farmyard manure. Few hardy plants object to the latter.

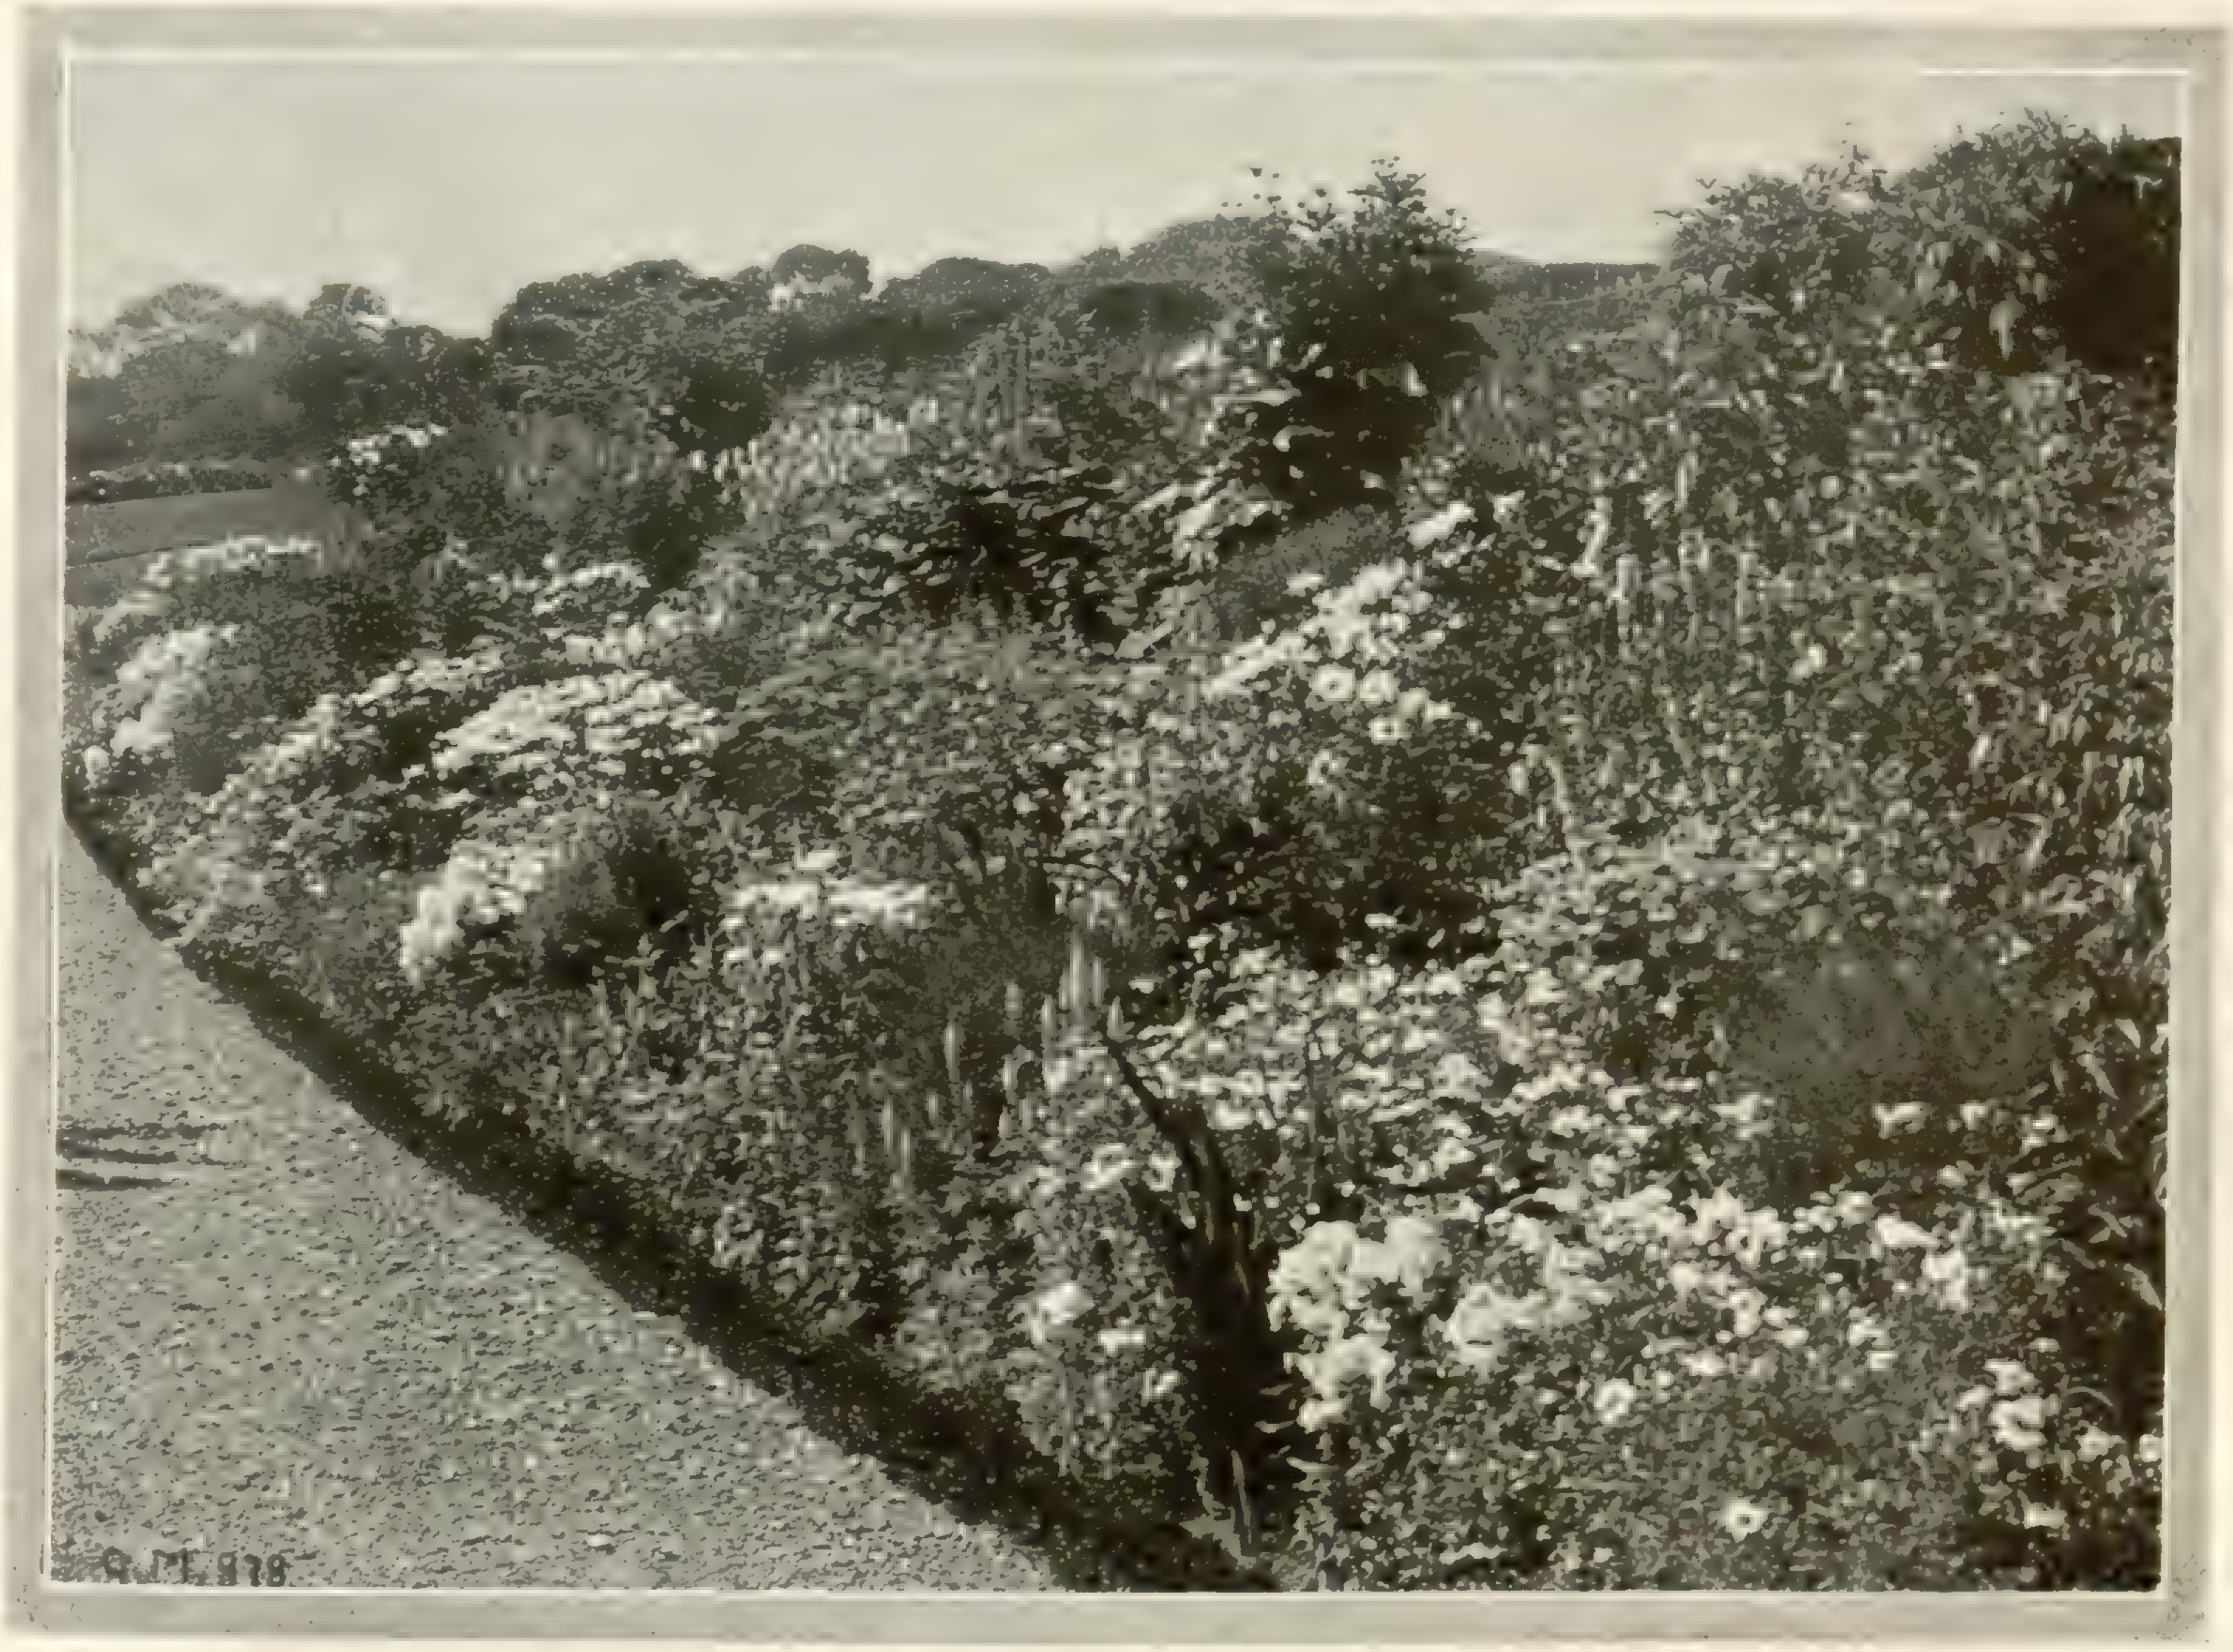
The width of the border is a question that gives rise to much difference of opinion, but there is no doubt that herbaceous borders, in a great many cases, are made too narrow. In a long stretch they may effectively be made of varying width, but where they must be all of one width I should recommend the width to be not less than sixteen feet. Then the planting of the border. The success of this will depend on the knowledge of hardy plants possessed by the planter.

It is not necessary to give a list, and there is no occasion to lay down the same rules regarding colour effects as in the case of a flower bed on a lawn, where certain combinations might not blend to please the eye. In the herbaceous border no plant stands out or is isolated from its neighbour. The whole should be a rich harmonious medley of colour. How close to plant is another question which requires consideration. While it is true that the plants should all have room to develop, the herbaceous border is always most effective when well filled up. There should be little room for the hoe, and none for the rake in a really good border.

Thos. Hay.

Hopetoun Gardens,
S. Queensberry, N.B.

[As Mr. Hay has not made any reference to the fine border devoted to hardy herbaceous plants in the gardens of Hopetoun House, it will be of interest to direct attention to the accompanying illustration of a portion of the border, as evidence of the great beauty and effectiveness of borders planted in accordance with the views expressed in the foregoing article. The photograph from which the illustration was reproduced was taken in the first week in August last, and it is not difficult to see that, contrary to the opinion of some writers, borders of hardy perennials may be made as attractive in that and the following month as at any other period during the summer.—Ed.]



A PORTION OF THE HERBACEOUS BORDER AT HOPETOUN HOUSE,
The seat of the Marchioness of Linlithgow.

September Rainfall at Leonardslee.—Mr. W. A. Cook tells us that the rainfall during September at Horsham was 3.16in. Rain fell on nineteen days, the greatest fall being on September 10 and 20, when the amount was .60 and .75in. respectively. For the nine months now ended the total rainfall is 20.06in., as against 20.93in. last year, so that the fall is still short, although this has been a wet season.

GROUPING RHODODENDRONS.

As the rhododendrons are such lovely flowering shrubs, and one section such valuable evergreens likewise, it is invidious to extol one particular group to the disparagement of another, while the same may be said of methods of planting, for each particular group, and each particular method of planting, has its own particular merits, and one could not be made to do duty for the other. In some instances vivid masses of colour formed by a large plantation of one variety call for admiration, in other cases groups of mixed varieties are thought to be very effective; and yet again, well grown isolated specimens seem peculiarly fitted to the surroundings. This being the case, each style of planting has to be studied separately, and it is well-nigh impossible to recommend one in preference to another.

The size of the garden is perhaps the best guide to the method of planting. Mixed groups are undoubtedly preferable for small gardens, for a greater variety of colour is obtainable, and the flowering season is extended over a longer period. For establishments of more pretentious dimensions, however, there is much to be said for large groups of a variety, the space around being ample to show off the boldness of each mass of colour to the best advantage. Such masses of colour owe much of their value to distance, for they exercise an alluring effect on the visitor, and, as he is irresistibly drawn nearer, he becomes more anxious to see what the plant is, while, on the other hand, if he suddenly finds himself before a large mass of brilliant colour in cramped surroundings he is inclined to think it rather out of place and vulgar. In such cases the value of the isolated plant is apparent, for, though a group of a dozen or a score might be quite out of place, there is ample room for a single specimen.

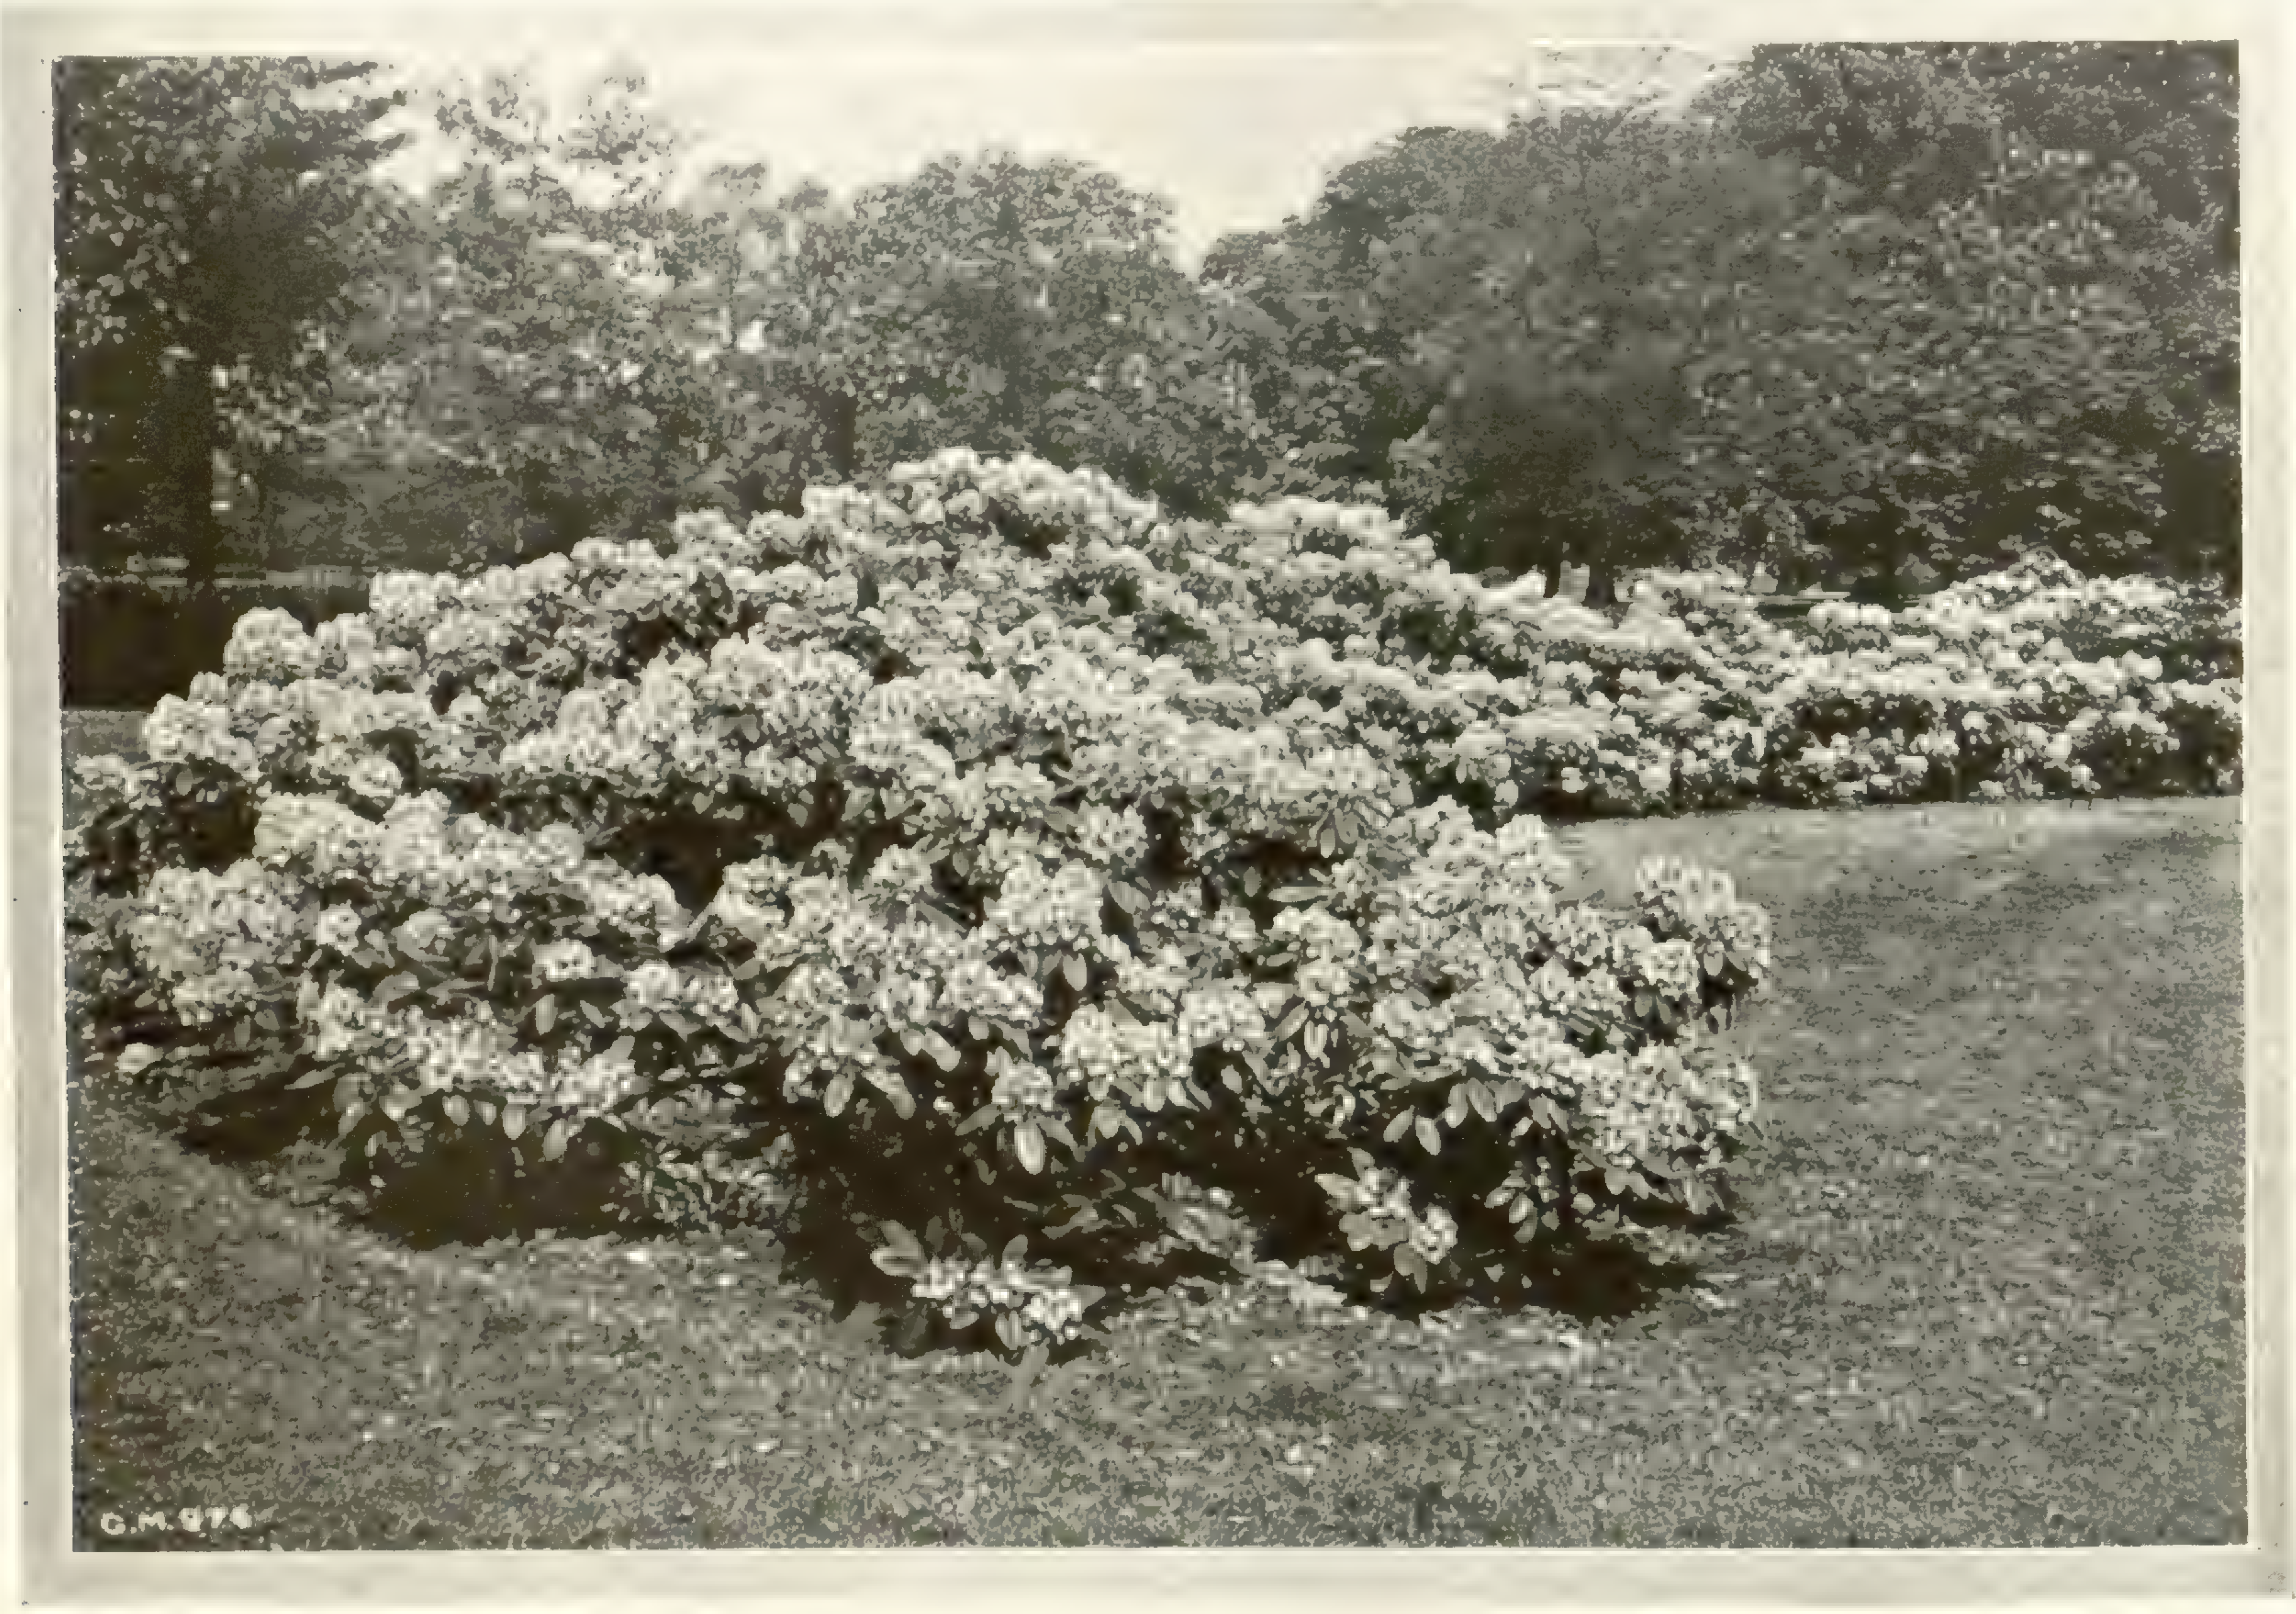
On hill sides these masses of single colours are sometimes placed to great advantage, whilst on the margins of extensive lawns, or standing well back from a carriage drive, they are commendable. A series of large beds, with considerable open spaces of closely-mown grass between, and wide avenues leading away in different directions, can be made effective, especially if the beds can be arranged on undulated ground. When planting these beds, however, care must be taken to arrange the various colours so that they do not clash with each other, for the evergreen varieties of rhododendron cannot be so easily dealt with in this respect as their deciduous relatives. Here, again, the usefulness of the single specimen comes in, for a good isolated specimen, in addition to relieving the sameness of the beds, serves as a break between colours which would not look well side by side.

For trimly-kept parts of the garden these groups have necessarily to be in the form of more or less formal shaped beds, and almost any variety can be used, providing it is not of stiff, upright habit, those in which the branches fall to the ground and clothe the bases being the best. If small examples are planted it will be necessary in a few years' time to thin them out, and a further thinning may be necessary a few years later, for a mature group is more effective when it contains a small number of well-grown plants which show some appearance of individuality, than when a greater number of plants are allowed to grow together and form a dense mass. In the event of transplanting being necessary at any period, the former plants can be lifted and used again, while in the latter case the plants are straggly and useless.

The subject of grafted and layered plants needs some consideration. In the former case a strict lookout has to be kept to provide against suckers growing and impoverishing the plant. A sucker may be easily overlooked, and do considerable damage before it is discovered, and after a few years, when its flowers make its presence conspicuous, a large gap is caused by its removal. On the other hand, layered plants are safe against any such mishap.

The selection of varieties needs care, for though the majority of the best sorts are suitable for masses, one particular sort will not do in any position. For instance, the very bright reds are not suitable for dark or dull corners, or for planting in woodland. The whites, mauves, and other subdued colours are infinitely more effective in such places. For any position that will make the plants look as if they are naturalised nothing is more serviceable than the common R. ponticum, and, left alone, with ample room for development, huge specimens are quickly formed which blossom with the greatest freedom.

For open places, such as the outskirts of lawns, the following eighteen varieties will be found first rate: Everestianum, rosy-lilac; Frederick Waterer, fiery crimson; Gomer Waterer, white, slightly flushed, fine truss; John Waterer, carmine; Kate Waterer, rosy-crimson; Lady Clementine Mitford, rose, fine truss; Lord Wolseley, scarlet; Michael Waterer, scarlet-crimson; Minnie, white, orange blotch; Mrs. Holford, salmon-pink; Doncaster, crimson, dwarf; Mrs. John Clutton, white; Mrs. William Agnew, pale rose with brighter edge; Pink Pearl, flesh pink; Queen, white; Sappho, white, black spots; Strategist, pink; Lord Palmerston, rosy-crimson. The accompanying illustration of this last-named variety gives a good idea of its suitableness for massing. It forms one of a series of beds which border the principal walk at Kew between



AN EFFECTIVE GROUP OF RHODODENDRON LORD PALMERSTON, AT KEW.
Flowers freely borne in large trusses, and of a rich shade of rose-crimson.

the main gate and the Palm House. With one exception each bed contains a single variety, and as these differ somewhat from the list already given, a list of them is appended, together with varieties used for single beds and groups in other parts of the gardens. Snowflake, white: Minnie, The Warrior, dark red; John Walter, red; Sappho, Madame Carvalho, white; Lady Clementine Mitford, Everestianum, John Waterer, James Nasmyth, lilac, dark blotch; Michael Waterer, Lord Palmerstone, fastuosum flore pleno, Mrs. Anthony Waterer, light, yellow blotch; Mrs. E. C. Stirling, white, flushed pink; James Macintosh, Mrs. Charles Sargent, light red; Charles S. Sargent, red; Mrs. William Agnew, Mrs. R. G. Shaw, Lady Grey Edgerton, Edith A. Boulton, pink (this is a Fortunei hybrid, which was raised at Kew); Johnstoni, bright red; Broughtoni, rosy-crimson; Ascot Brilliant, rich red; and Pink Pearl. All are good sorts, and should prove acquisitions in a collection.

Kew. W. Dallimore.

ORCHARD HOUSE FRUITS.

The growing interest in the cultivation of fruits in orchard houses has led me to make a few remarks relative to the means whereby we are able to obtain good crops of excellent fruit at Ferniehurst, the residence of G. C. Waud, Esq. We are, at Baildon, only two and a-half miles from the centre of Halifax, and we are in a manufacturing district, with lots of busy little towns and villages all around us. It will thus be seen that we do not start with any special advantages; indeed, the smoke and chemically-charged atmosphere must be regarded as severe handicaps, and yet our success has been wonderful.

The orchard house at Ferniehurst is made of teakwood, and is 80ft. long and 18ft. wide. It is provided with two rows of four-inch pipes along each side, and, as the illustration shows, the trees are raised from the ash-covered floor by means of a plank staging. There are three rows of fruit trees along each side of the central path. The front rows are raised a foot from the floor, the second row sixteen inches, and the two middle rows twenty inches. This is a somewhat unusual method, but it answers well in a lofty house, and has the merit of bringing the trees near the light in a smoky district. The staging is grooved, so that water passes away freely, and, though attention to watering entails a little extra labour, the trouble is amply compensated for.

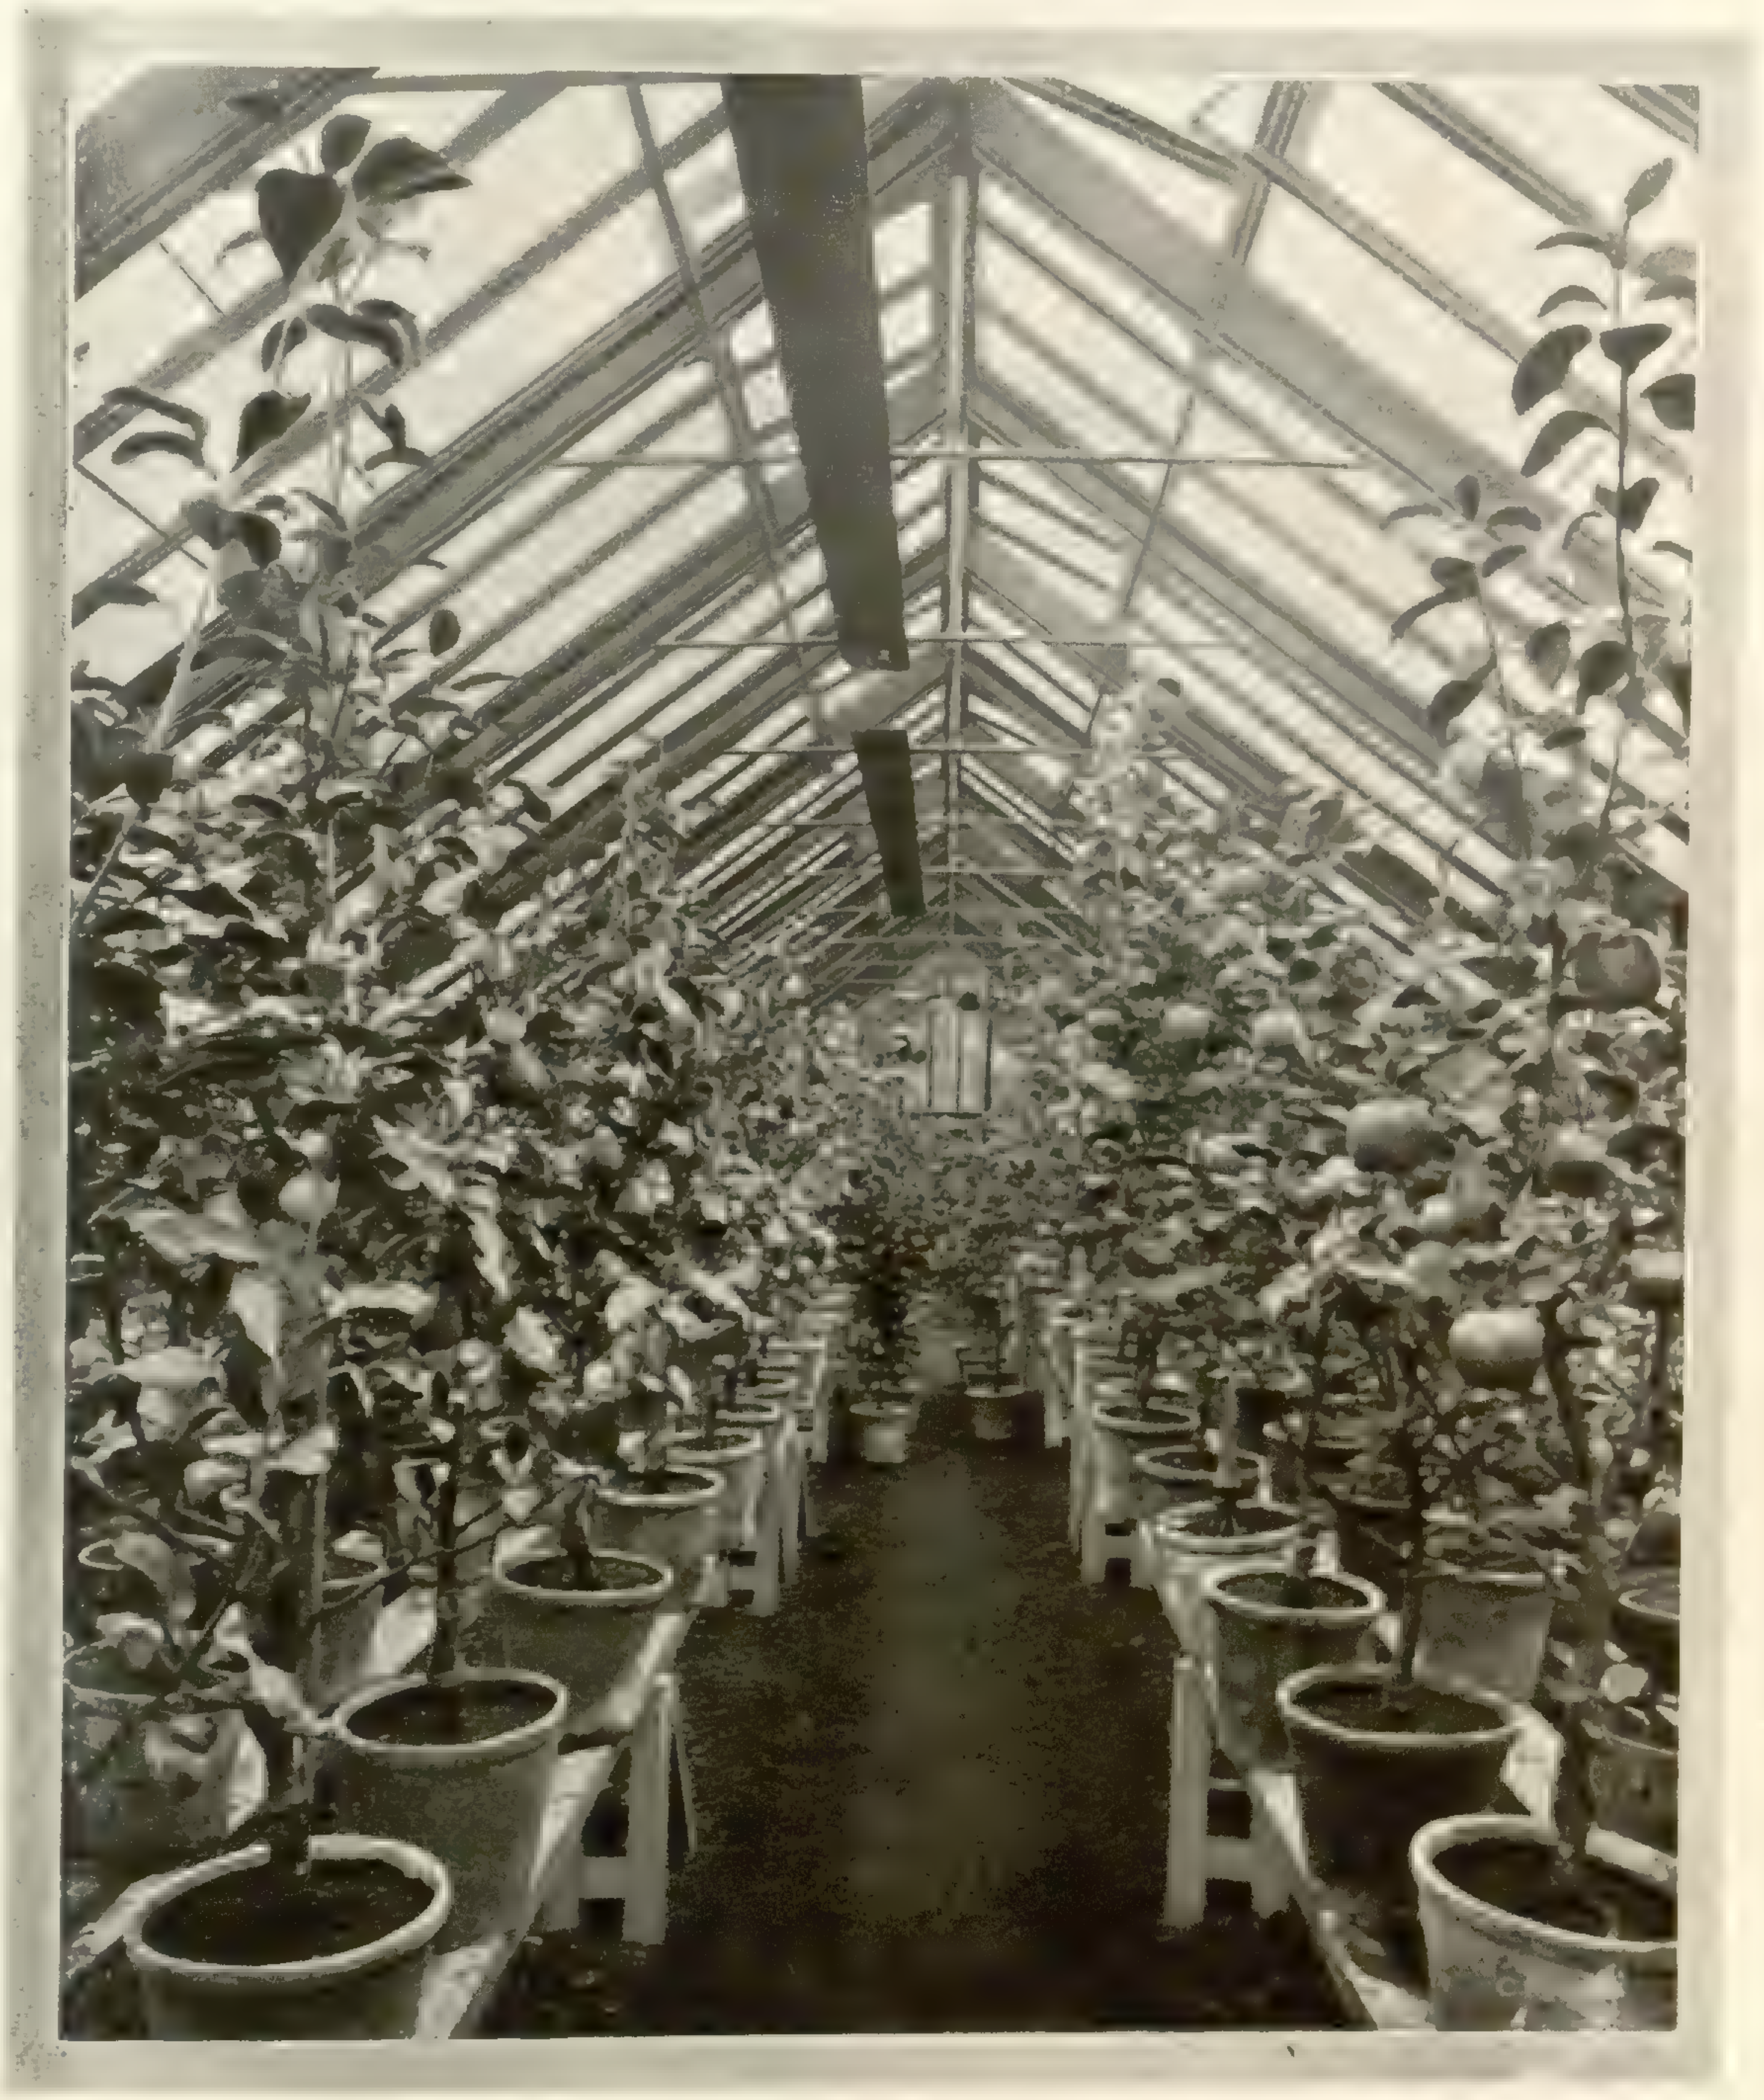
One division, 20ft. long, is set apart for peaches and nectarines that are forced in the usual way. We commence about the middle of January, and at the time the illustration was taken these had all given their crops.

The 60ft. division is kept quite cool, except in any severe weather, when a little heat is turned on. We grow apples, pears, plums, cherries, and apricots, and commence about the end of February by lightly syringing the trees once daily until the flowers begin to open. We pay close attention to fertilisation, and use a rabbit's tail to distribute the pollen. Constant and careful attention to watering is given the whole season through, and after the fruits have set the syringe is used freely.

Thinning the crop is an important item; we remove the surplus fruits a few at a time, and when those left to ripen have reached the size of a walnut we begin to feed with liquid manure twice a week, and frequently damp down the house with liquid manure. As the fruits swell up we increase the feeding, and occasionally dress the surface soil with a good artificial fertiliser. As growths develop the more vigorous ones are pinched at the sixth well-developed leaf, and all succeeding growths to the third leaf. The number of fruits per tree must be governed by its vigour and variety; from twelve to twenty-four is about the range. Each fruit must be carefully supported.

Occasional fumigation will keep aphides in check; caterpillars must be hunted after; and damping down with liquid manure will prove fatal to red spider.

After the fruits are gathered our trees are plunged out of doors in a sunny position, and well supplied with water and liquid manure to enable them to ripen up their wood and buds for another season.



ORCHARD HOUSE AT FERNIEHURST, BAILDON, YORKSHIRE,
With apple and pear trees in pots, carrying fine crops of fruit.

In September our peaches and nectarines are potted or top-dressed, as necessary, and then we follow on with the apricots, cherries, plums, and pears, finishing up with the apples early in November. The compost we use is two-thirds of good loam and one-third of decayed manure, with a little mortar rubble and bonemeal added. After the trees are potted we use the syringe freely until the leaves fall, and then we cover the pots with litter until we take the plants indoors about the middle of December.

The following are the varieties we grow: Peaches.—Diamond, Duke of York, Barrington, Crimson Galand, English Galand, Duchess of Cornwall, Gladstone, Thomas Rivers, Rivers' Early, Hales' Early, and Royal George. Nectarines.—Early Rivers, Byron, Newton, Pineapple, and Lord Napier. Apricots.—Royal and St. Ambrose. Plums.—Green Gage, Victoria, Monarch, Blue Rock, Stint, and Coe's Golden Drop. Cherries.—Knight's Early Black, Black Eagle, Elton, May Duke, Empress Eugenie, and Bigarreau Jaboulay.

Apples.—Gladstone, Beauty of Bath, Rivers' Early Peach, Lady Sudeley, Thomas Rivers, Cox's Pomona, Blenheim Orange, Ribstone Pippin, Mother, Cox's Orange Pippin, Washington, King of the Pippins, Worcester Pearmain, King of Tomkins County, Buckingham, Peasgood's Nonsuch, Allington Pippin, Gascoigne's Scarlet, and Emperor Alexander. Pears.—Jargonelle, Clapp's Favourite, Williams' Bon Chretien, Beurre d'Amanlis Souvenir du Congres, Louise Bonne of Jersey, Beurre Hardy, Marie Louise, St. Luke, Conference, Pitmaston Duchess, Doyenne du Comice, and Princess.

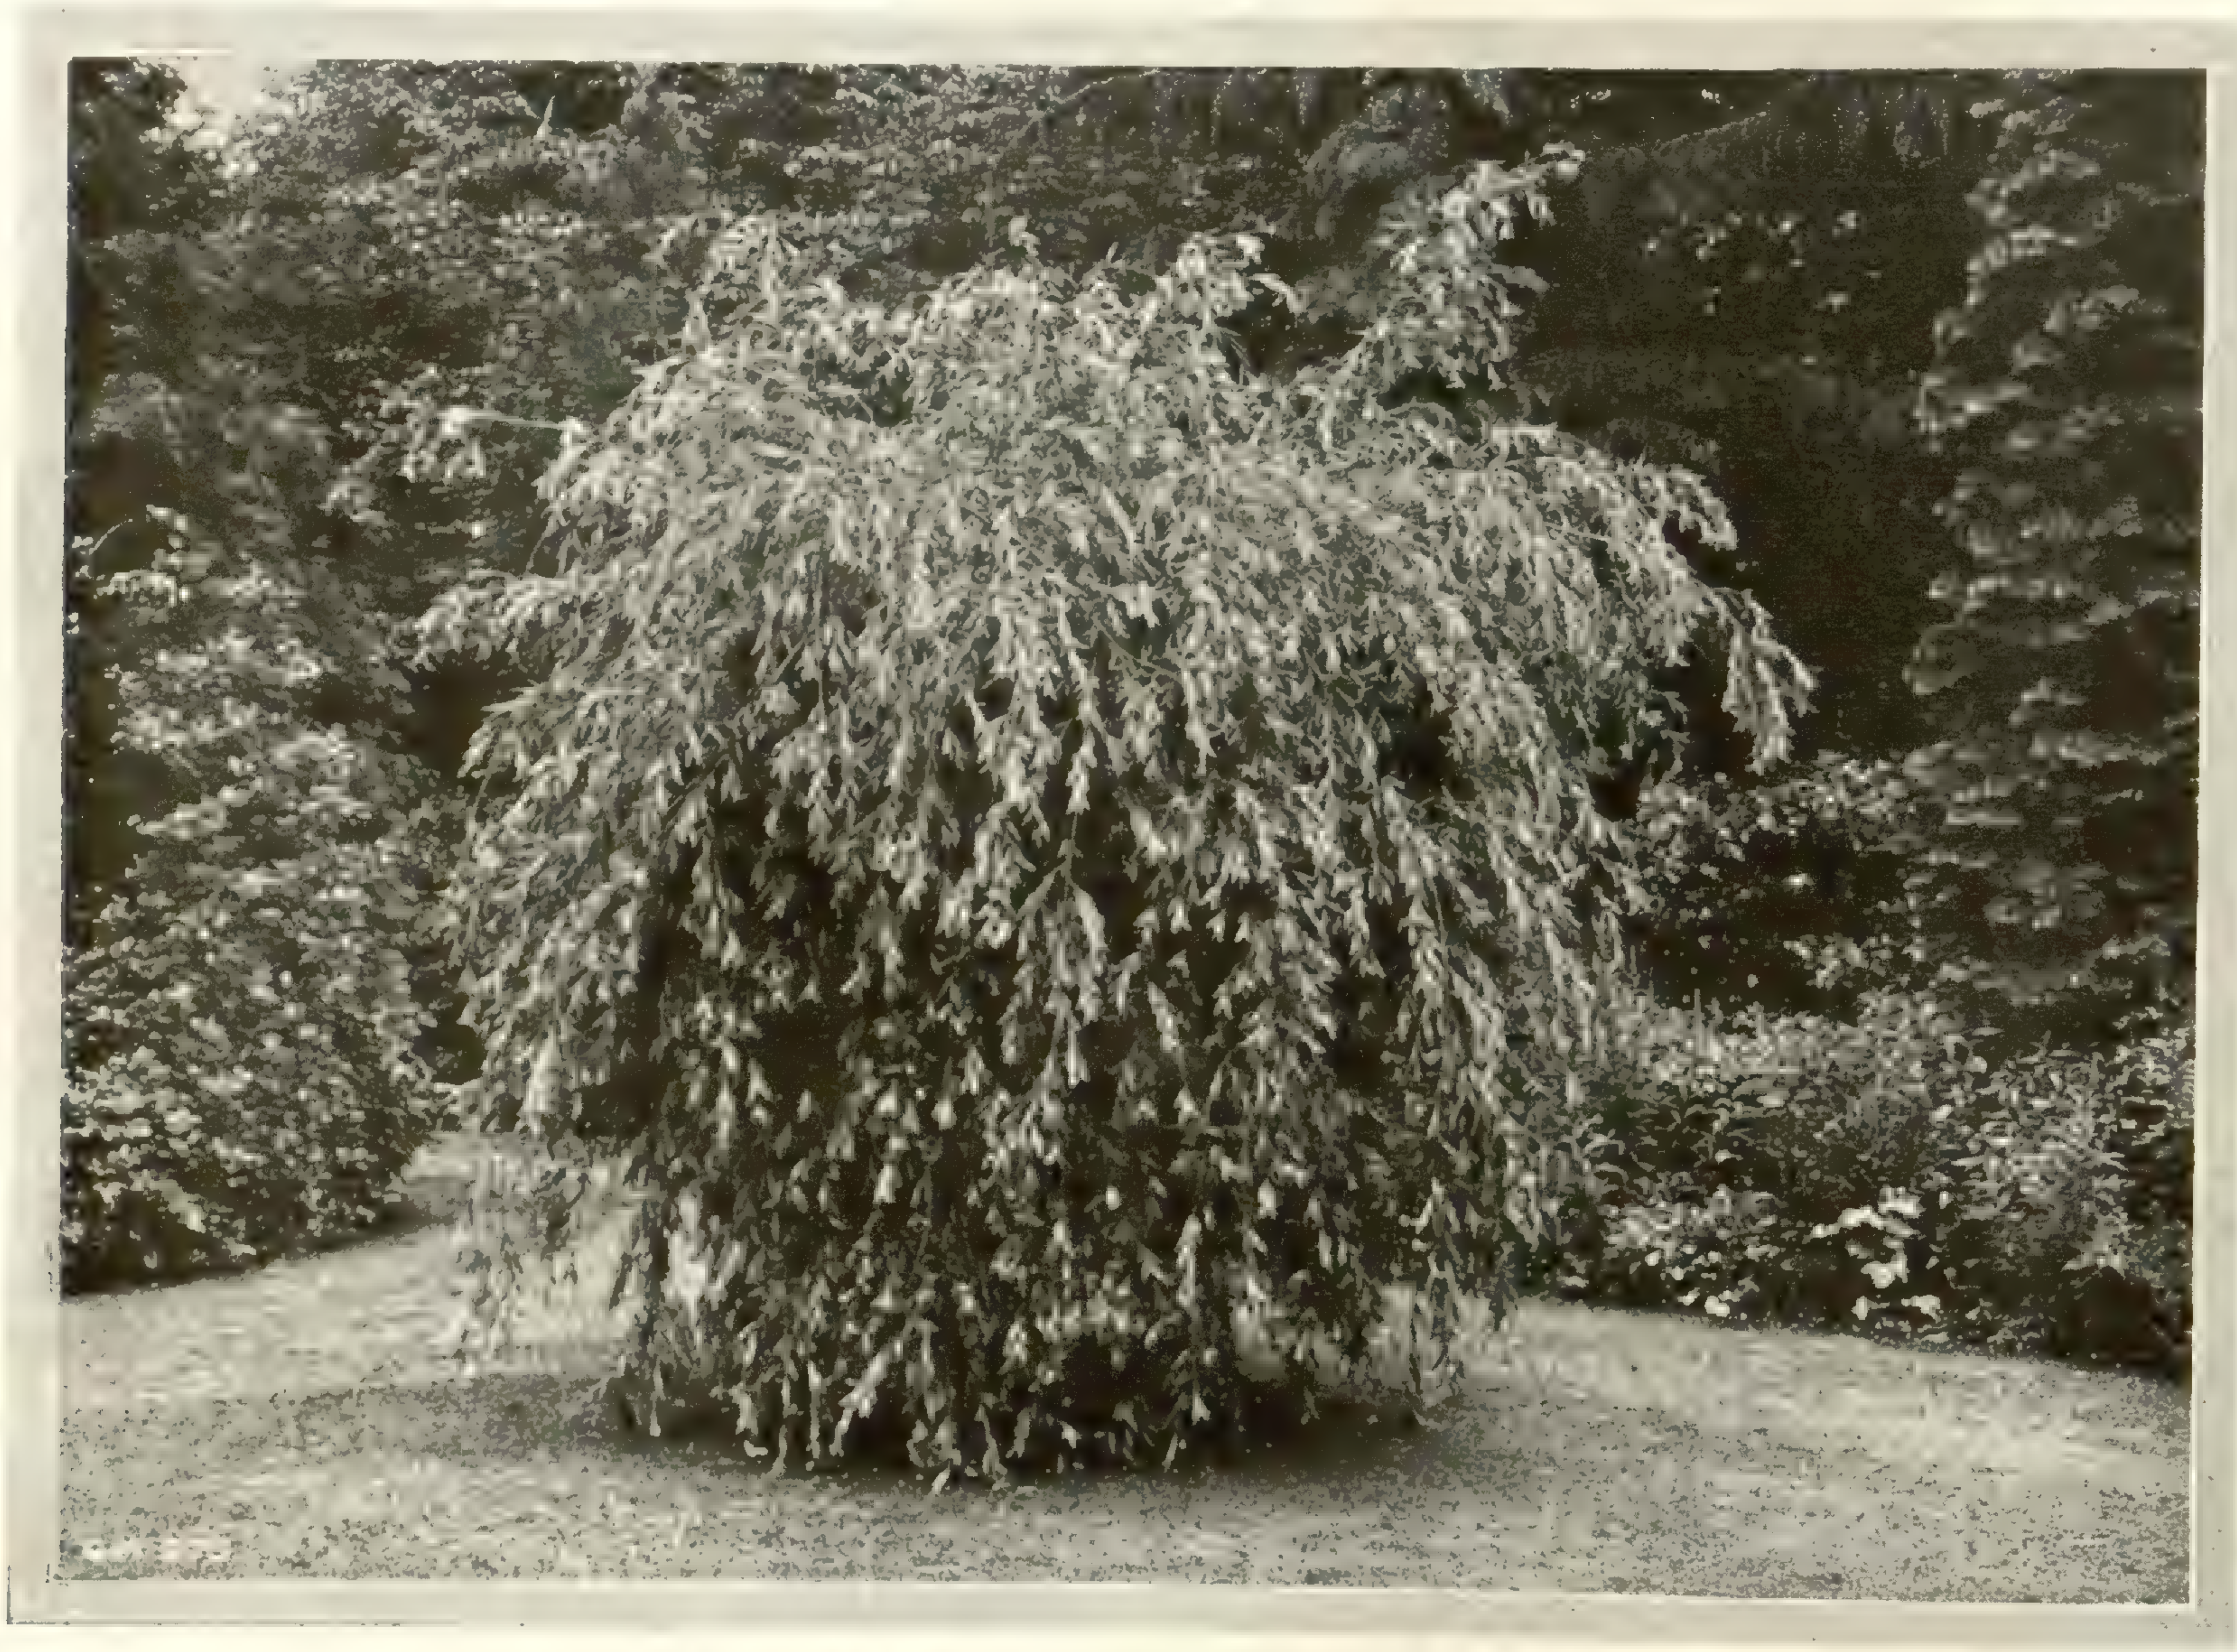
Wm. Taylor.

Ferniehurst Gardens,
Baildon, Yorks.

Roses for Town Gardens. At the next meeting of the London branch of the British Gardeners' Association, to be held at Carr's Restaurant (near the Law Courts), Strand, W.C., on Thursday, October 14, at 8 p.m., a lecture will be given by Mr. C. Hill, entitled "Roses for Town Gardens." The chair will be taken by Mr. E. F. Hawes, of the Royal Botanic Gardens, Regent's Park. All professional gardeners are invited to attend, whether members of the B.G.A. or not.

WEEPING TREES FOR THE GARDEN.

Certain of the hardy trees that have a pendulous habit of growth present so elegant an appearance when sufficiently developed to show their distinctive characteristics that some of the best should be represented in gardens large enough to allow the planter some scope for the exercise of his judgment when making a selection. Planted in positions where they can attain to a comparatively large size without the pruning-knife being used, except it may be for preserving their contour, and where their graceful habit can be seen to the best advantage, they form a distinct and attractive feature. Weeping trees must, however, be planted sparingly, and care be taken to select positions for the several kinds that appear to be specially suited for the display of their peculiarities of growth.



SALIX ALBA VITELLINA PENDULA NOVA.
A handsome specimen of this attractive Weeping Willow in the gardens of Presdales, Ware, the residence of A. G. Sandeman, Esq.

When considering the question of adding trees of pendulous habit to the garden, it is important to limit their number to the positions that appear especially adapted to weeping trees, and to the very best forms of the respective kinds. When planted in otherwise than small numbers they fail to enhance the attractions of the garden, and it may be they will be somewhat monotonous. No number can be stated as advisable, because so much depends upon the area of the garden, and the positions especially appropriate to trees of this class that it may contain; but, speaking in a general way, six or seven kinds will suffice for gardens having a considerable area. The following selection includes the best of the weeping trees, and there should be no difficulty in selecting from those enumerated the kinds most suitable for the positions that any garden may afford.

Weeping Birch.

There are several forms of the common birch (Betula alba), distinguished by their pendulous habit, and they all possess much grace and beauty. They, however, differ in relative merit, and the best for general planting is undoubtedly Young's weeping birch (B. alba pendula Youngi). This form is moderately vigorous in growth, and the long, slender shoots droop in a graceful manner, and give a well-developed specimen much the appearance of a glistening fountain. It should be given a somewhat open position, but whether in the highly-dressed grounds or in the wild garden matters not, but preferably it should be away from the water side.

Weeping Beeches.

There are two weeping beeches that deserve consideration, and these are the weeping beech (Fagus sylvatica pendula), and the purple weeping beech (F. sylvatica purpurea pendula). The first-named is a very handsome tree when fully developed, as in the case of the remarkably fine specimen, herewith illustrated, in the grounds of Eridge Castle. Beautiful as is the weeping beech when it has attained to considerable dimensions, it must be said that it is a tree for large grounds rather than for the small garden. During the earlier period of development the trees are somewhat eccentric in growth, and for some years they are more curious than beautiful, and not particularly desirable to have constantly under the eye. The purple weeping beech is somewhat similar to the other weeping form during the early period of growth, but the peculiarity is not quite so highly developed, and the rich colouring of the leaves adds so materially to its attractiveness as to render it desirable in the majority of gardens, it being equally suitable for large and moderate areas.

Weeping Ash.

The weeping form of the common ash (Fraxinus excelsior) is one of the best known and most popular of weeping trees, and the high estimation in which it is held is well deserved. It is equally suitable for dry positions in the higher parts of the garden, and for fringing the margin of a lake. In the magnificent gardens of Welbeck Abbey the weeping ash (F. excelsior pendula) is used with singularly good effect on the margin of the lake that skirts the pleasure grounds for a considerable distance. There are, perhaps, a dozen or more large, finely-developed trees, and arranged some distance apart on the margin of the lake, they contribute materially to the charm of the scene. In many cases the weeping ash fails to produce a good effect, owing to it being worked on too short a stem. For small gardens trees on 8ft. stems will be suitable, but in gardens where room enough can be given them to grow to a large size 10ft. stems will be preferable. The common ash and its varieties are the most exhausting of trees, and have the power of sending their roots surprisingly long distances in quest of nourishment; consequently, the weeping variety should not be planted near beds and borders devoted to choice plants or shrubs of moderate growth.

Weeping Cherries.

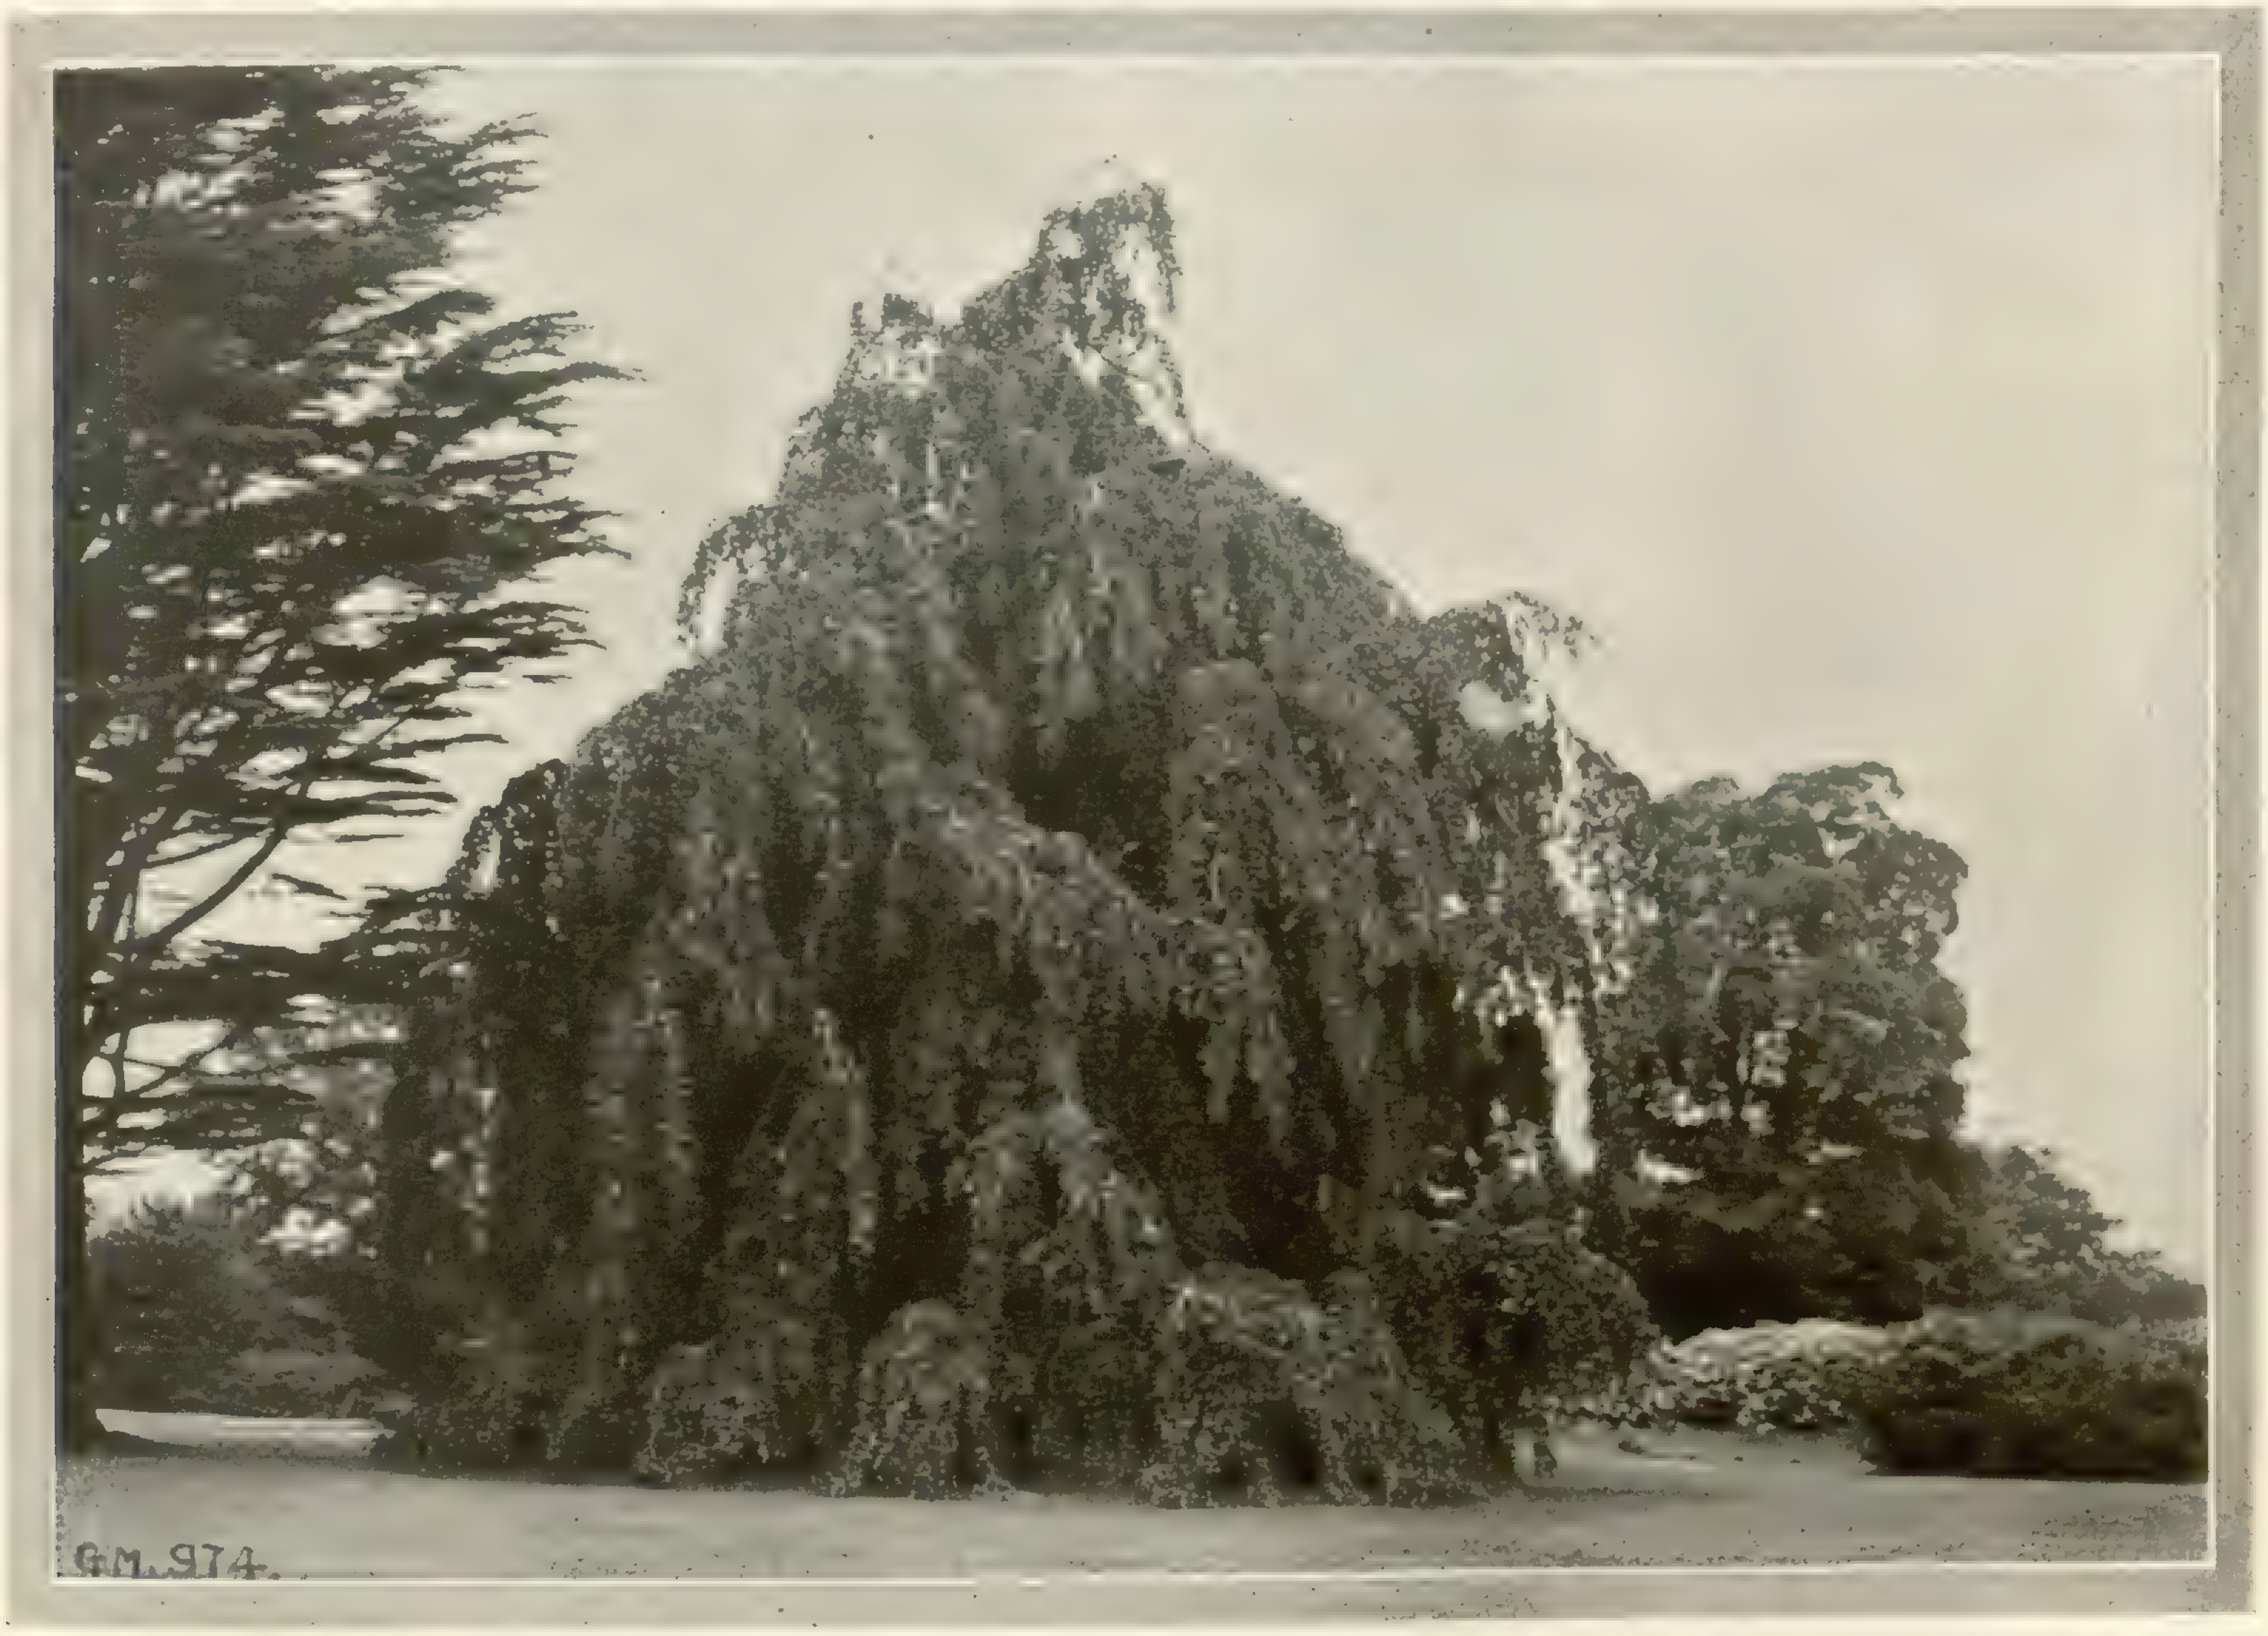
There are several weeping cherries, and, as they are rendered additionally attractive in spring by a profuse production of flowers and are of moderate stature, three may be mentioned as deserving a position in gardens with even a moderate area. These are Cerasus Avium Juliana pendula, C. Mahaleb pendula, one of the most graceful of trees; and C. sinensis pendula, a very beautiful pendulous form of the single pink Japanese cherry. These may be planted in open positions, and also in spacious borders.

Weeping Hollies.

There are several weeping hollies that deserve attention both for their attractiveness and for their small stature, the last-named characteristic rendering them of much value for planting on the lawns of gardens of the smallest size. The varieties especially desirable are Perry's weeping (Ilex aquifolium argentea pendula), a handsome form with silvery variegation; Waterer's gold weeping (I. aquifolium aurea pendula), a distinct variety with comparatively smooth leaves broadly margined with gold; and the green-leaved weeping (I. aquifolium pendula).

Weeping Aspen.

The poplars of pendulous habit of growth are not numerous, and of the few forms in cultivation the weeping aspen (Populus tremula pendula) is the one best suited for planting in gardens. It is of moderate growth, has an elegant habit, and the continuous movement of the leaves which is so striking a peculiarity of the aspen is especially attractive in the weeping form.



FAGUS SYLVATICA PENDULA.
A magnificent specimen of the Weeping Beech at Eridge Castle, the seat of the Marquis of Abergavenny.

Weeping Mountain Ash.

The common mountain ash (Pyrus Aucuparia) is a handsome tree of elegant aspect, but in gracefulness it is surpassed by the weeping mountain ash (P. Aucuparia pendula). This fine form is attractive at all times, and is especially so in the spring when in bloom, and in the autumn when the large clusters of fruit have taken on their brilliant colouring. The weeping mountain ash is of moderate growth, and well adapted to both large and small gardens.

Weeping Willows.

The willows include several weeping forms of considerable merit, and of these three may be specially recommended. The first of these is the golden weeping willow (Salix alba vitellina pendula nova), which does not appear to be very generally known, or to have obtained a place in the leading catalogues. The habit of this graceful form is admirably shown in the accompanying illustration of a well-developed specimen in the gardens of Presdales, Ware, the residence of A. G. Sandeman, Esq. As in the case of the erect form, the bark is a bright yellow, and the leaves are greyish-green, and the specimen is especially attractive when seen against the background of sombre-hued trees. It is an ideal tree for the small garden. The "weeping willow" (S. babylonica) is so well known as not to require any reference being made to it except to say that it is the best of all weeping trees for the waterside. The Kilmarnock weeping willow (S. Caprea pendula) is a handsome variety of considerable value for planting in the wild garden; and the American weeping willow (S. elegantissima) has much to recommend it for planting in small gardens. It is of comparatively low growth, and has slender shoots and narrow greyish leaves.

Weeping Wych Elm.

Several weeping elms are deserving of the attention of those who are engaged in planting on a large scale, but for the present purpose it will suffice to mention the weeping wych elm (Ulmus montana pendula), which is one of the most distinct and handsome of weeping trees. While handsome at all stages, the weeping habit is the most highly developed in the earlier stages, and trees of moderate age are decidedly the most attractive. When the trees attain to a considerable age the branches assume a more horizontal position and the leaves are much smaller. The weeping wych elm is usually seen occupying an open position, but at Thoresby, the seat of the Earl Manvers, it is assigned a secluded position and trained to resemble a low, broad tent, and the effect is remarkably good. Although of comparatively large growth the tree may, by judicious pruning, be kept to comparatively small dimensions without its graceful habit being in any way marred. G. G.

HARDY CLIMBERS.

When making a selection of climbers for pergolas, verandahs, pillars, trellises, or walls, due consideration should be given to the district, situation, position, and locality. Though soils play an important part in the growth of all plants, these, on a limited scale, can be made to suit each class of plants. The situation, too, in a measure, can be improved by the aid of shelter, but the climatic conditions cannot be altered in the least.

It is now generally understood that frosts are more prevalent in low-lying places than on higher or more elevated ground, and are more severe. Though the rainfall is not so great in flat districts, there is usually more moisture in the atmosphere, especially if the soil be of a stiff, retentive nature, therefore all these things should be taken into consideration before planting is commenced if one is to be successful. The frost is not more severe in some places in the South of Scotland than it is in the South-east of England; but though this is so, the latter district can boast of far more sunshine, especially early in the year, and the rainfall is usually considerably less. Here, though sixteen miles inland, we are only about one hundred feet above the sea level, and, as a rule, we can see the snow on the hills long after it has disappeared in the valley, and many would no doubt come to the conclusion that it was much colder on the hills; but if we take the average we shall find there is not much difference, for the nights are warmer on the hilly ground, while in the valleys the days are not so cold. I have often known a difference of from ten to fifteen degrees on the same night in different parts of this village, there being as much as six hundred feet variation in the elevation. On the higher ground such plants as Berberidopsis corallina, Carpenteria californica, Desfontania spinosa, will stand the most severe winters without the least protection, while down in the valleys such are usually killed to the ground. Therefore, in making a selection intending planters should be guided in a measure by the situation, and the position the garden is placed in.

Among climbing and trailing plants there are many very beautiful subjects, and some ought to be planted for the beauty of their foliage, others on account of their free flowering habit, and others for their fragrance, for if due attention be paid to their requirements in the way of pruning and training they are sure to give pleasure. I have purposely excluded from this list all mention of roses, for though there is an almost endless variety of these, it would be best to treat of their merits separately.

Pergolas are often made of trelliswork on each side of a path, having open work at the top. In making a selection of climbers for such places only the most hardy should be chosen, as these structures are often erected in the most exposed places, not the least consideration having been given to their position as regards suitability for plant culture; but where the situation is a sheltered one, and other things suitable, some of the choicest climbers and trailers will show themselves to advantage. It is a mistake to plant peat-loving subjects amongst those which require a rich fertile loam. Better by far keep each class separate, and those of a rampant habit ought to be kept away from those whose growth is more compact, and when two or more species are planted side by side, and these flower at the same time, the colours ought to be so arranged that they harmonise. White flowers will go with any colour, just as green leaves do, but not so pinks, blues, purples, etc.

There are many very pretty varieties of both the small and large flowered sections of clematis, and amongst the latest additions we find C. Armandi, C. montana rubens, and C. montana Wilsoni, the latter flowering quite late in the season. There are also some very fine foliaged plants amongst the recent introductions of ornamental vines, such, for example, as Vitis Thomsoni, V. megalophylla, V. Coignetiæ, and V. Thunbergi. These plants are useful for furnishing pillars where a bold effect is required, as their foliage is very telling. There are also many of the loniceras that are useful for this purpose, such as L. sempervirens, L. flexuosa, L. Hildebrandti, etc. Berberis stenophylla, with its soft drooping flowers; forsythias, Solanum jasminioides, wistarias, bignonias, and Akebia quinata are all worthy of a place. Most of these plants like a rich, well-drained soil, and if the situation is not too exposed they will grow most luxuriantly.

For low walls those kinds that do not grow so rampantly should be selected, as they will not need such constant attention in the way of pruning and training. Amongst these will be found Carpenteria californica, ceanothuses in variety, Choisya ternata, and Cratægus Lelandi. Escallonias are some of the most beautiful of plants, and as they flower for a long period they are very attractive; E. montevidensis produces terminal trusses of white flowers, while E. Langleyensis has small pink-coloured flowers dotted all over the young growths. Grevillea rosmarinifolia produces its small clusters of red-coloured flowers in early spring when but few other plants are in bloom. The common myrtle, pittosporums, photineas, Benthamia fragifera, Viburnum macrocephalum, and others are also useful for this purpose.

When choosing plants to cover tall buildings it is well to select those which cling closely to the wall, as such require less attention in the way of nailing or fastening. There is nothing more unsightly than large pieces of climbers hanging loosely from the walls. Such plants as Ampelopsis Veitchi, and some of the small-growing ivies, are very useful for this purpose.

Regarding plants for trellises, much will depend on what these structures are intended for, their height, and surroundings. If only required to hide some unsightly building a few feet high, then slow-growing trailing plants of an evergreen character will be found most useful; but if the trelliswork is erected for the purpose of training plants to for ornament, then some of the more choice species should be chosen, especially if the position is suitable, but there is no pleasure in looking at plants whose foliage has been disfigured by cold, blasting winds, or that look sickly owing to the situation being too exposed. Some people object to variegated foliaged plants, while others admire them. Among this class Euonymus radicans marginata variegata is a most useful subject. No one who has not seen it used for covering buildings could have any idea of its beauty in winter. We usually see it employed as a dwarf edging plant, but here, trained to a wall or fence, it grows to a height of ten or fifteen feet in a short time, the foliage being more than twice the usual size, and the plant in winter is covered with clusters of red berries. If the colour of the foliage is objected to in summer, then plant Tropæolum speciosum against it, as the dark green foliage of this, with its deep red flowers, will make a decided contrast. Some people have a difficulty in getting the latter to establish itself, and well they might, considering the miserable little bits often sent out in pots. If good strong roots, about the thickness of a goose quill, are procured, and these planted in a rich, moist soil, they will send up growths the first year from ten to a dozen feet long, which will flower most profusely for at least a couple of feet of their length. When once established it is difficult to get rid of, as every bit of root will grow. In addition to the plants above-named, there are many annuals suitable for covering such structures, some of which flower most profusely, but space will not admit of their consideration here.

H. C. Prinsep.

Buxted Park Gardens.

Sedum spectabile sanguinea is a deep crimson form of an old but exceedingly useful garden plant. This new-comer is likely to become indispensable in the autumn garden, as it succeeds under most trying conditions, and maintains its vigour even when battling with the hungry roots of shrubs. It throws up stout stems—a stem for every bud contained in the crown in spring—bearing thick fleshy leaves of a glaucous grey colour, so that when in bloom the contrasted colours of leaves and flowers produce a good effect. Established plants attain a height of fifteen inches, and spread out laterally for a distance of thirty inches or more. This sedum is easily increased by cuttings; old stools are broken to pieces, and each shoot inserted singly in pots, or placed in boxes of sandy soil, and kept moist, will soon form a good plant.—Thomas Smith.

STANDARD ROSES.

Given a proper selection of varieties there is no reason why roses in standard form should not be as popular as was the case thirty to forty years ago. In fact, with more care in selection, helped by the many good varieties introduced during the past two decades, this form of culture has become more promising than before. Perhaps in no case is it more necessary to bear in mind the growth and habit of any desired rose than when cultivating standards.

And what a grand choice we have. One can have them in weeping form, or as free-growing heads carried well above any flowers it may be desired to cultivate beneath. Another advantage of standards is found when growing any variety that has naturally pendant blossoms. When these are cultivated as dwarfs we seldom obtain a clean flower; even if the weather permits this, the blooms themselves are not seen to advantage. As examples, I may mention Mrs. Edward Mawley, Maman Cochet and its grand white counterpart Souvenir d'un Ami—one of our oldest favourites—Vicomtesse Folkestone, Grace Darling, and Marechal Niel. When the latter is doing well upon a standard no rose can surpass it.

But it is when we come to the newer forms of ramblers upon standards that the benefit of this stock is most evident. The drooping habit of their long branches of flowers being shown off to the best advantage. One point that can scarcely be insisted upon too strongly is the supporting of all standard stems, so as to avoid damage from wind as far as possible, and the consequent chafing of branches. There are many methods of securing these stems. Larch poles and strips of pitch pine are among the best. I do not care to have these dipped into tar or creosote, as in the case with hop poles, feeling certain more harm is thus done to the roots than most imagine. I have found ordinary galvanised gas or water pipes very useful. They are straight, strong, very durable, and have not so clumsy an appearance as larger wooden supports. With wooden stakes it so often happens the bottom rots about the time when the plants have grown well, and consequently need more support than ever, and the piping, especially when painted a drab colour, is not too conspicuous, makes the more permanent support, and can be utilised many times. Care must be taken to avoid chafing where the stem is secured. A band of leather or woollen material is preferred to hay or straw.

As a rule, standard roses are planted with an idea of occupying the same position for a considerable time, and hence it is even more necessary to thoroughly prepare the soil. Move it, no matter what its nature, to a depth of at least two feet—three feet is not too much. The class of manure to be added depends upon the natural constituents of the soil. As a general rule, it is well to take out a barrowload of this and replace with turfy loam, adding a good proportion of well-rotted manure. Let this and the loam be thoroughly incorporated, and be sure to plant firmly, and stake at once. Do not make the mistake of deep planting, thinking thus to aid in supporting the plant. I think it is even more advantageous to get in standard roses early than in the case of dwarfs.

Just a word about protection. This is not so easy as with dwarfs, and, consequently, I would avoid growing any but the hardiest varieties. But some of our best roses are tender, and thrive so much better when upon the hedge briar. In this case keep them upon the short standards, when you can protect them better. About the best plan of protection we have found is to tie some branches of fir or birch twigs among and around the heads of tender sorts. Bracken may be put in the centre if the position is very exposed. But think of this point when deciding what varieties to plant, i.e., you can have any desired colour in quite hardy form, a point of no small importance to amateurs who have but little spare time that they can devote to their garden.

Many exhibitors, especially in the case of tea-scented and hybrid tea roses, prefer growing them upon eighteen-inch to two-feet briars, the advantage being in keeping the flowers further from the ground, and avoiding rain splashes. These half-standards also produce better developed flowers than dwarfs in many cases.

[Photo: F. Mason Good.

A BEAUTIFUL GROUP OF STANDARD ROSES

In the gardens of Foxhill, Reading, the residence of Rufus Isaacs, Esq., K.C., M.P.

A few of the best ramblers or weeping roses can be selected from the following, of which I only give a brief description:

Dorothy Perkins, soft light pink, one of the very best: too well known to need more than that it is one of the most reliable. Its white counterpart makes a grand contrast, and if we plant Gardenia (a golden yellow, coming paler as it ages) in conjunction with this, a very pleasing contrast is obtained.

Delight, a newer variety, and much later in flowering than the above, bears large clusters of bright carmine flowers, white at the base, and filled with yellow stamens. A good summer and autumn flowerer: still in bloom (October).

Minnehaha is a brighter and improved form of Dorothy Perkins, and produces immense trusses of very double and rosette-formed flowers. It does not appear to give a few autumn or late summer blooms as in the case of Dorothy Perkins, but lasts well, does not fade, and is very sweet-scented.

Evangeline is one of our largest single roses, and also the hardiest. Flowers 2½ inches across, in clusters. The tips of the petals are clear carmine-pink. One of the most showy of all when grown in weeping form.

Claire Jacquier affords a clear nankeen-yellow shade, and large clusters of small shapely flowers, very showy and effective: but this is one of the tender varieties, and needs a warm corner.

Aimée Vibert scandens and Felicité Perpetué are two of the best creamy-whites. The first is more perpetual flowering than the other, but the last makes a grand show during August, just after so many of the other climbers are over.

Electra is one of the first to flower, producing its clusters of small, semi-double blossoms, that are clear yellow at first, passing away to almost milk-white.

Hiawatha is indispensable among this section. It gives large trusses of the most brilliant scarlet, with a well-pronounced yellow and white centre, and showy stamens. This rose also berries well in the autumn.

Wichuraiana Type, the white form, is grand. Although giving only a small single blossom, these are produced so freely and continuously that it forms a cascade of white for two months of the season, and this at the latter end, when most welcome.

Madame Alfred Carrière, blush, almost white, is one of the freest, as well as the sweetest scented of roses. It droops over almost as freely as Dorothy Perkins, and is also grand as a wall or pillar rose.

Rêve d'Or gives us a larger form of deep buff yellow, and is one of the hardiest. A very strong grower, and flowering best when limited to well-ripened growths of the previous season.

Trier is one of the best late bloomers, and is almost continuous. A creamy-white, with yellow anthers. Forms a grand head, but does not droop over so freely as some.

William Allen Richardson gives the best deep orange-yellow, and is exceptionally showy in standard form.

Elisa Robichon, rose, shaded pale yellow, is semi-double, an almost constant bloomer, very early, and one of the most charming miniature blossoms in the bud state.

Many more might be named, but the above give a good selection of colours, and have all been proved. The taller the stems used for these drooping roses the better the effect, and being of such vigorous growth they are able to draw sufficient nourishment through a longer stem than those of less rampant habit.

In the normal form of standard roses the stems range from three to four feet, and here many of the freer-growing hybrid teas and hybrid perpetuals are very suitable. Among the best dark crimsons are Victor Hugo, Captain Hayward, General Jacqueminot, and Fisher Holmes. In pinks we cannot miss Mrs. John Laing, Caroline Testout, Mrs. R. G. Sharman Crawford, La France, and Killarney; while for whites Frau Karl Druschki is pre-eminent. Viscountess Folkestone, Augustine Guinoisseau, and La Tosca are grand varieties as blush-whites approaching to cream. Yellows can be found in Le Progres, Madame Ravary, Souvenir de Pierre Notting, and a grand newer variety is Madame Pol Varin-Bernier, one of the sweetest roses grown.

Finally, plant early, and firmly, and never attempt to grow any but the freest and strongest habited varieties.

Uckfield. A. Piper.

SUMMER AND AUTUMN RASPBERRIES.

For use in tarts, and for preserving, the raspberry is one of the most valuable of our small fruits, and it is profitably grown in both market and private gardens. My present remarks upon it will, however, chiefly refer to preparing plantations in private gardens.

Being indigenous to Britain, its cultural requirements are comparatively simple, yet successful crops of fruit cannot be obtained unless considerable pains are taken to secure them, and it is to conditions not wholly favourable that my notes will especially apply.

Although raspberries will succeed in most soils, provided they are properly prepared, a deep, moderately light loam, situated in an open position, best suits them. In any case, the land should, if necessary, be drained, be bastard trenched at least two feet in depth, and heavily dressed with farmyard manure. Heavy or clayey land will be greatly benefited by being thoroughly dressed with charred soil from the rubbish heap, or other material of a similar character. On poor light soil the staple should receive rich additions of a cooling, substantial nature. This work should be completed while the land is tolerably dry, and in time for it to become settled before the planting season.

If not at hand, well-rooted strong young suckers should be secured from a nursery as soon as their leaves fall, and when received the roots, if dry, should be moistened, have their damaged parts removed, and, if the weather and other conditions permit, be at once planted. In arranging for planting, especially where neatness is a consideration, it is a good practice to have suitable wire trellises fixed at six feet apart across the plot to be planted, and against these the plants should be placed two feet apart. Spread the roots about three inches deep in fine soil, making this firm around them; mulch with partially decayed stable litter, and loosely secure the canes to the trellises. Towards the end of February the canes should be cut down to nine inches or one foot from the ground, and, should they be weak, still lower. This is important, in order to ensure the production of strong suckers. In subsequent years, when the plants have become established, the fruiting canes should be trained at about eight inches apart, the strongest being selected for the purpose. These remarks refer to summer fruiters.

In the case of autumn fruiting varieties, which produce their fruit upon the current year's growths, the suckers should be well thinned soon after starting into growth, the strongest being left to fruit. In February these should be cut down to the ground level.

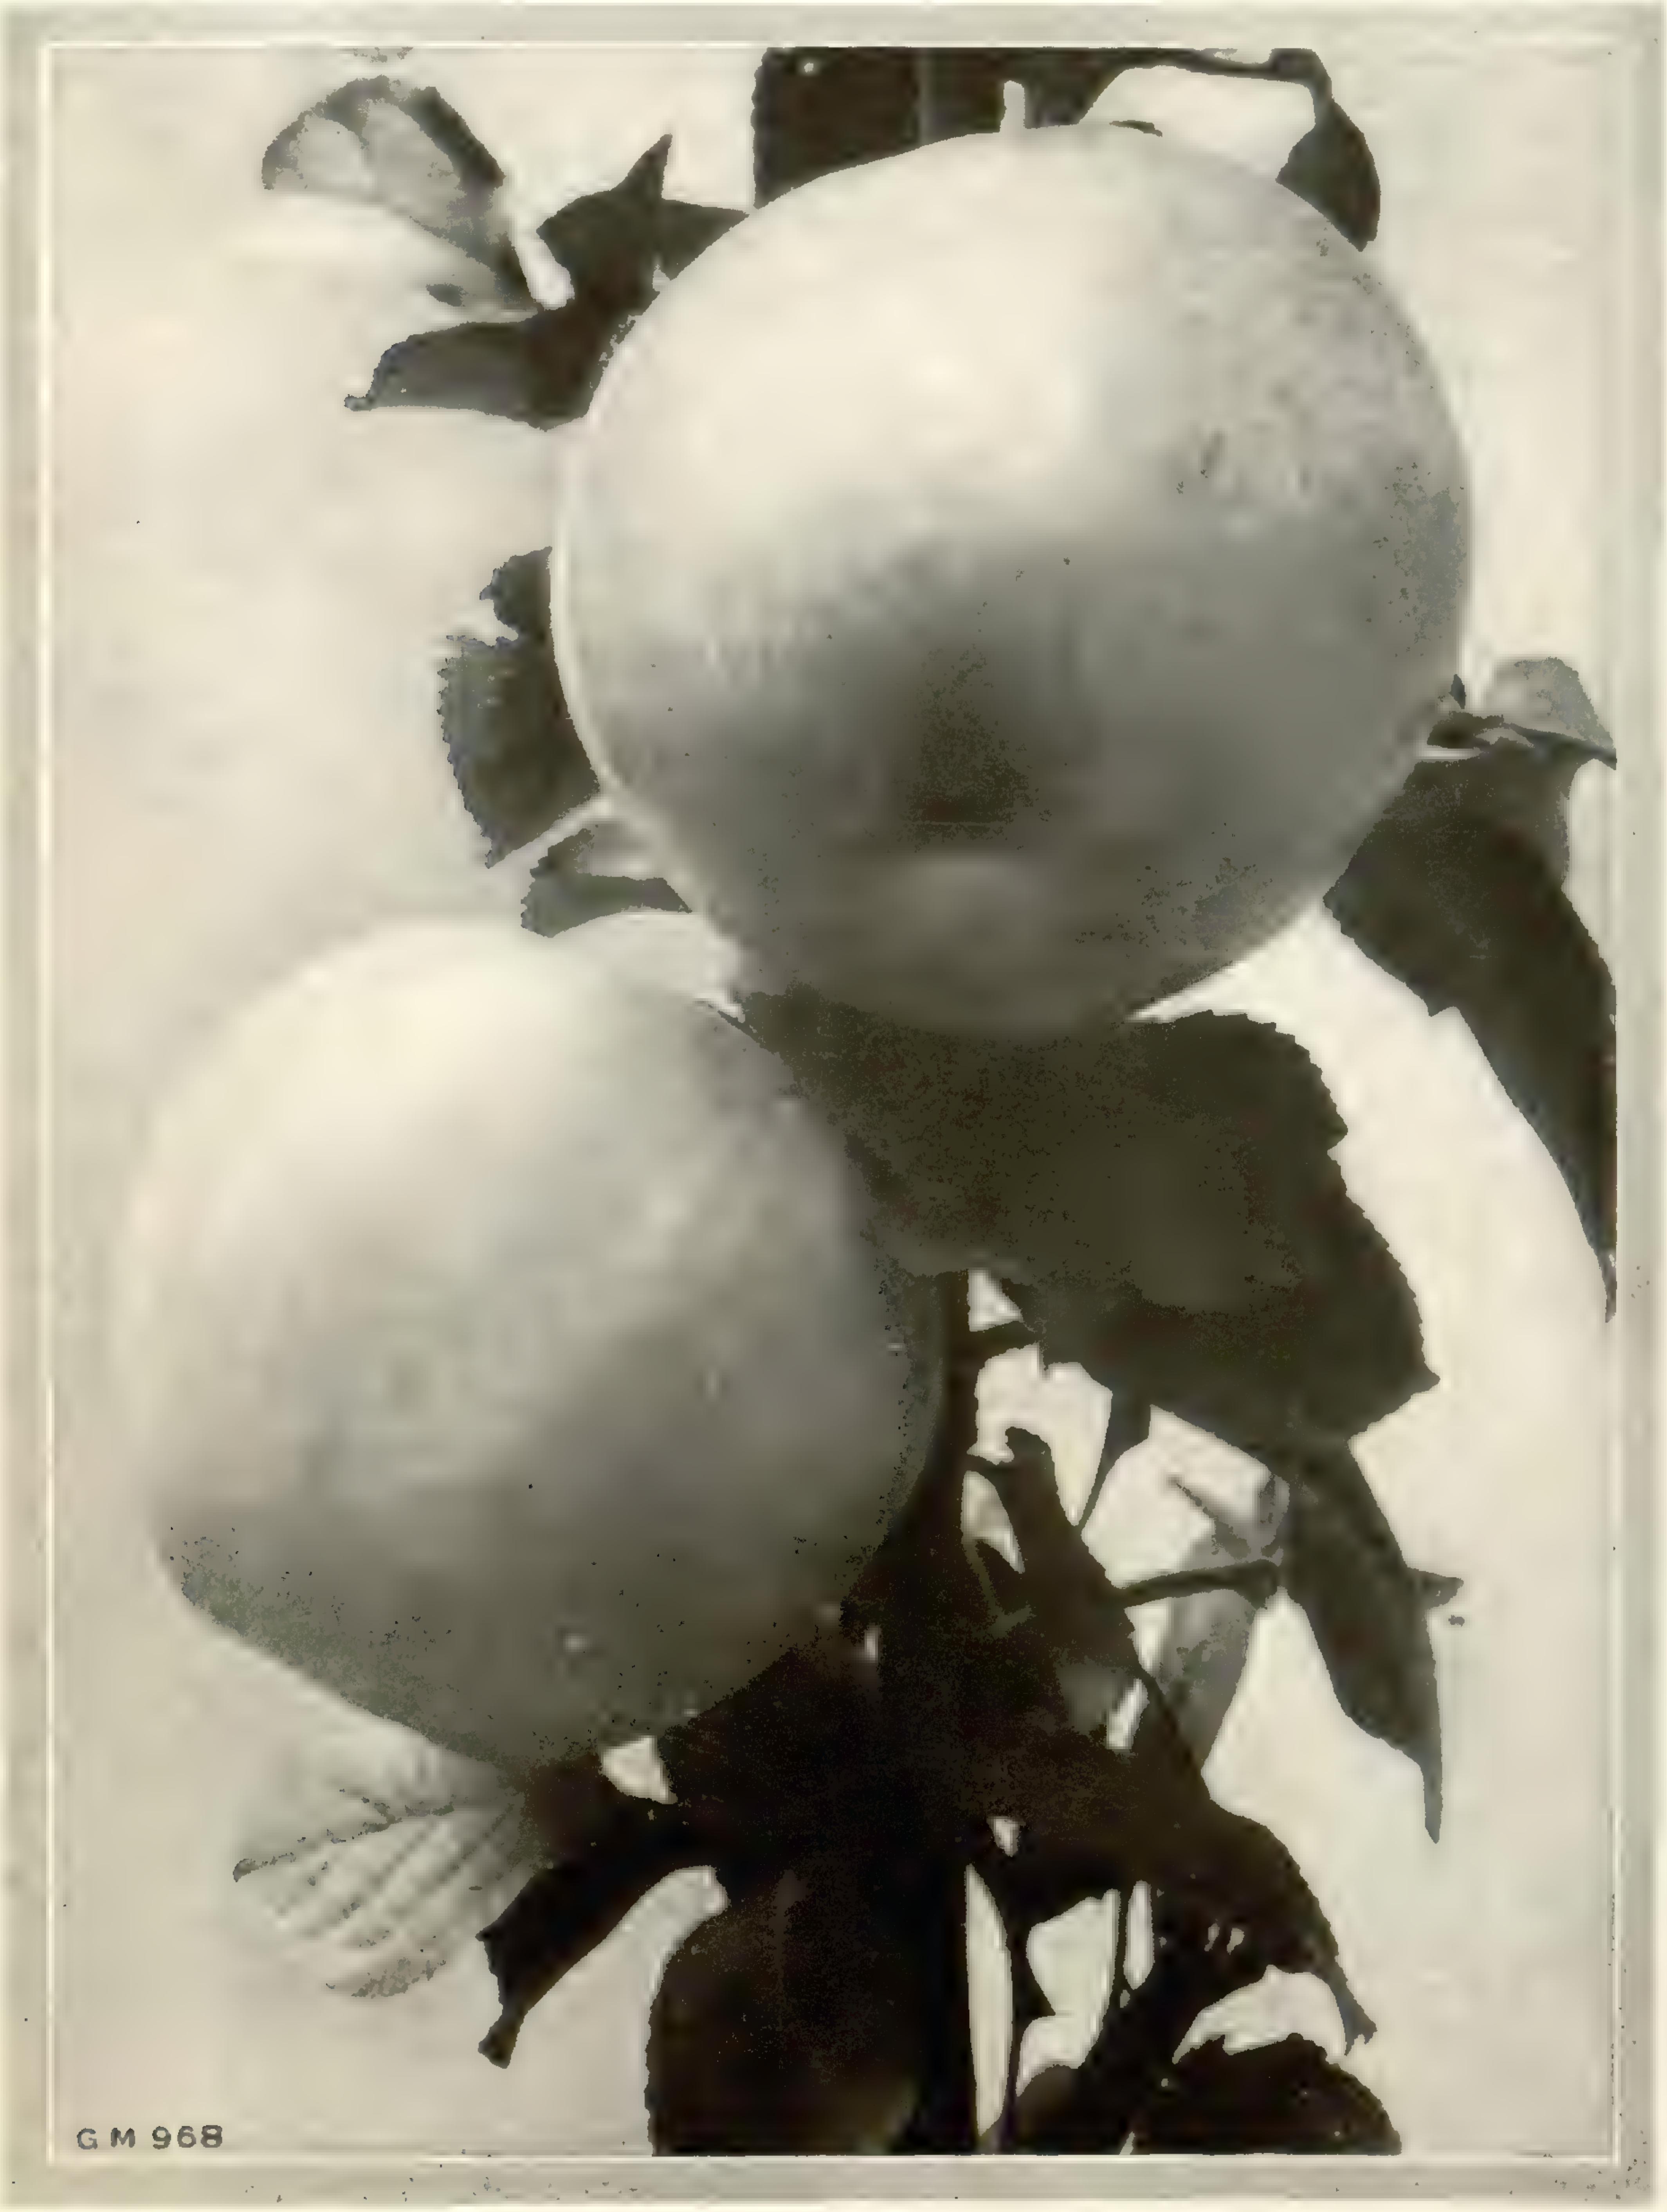
The chief points in routine management consist in keeping the ground free from weeds, and its surface, especially during spring and summer, frequently stirred with the hoe, but this should not be done sufficiently deep to injure the surface-feeding roots. In dry seasons particularly mulchings of partially decayed stable litter are of great value, and, more important still, more especially in the case of full-bearing plantations, it is to keep the roots adequately supplied with moisture in the form of diluted farmyard liquid, or, failing these, top dressings of rich farmyard manure, or of suitable artificial compounds, should be applied previous to affording copious supplies of water.

The training of the canes of summer fruiting varieties has been referred to, but it should be remarked that the suckers should be well thinned at an early stage of growth, and the old canes removed early, so that the young ones may derive the fullest benefit from sun and air. The shortening or pruning of the canes should take place at the end of February, when, more or less (according to their strength, and condition as to maturity), of their points should be cut away.

Superlative is undoubtedly the best of the summer fruiting varieties; Hornet and Baumforth's Seedling are also good. Of yellow varieties, The Guinea, or Yellow Superlative, and Yellow Antwerp can be recommended. Amongst autumn fruiters we prefer Belle de Fontenay; Yellow Four Seasons is also good, while November Abundance and The Alexandra, new autumn fruiting sorts, are said to be valuable.

T. Coomber.

The Hendre Gardens.



NEW CULINARY APPLE REV. W. WILKS.
Colour pale greenish-yellow, with brown and scarlet spots. Introduced by Messrs. Jas. Veitch and Sons, Chelsea.

NEW CULINARY APPLE REV. W. WILKS.

One of the best of the newer apples is named Rev. W. Wilks, after the able and energetic secretary of the Royal Horticultural Society. The fact that the apple bears such a title is itself a great recommendation, for the reverend gentlemen is a keen pomologist, and is hardly likely to have permitted the use of his name in this respect unless he felt quite sure the apple was an excellent one. It was on September 20, 1904, that the variety gained an Award of Merit at the hands of the Royal Horticultural Society's Fruit Committee, and since that time we have seen growing plants at Messrs. James Veitch and Sons' nurseries at Langley, where it was raised by crossing Peasgood's Nonsuch with Ribston Pippin. Rev. W. Wilks is a large apple, solid, and of conical outline. The skin is clear pale greenish-yellow, with sometimes spots of brown and scarlet, and it is greasy to the touch, reminding one in this particular of Peasgood's Nonsuch. The variety is a fine strong grower, and a remarkably free bearer right from its infancy. The flesh is white, pleasantly flavoured, and cooks beautifully; indeed, as a moderately early or midseason culinary apple the newcomer takes a very high position. Those who saw the splendidly cropped trees of this new apple at the meeting of the Royal Horticultural Society on September 28 do not need to be told that in Rev. W. Wilks the Messrs. Veitch have a first rate apple, and a sterling novelty.

PLUMS FOR THE GARDEN.

Although there are many useful varieties of dessert and cooking plums which succeed well when grown on bush or standard trees, yet the best and finest fruits are those taken from trained trees on walls or fences. At Wrotham Park we have two walls facing the east, each 80 yards long, devoted to plum culture, as well as a certain quantity of gages growing on a west aspect, all of which bear very freely in the majority of seasons. Many of the varieties are not new, but, nevertheless, are excellent.

I have for many years trained the trees fan-shape and am well satisfied with the system. Each year as the trees make fresh growth we preserve and lay in close to the wall sufficient new wood all over the trees, and it is from these young growths the second year that we invariably get the best and most fruit. This season the crop has been exceptionally heavy, and required some thinning, especially in the case of Coe's Golden Drop, which is probably the very best late dessert plum grown. We have both young and old trees, all alike bearing freely, though, owing to the wet weather we have experienced some of the largest and best fruit cracked. The fruits of this variety, when ripe and perfectly dry, if gathered and rolled up in thin tissue paper, and then placed on a dry shelf in the fruit room will keep fresh for several days, the flavour being excellent and the beautiful golden colour very pleasing.

Young trees of the Green Gage we find rather shy in bearing, and to encourage productiveness we do not prune the side shoots so severely as we do most varieties. I am not an advocate of many varieties of plums, but prefer good, useful sorts to meet the requirements and keep up the supply for some length of time. With us Washington crops freely and the fruits produced are of excellent size and flavour. This is rather strong growing, and the foliage being large, more space is required between the branches. Sometimes, when in a young stage of growth, the wood is very apt to become coarse, and root pruning or lifting and replanting is the course to adopt, but when once the tree begins to bear fruit good crops follow as a rule.

Where very choice plums are needed, Transparent Gage will prove an excellent one to grow, the fruit generally comes a fine colour and the flavour is rich and sweet. Oullin's Golden is most valuable for its earliness, pleasing golden colour, and fine flavour. Bryanston Gage crops heavily with us, and the fruit grows to a good size, and, in the majority of seasons is sweet and rich. The same remark applies to Jefferson. I have seen standards of this variety, rather old, bearing fine crops, which usually find a ready sale in the market. Kirke's does well in most parts if the roots are healthy and the soil not too heavy. Victoria, needless to say, is one of the most reliable varieties grown, as its fruits are useful for cooking, dessert, and also for jam-making.

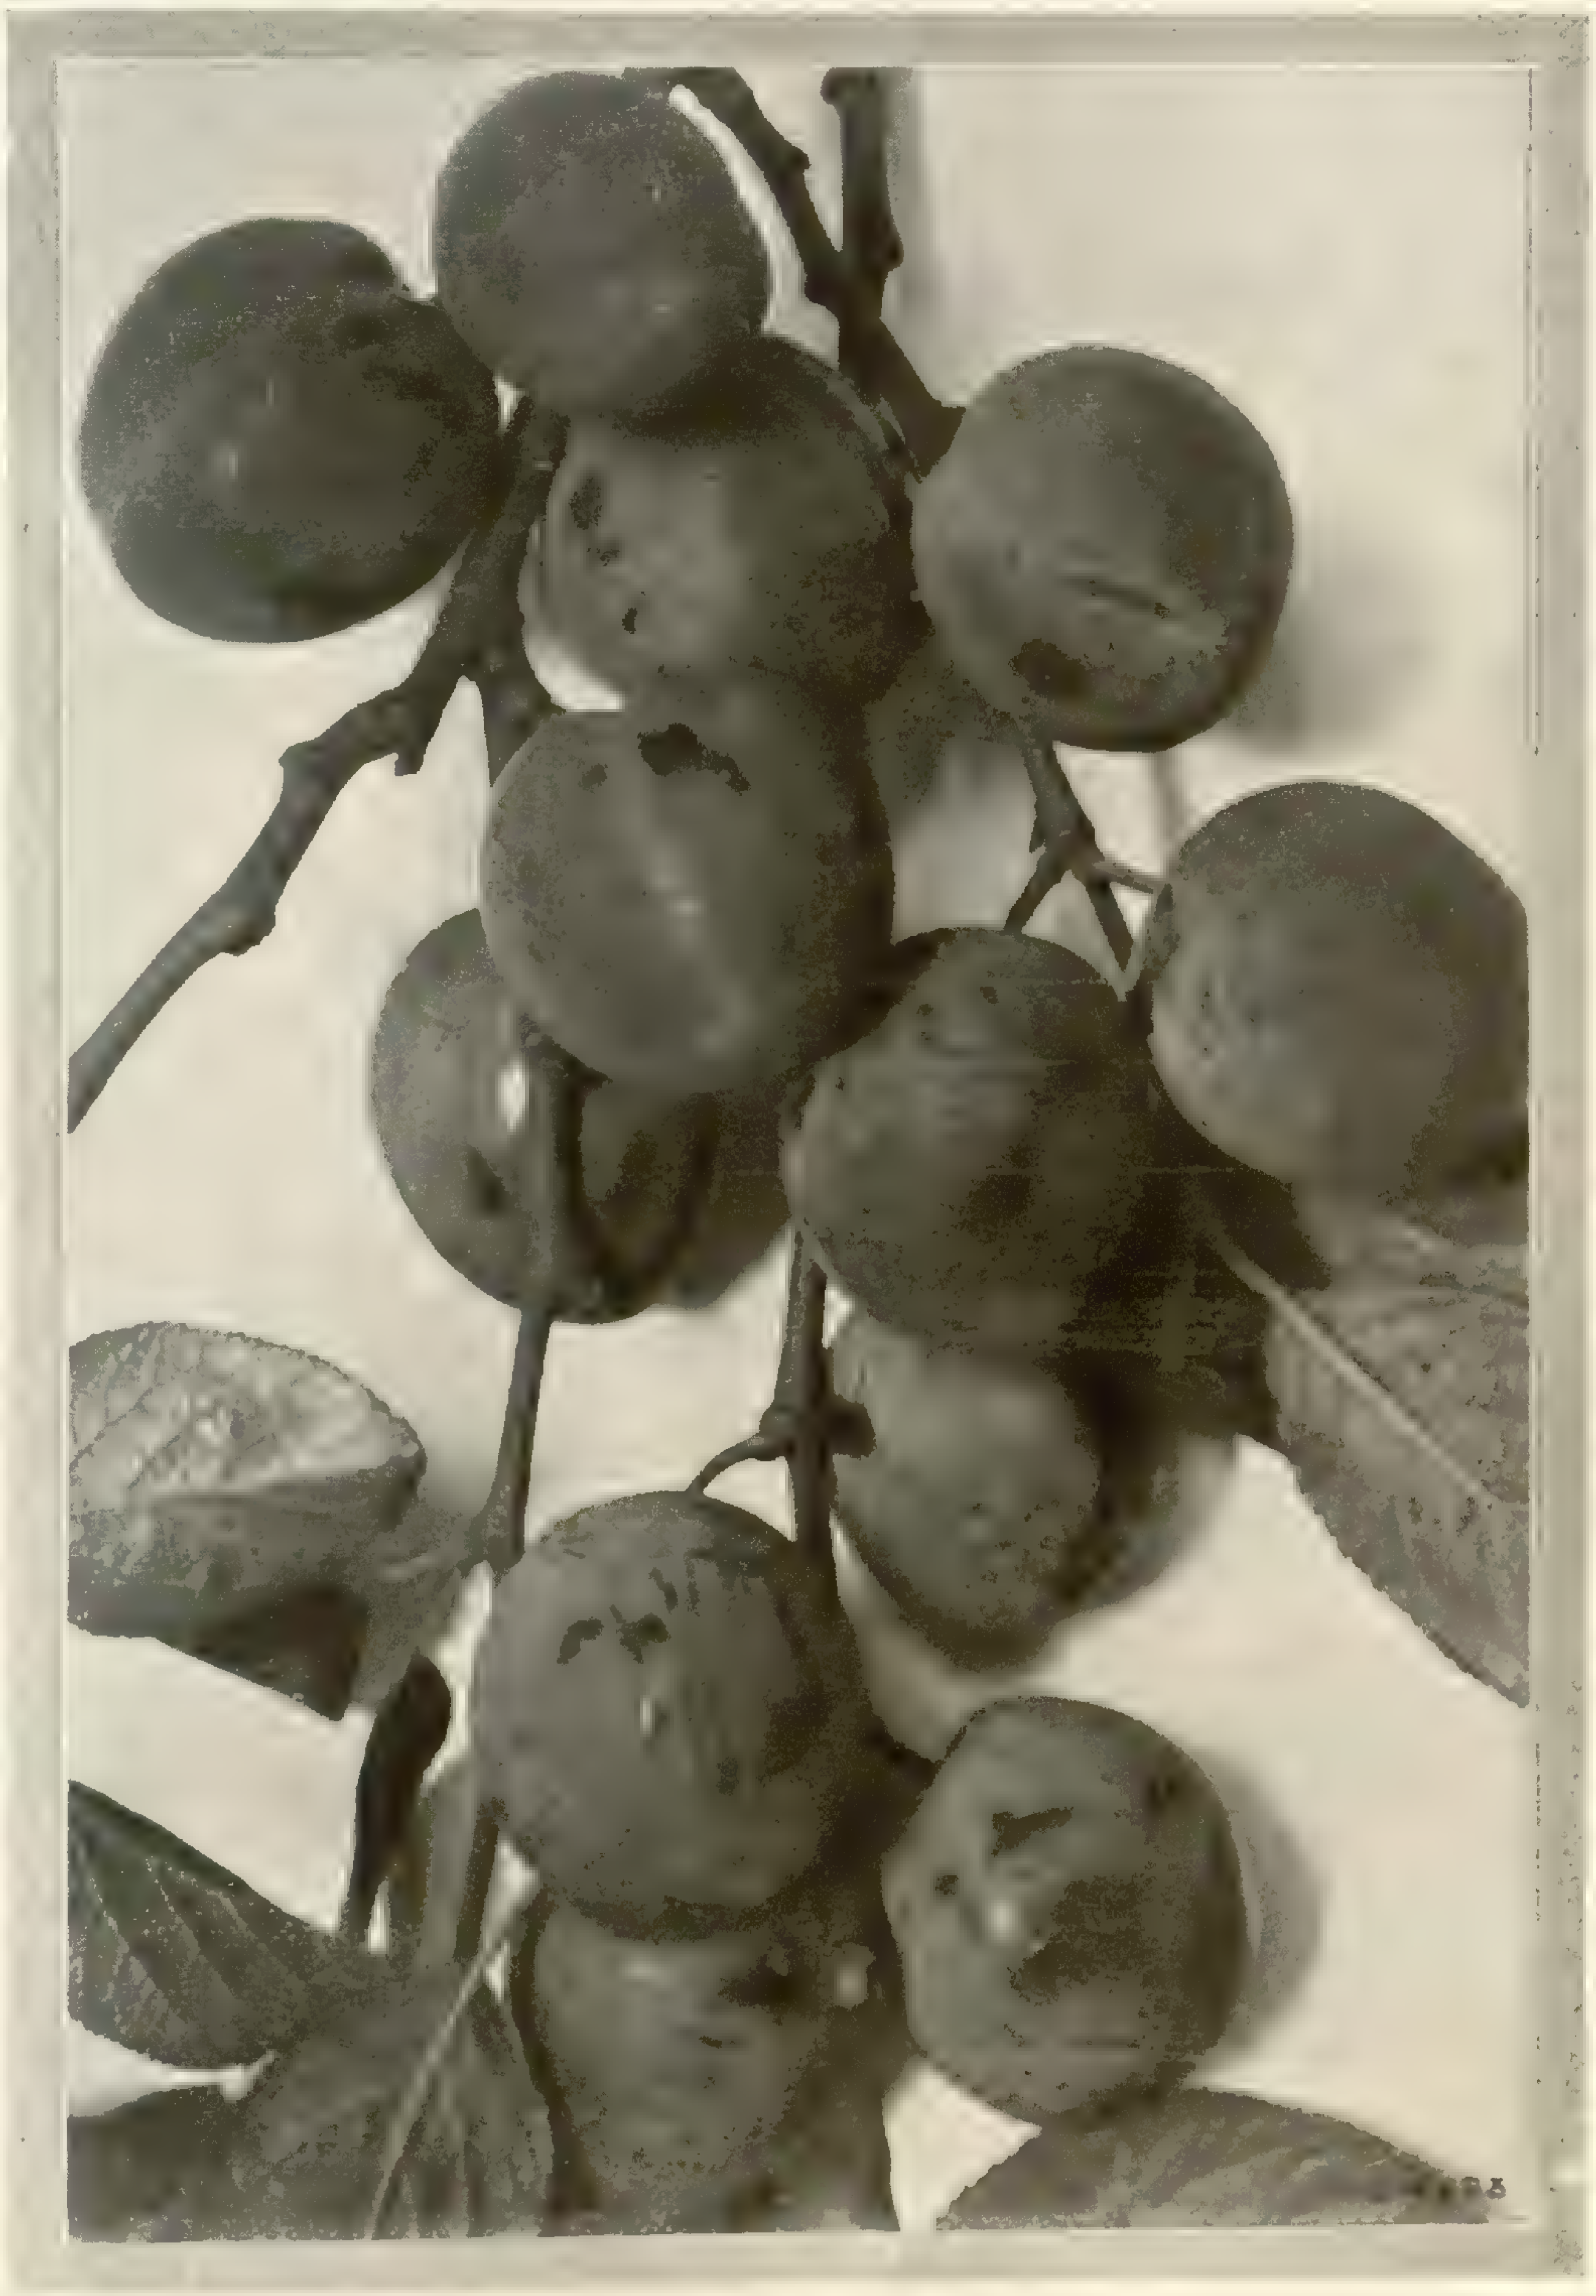
The Nectarine plum is very useful as an early variety, the flesh being exceptionally sweet, but it tightly adheres to the stone. Count Althann's Gage has a most taking appearance, is of the Transparent type, and has good flavour. Gisborne's crop heavily here on standards, and Pershore on the bush. Belgian Purple Monarch, Early Prolific, Archduke, and Pond's Seedling are all dependable varieties for culinary purposes.

Those intending to plant plums this autumn should see that the borders are well drained, and the soil of a medium texture, with plenty of lime in it. If well prepared at the first the trees ought to thrive and bear satisfactorily for many years, but a light, hungry, and gravelly soil means a very short life. Pruning in summer must receive attention, shortening the lateral growths not wanted when about ten inches long to half their length, and these at the winter pruning should be cut back to two or three eyes. During the early part of the season we were greatly troubled with aphis, and had to wash repeatedly with quassia extract, followed by a good syringing with warm water till the foliage was thoroughly freed of the insects. Mulching the roots of all trees bearing heavy crops and a heavy soaking of liquid manure two or three times will prove very helpful in swelling up the fruits and assisting the trees to build up strength for next season's bloom and crop.

H. Markham.

Wrotham Park Gardens.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price 1s. 6d. net, by post 1s. 9d.; cloth, 2s.; by post 2s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.



RIVERS'S MONARCH PLUM.

A valuable late culinary plum, raised by Messrs. T. Rivers and Son, and equally suitable for gardens and market plantations. Fruit large, dark purplish blue.

EARLY-FLOWERING CHRYSANTHEMUMS.

Your remarks anent the position that should be accorded to early-flowering varieties deserves to be well read and acted upon. Writers on this type of chrysanthemum are all too apt to say the herbaceous border is the proper site for the early-flowering chrysanthemum. I agree with you it is not so, except in a limited manner, where single plants may be put out to fill gaps quite early in the season. I consider the advantage of the early-flowering chrysanthemum lies in its power to provide abundant means of giving huge quantities of flower for cutting rather than the decoration of the garden, as cut flowers during the month of October out of doors are becoming scarce, except for Michaelmas daisies, and many of these lack the colour obtained in chrysanthemums.

I have found that stopping the plants once was quite sufficient to give good returns, as the bulk of varieties branch freely, and give longer stems or branches surmounted with flowers more suitable for filling large vases than where the plants are pinched several times to induce them to grow bushy, as it were. Some simple means of supporting the branches upright is very important to prevent their becoming crooked, if in this way much difficulty is experienced in arranging the flowers, and thus much of an otherwise desirable effect is lost.

E. M.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CALANTHES.—The different species and hybrids that have finished the development of their pseudo-bulbs will now be rapidly pushing their flower spikes. The foliage also will be ripening, and, as the leaves decay, they should have the dead portions cut away, so as to permit all the light possible to reach the pseudo-bulbs. It is useless to obtain gross pseudo-bulbs and huge spikes that lack substance in the individual blooms after they have become expanded. I do not know any plants that are more affected by the influence of light than calanthes. Take, for example, C. Veitchi, when grown in the neighbourhood of London, other large towns, or in smoky manufacturing districts. One generally finds the flowers of this most desirable orchid so faded in colour as to render them practically useless, and scarcely worth the trouble of cultivating. Surely this is a sufficient illustration of the practical advantages of securing as much light as possible, so that the plants may become properly matured, and display their flowers to the greatest advantage. Root moisture must be continued until the flower scapes have been removed, or the plants pass out of flower, but the moisture in the atmosphere should be reduced to the minimum. Ventilate freely whenever the outside conditions permit, but care should be observed to keep the temperature at about 65 deg. at night. This will, to some extent, prevent the flower scapes from becoming disfigured by spot. Plants that are still in full growth, and that usually flower in the New Year, should still be kept growing, but where possible they should be placed on a shelf within reasonable distance of the roof glass.

EAST INDIAN HOUSE. — In the East Indian division many of the ærides, saccolabiums, vandas, and allied genera will have matured their growths, but are actively rooting. While it is desirable that the plants should have every encouragement, up to the time that the roots become sealed over, care should be observed to keep the atmospheric moisture under proper control, so that it may easily be reduced to the lowest minimum, should this be desirable owing to the changing conditions outside. A sudden fall in temperature with the atmosphere charged heavily with moisture is one of the greatest dangers orchid cultivators have to guard against. Phalænopsis in particular are very susceptible to sudden changes, these frequently causing disfigurement, and often loss of foliage. Where phalænopsis are advancing their flower scapes they should be placed within reasonable distance of the roof glass to prevent their becoming drawn. — H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

TEMPERATURE.—After this date the temperature and supply of moisture should be gradually realised, but air and sunlight must be freely admitted as much as possible in order to make the tissues of the stems firm; and when plants are brought into a quiescent state the temperature of the warmest house need not exceed 65 degrees by night, and the cooler house 5 degrees lower. Stephanotis floribunda, when growth is completed, may be wintered in a temperature of 55 degrees, with plenty of light and little water; for successful flowering thoroughly ripened wood is most essential.

GLORIOSA SUPERBA.—When growth is completed, cut down the stems to twelve inches from the pot, and place the latter in a temperate house, keeping the soil quite dry, and the pots on their sides until spring.

ÆSCHYNANTHUSES. — These beautiful and easily-grown plants should, as soon as they show signs of going to rest, have water gradually withheld, and eventually be kept quite dry in a temperature of 55 deg. until spring. Treated in this way vigorous growth will result.

FRANCISCEAS. — Where given special treatment for the production of autumn flowers, these will now be coming into bloom, and weak doses of liquid manure at every other watering will benefit them. Just before the blooms open, fumigate the house, and cease syringing the plants. Keep them free from mealy bug, and place them in the coolest part of the stove.

ANTHURIUM SCHERZERIANUM. — Those plants which have completed their growth for the year may now be removed from the stove to an intermediate house for six or seven weeks' rest; little water will be required. If scale is in evidence, have the foliage thoroughly cleaned before growth commences.

ANTHURIUM ANDREANUM.—Specimens grown in 7-inch pots, when used amongst other plants, are very effective. They should be liberally supplied with moisture at the roots, and kept in the warmest house, when they will be found very useful for supplying fine material for winter cutting.

REARRANGEMENT. — Everything connected with the rearrangement of the plants should now be completed. Remove all stove plants from other and cooler houses, and those which have been used for furnishing the greenhouses during the summer months should be returned to their winter quarters. Arrange the stock with a view to good effects. Destroy large examples which have lost their beauty, remembering that healthy young stock has a much greater decorative value.—Wm. Fyfe, Lockinge Gardens.

FRUITS UNDER GLASS.

EARLY VINERY. — The vines may be pruned as soon as an opportunity occurs, and the house be thoroughly cleansed with some carbolic soap and paraffin. Then the vines may be taken in hand, and if they are at all unclean the loose bark should be removed, but if no mealy bug or scale be present I do not recommend this process beyond rubbing off loose or untidy pieces, but if pests do exist it is well to take off all that can be conveniently removed in order to get at every possible insect. The rods should then be subjected to a good scrubbing with warm water in which some insecticide has been mixed, and this operation should be performed several times, and finally the rods should be dressed with some approved mixture. The vines can then be slung up to the wires, and have a complete rest before being started again. The border should next be dealt with, and if no renovation is required take off an inch or two of the surface, wheel it away, and apply a like quantity of fresh, sweet soil, made firm. This done the walls should be white-washed, and in mixing a preparation for this it is well to form one that is thick enough to fill up any small crevices; to each bucket of lime-wash add a 1lb. packet of size to make it adhere properly, and mix in it also half-a-pound of petroleum, and one pound of flowers of sulphur. This is an effective mixture against pests of all kinds. Keep the ventilators open top and bottom, especially in good weather.

LATE GRAPES must be examined frequently, and any berries damping or decaying must be promptly cut out. Madresfield Court should be used as soon as possible, as this is very liable to damp quickly. Muscats should have a little heat, with the top ventilators open, and any young growths should be taken off, as there is a danger lest the young laterals that are touching the glass convey moisture to the bunches. See that all cracked glass is repaired. All late grapes should have a little heat in damp weather, with a little air on, to dispel damp. See that the border is sufficiently moist, but give water only when necessary.

POT VINES.—Where these are used for the first crop they should be pruned now. They may be kept outside for the present, but they should not be subjected to too heavy rains.

STRAWBERRIES IN POTS. — These should be placed thinly, so that the leaves have every possible chance to develop; give them the sunniest position available, as this assists the ripening of the crowns.

CUCUMBERS.—Those just beginning to bear must be kept clean by fumigating them about every ten days, and syringing each morning and early in the afternoon. Give a little top-dressing as soon as the roots come through the soil, and do not allow too many fruits, as this will weaken the plants. Plant out the batch to succeed this, providing a slight hotbed, as well as bottom heat from pipes. Winter-fruiting tomatoes should be kept in a warm and moderately dry house, and have all side growths removed.—W. A. Cook, Leonardslee Gardens.

THE KITCHEN GARDEN.

GLOBE ARTICHOKES.—These will have nearly completed their cropping by this date, and, not being quite hardy, will require some form of protection to keep them from injury during severe frost. Dry leaves packed round the stems are serviceable, but will need to be covered with straw litter to keep them in position. Where new beds are contemplated next year suckers carefully lifted now from the old stools, potted up and stored in cold frames during the winter months, will be suitable for planting out next spring.

JERUSALEM ARTICHOKES.—The tubers are about ready for use, having nearly reached their full size, so a commencement may be made in lifting a quantity for present purposes. The larger portion of the crop will be better left in the ground until the end of the present month.

LEEKS.—For ordinary culinary purposes it is not necessary to waste valuable time in papering each specimen for blanching, but the crop will be considerably improved if soil is drawn up to the plants. A dry day when the land will work kindly should be chosen for this, taking care that the hearts of the plants are not choked with dirt.

LATE CARROTS. — The sowings of the French Short Horn carrots will be giving useful roots by this time. The larger ones may be pulled and stored in sand for present consumption. The later sown and smaller roots may be left in the ground, and will still grow slowly, and come in for use in the winter. During severe frosts light coverings of straw or bracken fern is of advantage in preserving this crop.

TRENCHING.—Many quarters will by this be cleaned of their crops, and will be in readiness for preparation for trenching. The wheeling on of manure should be taken in hand as soon as convenient, and the work can be pleasantly carried out on frosty mornings, or dry days, and does not then damage the walks to anything like the same extent it would if done during wet weather. If the land is of a stiff nature, leaf-mould or burnt vegetation from the rubbish heap is of value in bringing it to a better condition, if worked in with the manure. Every kitchen gardener should be alive to the desirability of deep cultivation for most plants to obtain the best results, and, as far as the strength of the staff will allow it, should carefully attend to the matter for the next few months.

PREPARATIONS FOR FORCING.—Preserve carefully all the useful leaves that are raked up, as they are invaluable for hotbeds for forcing. Nothing provides such a desirable and prolonged heat as these, with the addition of a little sweetened stable manure. It is also a great advantage to have plenty of leaf-mould on hand. Have the glass lights repaired or painted for use as required, so that when the time arrives there is no delay. — Charles Flack, Cholmondeley Castle Gardens.

Rose Flower of Fairfield. — From experience I have a good word to say of this new rambler rose, as it is certainly of a perpetual-flowering character, and that is indeed a gain, especially in this type. When my plant opened its first flowers in the summer, I considered the colour was more bright even than the old Crimson Rambler, from which the new-comer is a seedling. As late as the first of October I had blooms on my plant, which is saying a good deal for this section.—E. M.

KENT COUNTY CHRYSANTHEMUM SOCIETY.—The 22nd GRAND ANNUAL EXHIBITION will be held at the RINK HALL, BLACKHEATH, opposite S.E. and C.R. Station, on WEDNESDAY and THURSDAY, Oct. 27 and 28th. 1909. Schedules and all particulars of the Hon. Sec., F. FOX, The Gardens, The Cedars, Lee, S.E.

NATIONAL CHRYSANTHEMUM
SOCIETY.
GREAT AUTUMN SHOW
at the
CRYSTAL PALACE,
November 3rd, 4th, and 5th, 1909.
Entries Close October 27th.
Write at once for Schedule to the Secretary, Mr. RICHARD A. WITTY, 72, Savernake Road, Gospel Oak. N.W.

YORK.
The 30th GRAND ANNUAL CHRYSANTHEMUM SHOW will be held on 17th, 18th, and 19th November. About £200 offered in Prizes. Groups, Cut Flowers, Fruits and Vegetables. (36 Japanese Cut Blooms £20 10s.) Medals for Trade Exhibits.
Entries due 10th November.
Schedules on application to the Secretary,
GEO. F. W. OMAN, A.S.A.A., 38, Petergate, York.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

OCTOBER 12.

Once again a packed hall; once again a crowd of visitors; and once again a good deal of "vain repetition," and some exhibits that would have been better left at home. Fruit and vegetables were abundant and good; orchids showed up well; hardy shrubs and flowers were very much in evidence, and there was a fair show of choicer things.

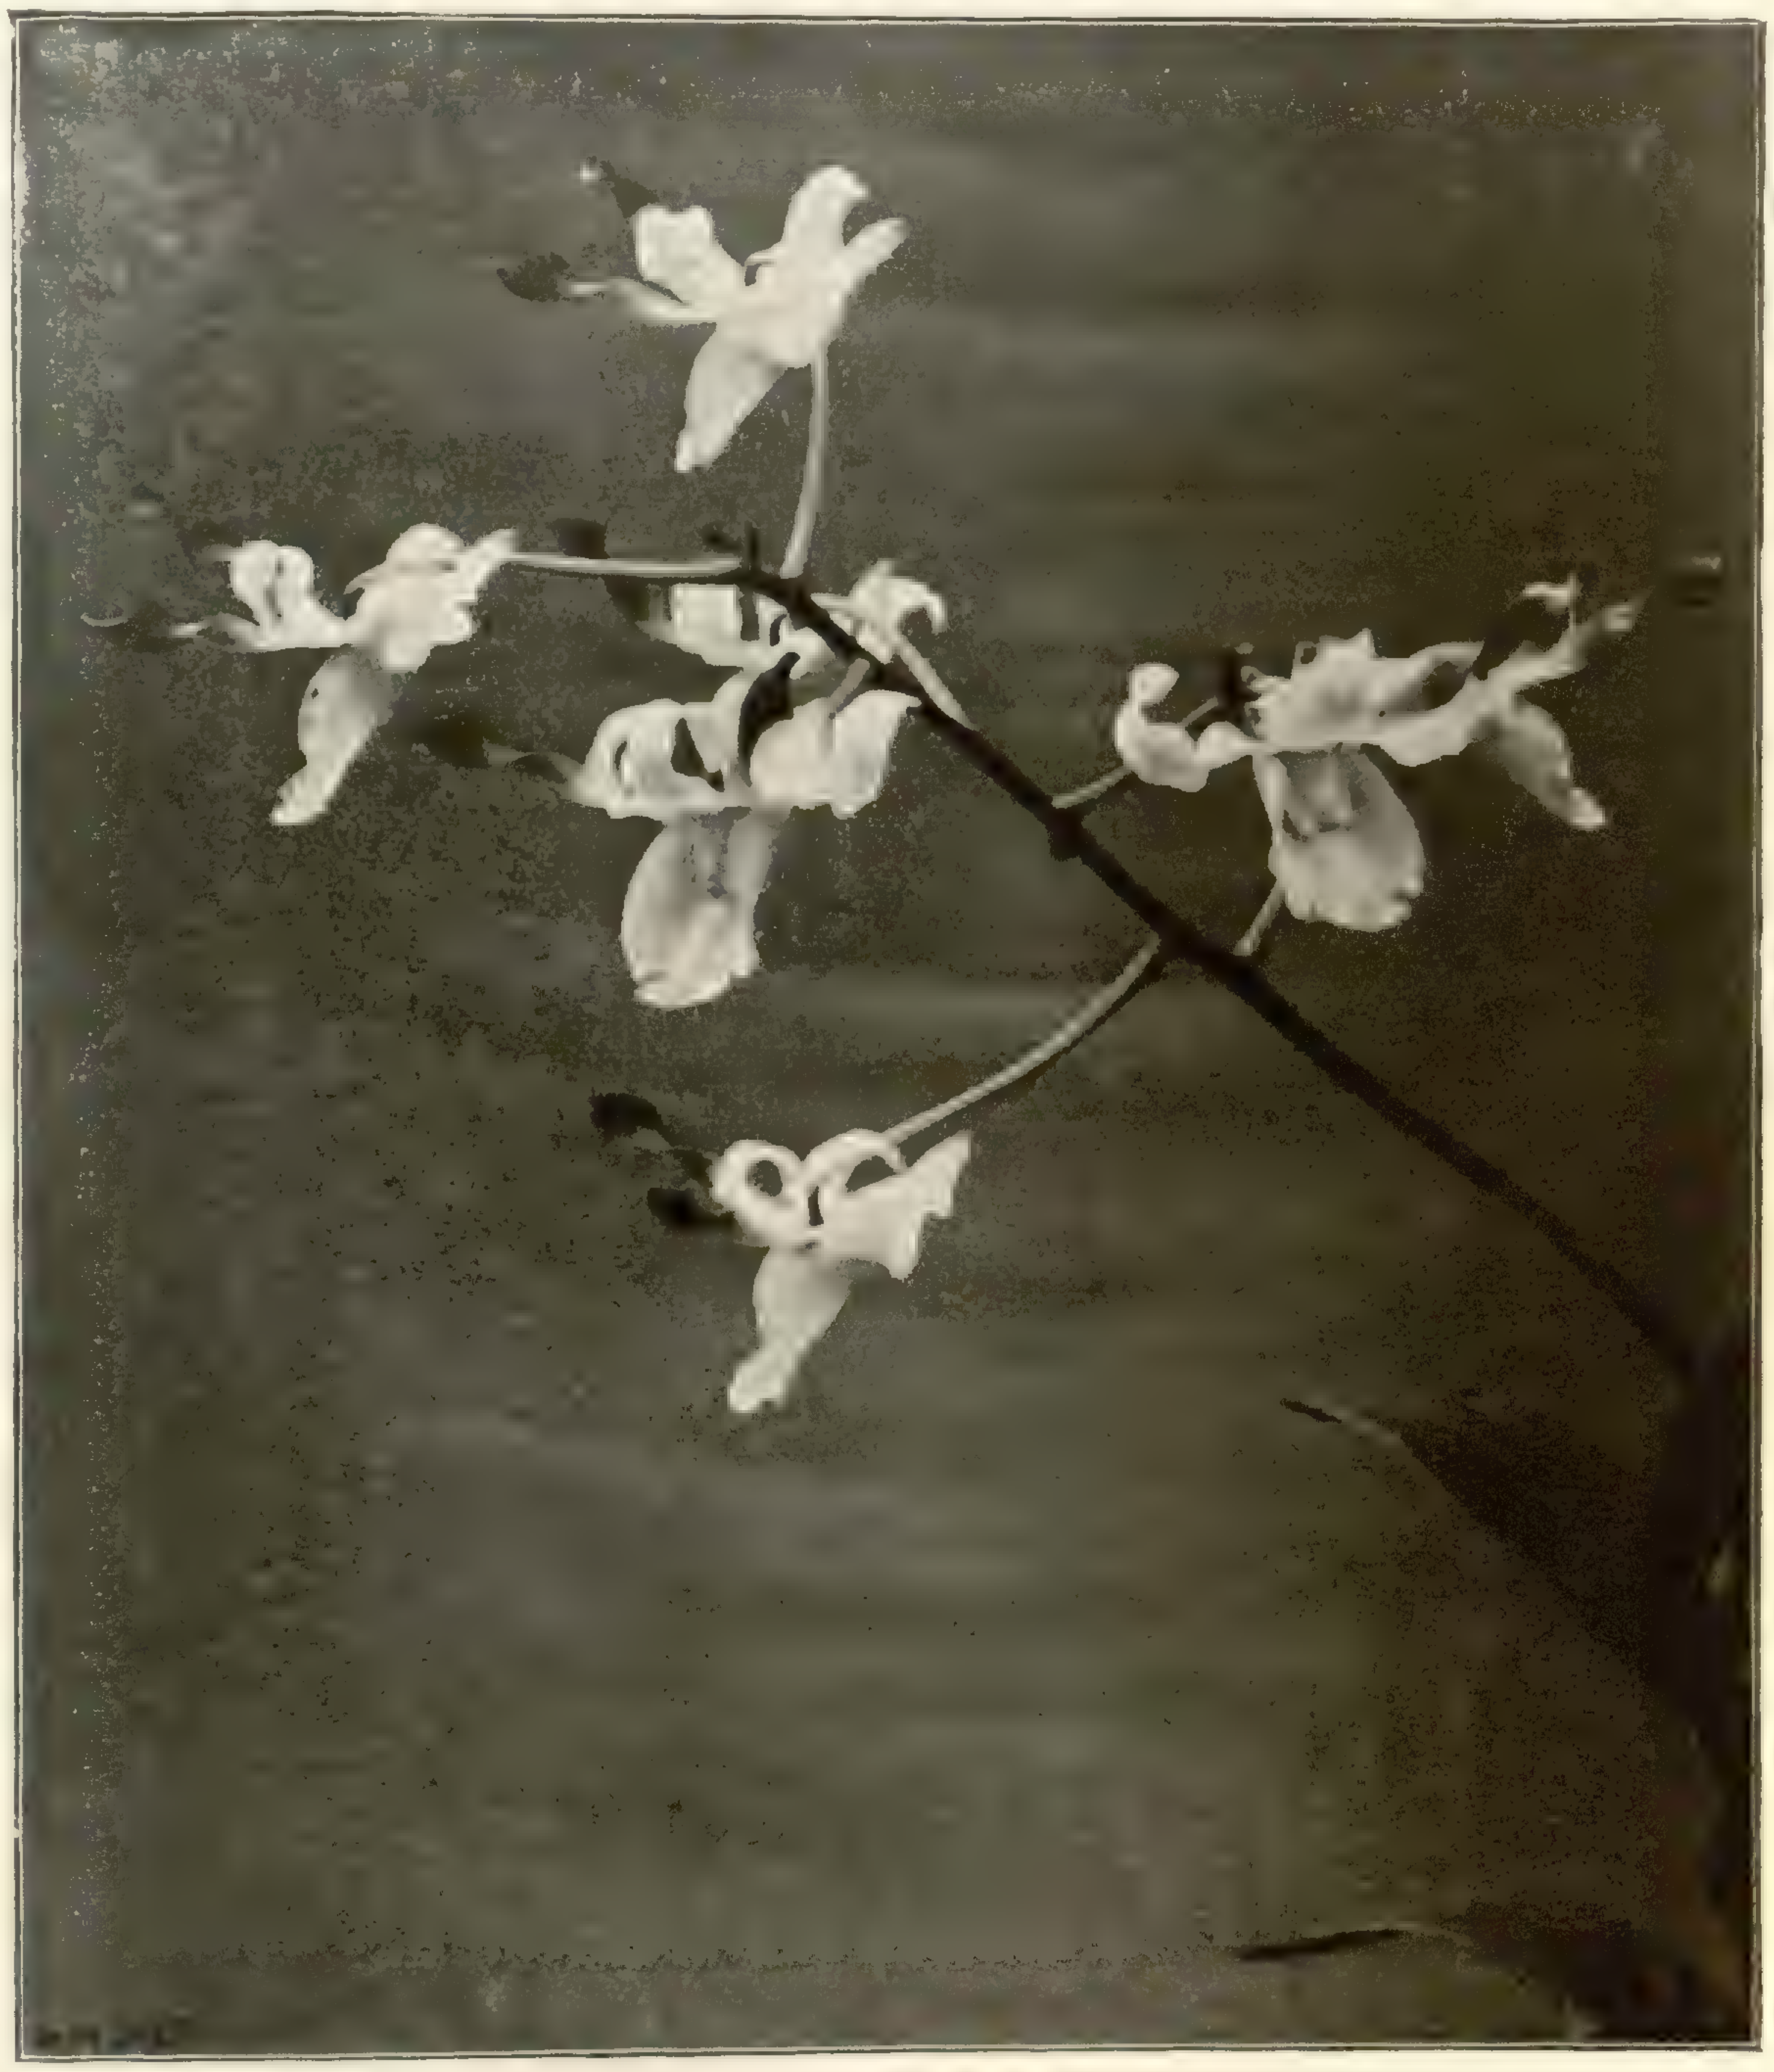
FLORAL COMMITTEE.

Messrs. Jas. Veitch and Sons, Chelsea, were large exhibitors, and one of their displays consisted of batches of Mrs. Heal and Elatior begonias, perpetual-flowering carnations, a fine lot of Nerine Fothergilli major, the blue-berried Callicarpa purpurea, and a set of beautiful greenhouse rhododendrons. The firm also set up a grand lot of magnificently-grown nepenthes, arranging these on stands over a groundwork of Asparagus plumosus. There were superb pitchers of Nepenthes, Sir W. T. Dyer, N. Tivezi, N. Burkei, N. Balfouriana, N. Curtisi, N. mixta, N. mixta sanguinea, N. Dicksoniana, N. Mastersiana, N. Hookeriana, N. Chelsoni excellens, etc. These formed a most attractive exhibit, the quaintness and bright colours of the pitchers attracting a great deal of attention. The hardy, graceful, crimson-scarlet Fuchsia macrostemma, a Chilian species, was displayed by Messrs. Jas. Veitch and Sons, Chelsea, who showed fifteen pyramidal specimens, 5ft. or 6ft. high. The flowers are small and drooping, and the whole plant very elegant.

Messrs. Gunn and Sons, Olton, made a pretty display with baskets of Viola cornuta purpurea, all splendidly flowered and of brilliant deep blue-purple colouring. Some elegant Michaelmas daisies, set up by Mr. Charles Turner, Slough, included such pretty varieties as William Marshall, May Crum, Lily Fardell, King Edward, and Mrs. Raynor. Mr. W. Leggett, West Bergholt, Colchester, had good flowers of such roses as Mildred Grant, Ulrich Brunner, F. K. Druschki, and other popular varieties. Some handsome chrysanthemums came from Mr. Martin Silsbury, Shanklin, Isle of Wight, the set including the new creamy White Queen (A.M.), a beautiful Japanese variety.

Early-flowering chrysanthemums and Michaelmas daisies formed the bulk of the display made by Messrs. Barr and Sons, Covent Garden, and with these they associated the yellow Gladiolus sulphurea, Cimicifuga racemosa, a few kniphofias and colchicums. From Mr. R. C. Notcutt, Woodbridge, came Michaelmas daisies in quantity, some dahlias, and an attractive stand of kniphofias and sprays of Cimicifuga racemosa. Mr. David Russell, Essex Nurseries, Brentwood, filled one corner of the hall with attractive conifers, etc. Messrs. Stuart Low and Co., Bush Hill Park, Enfield, brought forward a few flowering plants of the new Rose Doré perpetual-flowering carnation. New pæony-flowered dahlias were submitted by Mr. J. T. West, Brentwood, and his Liberty, Turner, Titian, Rubens, and Burne Jones were very effective.

Mr. Frank Brazier, Caterham Valley, submitted a big bank of Michaelmas daisies and early-flowering chrysanthemums, and set them up in first-rate style, with pentstemons and phloxes. Messrs. B. R. Cant and Sons, Colchester, showed autumn roses, and there were lovely flowers of Frau Karl Druschki, Corallina, Ma Capucine, Safrano, General Schablikiné, Mdme. Jean Dupuy, Mdme. Falcot, Claudius (deliciously scented), and Rose du Barri, a fine new seedling bedding rose with big reddish-rose coloured flowers. Messrs. Thomas S. Ware, Lim., Feltham, had a brilliant exhibit of tuberous begonias, the blooms all picked from the open air, from the seedling stocks, true to colour. The crimson, apricot, deep-rose, and white varieties and the crested forms were all delightful, and took us back into summer-time again.



DENDROBIUM TAURINUM COLMANI.

A distinct form of this interesting species exhibited by Sir J. Colman, Bart., at the meeting of the Royal Horticultural Society on the 12th inst., when it received an Award of Merit. Flowers white, the sepals suffused with purple, and the petals tipped with rose.

Some grand specimen ferns of huge size, shown by Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham, reminded one of the old days when specimens were much more in evidence than they are nowadays. Of special merit were the examples of Polypodium Mayi, Adiantum cardiochlæna, Dicksonia antarctica, Microlepia speluncæ, Platycerium Willincki, Davallia Mooreana, Asplenium caudatum, and Nephrolepis Amerpohli. This was a fine exhibit from a private garden. Very bright was the group of early chrysanthemums put up by Messrs. W. Wells and Co., Merstham, of Glory of Merstham, Leslie, Ethel Blades, Roi des Blancs, Nellie Riding, Wells' Scarlet, Perle Chatillonaise, and Bouquet Rose, there were very handsome bunches, but the five-gallon "packet" of early single chrysanthemum seed was the greatest wonder. In the display made by Messrs. G. and A. Clark, Dover, a large single dahlia, red, blush-tipped, named Arabic, was very showy; liliums, gladioli, Michaelmas daisies, gaillardias, pyrethrums, and Gilia coronopifolia were other effective flowers.

One of the grandest exhibits of ivies we have seen was the big one put up opposite the entrance hall by Mr. L. R. Russell, Richmond. There were standards of several sizes, low bushes and climbers, and the outstanding variety was the new climbing, variegated form of Hedera dentata. Other good things were H. arborea spectabilis aurea, H. a. macrodonta, H. a. flavescens, and the very pretty H. a. elegantissima. It was a splendid exhibit of well-grown and useful material. The beautiful bertolonias were shown in fine style by Mr. L. R. Russell, Richmond, and the exquisite veining and spotting of the leaves attracted a good deal of attention. Of Souvenir de Gand, Comte de Kerchove, Mdme. E. Pynaert, Mdme. A. Bleu, Sanderiana, and Mdme. van Houtte, with their charming silver-green and blue markings and shadings, there were fine specimens.

Michaelmas daisies were delightfully shown by Mr. H. J. Jones, Ryecroft Nursery, Lewisham, who put up pretty sprays in goodly bunches over a white-paper groundwork. A few of the very best varieties were St. Egwin, pretty rosy-lilac, very dainty; William Marshall, H. J. Jones, Thora, Grace, Miss Southall, Hilda Morris, Fairfield, and Irene. Very bold and brilliant was the large group of single, pompon, cactus, and pæony-flowered dahlias so well set up, with grasses, etc., by Messrs. Carter Page and Co., of London Wall. In the bank of hardy flowers put up by Messrs. W. Cutbush and Son, Highgate, the pentstemons were a fine feature, but liliums and Michaelmas daisies, and Potentilla Gibson's Scarlet, were well shown. The same firm brought up a beautiful lot of perpetual carnations, their collection including Afterglow, Mrs. Burnett, Enchantress, Aurora, May Bennett, Winona, and White Perfection. Varieties of veronicas, all in flower, were contributed by Messrs. H. B. May and Sons, Edmonton, and the varieties La Seduisante, Conquete, Admiration, and Diamant are fine for autumn flowering; the same firm contributed a large number of small plants of Scolopendrium vulgare crispum varieties, all very finely frilled or crisped.

Messrs. G. Bunyard and Co., Maidstone, contributed a collection of hardy flowers, their Michaelmas daisies, kniphofias, and anemones being the chief features. Mr. Clarence Elliott, Stevenage, had Michaelmas daisies in fine condition. Messrs. Frank Cant and Co., Braiswick Nursery, Colchester, put up large bunches of beautiful and fragrant roses, such varieties as Mdme. Ravary, Mdme. C. Soupert, Gustave Regis, Lyon Rose, Mons. Paul Léde, and Edu Meyer being specially good.

Single dahlias were very well shown by Messrs. J. Cheal and Sons, Crawley, the colours being particularly fine in the case of Formosa, William Parrot, Rosebank Scarlet, Miss Morland, Serita, Tommy, Columbine, Victory, and Cardinal. Messrs. Harkness and Co., Hitchin, had a lovely exhibit of roses set up in stands, vases, and boxes, and they had F. K. Druschki, Mdme. Ravary, Hugh Dickson, Mrs. J. Laing, Edu Meyer, and other varieties as abundantly as in summertime.

ORCHID COMMITTEE.

Orchids were well shown on this occasion. Messrs. Charlesworth and Co., Haywards Heath, brought up a very bright collection, in which Vanda cœrulea was prominent, associated with Odontoglossum grande, O. g. aureum, Odontioda Bradshawiæ, Dendrobium Phalænopsis, Cattleya labiata var. G. G. Whitelegg, the white Saccolabium violaceum Harrisoniæ, Cattleya Venus, Sophrocattleya Sibyl, and Odontoglossum Phœbe and O. Eleanor.

Mr. G. E. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, showed the lovely white-petalled Cattleya Hardyana var. The Baron (F.C.C.), half a dozen flowering plants of Cypripedium Maudiæ, Odontioda Charlesworthi, Anguloa eburnea, Masdevallia chimæra, etc., etc. Messrs. Stuart Low and Co., Bush Hill Park, Enfield, set up graceful spikes of Odontoglossum Pescatorei, Oncidium varicosum and O. crispum, Cattleya Vulcan, C. Venus, Cycnoches chlorochilon, etc.

From Westonbirt Mr. Alexander brought up several good things from Lieut.-Colonel Holford's collection, the chief being Cattleya Marie Ludovic, C. Dirce, Cypripedium Cynthia Westonbirt var. (A.M.) and C. Garton Bulteel var. King Edward VII. Mons. Maurice Mertens, Mont St. Amand, Ghent, brought over a few brilliantly-marked hybrid odontoglossums. Mr. J. Collier, gardener to Sir J. Colman, Bart., Gatton Park, Reigate, showed the curious Cirrhopetalum fascinator (A.M.), Cattleya amabile illustre, Dendrobium taurinum Colmani (A.M.), and Zygocolax leopardinum Gatton Park var. Mr. W. Thompson, Walton Grange, Stone, Staffs, sent Cypripedium Daisy Barclay var. Dunhamensi and Odontoglossum exultans Christopher. Mr. Hopkins, gardener to Francis Wellesley, Esq., Westonbirt, contributed Cypripedium Charlesianum Westfield var., and Mr. F. Menteith Ogilvie, Oxford, showed the brilliant Sophro-cattleya Doris Shrubbery var. Mr. A. W. Jensen, Lindfield, Haywards Heath, had some odontoglossums on view, and Mr. Chapman, gardener to Mrs. Norman Cookson, Wylam-on-Tyne, sent up Cypripedium Fair Maude (A.M.), a handsome thing. From Baron Schroder's collection at The Dell, Egham, came the old Cattleya Lamberhurst Hybrid—a C. citrina cross.

Messrs. J. Cypher and Sons, Cheltenham, presented a goodly set of cypripediums, the batch of C. Fairrieanum being very pretty, while C. Maudiæ and C. triumphans were good. Dendrobium phalænopsis in variety, Oncidium varicosum, Cattleya Mantini, and C. M. nobilior were other attractions. The fine old Vanda Lowi, with one long spike of bloom, was the centre of interest in Messrs. F. Sander and Sons' group of orchids; Cattleya Appletoniæ, Odontoglossum Phœbe, Cœlogyne occellata, Vanda cœrulea, Miltonia vexillaria Leopoldi, and Cypripedium Actæus Bruggense were other good things.

FRUIT AND VEGETABLE COMMITTEE.

A splendid group of fine hardy fruits from Messrs. G. Bunyard and Co., Maidstone, was one of the features of the meeting. Arranged in baskets and dishes of various shapes and sizes were about a hundred and ten varieties of apples and pears. The pears were splendid, and among the fine kinds shown we noticed Verulam, Pitmaston Duchess, Beurre Alexandre Lucas, Uvedale's St. Germain, Le Lectier, Beurre Diel, Durondeau, Duchesse d'Angouleme, Marie Benoist, and Doyenne du Comice. Among the best of the apples we made special note of King of Tompkins County, Charles Ross, Emperor Alexander, Cox's Pomona, Newton Wonder, Rival, Lord Derby, Cox's Orange Pippin, King of the Pippins, Hitchin Pippin—somewhat like King of the Pippins, Grenadier, Pott's Seedling, The Houblon, Peasgood's Nonsuch, Lord Grosvenor, and Allington Pippin. There were also some excellent peaches in this collection.

Another splendid and wonderfully fine display of superbly-grown vegetables from Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, was the great feature of the show. It was an extraordinarily fine contribution even for Mr. Beckett, and, remembering the season, it is difficult to praise the exhibit too highly. The arrangement of the vegetables was also very fine, and in the matter of appearance alone the group compared quite favourably with the fruits and flowers. There were about a hundred and five dishes, and if it be possible to select out a few of the best we should name Veitch's Selected Globe, Banbury Improved, and Ailsa Craig onions; Favourite carrots; Early Giant and Veitch's Autumn Giant cauliflowers; Autocrat and Gladstone peas; The Hastings, Frogmore Selected, Ham Green Favourite, and Hackwood Park tomatoes, celeriac, mushrooms; Prize Pink, Superb White, and Standard Bearer celery; Veitch's Exhibition sprouts; Challenger and Improved Telegraph cucumbers; The Factor, Cigarette, King Edward VII., Mr. Bresee, and Chiswick Favourite potatoes. So far as we could gather, there were about thirty-two distinct kinds of vegetables in this masterly exhibit of fine vegetables, finely grown and finely shown.

Mr. William Howe, gardener to Lady Tate, Park Hill, Streatham, showed a dozen bunches of finely-finished Alicante grapes cut from a vine carrying eighty bunches. The colour and bloom were excellent. A collection of fifty dishes of clean potatoes was set up by Mr. R. W. Green, Wisbech; particularly attractive were the sets of Table Talk, Eldorado, King Edward VII., The Factor, and The Cottar. From Mr. Leopold de Rothschild's garden at Gunnersbury Park, Mr. G. Reynolds brought up a dozen fine melons—Eminence and Blenheim Orange; half a dozen Queen Pines; and eight dishes of peaches—Thomas Rivers, Golden Eagle, Gladstone, Sea Eagle, Princess of Wales, Lady Palmerston, and Albatross.

A collection of hardy fruits was submitted by Mr. R. C. Notcutt, Woodbridge, who had good samples of Warner's King, Peasgood's Nonsuch, Charles Ross, Bismarck, Cellini, Bauman's Red Reinette, Allington Pippin, and Beauty of Hants apples.

Mr. T. Pateman, gardener to M. Price, Esq., The Nolle, Welwyn, staged about three dozen dishes of high-class fruits, including grapes, peaches, melons, figs, pears, and apples; he had fine dishes of Charles Ross, Rival, and Cox's Orange Pippin apples.

Across the end of the hall the King's Acre Nursery Company, Hereford, arranged a very fine lot of picked fruit, and young fruiting trees of apples and pears. It was a fine exhibit of clean, bright fruit, and among the picked fruits we were specially interested in the baskets of Royal Jubilee, Potts' Seedling, Warner's King, Lord Gresvenor, Bramley's Seedling, Jas. Grieve, Charles Ross, Emperor Alexander, Lane's Prince Albert, Hambling's Seedling, Stirling Castle, Norfolk Beauty, Lord Derby, and Peasgood's Nonsuch apples; and Conference, Pitmaston Duchess, Beurre Bachelier, Emile d'Heyst, and Beurre Diel pears; peaches and plums were also shown.

Messrs. J. Peed and Sons, West Norwood, filled a considerable space with apples and pears displayed advantageously with small palms and vases of carnations; Gascoigne's Scarlet, The Queen, Tyler's Kernel, Golden Spire, Peasgood's Nonsuch, and Withington Fillbasket were largely represented in this exhibit. An interesting collection of beet and carrots from Messrs. G. Massey and Sons, Spalding, served to show that in these things there is a distinct need for a grouping of too-much-alike varieties. Messrs. Stuart Low and Co., Enfield, had a small collection of popular apples, set up in dishes and baskets.

Fruit trees in pots, shown by Messrs. William Paul and Son, Waltham Cross, were grandly cropped with very fine fruits. Conference, Marguerite Marillat, Durondeau, Grosse Calabash, and Beurre Clairgeau pears were especially fine, and Conference was magnificently cropped. A big exhibit of fruit from Messrs. J. Cheal and Sons, Crawley, contained fine samples of Van Mons Leon Leclerc, Glou Morceau, Doyenne du Comice, Pitmaston Duchess, Durondeau, Catillac, and the new Beurre de Naghan pears, as well as of The Queen, Peasgood's Nonsuch, Jubilee, Encore, Nanny, Charles Ross, Lord Derby, Warner's King, and Newton Wonder apples.

A large display of fruit came from the Royal Horticultural Society's Gardens at Wisley; the pears, of which there were fifty-four dishes, were rather small; but the grapes were the chief attraction, notably the bunches of Golden Queen, Alicante, Cannon Hall Muscat, Gros Colman, Mrs. Pearson, Syrian, Prince of Wales, Lady Downes, and Trebbiano.

COMPETITIVE FRUIT CLASSES.

An interesting class was the one for affiliated societies, and consisted of eighteen dishes of hardy fruits—i.e., twelve of apples and six of dessert pears. There were twelve competing societies, and the silver cup and silver-gilt Knightian Medal fell to the Royal Jersey Horticultural Society, which scored heavily on pears; they had Doyenne du Comice, Pitmaston Duchess, Glou Morceau, Beurre Superfin, and Duchess d'Angouleme very good, and a fine dish of Peasgood's Nonsuch apples. The East Anglian Horticultural Club gained the second award, and must have run the Jersey people closely. Other societies competing were Ipswich, Addlestone, Stour Valley, Ibis (Prudential Insurance), Reigate, Brentford, Newport, Gosport, Sutton (St. Barnabas), and Croydon.

Premier award for three bunches each of three varieties of grapes was won by Mr. H. H. Brown, gardener to W. G. Raphael, Esq., Castle Hill, Englefield Green, who showed Lady Downes, Muscat of Alexandria, and Alicante; Mr. J. Kidd, gardener to T. Miller, Esq., Newberries, Radlett Heath, second, with Alicante, Mrs. Pince, and Lady Downes. In other grape classes the chief prizes were won by Mr. H. Cornish, gardener to A. Benson, Esq., Upper Gatton Park, Reigate; and Mr. J. Shelton, gardener to the Dowager Lady Hillingdon, Wildernesse, Sevenoaks.

SAMUEL M'GREDY and SON'S
New Roses for 1909.

Every one of these are Sterling Novelties, and absolutely distinct from anything in cultivation. They are the most marvellous set of new varieties that have yet been put into commerce.

HIS MAJESTY (H.T.),

Called the Crimson "Frau Karl Druschki," when seen at its best is the grandest and noblest flower among Roses, and deliciously sweet scented. Awarded the Gold Medal of the National Rose Society, 1908. **7/6** each; **6** plants, **42/-**

LADY ALICE STANLEY (H.T.)

The ideal Hybrid Tea Rose in habit of growth and freedom of flowering, an Exhibitor's and superb garden rose combined; the Coral Rose and pale flesh shading is remarkably attractive and pleasing; also one of the best pot roses in existence. Highly and deliciously fragrant. Awarded the Gold Medal of the National Rose Society, 1908. **7/6** each; **6** plants, **42/-**

MRS. ALFRED TATE (H.T.)

Without doubt the most beautiful Rose of its type in commerce. Colour: Coppery-red, shaded fawn (many expert Rosarians prefer its colour to that of the Lyon Rose); a wonderfully long pointed flower, faultless in shape and form. Has no equal as a forcing rose under glass in winter. Blooms throughout the entire season. Has a delightful sweet perfume. Award of Merit, Royal Horticultural Society, 1908. **7/6** each; **6** plants, **42/-**

MRS. E. J. HOLLAND (H.T.)

Colour: Lovely waxy salmon-rose; the most model and perfectly shaped flower among roses, a true "Kaiserin Augusta Victoria" type flower, but opens freely in all weathers. A variety that must find its way into every garden when known. Probably the freest blooming exhibition and garden Rose in cultivation. Very sweet scented. Awarded the Gold Medal of the National Rose Society, 1909. **7/6** each; **6** plants, **42/-**

MRS. WAKEFIELD CHRISTIE MILLER (H.T.)

Colour: Pearly blush, outside of petal clear vermilion-rose; a marvellous scheme of colouring, there is nothing like it in cultivation; the blooms are of enormous size, retaining their colour in the hottest sun. For massing and bedding we know no rose so striking or effective; it is of uniform even growth, holding its flowers upright, producing its huge blooms with such freedom that at a distance they look like Japanese Paeonies. Will become a famous garden rose. Award of Merit, Royal Horticultural Society, 1908, Card of Commendation, National Rose Society, 1909. **7/6** each; **6** plants, **42/-**

We offer one plant of each of the above New Roses for 35/-, packing and carriage free.

Please send for our New Rose Catalogue, which contains every Rose worth growing, post free on application.

Mr. T. W. Herbert, gardener to J. T. Charlesworth, Esq., Nutfield Court, Redhill, had the best three dishes of dessert plums—Coe's Golden Drop, Transparent Gage, and Guthrie's Late Gage; Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, second. Mr. Vert led for three dishes of cooking plums, with Monarch, President, and Pond's Seedling; Mr. Herbert, second.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Cattleya Hardyana The Baron, from H. S. Goodson, Esq. (gardener, Mr. Day), Fairlawn, Putney.

Award of Merit.—To Chrysanthemum White Queen, from Mr. M. Silsbury, Shanklin, Isle of Wight; to Chrysanthemum Mary Turnsworth, from Messrs. J. Stredwick and Son, St. Leonards; to Michaelmas daisy Lustre, from Mr. Edwin Beckett, Aldenham House Gardens, Elstree; to Streptocarpus hybrids, from Mr. E. Beckett, Aldenham House Gardens, Elstree; to H. T. Rose Claudius, from Messrs. B. R. Cant and Sons, Colchester; to Dendrobium Taurinum Colmani, from Sir J. Colman, Bart. (gardener, Mr. J. Collier), Gatton Park, Reigate; to Cypripedium Cynthia, Westonbirt var., from Lieut.-Colonel Holford (orchid grower, Mr. H. Alexander), Westonbirt, Gloucester; to Cirrhopetalum fascinator, from Sir J. Colman, Bart.; to Cypripedium Fair Maud, from Mrs. Norman Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne.

MEDALS.

Gold.—To Messrs. Jas. Veitch and Sons, Chelsea, for nepenthes, nerines, fuchsias, etc.; to Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House Gardens, Elstree, for vegetables; to Mr. L. R. Russell, Richmond, for ivies and bertolonias.

Silver-gilt Knightian.—To the King's Acre Nursery Company, Hereford, for fruit, and fruit trees in pots; to Messrs. J. Cheal and Sons, Crawley, for fruit; and to Messrs. G. Bunyard and Co., Maidstone.

Silver-gilt Flora.—To Mr. Howe, gardener to Lady Tate, Park Hill, Streatham, for specimen ferns.

Silver-gilt Banksian.—To Mr. Pateman, gardener to M. Price, Esq., Welwyn, Herts, for fruit; to Messrs. T. S. Ware, Lim., Feltham, for begonias, etc.; to Messrs. Carter Page and Co., London Wall, for dahlias; to Messrs. J. Cheal and Sons, Crawley, for dahlias.

Silver Knightian.—To Mr. G. Reynolds, gardener to Leopold de Rothschild, Esq., Gunnersbury Park, Acton, for choice fruits.

Silver Flora.—To Messrs. H. B. May and Sons, Edmonton, for ferns and veronicas; to Messrs. William Cutbush and Son, Highgate, for hardy flowers; to Mr. H. J. Jones, Ryecroft Nursery, Lewisham, for Michaelmas daisies; to Messrs. Frank Cant and Co., Colchester, for roses; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. F. Sander and Sons, St. Albans, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; and to Mr. J. Day, gardener to H. S. Goodson, Esq., Putney, for orchids.

Silver Banksian.—To Messrs. Jas. Cypher and Sons, Cheltenham, for orchids; to Mr. D. Russell, Brentwood, for conifers; to Messrs. R. Harkness and Co., Hitchin, for roses; to Mr. Howe, gardener to Lady Tate, Park Hill, Streatham, for grapes; to Messrs. J. Peed and Sons, West Norwood, for hardy fruit; and to Mr. R. W. Green, Wisbech, for potatoes.

Bronze Flora.—To Mr. Charles Turner, Slough, for Michaelmas daisies; to Mr. C. Elliott, Stevenage, for Michaelmas daisies; to Messrs. G. and A. Clark, Dover, for hardy flowers; to Mr. Frank Brazier, Caterham, for hardy flowers; to Messrs. W. Wells and Co., Merstham, for early chrysanthemums.

Bronze Banksian.—To the Misses Hopkins, Shepperton, for hardy flowers; to Messrs. Gunn and Sons, Olton, for violas; to Messrs. Barr and Sons, Covent Garden, for hardy flowers; to Mr. R. C. Notcutt, Woodbridge, for hardy flowers.

OBITUARY.

◆

MR. ROBERT GORDON RAE.

Amid every manifestation of sincere respect and regret, there were laid to rest on Tuesday, the 5th inst., the mortal remains of Mr. R. Gordon Rae, who for the long period of twenty-five years held the office of superintendent of Dundee Western Cemetery. For some considerable time past Mr. Rae had not enjoyed robust health, but he was at his post as usual on Friday, October 1. A member of an Aberdeenshire family, Mr. Rae served his apprenticeship as a gardener at Haddo House, the chief Scottish seat of the Earls of Aberdeen, during the regime of the Premier-Earl of Aberdeen. Studious and painstaking to a degree, Mr. Rae soon made a name for himself in the profession he had adopted, and, after serving at a number of gardens, he ultimately became head gardener to the Earl of Eglington, in Ayrshire.

Early in the seventies he received the appointment of superintendent of Craigton Cemetery, near Glasgow, and laid out the ground there. Mr. Rae remained there for eleven years, and fully a quarter of a century ago he went to Dundee to the position he held at the time of his death. He had a wide reputation as a cemetery architect, and, in addition to laying out the new portion of the Western Cemetery, his advice and assistance were sought in this connection over a wide area. His public position brought him into contact with all classes of the community, among whom he was highly respected, and esteemed as a quiet and gentlemanly official, with splendid qualities of head and heart. Mr. Rae, who was in his seventieth year, was predeceased many years ago by his wife, and is survived by a devoted sister (who was his housekeeper for nearly forty years), and two sons.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

TERMINATION OF ENGAGEMENT.—M. E. J., Nottingham: One month's notice, either given or received, is the usual practice in the case of terminating an engagement as head gardener.

SPLIT BEURRE RANCE PEARS.—A. C., Edgware: The cracked or split pears give ample evidence of a bad attack of a fungus known as Fusicladium pirinum, a pest that is somewhat prevalent in some parts of the country. Give the trees a thorough winter dressing later on, and at present gather up and burn the fallen leaves. In the spring, when the buds are beginning to open, spray with weak Bordeaux Mixture, following this up with another spraying just as the flowers fall away, and a third spraying as soon as the fruit crop has set.

KAINIT AND NITRATE OF SODA.—C. T. C., Winchester: Kainit should be guaranteed to contain 23 per cent. of sulphate of potash, and nitrate of soda to contain 95 per cent. pure nitrate of soda.

THE BLUE ROSE.—F. C., Tunbridge Wells: Whether this or that colour is good in the garden is so much a matter of taste that we do not care to appear dogmatic, but we cannot honestly recommend the new rose Veilchenblau for its blue colouring. We have seen it, and the curious purple-blue shade of the expanded blossoms does not greatly appeal to us, certainly it is not blue such as we have in delphiniums, gentians, etc. Do not mistake us; Veilchenblau is a very distinct pillar rose, but, as so much has been said and written about it as a "blue" rose, we fear there will be much disappointment.

MENDING A TENNIS LAWN.—B. F. H., Montgomery: Cut out the portions that have been worn bare, fork up the soil, make it firm and level, and then lay down new turves. The latter may very well be cut from a portion of the lawn where there is practically no wear, and the vacancies thus created may be made good by filling them up with rich soil, and sowing with lawn grass seed in March next. Of course, if you can obtain really good turves cheaply, it will save time and labour to secure these, and place them in the worn places. The work

CROLL'S FAMOUS DUNDEE ROSES

We have this year a specially fine lot of Roses to offer; our Nurseries are situate at a high altitude which ensure plants purchased from us to be of the hardiest nature, and can therefore be transplanted with the least possible risk.

(PHONE, HOP 372.) LONDON, S.E.

should be done at once, and some fine soil should be worked into the joints of the turves by means of a half-worn birch broom. Beating, rolling, and sweeping must be attended to, as a firm turf is necessary to good tennis.

CORDON GOOSEBERRIES.—B. B., Tiptree: We have consistently advocated and recommended the method of cultivating gooseberries as cordons, as we know from personal experience that the method is an excellent one, because it occupies comparatively little space, and the yield is very heavy. For the present we commend to your notice the article on "Currants and Gooseberries" in this issue; if there are other points upon which you desire information, we shall be pleased to help you.

BLACK SPOTS ON CYPRIPEDIUM LEAVES.—T. E. L., Marple: Some cypripediums require much more heat than others, but as you do not give the names of the species and varieties that have spotted foliage, we cannot tell whether these would be better managed in a higher temperature or not. The conditions conducive to black spot are a saturated atmosphere, coupled with a low temperature. Try the disfigured plants in a warmer house.

MARGUERITES.—N. H. B., Bray: Unflowered growths, about four inches long, make excellent cuttings for insertion in sandy soil at the present time. These cuttings will root well in a close, cool frame, if shaded from sunshine. They should be wintered in a greenhouse. Pot up a few of the old plants for stock purposes.

DUMELOW'S SEEDLING APPLE. — H. M. G., Normanton: The history of this fine old apple shows that a farmer named Dumeller, living at Shakerstone, in Leicester, not far from Ashby-de-la-Zouch, raised it, and that the variety was largely grown in the district under the title of Dumelow's Crab. Dumelow, we may add, is a phonetic spelling of Dumeller, the latter being not pronounced as written. It appears that Mr. Richard Williams, of Turnham Green Nursery, Chiswick, received the apple from Gopsal Hall, the seat of Earl Howe, and, in 1820 he placed fruits before the Royal Horticultural Society. The popular and market name of Wellington originated with Williams, and is even now more commonly used than the correct title of Dumelow's Seedling.

NAMES OF PLANTS.

M. G., Weybridge.—1, Pinus Laricio; 2, P. cembra; 3, Abies Nordmanniana.

R. P., Sheffield.—1, Rubus phoenicolasius; 2, Kleinia repens; 3, Gerbera Jamesoni.

E. J. W., Wellington.—1, Viburnum lantana; 2, Panax Victoriæ; 3, Asparagus Sprengeri.

F. S., Bristol.—1, Begonia rex; 2, Jasminum nudiflorum; 3, Fatsia japonica; 4, Bambusa Metake.

A. O., Tonbridge.—1, Rhus cotinus; 2, Dabœcia polifolia; 3, Caryopteris mastacanthus; 4, Abelia rupestris.

F. L. C., Frodsham.—1, Amaryllis Belladonna; 2, Eccremocarpus scaber; 3, Anthurium Andreanum; 4, Polygonum cuspidatum.

A. L. B., Torquay.—1, Kalanchoe flammea; 2, Hoya carnosa; 3, Oncidium ornithorhynchum; 4, Trachelium cœruleum; 5, Solidago virgaurea; 6, Cimicifuga racemosa.

NAMES OF FRUITS.

F. F., Hull.—1, Cellini; 2, Waltham Abbey Seedling; 3, Duchess's Favourite.

A. E. W., Bletchley. — 1, Lane's Prince Albert; 2, Warner's King; 3, Bramley's Seedling.

HERBERT'S PARK POTTERY CO., Darlaston, Staffs.

EVERY GARDENER knows that the XL-ALL SPECIALITIES are the best on the market. The time is at hand for housing Plants for the Winter. When these are arranged under glass a fumigation with XL-ALL COMPOUND, or a syringing with XL-ALL LIQUID INSECTICIDE will at once free them from insect pests and save lots of trouble later on. Any plants or fruit trees suffering from Mildew should be sprayed with XL-ALL MILDEW WASH, or with the newly-patented CUCASA, the finest preparation of Copper ever offered to Gardeners. RICHARDS XL-ALL FERTILIZER is unequalled for finishing off fine blooms and fruit. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink List, giving particulars of these and many other "XL-ALL" Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

GARDENER (Second), seeks RE-ENGAGEMENT; 15 years' practical experience in leading places; good references; married; age 27. South preferred. GARDENER, Hill Cottage, Sunninghill, Ascot.

GARDENER (Second, Inside and Out), age 27; 12 years' experience; good character; well recommended. A. HALL, Moor Place Gardens, Much Hadham, Herts.

GARDENER (Second).—Mr. R. ROGERS, Brookside Gardens, Headington Hill, Oxford, will be pleased to recommend, A. HEWLETT, 12 years' experience, Inside and Out; good references; married, age 30.

A DOCTOR recommends, as SECOND GARDENER on large estate in England, Young Belgian (20), just left the Ecole of Horticulture de l'Etat in Ghent, with highest diplomas, and a grant from the Government; little English. Apply to DOCTEUR VERBRUGGHEN, Gand, Belgium; or, for first informations, to MADLLE. DUPONT, Sunnyside, Stanley Street, Southsea.

GARDENER (Second, or Single-handed, or with help); age 27; life experience in all branches Inside and Out; highest references from good places; disengaged. H. LYTH, Betley, Crewe.

GARDENER (Second, Inside and Out) seeks SITUATION; 10 years good experience; 7 years in present place; good references. T. JARRATT, Waverley Road, Weybridge, Surrey.

YOUNG MAN (single) seeks SITUATION as GARDENER (Single-handed or Second), where more are kept; three years' reference. Apply W. GODDING, Sandhurst, Camberley.

GARDENER, age 28, requires SITUATION in Kitchen Garden or Pleasure Grounds; well experienced; abstainer; good references. BEESTON, care of Garner, Stratford Road, Hockley Heath, Warwickshire.

GARDENER, or Nursery; life exp. Growing, Laying Out, Jobbing, London Florist work; handy with tools; can superintend; temp. or permanent; 30; abstainer. MELHUISH, Hartley, Longfield, Kent.

GARDENER (42) seeks SITUATION, with one under, or good single-handed with help; life experience with Fruit, Flowers, Kitchen Garden, 19 years present place; leaving no fault; good references; married when suited. COVENTRY, Reading Road, Pangbourne, Berks.

GARDENER, good all-round, Inside and Out; 6 years' good character; leaving through death. F. COSSINS, Placewood, Sutton Valence, Maidstone.

GARDENER (Under) wants SITUATION Inside and Out; age 18; strong and active; three years' experience; good references. F. COOLING, Fulbeck, Grantham, Lincolnshire.

JOURNEYMAN (Inside), under Foreman; experience in Plant Houses, etc.; 4½ years last place; excellent reference; age 20; Bothy preferred. Apply BEATRIP, Blendon Cottage, Bexley, Kent.

UNDER-GARDENER, or GROOM, or COACHMAN; AUGUSTUS F. KIRCHER, age 25; good references, and previous experience both in garden and stables. Capt. S. G. Reid, The Elms, Yalding, Kent.

HANDYMAN seeks SITUATION on Gentleman's Estate; good carpenter and joiner; own tools; abstainer; age 26. W. BARRIER, 17, Lennard Road, Penge.

LADY GARDENER (Cert., R.H.S.), undertakes charge of gardens and small greenhouses within half an hour of Balham Station. Address, M. E. F., 18, Cheriton Square, Balham, S.W.

SITUATION required, pleasure grounds or otherwise; used to horse machine, scythe, etc.; married; 10 years' experience; good ref. E. HUMPHREY, The Gardens, Upper Gatton Park, Merstham, Surrey.

SMART YOUTH requires SITUATION as GENERAL (Inside and Out); Bothy preferred; 2½ years present place; age 20. Apply J. KEITH, Gladstone Cottages, Lower Road, Sunninghill.

SITUATION COUPON

To the Advertisement Manager of "THE GARDENERS' MAGAZINE,"
148 & 149, Aldersgate Street, London, E.C.

For OCTOBER 30, 1909.

Please Repeat my Advertisement.

Name..

Address ....

....

Date..............................

THIS COUPON, duly filled up, should be forwarded not later than Tuesday for the next issue.

Situations Wanted—*continued.*

YOUNG MAN, married, no children, seeks SITUATION as PAINTER, GLAZIER, and GARDENER on Estate; good references. RUST, 13. Charnwood Terrace, Bernard Street, Carrington. Notts.

YOUNG MAN seeks SITUATION in Nursery. Inside; experience in Chrysanthemums, Tomatoes, etc.; Hampshire district or near London.—CHAS. COLES, 199, Camberwell New Road, London.

YOUNG MAN (18) seeks SITUATION in gentleman's garden; 3 years in present situation, highly recommended. C. COLESHILL, 3, Wol[illegible] Road, Hampton Hill.

YOUTH, 17, strong, desires situation on small farm, garden, or holding; no previous experience; live in; nominal wages to start. C. L., 24, Reynolds Road, Peckham Rye, S.E.

Situations Vacant.

WANTED, for N. Wales, JOURNEYMAN, one able to take charge; well up in Fruits, Carnations, Chrysanthemums, Orchids, and Greenhouse Plants; must be a good propagator and grower; age about 26. Wages £1 per week and room. Apply, firstly by letter, to Mr. A. D. CLARKE, 21, High Street, Manchester Square, London, W.

CARNATION PLANTING SEASON.

NOW IS THE TIME TO PLANT CARNATIONS,

Either in Outdoor Beds, or in Pots for Wintering.

We offer good, strong, well-rooted Layers in 12 Choice named varieties, either

SELFS, FANCIES, and YELLOW-GROUND PICOTEES,

Or 4 of each sort for **5/-** post free. 12 Newer varieties, **7/6**

Splendid strong **Clumps of Violets**, in all best varieties, **4/-** per dozen. Comte de Brazza, **5/-** per dozen.

List of Named Sorts free on application.

BLACKMORE & LANGDON,
Twerton Hill Nursery, BATH.

BENTLEY'S WEED DESTROYERS

(POISON).

Sales larger than those of any other Weed Destroyer.

Strongest manufactured.
Most permanent in effect.

Used regularly in the Royal Gardens, Public Parks, Cemeteries, &c., and in many thousands of largest and best kept Estates throughout the United Kingdom.

SPECIAL CONCENTRATED STRENGTH (1 to 80), 3 gall. drums, **14/6**; 6 gall drums, **£1 8s.**; 12 galls. (in two 6 gall drums), **£2 7s. 6d.**; 24 galls (in four 6 gall. drums), **£4 10s.**

DOUBLE STRENGTH (1 to 50), 3 gall. drums, **10/-**; 6 gall. drums, **18/-**; 12 gall. barrels, **£1 14s.**; 20 gall. barrels, **£2 10s.**; 40 gall. barrels, **£4 15s.**

Drums and Barrels charged and returnable.

PATENT POWDER (1 to 25) 5 tins, **8/9**; 8 tins, **12/6**; 12 tins, **17/6**; 20 tins, **£1 8s.**; 40 tins, **£2 10s.**; 80 tins **£4 17s. 6d.**

BENTLEY'S COMPOUND QUASSIA EXTRACT

(THE ORIGINAL)!

The PERFECT Insecticide for destroying GREEN-WHITE and BLACK FLY, CELERY, CARROT, TURNIP and ONION FLY, CATERPILLAR, &c.

Each gallon makes from 80 to 100 gallons ready for use.

Cultivated at their **LANGLEY & FELTHAM** Nurseries.	For **FRUIT TREES** in Pots	**4 Gold Medals**
	For Collections of Fruit of **APPLES & PEARS**	**2 Gold Medals**
	For Collection of **GOOSEBERRIES**	**2 Gold Medals**

NOVELTIES for AUTUMN 1909

APPLE, FELTHAM BEAUTY

A remarkably fine dessert apple, ripening early in August. Intermediate in character between the two parents—Mr. Gladstone and Cox's Orange Pippin. A.M. R.H.S.

Dwarf Maidens, **7/6** each.

"The variety is **especially welcome** as it is **in season when good dessert apples are scarce.** The fruit is very pleasant to the palate, the flesh being brisk and sweet."—*The Gardeners' Chronicle*, Sept. 5th, 1908.

APPLE, REV. W. WILKS

The fruits of this fine novelty are very large, of good shape, and yellowish green in colour, spotted with brown and scarlet. The flesh is white, juicy and pleasantly flavoured. **An excellent apple for cooking purposes.** A strong grower and free bearer. It was raised from Peasgood's Nonsuch x Ribston Pippin. A.M. R.H.S.

Dwarf Maidens, **5/-** each.
2 year Pyramids, **7/6** each.

GRAPE, PRINCE OF WALES

A sport from Mrs. Pince; berries black, large and oval, of good and slightly Muscat flavour; bunches large, long and tapering. F.C.C. September, 29th, 1908.

Planting Canes, **7/6** and **10/6** each.
Fruiting Canes, **15/-** to **21/-** each.

STRAWBERRY, GEORGE MONRO

A splendid early forcing variety, sets freely, and is **not subject to mildew.** Its bright colour, solid flesh, rich flavour, earliness and most prolific cropping qualities, make it **a most valuable acquisition for market purposes, as well as for the private garden.** A.M. R.H.S.

Plants in small pots, **6/-** per dozen; **40/-** per 100.
Runners from the open ground, **3/-** per dozen; **20/-** per 100.

Messrs. VEITCH will be pleased to forward post free on application Catalogues of all Garden Plants, Fruit Trees, Bulbs, Seeds, and requisites.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Gardeners' Associations.

One of the most important of the educational aspects of horticulture during the past twenty years has been the continuous growth of associations, at whose gatherings gardeners have opportunities for meeting each other and discussing questions bearing on the practical and scientific sides of their work. The importance of the extension of such facilities as the gardeners' associations afford for the interchange of views upon the many matters to which gardeners have to give their attention cannot well be overestimated, and we trust this extension will continue until there are strong associations in all the principal centres of horticultural activity. It is satisfactory to know that gardeners should have so fully recognised the usefulness of these associations, as it indicates that the most experienced feel they have need to be on the alert to keep themselves well acquainted with the continuous flow of novelties, and with the changes that are continually being made in the public taste. Fully recognising the great value of associations of gardeners, we have long taken a keen interest in their work, and endeavoured in various ways to assist in rendering them thoroughly useful. For a considerable period the pleasure we had in watching the development of these associations was tinged with a feeling of regret that the large number scattered over the country were so many separate units, instead of members of a strong united body. The cause for regret has, to some extent, been removed by the opportunity that has been given them for entering into affiliation with the Royal Horticultural Society; but the results, so far, have not been such as to give complete satisfaction. It is possible that the Royal Horticultural Society has not made provisions so ample as one might wish in the way of lectures and lantern slides for the use of the associations, but we are not disposed to question the wisdom of the Society in not expending large sums of money in providing them until the number in affiliation and the demand for lectures and slides is sufficient to justify the expenditure. Whether this be the case or not, the matter is one that is really in the hands of the associations in affiliation, for if the provisions made are unequal to their requirements, they have only to make their wishes known to the council in a practical manner to obtain what they require. The annual conference affords an excellent opportunity for discussing a matter of this kind, and other points that have a direct bearing upon the work of such associations, but at the one held the other day this opportunity was practically lost. The delegates talked about the desirability of the associations in the several districts holding joint meetings for the purpose of inducing the Royal Horticultural Society to hold county exhibitions; the status of the gardener, the amateur, and cottager at competitive gatherings; the handicapping of exhibitors, and so forth. These questions would have been appropriate at a conference of horticultural societies, but at one of bodies whose work is chiefly educational, they were somewhat out of place. One of the questions discussed was quite appropriate to the occasion, and that was, "How can the meetings be made more attractive to young gardeners?" The discussion was somewhat lengthy, but it was much less useful than it might have been, owing to the speakers, with one or two exceptions, overlooking the possibility of greatly increasing the interest of the meetings. Instead of addressing themselves directly to the question, and making suggestions that would assist in the solution of the problem, they indulged in an expression of opinion that it was impossible to induce young gardeners to attend the meetings owing to their devoting so much of their attention to athletic sports. There are, of course, exceptions, but, as one of the delegates pointed out, young gardeners do not devote anything like so much time and thought to football and other sports as do young men engaged in other walks of life. We were not a little surprised to hear that so few young men attend meetings, because we have, on not a few occasions, been struck by the large number of young men in the audience. It would be well were societies that have to contend with this difficulty to carefully consider the question, not of lowering the subscription, as was suggested, but of increasing the interest and attractiveness of the meetings. There are many ways of doing this, and one that is likely to improve matters considerably would be the inclusion in the programme of papers and lectures by men from a distance who have become widely known as masters of their subjects. If some of these are of a scientific character it will be an additional attraction, and, where possible, the lectures should be illustrated by lantern slides. This will necessarily involve additional expenditure, but there should be no difficulty in providing the means wherewith to meet it where there is any considerable number of gardeners. In some cases it might be well to make a trifling increase in the subscription of or-

MR. J. B. BLACKMORE.

dinary members, in others to have a list of honorary members, and it is well worth considering whether money given in small prizes at the meetings would not be more usefully employed in giving increased interest to the programme.

Mr. J. B. Blackmore, who has achieved considerable success as a raiser of begonias, and brought the frilled single varieties to a high state of beauty and perfection, was not brought up to the business of horticulture. Born at Newton St. Loe, near Bath, Mr. Blackmore took up the profession of engineer and wheelright directly after leaving school, but from his earlier years he always found time to grow a few plants and flowers, and as a small boy he took advantage of every opportunity that served to visit and admire good gardens. About 1886 Mr. Blackmore began to grow tuberous begonias, and a few years later he had the privilege of often visiting the gardens of the Rev. E. Lascelles, rector of Newton St. Loe, who was then one of the foremost raisers of begonias, and had a grand collection, then under the charge of Mr. C. F. Langdon, who is now Mr. Blackmore's partner in business (Messrs. Blackmore and Langdon) at Twerton-on-Avon. Each year Mr. Blackmore purchased a few of the finest of Mr. Lascelles' begonias, and when the latter gave up cultivating single varieties Mr. Blackmore purchased the whole stock. From 1889 to 1901 he exhibited largely, and won the chief awards in most of the begonia classes at Weston-super-Mare, Taunton, Bath, Trowbridge, Kingswood, and Shrewsbury. It was in 1900 that Mr. Blackmore decided to give up his business and devote his whole energy to horticulture, specialising in begonias and carnations. He had already raised and improved begonias considerably, but lack of time and space limited his seedlings to about 2,000 per year. In the autumn of 1901 Mr. C. F. Langdon was taken into partnership, and since then the work of improvement has proceeded rapidly, as the displays at the Inner Temple, Holland Park, and Shrewsbury have testified. No fewer than twenty-two gold medals, besides cups and other medals, have been awarded to the Twerton Hill begonias since 1901—a good record surely.

New Apples and Pears.—The special interest attaching to the competitions to be held at the Royal Horticultural Hall on Tuesday next, lies in the fact that the eleven classes for apples and four classes for pears will all be limited to varieties of these fruits introduced to commerce since the year 1892. In such a competition as this the term "new" is comparative, but the classes should serve to show which varieties sent out during the last eighteen years have achieved some success and become popular.

Visit of Market Gardeners to Holland.—A short time since a party of market growers in the Evesham district visited the market gardening districts in Holland for the purpose of obtaining information on the methods of culture and marketing that find favour with the Dutch growers. Two or three years since a similar visit was paid to the market gardens round Paris, and, as the result, several gardens have been established on similar lines to those near that city. The visit to Holland is not regarded as so profitable as that to France, although it proved interesting and afforded information on the practice that obtains. The visitors were much struck by the fact that the use of artificial fertilisers which forms so important a feature of the practice that obtains in the Vale of Evesham, is on a very limited scale in Holland. The co-operative markets created much interest, and some members of the party returned home strongly impressed with the opinion that similar markets at Evesham and other centres where vegetable and fruit culture is carried on on a large scale, would be highly advantageous to the growers. The Dutch markets belong to the growers, and 4 per cent. on the value of the produce covers the cost of management, depreciation, and the interest on capital. At the markets the goods are displayed by porters, and any seller found offering "topped" produce has to pay a sum equal to 10 per cent. on the value to the purchaser, and also a sum to the general fund in proportion to the offence.

"**Kew Bulletin.**"—The more important of the contributions to the current issue of this publication are an illustrated article on Ecanda rubber, which is obtained from the tubers of Raphronaceme utilis; a further instalment of "Diagnoses africanæ"; notes on Cornus macrophylla and some Asiatic congeners; notes on trees in Devonshire, and descriptions of coffee diseases of the New World.

Trials at Wisley.—Trials of the following fruits, flowers, and vegetables will be conducted in the gardens of the Royal Horticultural Society during 1910-11: Strawberries, autumn fruiting (20 runners of each), early-flowering outdoor chrysanthemums (two plants of each, to be sent in April), clematis (two plants of each early in April), gladioli, early, midseason, and late (four bulbs of each early in February), rhododendrons, early, midseason, and late (two plants of each in February or March). Potatoes (each variety must be labelled as being "early," "midseason," or "late." Twenty tubers of each to be sent by February). Also experiments with "Ashleafs" of all forms (20 tubers), secured from as many varying sources as possible, under different soil and climatic conditions. Please send particulars of soil and climate. Salads, of all kinds and varieties (¼oz. of seed of each, early in February). Peas (½ pint of each, early in February). Spinach (½oz. of each, early in February). Everything sent for trial must be named, and the name and address of the sender attached. If sent by post: The Superintendent, R.H.S., Gardens, Wisley, Ripley, Surrey; if by rail: The Superintendent, R.H.S. Gardens, Wisley, Horsley Station, L. and S.W.R., with advice by post to the superintendent.

The Potato Crop of 1909.—According to the agricultural returns for the current year the area under potatoes has been 575,461 acres, or an increase of 13,000 acres, as compared with last year's acreage. This increase is almost identical with that shown in 1908, and the loss that occurred in 1907 has now been more than recovered. Potatoes suffered so severely from disease during September and the early part of the present month that the crop of tubers will, as a whole, be considerably below that anticipated towards the end of the summer.

Leeds Paxton Society.—The growers of sweet peas in various parts who so kindly helped the committee of this society with contributions of flowers on the occasion of their first show held at Headingley, Leeds, on August 7, will be pleased to learn that the exhibition resulted in a net profit of £7, in aid of the Royal Gardeners' Orphan Fund.

British Gardeners' Association.—A few evenings since a meeting of gardeners was held at the Masonic Hall, Caterham, for the purpose of considering the desirability of forming a branch of the British Gardeners' Association. About fifty were present, and the Rev. Fergus Wood, who presided, urged those present to organise themselves for the purpose of improving their position generally—improving the general level of the quality of their work, and improving their position in regard to the recognition which the public gave to their work. The meeting was addressed by Mr. E. F. Hawes, and Mr. Smart, and in the result it was decided to form a branch, with Mr. H. Groves as secretary pro. tem.

Plant Dispersion is a most fascinating study, and one that the Rev. Professor G. Henslow, V.M.H., has taken a great interest in. On Tuesday, October 26, the reverend professor will lecture on this subject under the title of "Remarkable Instances of Plant Dispersion," before the Royal Horticultural Society, at Westminster, and the lecture will commence at three o'clock.

Fertility of Soils.—To the meeting of the British Association, a paper was contributed by Mr. A. D. Hall and Dr. E. J. Russell on the "Conservation of the Fertility of Soils." The authors remarked at the outset that nitrogen was the most important of the elements of fertility in the soil, and the one most subject to change through either the natural conditions prevailing or the form of cultivation the land received. They then proceeded to point out that the various factors affecting the amount of nitrogen in the soil might be distinguished. (1) The growth of plants simply removed some of the nitrogen that had reached an available form. (2) Various bacteria were capable of bringing atmospheric nitrogen into combination and so increasing the stock of soil nitrogen. (3) Another group of bacteria, in the process of breaking down organic matter, liberated the nitrogen in the free state and so reduced the stock of soil nitrogen. (4) Natural drainage waters contained nitrates which had been derived from the soil nitrogen by bacterial oxidation. (5) The rain annually contributed a certain amount of combined nitrogen to the soil. The interplay of these factors gave rise in practice to the following types of cases: (a) The nitrogen content of land under arable cultivation declined when the produce was entirely removed and no organic nitrogen was added as manure. (b) When land rich in organic compounds of nitrogen was subjected to arable cultivation, the destructive agencies (No. 3) became very active and the land lost nitrogen rapidly. (c) When land was carrying a natural vegetation which was not removed there was a gain of nitrogen. From the practical point of view, the cultivation of successive cereal crops would rapidly reduce the stock of nitrogen originally in the soil, not only by the amounts withdrawn in the crop, but also by the oxidising actions set up in the cultivated land.

Mr. James Britten, who recently retired from the botanical department of the British Museum, after thirty-eight years' service there, was previously at the Herbarium, Kew, for two years. Mr. Britten has been preparing a catalogue of the Sloane Herbarium, and this, to be published shortly, should be of great interest, because it was the collections made by Sir Hans Sloane, of Chelsea, that laid the foundation of the British Museum.

SINGLE-FLOWERING ROSES.

The note on this subject in the issue of October 16 reminds me that thirty years ago, if one wanted single roses one had to go to the species and hybrids of species. Probably the single-flowering seedlings of hybrid perpetuals and teas were thrown away as worthless. But as these species are without exception "summer-flowering" roses, varieties that give only one crop of flowers, and were for the most part rampant growers for which a considerable amount of space was required, they were unsuitable for small gardens and ordinary rose beds.

Within the last ten years or so fashion in the rose world has changed, and the public taste lies less in the direction of form and size of the individual flower, and more in the freedom of flowering and novelty in colouring, and, except for the exhibitor of specimen blooms, form and fulness are quite secondary considerations. Time was when a rose "showed its eye," it was regarded as a defective flower; it was past its best. Now the depth and rich colouring of the anthers are good features, and we see in them not only a beauty but an indication of freshness.

Thus, single roses with bright golden anthers have been restored to popular favour, and with the demand follows the supply. No longer in our quest for single roses have we to confine our search to the species, the real single roses, having just five petals only—but we go to that "universal provider" class, the hybrid teas, and find them there. Even among the hybrid perpetuals we may find them, Maharajah, for instance, which, although strictly speaking has more than five petals, yet is very close on the border line. Maharajah is a glorious deep velvety crimson rose, to which we are indebted to Messrs. Benjamin R. Cant and Sons. It is somewhat of a single Horace Vernet, and almost as beautiful when caught right. Of strong, sturdy, upright growth, lacking perhaps in gracefulness, but nevertheless attractive on the plant. The colour is fleeting, and a few hours after cutting, as we know to our cost, the yellow shading in the red has gone, and the flower has lost its brilliancy. Another single, or almost single, is Gottfried Keller, one of the race of Austrian briars, but perpetual and an autumnal, apricot in colour, with golden-yellow centre, wood dark brown, foliage glossy and mildew proof. The flowers, in clusters, are given on the tips of long shoots; too long perhaps, for its habit is straggly and thin, and furthermore it is not quite as free in flowering as one could wish. It is, however, quite distinct, and its remarkable colouring makes it most attractive.

Another rose destined to be popular amongst lovers of single roses is the new hybrid tea, Simplicity, sent out this year by Hugh Dickson of Belfast. It is one of the few single roses that has obtained the gold medal of the National Rose Society. The colour is pure white, with rich golden anthers, petals of much substance, flowers four or fine inches across, in effect something like a water lily. It is of good constitution, a vigorous grower and very free bloomer, always in flower until quite late in the autumn.

That celebrated firm of hybridists, Alex. Dickson and Sons, of Newtownards, has given us a series of single perpetual roses, sent out with the prefix "Irish," such as Beauty, Brightness, Elegance, Harmony, Pride, Star, Glory, and Modesty. Of the set, two stand out beyond their fellows. The first and better known is Irish Glory, of good constitution, and when left alone and not hacked about by the knife, will develop into a fine bush. The flowers are silvery pink, shaded crimson, produced in clusters; a good autumnal. The second and newer rose is Irish Elegance, not perhaps so robust as the former, but time will prove. In this variety the colour is most attractive, a colour which is sure to make it popular; bronzy orange, opening out to various shades of yellow. A free-flowering rose and an excellent autumnal, as those who saw the bunches of it at the autumn rose show of the N.R.S. this year will testify.

Joseph H. Pemberton.

NERINES.

The genus nerine includes some very beautiful bulbous plants, and the varieties of more recent years have enhanced the value of these autumn-flowering subjects. True, the fact of the plants flowering before much leaf growth appears gives a bareness that detracts a little from their appearance as decorative plants, but if they are arranged in a suitable place while in bloom, a ground work of ferns will furnish the necessary greenery, and also somewhat tone down their brightness.

The spikes of flowers are of considerable value in a cut state, and may either be arranged by themselves or with flowers of lighter appearance to act as a foil to their brilliancy of colour.

The culture of nerines is not difficult, but they cannot be grown haphazard with a variety of other plants, but, like the majority of bulbous plants indigenous to South Africa, they require a growing period, gradual ripening afterwards, and, after the leaves have fallen, absolute rest in full sunshine until the flower spikes begin to appear. At this latter stage water should be very carefully given until, as growth becomes active, more liberal supplies must be afforded

Frequent repotting is not necessary, but it is essential that the bulbs when first potted be put into a good compost that will last several seasons; ample drainage, good loam, with some leaf-soil, and the addition of sand, and a little charcoal, will suit them. A top-dressing annually, after the first potting, should be given them, and this should be done before the roots become active. Occasional waterings with weak stimulants will benefit the plants while in active growth.

Varieties are now somewhat numerous, but for brilliancy of colour few equal Nerine Fothergilli major and N. sarniensis, as they are quite distinct in their colours from the later hybrids. The more recent introductions give new shades of colour, which makes them welcome, but they do not appear to possess the strength of N. Fothergilli. Among the best of these are N. rosea and N. rosea crispa, both rose colour, one a trifle deeper in colour than the other. These two are stouter in spike and flower than the others. Lady Clementina Mitford is a pleasing shade of salmon-pink, with a rosy base; O'Brieni is deep salmon, without any deeper shading; Lady Altamont is terra-cotta, shaded salmon; Miss Elwes, rosy-pink, medium spike and truss; Miss Willmott, light rose; and H. J. Elwes, blush-white, rosy base. Other varieties include F. D. Godman, Elliott's Seedling, and E. Godman. The older N. corusca and N. corusca pallida are also worthy of a place in gardens.

Nerines are not so much grown as they deserve to be, and they appear to be grown more in the county of Sussex than in other parts of the country. The writer's acquaintance of them dates back some few years, but he has never met them in such quantities as on the South Coast.

Horsham. T. H. Slade.

GREASE BANDING.

(Concluded from page 800.)

At the same time, it must not be assumed that because a good coat of grease was put on at first that no further attention is needed, and that the bands can look after themselves for the rest of the time. A constant watch must be kept, and as soon as any place appears dry then the brush must be used, and touch it up when the paper is dry enough to bear the drag of the brush. This is the real difficulty which attaches to livening the grease up, and renders it so important to minimise the labour as far as possible. One often has to wait two or three weeks during the winter until a suitable day arrives on which the work can be carried out.

In our opinion only the especial difficulty of using a brush on the damp papers can justify the use of the hands. In some quarters the advice is given to apply the grease in the first place by hand, but we consider this quite unnecessary, and very obnoxious indeed for the workers. The quantity which one gets on the hands during the course of applying it by means of brushes is very hard to get off, but it must take several days to finally get rid of the odour.

If the grease is applied before the leaves are shed from the trees an occasional inspection of the bands will be necessary, as the leaves are sometimes driven by the wind on to the grease, and so form a bridge by which it is possible for the moths to cross the danger zone.

While grease banding will cause a remarkable diminution in the number of our caterpillar enemies, it practically only accounts for two varieties, i.e., the ordinary Winter Moth (Cheimatobia brumata), and the larger Winter Moth (Hibernia defoliaria) or Mottled Umber, which is much more seldom met with on the bands. The late Miss Ormerod suggested to the writer that the Codlin Moth might be caught, but we have never succeeded in securing one, nor have we found the March Moth (Anisopteryx œscularia), which is often the culprit when the Winter Moth gets the blame, though we have kept our bands moist right into the spring on the chance of catching it. If the bands are on the trees and greased before the middle of October, that is, in general seasons, a very good time; last year the majority of the moths did not ascend till quite the end of November.

It is unwise to do the greasing any earlier than is absolutely necessary, as the heat of the days is then a shade more than it is later on, and the bands are inclined to dry, and to be ineffective just at the very time when the moths are going up the trees, and before it is considered that the bands will need touching up. At present, so far as we know, there is not in this country a grease which will stand our summer heat, and therein lies the difficulty in keeping the bands right at both ends of the grease-banding period, this is during September-October and March-April.

However, with all its drawbacks, grease banding is a very valued aid to the fruit grower, enabling him, to some extent, to combat the many pests with which his trees are beset.

F. W. Hammond.

Kniphofia John Benary.—This is quite one of the most showy of autumn-flowering plants, and certainly one of the best of the family, its bright coral-red blooms with orange-tinted buds on stems 6ft. high rendering it an object of much interest during the latter part of September and early in October, when hardy flowers are becoming scarce.—E. M.

TORCH LILIES FOR THE ROCK GARDEN.

The possession of a good rock garden often affords the inspiration, and also the means, for the cultivation of rare and choice subjects which would otherwise be missing from many gardens. The varied aspects obtainable on a fairly large rock-garden, together with the pleasant nooks under the shelter of the rocks, the warm spots which the sun haunts at every possible opportunity, and the well-drained pockets and crevices among the boulders, give an opportunity for the culture of many plants, some of which are deemed but half-hardy.

It has been borne in upon my mind that the lesser kniphofias, or torch lilies as one loves to call them, are not nearly so fully utilised for rock-garden adornment as they deserve to be. I shall refrain from mentioning the stronger growing species and varieties, as they could only be used in large rock gardens, but the smaller and lighter growing gems will be found distinctly serviceable.

Granted that one selects positions where there is a good depth of soil, and where plenty of sunshine falls, there should be little difficulty in founding successful colonies of these delightful torch lilies. The reader will bear in mind that the kniphofias are good feeders, and should provide a rooting medium of sandy-loam enriched with well-decayed manure, and also, if the district is a cold one, a little bracken over the ground in winter time will assist in fighting the frost.

To come to the all-important question of suitable species, etc., I briefly note a few forms which will be found meritorious. K. Nelsoni is probably the best known of the group. It is a prolific-flowering coral-scarlet gem from the Orange River Colony, very neat in growth and of pleasing appearance. The dainty clear yellow K. pauciflora, with its light, semi-drooping spikes of blossom is distinctly pretty, while its near relative K. breviflora, a rarity of almost similar colouring, is exceedingly graceful in formation, and provides a wealth of tiny torches from among the grassy foliage. Those superb hybrid forms, Torchlight and Goldelse, which are a very delight, are markedly noticeable each season at the Kilnfield Gardens of Messrs. Wallace and Co. Torchlight, with its sheaves of flame-tipped miniature torches, is grand for rock-garden purposes, and forms a pretty group when surrounded by low-growing alpines, etc. Its companion, Goldelse, is notable for its clear golden-yellow colouring, and is as free as the well-known K. Nelsoni.

Other good kniphofias are K. media, a light-growing species with a floriferous habit, and apricot colouring; K. citrina, rather stronger growing with narrow foliage and clear citron-yellow torches. K. rufa, a sterling species of recent introduction from the Orange River Colony; and the delightful Abyssinian rarity K. comosa, with its bright yellow spikes of blossom, which is very dwarf and free.

The seldom seen K. modesta, the white torch lily of Natal, is none too hardy, yet it merits a place in the rock garden, if only for its interest and rarity. The varieties raised from K. modesta, and some of the hardier grassy-foliaged forms, are of a hardier character, and some pleasing shades of amber, terra-cotta, etc., are being secured.

An exceptionally pleasing new hybrid from K. citrina, with blossoms of a wondrous shade of coral-red, and a dwarf, erect habit, has struck me as being well-worthy of note, and if placed in commerce should have a good future before it.

The value of these charming kniphofias throughout late summer (one might almost say from June until the end of September) in embellishing certain positions among the rocks, is certainly great, and a trial planting would almost certainly give pleasure to the grower, while at the approaches to the rock garden a grouping or two of such varieties as K. R. C. Affourtit, K. John Benary, K. Seraph, K. tricolor, and other of the stronger forms will give a grand display.

P. S. Hayward.

THE HISTORY OF THE EARLY-FLOWERING SINGLE CHRYSANTHEMUM.

The following paper was read at the Chrysanthemum Conference at Essex Hall by Mr. W. Wells:

The commencement of the early single chrysanthemum may be said to have been with the advent of Mabel Goacher, and the honour of the first-born must be given to Mr. Goacher, who has raised so many of the good early doubles.

Mabel Goacher was first introduced by me in the spring of 1902, when at Earlswood. The description which appeared in my catalogue for that year was: "Mabel Goacher, single, pure white, with blush reverse. A profuse bloomer during August and September. Were it not for the buds showing the blush reverse, it would be white enough for wreath work. This is the first early flowering single white that flowers out of doors; 1½ft."

For the first year this was catalogued with the early doubles, but very little demand was made for it. Later, it was catalogued with the November singles, when there seemed to be more demand. In 1904 I had a plant of Mabel Goacher and one each of Miss Rose and Bertha Jinks in a cold house, and cross-fertilised them. The first batch of seedlings was very disappointing, only one was considered worthy of notice. In 1905, this variety, which was eventually named Surrey, was lifted and put aside with Mabel Goacher and a seedling from Mr. Goacher. These were fertilised, and the seeds sown in the spring of 1906. From this sowing we selected about forty varieties, which appeared to be the most distinct, and gave most promise of a plentiful stock of cuttings. In the autumn of 1906 they appeared in our catalogue under the heading of "Early Flowering Singles." From that batch we held over about 100 others for trial the following season. From these forty more were selected for distribution in 1907-08.

We had no fear of the first batch being too much alike anything already in commerce, for we had the whole stock in our own hands. The following year we might easily have selected 100 sorts, but only sixteen were distributed, and each year more care will have to be exercised in selecting varieties. I willingly admit there is plenty of scope for improvement, for many of our varieties are very highly bred, as can be easily understood, for we had no course open to us but interbreeding, and this is what all stock growers try to avoid. There will be plenty of opportunities of getting wider parentage shortly, and the habit of the plants will no doubt be greatly improved.

There are several varieties sent out which can hardly be called singles, some having three or four rows of petals. No doubt I shall be called to account for calling these singles, but I must inform those exacting persons who find fault that these varieties, with their semi-doubleness, were intentionally saved for a purpose. I will mention Eva Grantham, Spitfire, Firebrand, The Navy, and Mary Richardson. Suppose we take two of the best varieties as a contrast, say, Mary Richardson and Dorando. The former has three rows of florets, the latter but a single row. Pack them for a journey in exactly the same way, and give both the same amount of rough handling. Dorando will have a few of its petals bruised, and do what you may, they will show it, for there are no reserve rows to fill up the space; while Mary Richardson has a good reserve, and can fill up gaps; also, it is not so likely to get damaged, for the extra rows of petals support the others.

It was in the autumn of 1907 we found ourselves in possession of such a vast variety that my two sons and myself discussed the question of saving seed for sale, being quite satisfied that the early-flowering chrysanthemums could be treated as annuals, and we decided that, being introducers of the varieties, we would introduce the seed, and, controlling an almost unlimited stock, we would make preparations for planting half an acre of our best and newest varieties. We secured more land, and planted 15,000 plants for the purpose. The autumn of 1908 favoured our venture, for never was a more favourable time for seeding the early singles. Every day brought millions of bees and flies of all kinds and sizes. After harvesting, threshing, and winnowing the crop, we had a splendid sample, in bulk a little over six gallons. That, I think, will be well on the road towards establishing a record.

Although the early single chrysanthemum may be readily raised from seed sown in the spring and flowered in the autumn of the same year, I do not think seedlings will ever be reliable enough to be planted in beds or lines for the same effect as so many annuals. For they cannot be produced in the separate colours; neither will they all flower at the same time. For instance, if the seed is sown at the same time, and the seedlings treated exactly alike, some plants will begin flowering in August, while others will bloom at various periods from that time till November; but, unless very hard frost or snow prevents, they will certainly flower the same year as the seed is sown.

In making a selection in future, great care must be exercised by committees of the various societies granting certificates, for the named varieties will become more bewildering than in any other class of plant with which I am acquainted. There is plenty of room for improvement to be made in colour and shape of flower, and in the habit of the plant. We are frequently receiving packages of flowers to give advice upon or to name, and it is quite natural for everyone to have a particular fancy for one's own raising. I will give a selection of twenty-five good varieties which are now in commerce, not including novelties:

Three whites: White City, Florence Gillham, and Snowstorm. Three yellows: Nellie King, Marie Corelli, and Dolly. Three pinks: Kitty Riches, Ena, and Charming. Three crimsons: Carrie Luxford, Kate Westlake, and The Carlton. Three terra-cottas: J. H. Runchman, Dr. Ingram, and Hilda's Favourite. Seven bronze, orange, and salmons: Well's Pride, Eric, Alexandra, Kate Carter, Kathleen, Mary, and Surrey. The best purple-crimson is Merstham Glory. Kitty Graham and Goldlace are also good in their shades.

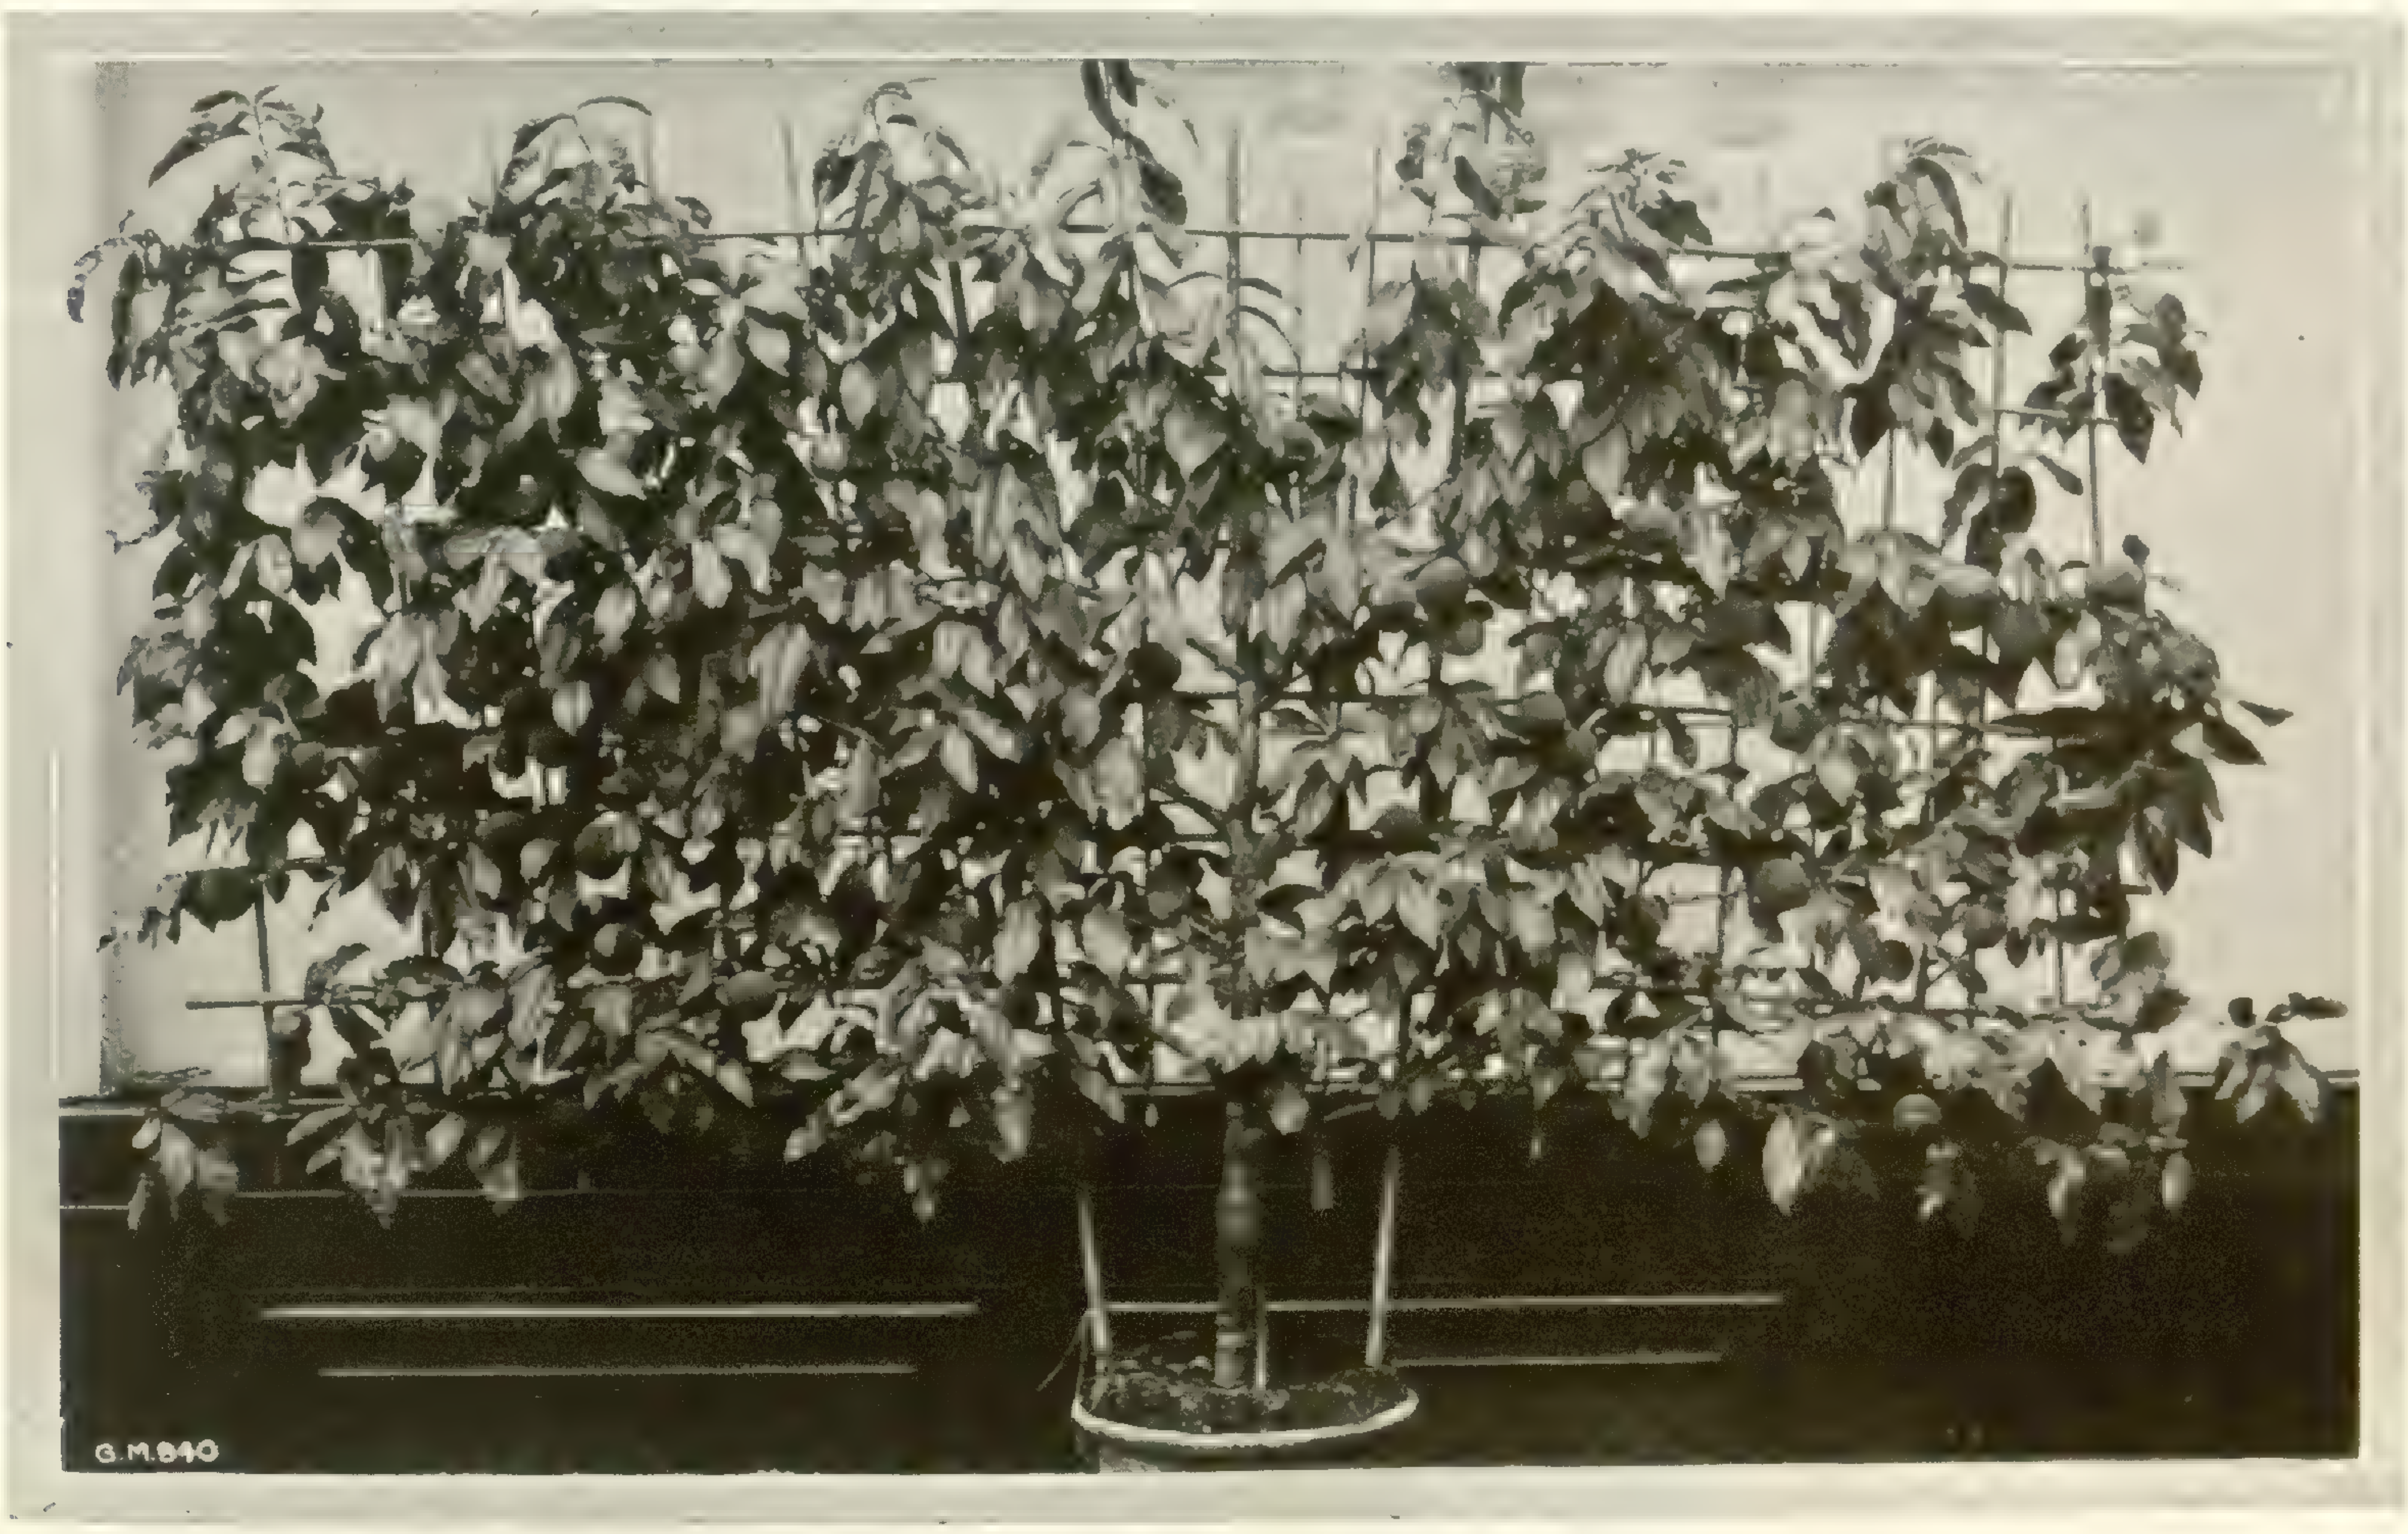
This paper deals mostly with the September varieties, but there are very many equally good October sorts. Here, especially, the flowers with only a single row will never become standard sorts, for they will not stand the weather so well.

The cultivation of the singles is the same as the doubles, except, as I have already said, being high-bred the cuttings are not produced so readily. At first they are very thin, and until they gain strength, therefore, I advise leaving them on the plant until March, when they quickly take root and grow away. Instead of planting them 18in. apart, as with the doubles, they might easily be put 15in. one from the other. They commence flowering in July, but I advise picking off the early buds, for the hot sun (if we get any) in August will burn the flowers, and they will not be as bright in colour as the later flowers will be on the same plant.

LIMING THE SOIL.

Lime is absolutely indispensable to the growth of all garden plants, yet it is required in comparatively small amounts, because what is necessary for the soil is not so much the chemical substance lime, but a base, or, in other words, something which is capable of combining with the acids produced naturally or artificially in the soil. In quicklime, or slaked lime, this base is found, and in nothing else, for it must be remembered that lime is not a plant food in itself, it must combine with some dormant plant food already in the soil, which it sets free and renders soluble and available for plants to take up.

Lime is comparatively abundant in the leaves of all green plants, but in the matured wood of fruit trees it may vary from 2 to 15 per cent. of the mineral substances, while 1,000lb. of ripe fruit will never contain more than from 2lb. to 3lb. of lime. Lack of lime in plant development is first indicated by stunted growth, and the production of small, yellow coloured leaves.



PEACH THOMAS RIVERS.

A finely-trained specimen, in a 15-inch pot, carrying about 50 fruits; grown by the King's Acre Nursery Company, Hereford.

The precise use of lime to plants is unknown, but, as already stated, it is indispensable, and cannot be replaced in the food of plants which contain chlorophyll (leaf green) by any other substance. In the absence of lime, the starch contained in the leaves is with difficulty changed into sugar, possibly owing to the failure of the nucleus of the plant cells to manufacture diastase, the ferment necessary for transforming starch to sugar in plant nutrition. Lime also greatly contributes to the building up of the tissues of the growing plants in the form of organic matter.

Uses of Lime in the Soil.

Lime, however, performs other functions in the soil than the supply of plant food. One of the most important of these is, as I have already stated, the neutralising of acidity, which is especially abundant in old and rich garden soils which have been heavily dressed with farmyard or stable manure, or even with leaf-mould. For such a purpose lime is the most suitable material, because of its comparative cheapness, and of its importance as a constituent of living plant tissues. This means that some excess of available lime in the soil is necessary over and above the bare needs of the growing crop for tissue building.

Another function performed by lime is the liberation of plant food from otherwise locked up or dormant compounds in the soil. If a little freshly burned lime be mixed with strong manure, such as chicken manure, guano, or fresh stable manure, an odour of ammonia will become apparent. This means that the lime is entering into chemical union with certain ingredients of the manures, and in doing so is liberating other elements which pass off in the form of ammonia gas.

If lime be mixed with the soil a similar action will take place; the lime will unite with the decaying vegetable matter or humus contained in the soil, liberating nitrogen in the form of ammonia.

If a crop is growing upon the soil it may absorb a part of the escaping ammonia, and a larger yield will result; but this larger yield is produced at the expense of the soil's store of plant food, and if these stores are not maintained by liberal manuring the soil will eventually fail to respond to applications of lime, because all the material in the soil upon which lime can act has been destroyed, leaving the soil poorer than if no lime had been used. Hence the old adage, "Lime without manure makes both garden and gardener poor."

Lime Improves the Working of the Soil.

For the reason stated above it has been found better to apply small quantities of lime at frequent intervals rather than large quantities at one dressing. An application of 5cwt. per acre twice in the year is better than large dressings from 10cwt. to 20cwt. per acre applied all at once.

A third function of lime is the amelioration of the texture of the soil. When heavy, plastic clay is wet, pressed into a cake, and then dried, it becomes almost brick-like in appearance; but if a small portion of quicklime be incorporated with the clay before manipulation it will crumble easily between the fingers after drying. For this purpose quicklime, or, possibly, better still, ground burnt lime unslaked, may be very usefully employed on many of the more refractory clay soils, using it at the rate of one ton per acre.

Clays thus treated will become much more friable, will respond more readily to cultivation and manuring, and will not become so caked after rain. The effect of such an application of lime will last for a number of years. It will be easily understood that the opening of the soil by a dressing of lime will facilitate the action of air, rain, and other agencies by which the plant food of the soil is made available to plants. Loose, sandy soils may also be improved by liming, the lime rendering them more compact and more retentive of moisture.

J. J. Willis.

Harpenden.

A FINELY-TRAINED POT PEACH TREE.

On several occasions this season some exceptionally well-trained fruit trees have been exhibited by the King's Acre Nursery Company, Hereford, and these have attracted a great deal of attention. It is not a common practice to grow trained peach or other trees in pots for early fruiting, as, in a general way, a pyramidal or slender bushy habit is found more useful and convenient. But these trained trees, as shown at Shrewsbury, at Westminster, and elsewhere, have carried heavy crops of good fruits, and thoroughly justified their existence. The specimen peach tree illustrated was the centrepiece of a fine gold-medal display arranged at the Royal Horticultural Hall, Westminster, on August 31 last. It was in a 15-inch pot and carried about fifty fruits; the variety was Thomas Rivers.

HINTS FOR SPRING BEDDING

Spring flowering plants provide a direct evidence of Nature's re-awakening and appeal to us in a very different way to the thousand and one subjects and the galaxy of beauty which prevails at a later date and on throughout the summer. Happily in both private and public gardens and parks the harbingers of spring are now found in immense numbers, and additional developments are noted each season.

It is interesting to notice that combinations of bulbous and other spring-flowering plants are now freely represented in most gardens, and although many kinds are capable of producing a fine effect alone, a combination seems to be a step in the right direction. I was much impressed with the beauty and brilliance of a large bed last spring where the double white arabis made a dense and snowy white carpet, and Tulip Imperator rubrorum was thinly disposed over it. A flat appearance and absence of brightness was noted where Hyacinth Lord Macaulay and double white primroses were brought together, and Gigantea, or Robert Steiger hyacinths may be suggested as better. Very fine must be written against well-flowered plants of Dicentra spectabilis over Myosotis Royal Blue, which was carried to the extreme edge of the large oblong bed. To produce a succession of bloom and to remain bright and effective until the time has arrived for the summer bedders to be placed in position, a carpet of polyanthuses with Tulips Proserpine Titian and elegans alba thinly interspersed between them will do all that is required.

Irregular groups of Tulip Bacchus of very irregular outline, associated with a dwarf golden wallflower, struck a rich note, and yet another fine arrangement was Hyacinth King of the Blues and Narcissus Horsfieldi, the surface of the soil being hidden by a mass of crimson daisies. How wonderfully effective are comparatively dwarf bushes, or plants, of the double cherry, when seen rising above dark or rose-coloured hyacinths, or Tulips Crimson King, Purple Crown, or Thomas Moore. Pyrus Malus floribunda clothes itself in beauty and loveliness in spring and is simply invaluable with bedding arrangements, or for playing a part in conjunction with bulbous plants, etc., in rendering the borders attractive. As seen employed in a western garden last spring, plants two and a-half feet in height, and literally smothered in bloom, were arranged three feet apart over a very large bed, and upwards of a dozen varieties of hyacinths and tulips, in various shades of rose and blush white, were arranged underneath, while a carpet of double rose silene completed a soft and very pleasing picture.

PÆONY-FLOWERED DAHLIA KING LEOPOLD.

A handsome variety with large bright yellow flowers, which has been admirably shown by Messrs. T. S. Ware, Lim., at the Royal Horticultural Society's Meetings this season.

Tulip La Reve, which boasts an art shade, is a fitting companion to Wallflower Eastern Queen, that is of the softest and most refined shade of yellow. A wide belt of Daisy The Bride, and a carpet of myosotis, with Tulip Vuurbaak between them, cannot fail to please, while one may have a glowing picture when bronzy golden wallflowers and Tulip Vermilion Brilliant are massed together. Tulip Ophir d'Or forms a very fine bed alone, and the same applies to white Joost van Vondel (a great beauty), Cottage Maid, Keiserskroon, Fabiola, Prince of Austria, and Thomas Moore. Mon Tresor is a splendid tulip in yellow colouring, and may well be planted with Aubrietia Leichtlini.

In the arrangement of bulbs in borders there is much to recommend in the formation of large colonies and bold masses. A wide border which attracted my attention a few years ago consisted of more or less extensive groups of all the leading varieties of hyacinths, which were outlined and surrounded by the white Tulip Comte. de Mirabeau, and a strikingly effective display was produced. To create a picturesque effect there is nothing to surpass masses of spring-flowering plants, set down in irregular fashion regardless of distance or what may be termed "the right spot" in the borders, the intervening spaces being furnished with a mixture of hyacinths, narcissi, and tulips thrown carelessly upon the ground and planted where they lie. In this case a few shrubs, which are either attractive by reason of their flowers or foliage, will enhance the effect.

The tulip species and May-flowering kinds which until recent years were employed exclusively for border decoration, are now being utilised as bedders, and I hardly think we have anything to compare with them for elegance, brilliance, and general excellence amongst bulbous plants. The only disadvantage is they occupy the beds until a late date, and in order that they may not unduly interfere with the summer bedding arrangement they should be planted in beds that are intended for very tender subjects.

Bermondsey. WALTER H. AGGETT.

FINE GOOSEBERRIES.

Berry's Early Kent.

This is a grand variety to grow either for market or home use. It is a good early fruit, firm, and of agreeable flavour. The bush grows very strongly, ripens its wood satisfactorily, and bears freely. I have grown this variety for several years, and found that, if the bushes were fairly hard pruned in the autumn, and then protected from the ravages of birds, they bore immense crops of very large fruits, much finer than those from bushes which were pruned in the spring. The berries are solid, and do not readily crush when ripe.

Langley Beauty.

The flavour of the berries of Langley Beauty is delicious. The fruits are large, and borne on upright-growing branches. If care be taken in the matter of pruning, so as to cut back to leading buds that point outwards and upwards, few branches will grow near the border soil; thus the fruits are not soiled through being splashed in rainy weather. The fruits are hairy, fairly transparent, and dull yellow in colour.

Langley Gage.

The berries of this variety are not large, but they are borne on the bushes in large numbers, are transparent, and of delicious flavour. These are three varieties that should be added to every collection.

G. B.

OUTDOOR PEACHES AT ALDENHAM.

Those who have had an opportunity of inspecting Aldenham House Gardens recently could not fail to be struck with the appearance of the peaches and nectarines planted so recently as three years' since at the foot of a wall with a western exposure. Such an example of a wall covered in so brief a space of time as is here to be found should encourage the few sceptics who still remain, and who argue that the British climate renders the success of peach culture in the open quite a matter of chance, if not an utter impossibility.

When folk deprive the trees of reasonable light and sunshine by the growth of tall herbaceous plants within two feet of the wall, and when broccoli and cauliflower are allowed to impoverish the soil within two feet of the peach tree stems, there is small chance of success. None of these things prevail at Aldenham, where the border in front of the peach trees is occupied with a marvellous batch of seedling pentstemons growing to within a yard of the trees. The branches thus obtain the fullest amount of sunlight and air, and as pentstemons are not voracious feeders, the peach-tree roots do not suffer in any way. Although the trees have been planted but three years, the twelve-foot wall is now quite covered; standard-trained trees were employed for the higher portion, with dwarf, fan-trained specimens for the lower part. On some of the trees I noticed current year's shoots were four feet long, and not of a soft, sappy character, but hardy and tough, a shade thicker than the proverbial cedar pencil perhaps, but not excessively vigorous. The foliage was of that thick leathery character, which, with a full supply of chlorophyll, betokens perfect health. The error which is so common in many trees is not committed here. I mean that of overcrowding the shoots. Reasonable space is allowed for a full development of leaf, and plump buds follow with the maturity of the shoots.

Formerly the wall was occupied by apricots, and when the change to peaches and nectarines was desired, the soil was removed to a width of six feet, and a depth of two feet, and in its place fresh turf, etc., was put on a well-drained base. The varieties of peaches named were at the time of my visit, at the end of September, carrying crops of well-coloured fruit, as many as six-dozen on a tree: Grosse Mignonne, Dymond, Bel'egarde, Barrington, Violette Hative, Royal George, Princess of Wales, and Goshawk. Early Alexander and Hale's Early were naturally not carrying fruit. Of nectarines, Rivers' Orange, Spencer, Lord Napier, and Dryden, were noteworthy.

E. Molyneux.

AN ATTRACTIVE GROUP OF EREMURI

In the gardens of Ashbourne, County Cork, the residence of R. H. Beamish, Esq. We published an account with illustrations of these highly interesting and beautiful gardens in our issue of the 2nd inst.

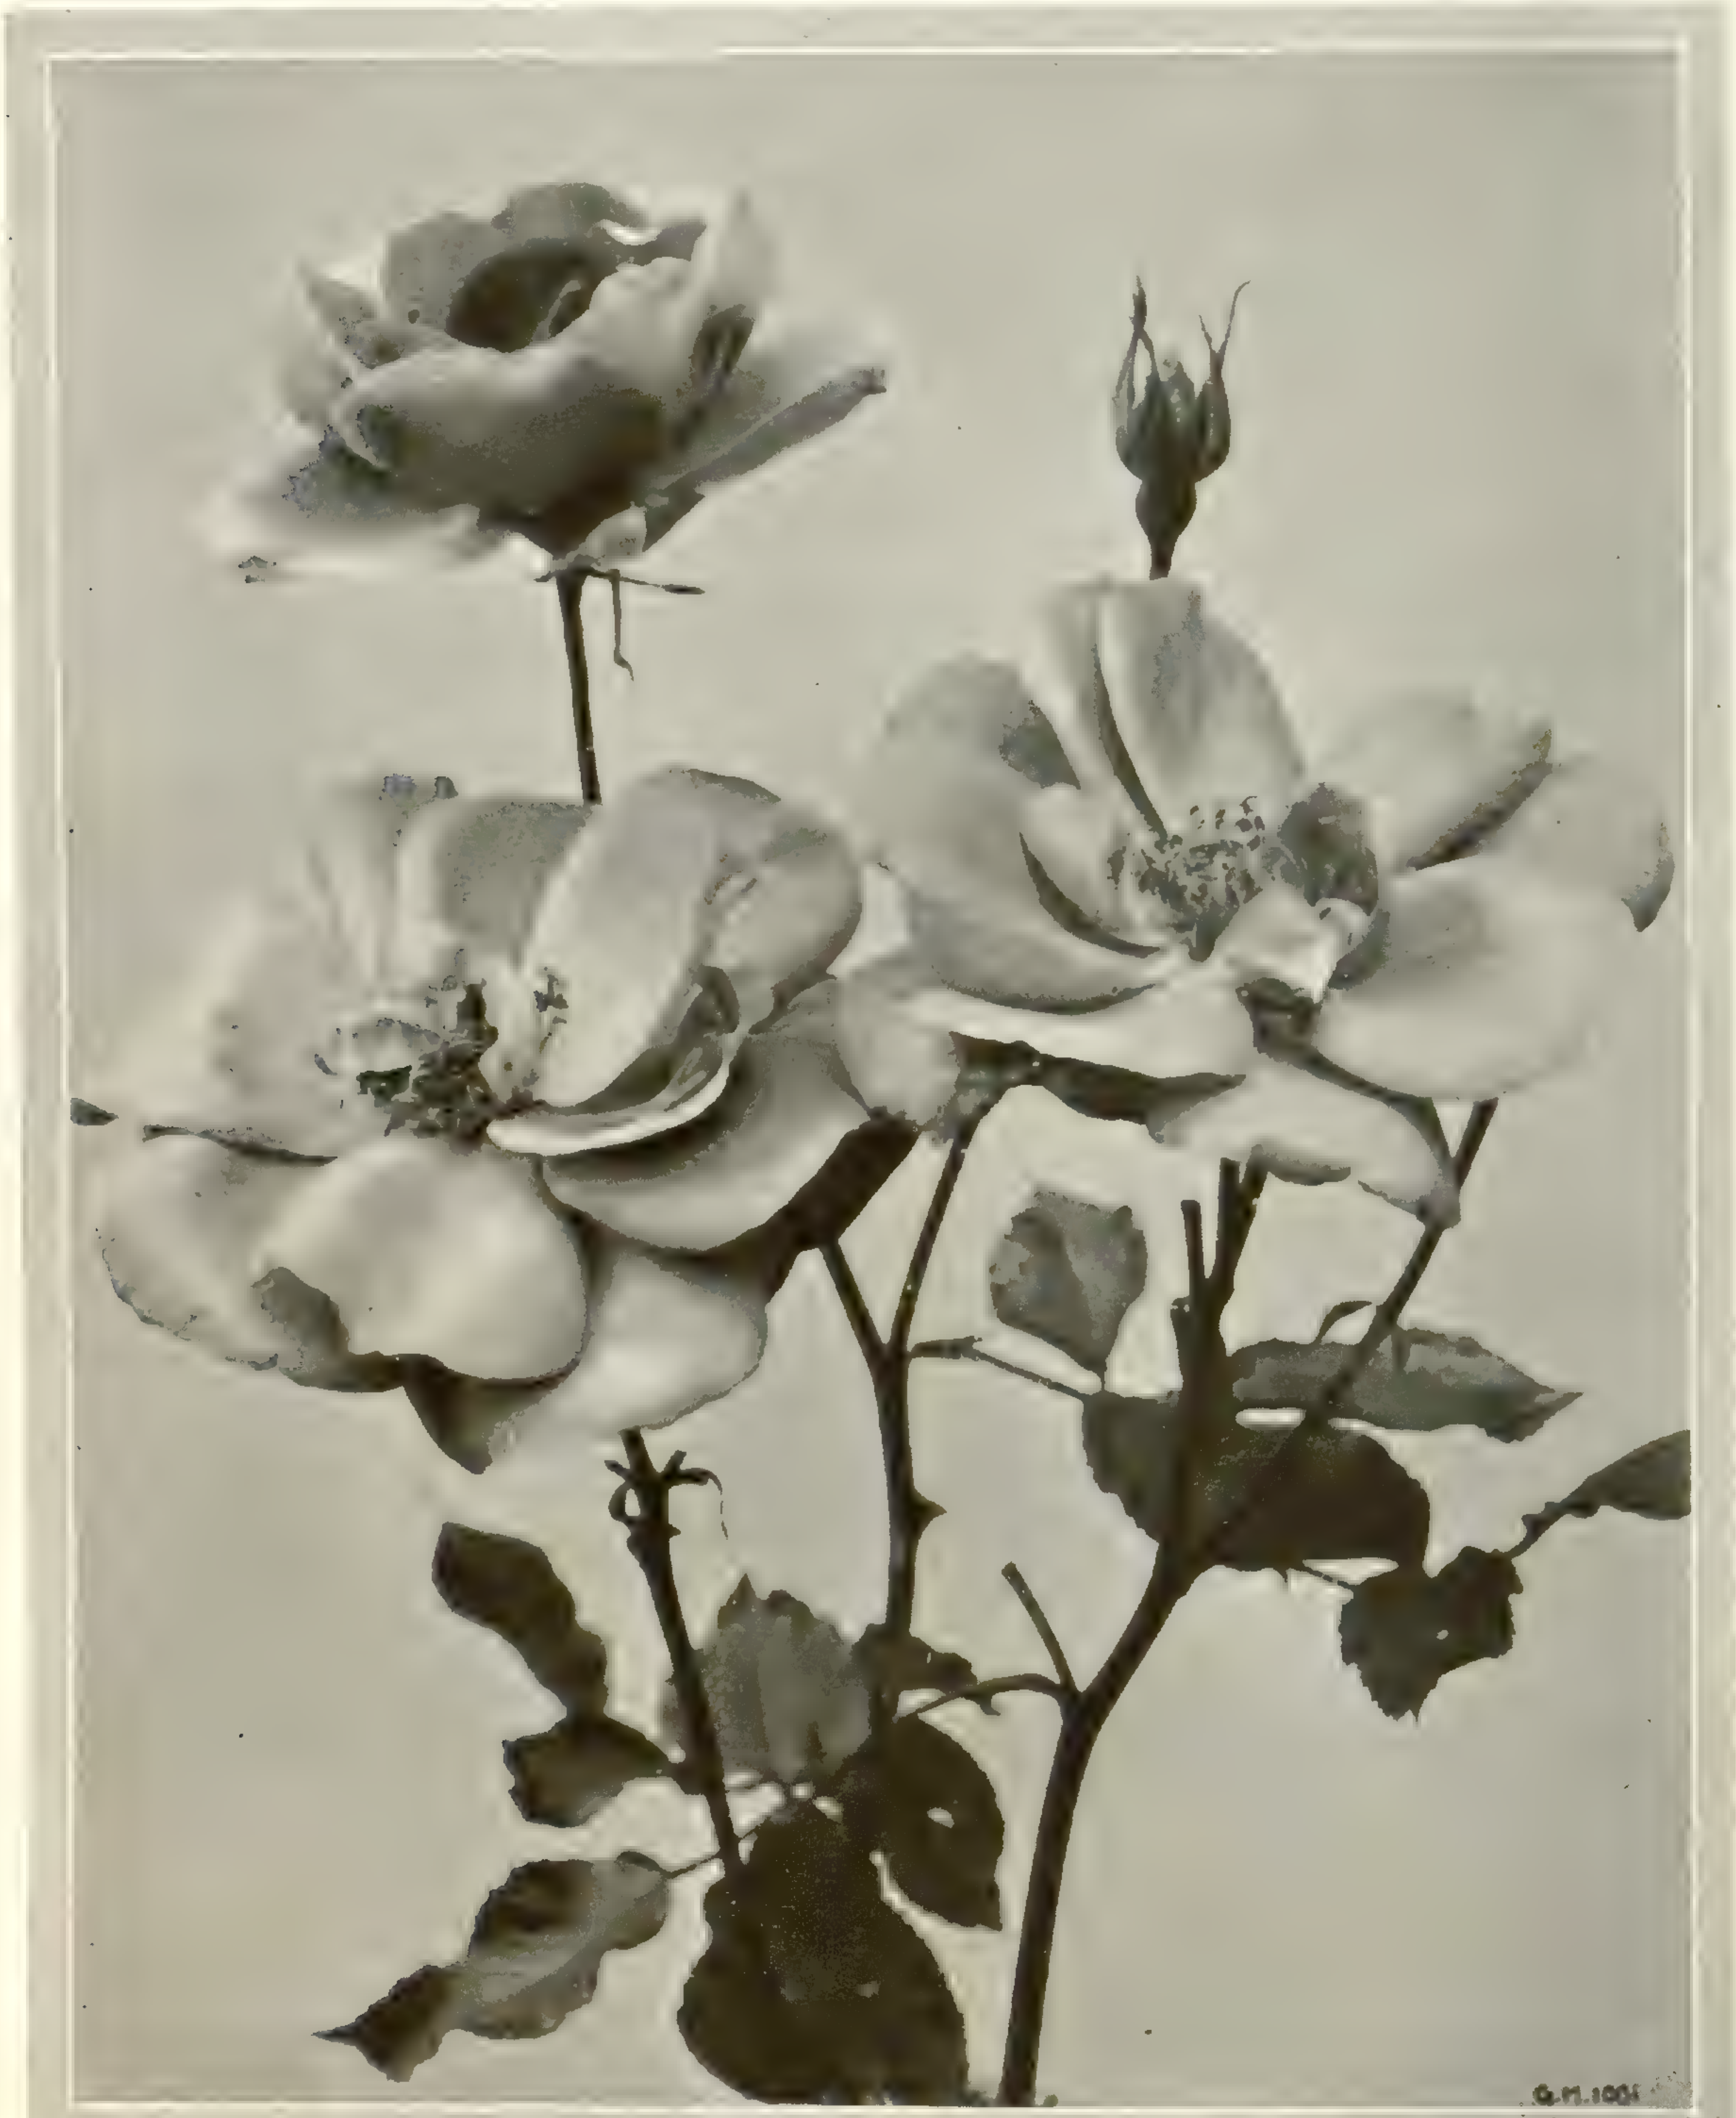
THE PRAIRIE CONE-FLOWER.

The cone-flowers embrace a number of beautiful and distinct garden plants, the central disc in the form of a cone giving them an appearance which distinguishes them largely from the other yellow composites of autumn, when they bloom. Some of them have the cone of a deep black or brown colour, which gives distinction to the blooms.

The species under notice, Lepachys columnaris, which is now recognised to belong to a different genus from the rudbeckias, which constitute the best-known cone-flowers of the garden, has not the colouring of the cone so fine as some of these, as it is grey, rather than brown, black, or green, but it makes up for this by its greater length. With its narrow drooping ray petals of yellow it has a character of its own, seldom seen in the occupants of the hardy flower garden. The plant itself is not tall, the height being only from one to two and a-half feet, but it is ornamental, with its thickish, pinnately-divided leaves on the upper part of the stems and its long-coned yellow flowers, the cone itself being three or four times as long as it is thick at the base, and tapering away to the point.

The fly in the ointment as concerns Lepachys columnaris is that it is none too hardy, and often proves too short-lived to give entire satisfaction to its owner. In some gardens, indeed, it is best treated as a biennial, sowing the seeds annually for the next year's bloom. But in its native habitats, and in warm districts in this country it is a true perennial, save, it may be, when it flowers so freely that it exhausts itself, and the plant becomes weakened, and fails to recover its vigour.

It is possible that the plants which have succumbed to our winters have come from the southern habitats of the plant, as it is a perennial in some of the coldest parts of the Western United States and Canada. It blooms with us from June to August and September. S. Arnott.



NEW H.T. ROSE DU BARRI.
A beautiful semi-double hybrid tea raised by Messrs. B. R. Cant and Sons, and of great promise as a bedding rose. The flowers are of large size, and a rich rose colour.

A NEW BEDDING ROSE.

A new seedling hybrid tea rose shown at the meeting of the Royal Horticultural Society on October 12, by Messrs. B. R. Cant and Sons, Colchester, the raisers, attracted a very great deal of attention. It is a large semi-double rose, very free, and we are told its habit is excellent for bedding purposes. So brilliant is the rich rose colouring of this variety that we anticipate it will have to be given a bed entirely to itself, or be planted as a distinct group. The variety is named Rose du Barri. The flowers open wide and are then about four inches across, so that a bed or large group of plants in full bloom should produce a wondrously fine effect. We look forward with pleasurable anticipation to such a display.

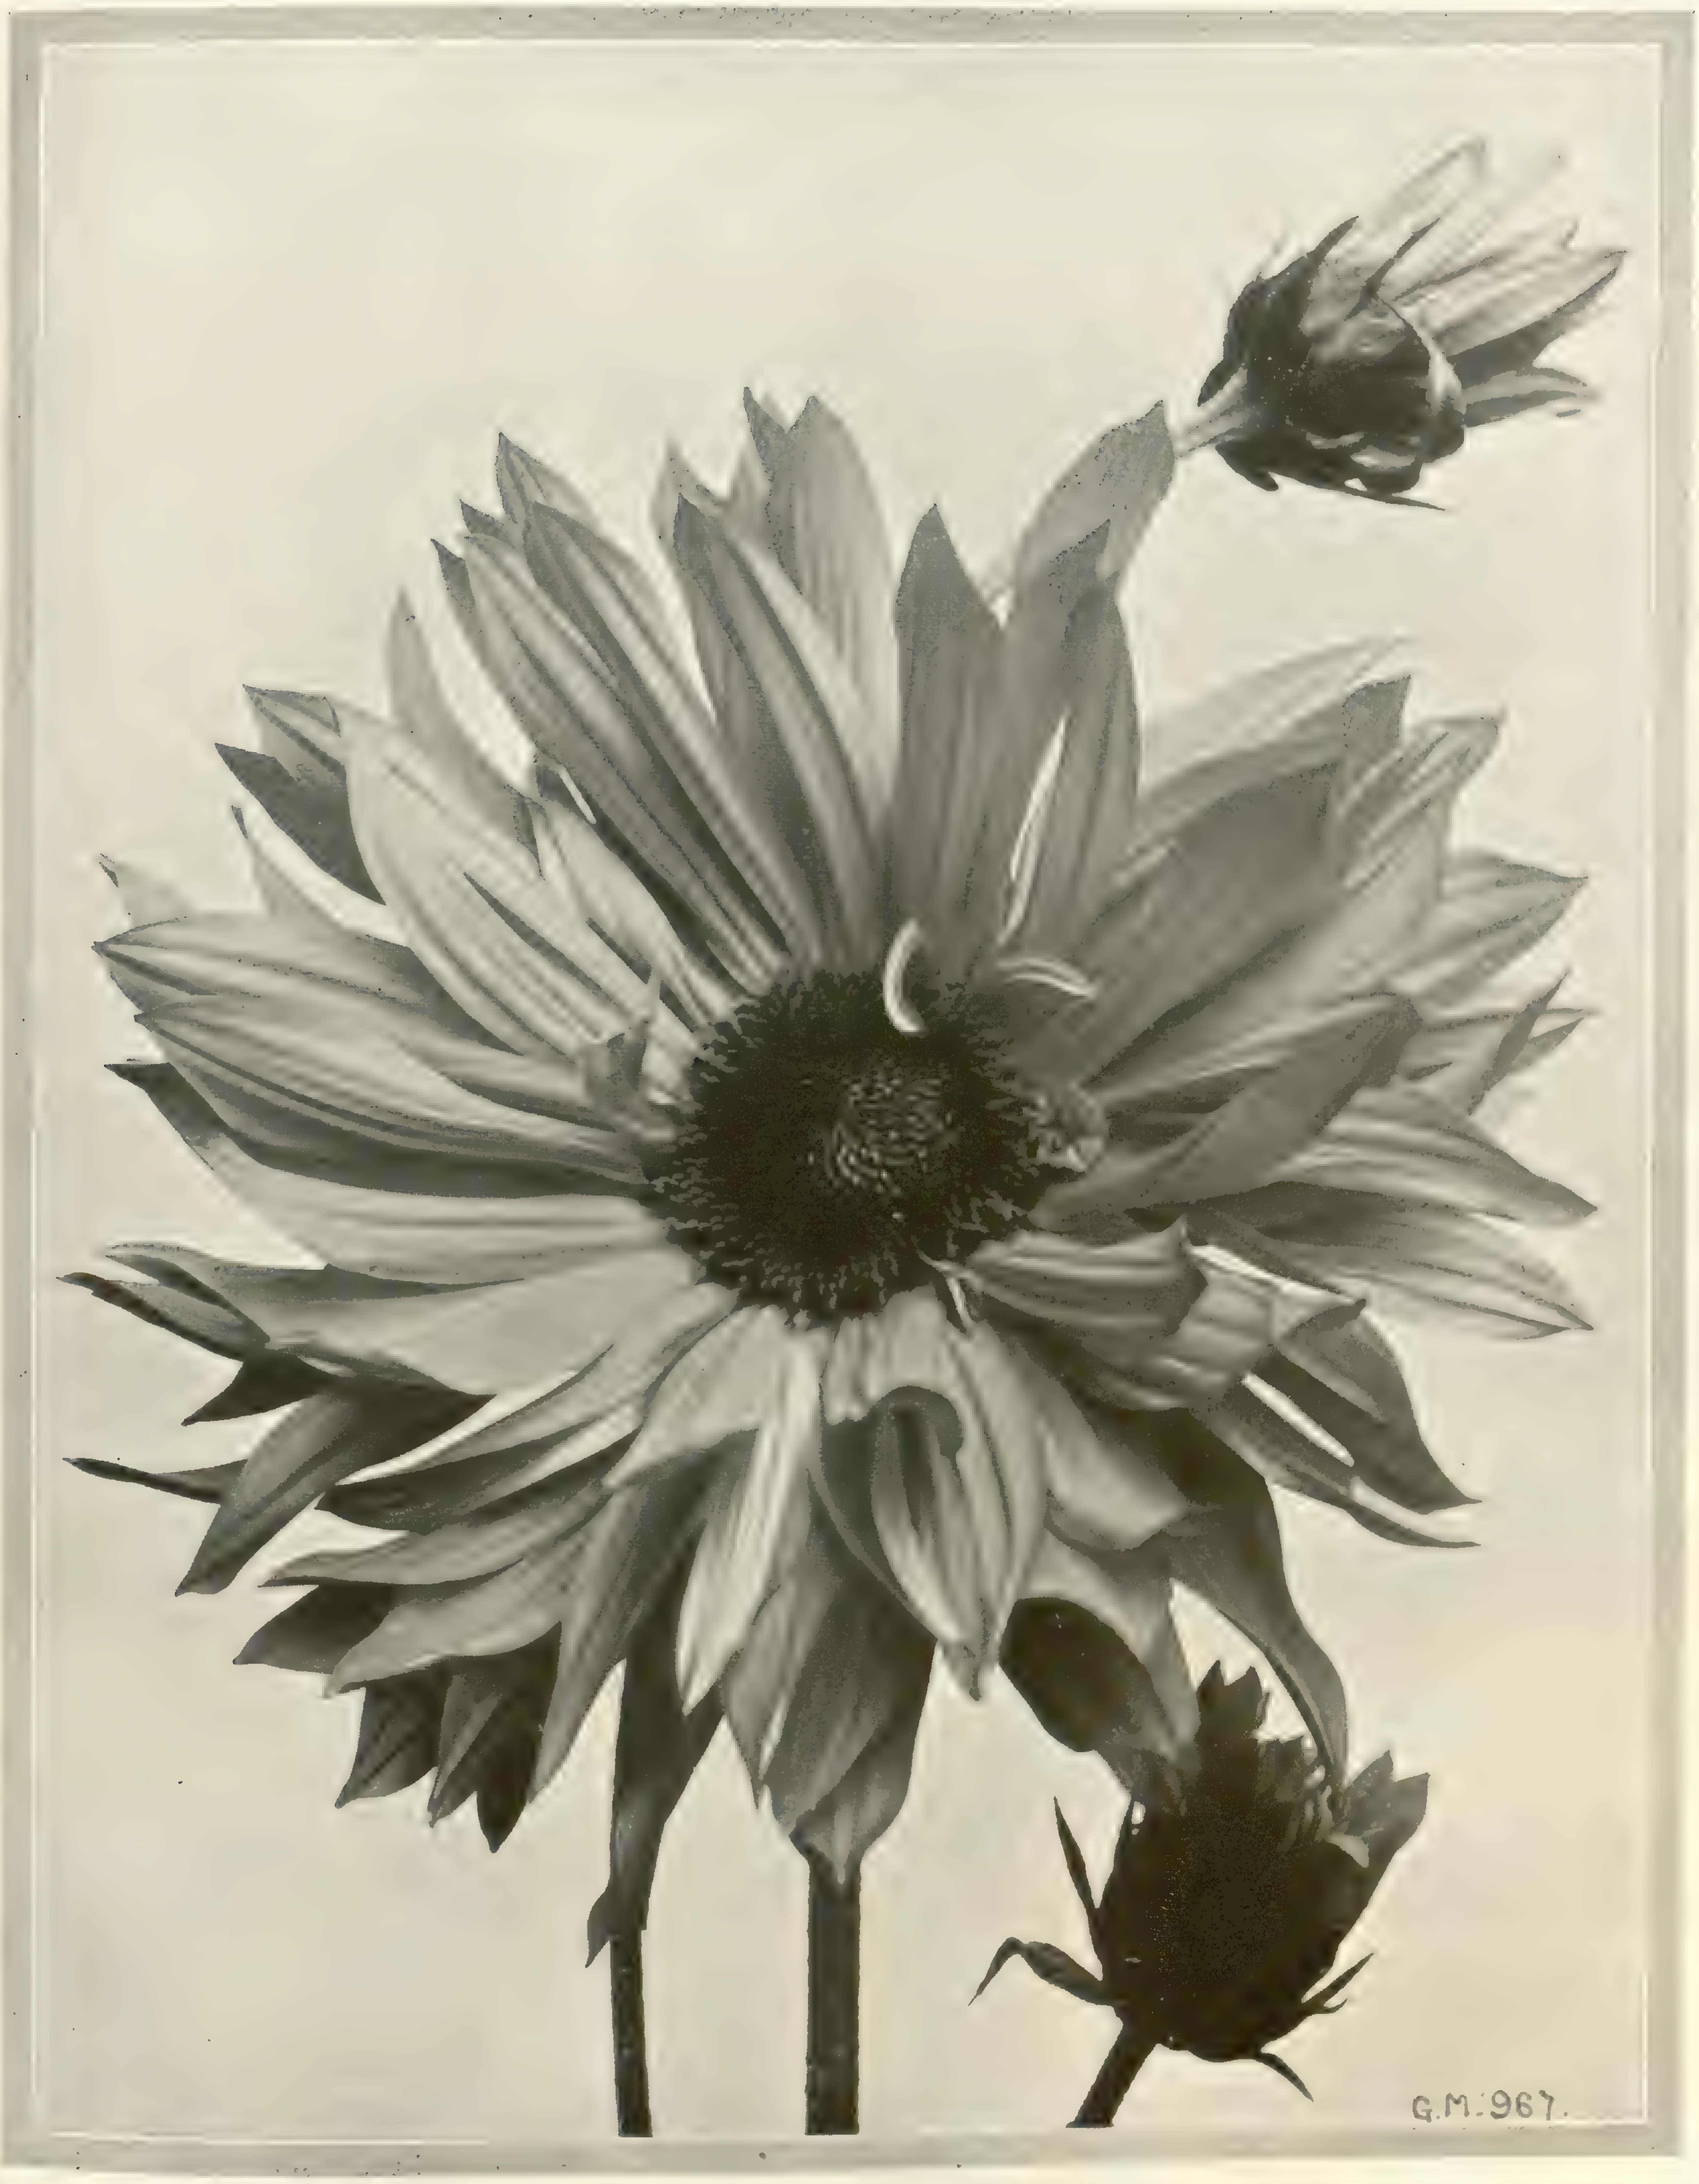
GOLDEN FLOWERS OF AUTUMN.

There is no dearth of hardy plants with golden flowers that bloom during the autumn months, and when a selection is made with a full knowledge of the characteristics of the several kinds, and the plants selected judiciously used, they contribute immensely to the attractions of beds and borders devoted to hardy perennials. This is a fact that may be regarded with some satisfaction, for at no season of the year are golden flowers more highly appreciated, and certainly at no time do great breadths of gold appear to greater advantage than when seen under the soft rays of the sun peculiar to the season which forms the connecting link between the summer and winter months. This being the case plants with flowers of varying shades of yellow should be freely used; but they must not be overdone, and due care must be exercised to ensure the selection being free from kinds that are otherwise than highly meritorious. There are, it should be remembered, a goodly number of second-rate kinds, and as it is important they should have no place in borders devoted to choice subjects, a brief reference to some of the best can hardly fail to prove useful. In these notes no attempt will be made to include all the good things, and no mention will be made of the chrysanthemums which include some of the best of the yellow flowers of the season, as they are now being dealt with in these pages somewhat fully.

The species and varieties of Anthemis include several that are of much value in the production of colour effects from July onwards. The most noteworthy of these are the varieties of A. tinctoria, known as grandiflora and Kelwayi. Both are free in blooming and bright in colour, and attain a height ranging between two and three feet. Of the two the last named is of special merit, and one of the most useful of the many fine plants introduced by Messrs. Kelway and Son. To have anthemises at their best the plants should be lifted and replanted every second year or so, and have the advantage of a moderately rich root run.

The Coreopsis are remarkable for the freedom with which they bloom, and the long period over which their flowering season extends. If but one representative of the genus is required, C. grandiflora should have the preference. It has an average height of three feet, and produces a profusion of large flowers of a bright lemon-yellow colour. From July until October it blooms freely, producing a fine effect, and the flowers are useful for the filling of vases in the house. C. auriculata and C. verticillata are two attractive species that deserve attention where large borders have to be filled. Their flowering season, although hardly so long as that of the first named, extends over a period of three months. Their heights range from thirty to thirty-six inches, and the soil best suited to their requirements is sandy loam.

From the Heleniums may be selected several possessing much merit. These have the advantage of being compact in growth and of moderate height, and when they are lifted and divided every second or third year and given a rather rich soil, they will bloom profusely for at least two months and produce a rich effect. H. autumnale and its variety superbum attain a height of about four feet, have deep yellow flowers, and are most useful for the second and third rows. H. Golden Gem, is a comparatively new form, attaining a height of about two feet and bearing deep golden-yellow flowers. H. pumilum is rather



HELIANTHUS SPARSIFOLIUS.

A remarkably distinct and handsome sunflower, attaining a height of eight or more feet, and bearing large golden-yellow semi-double flowers. The flower illustrated was supplied by Mr. Charles Turner, Slough.

dwarfer than the last named, has a compact habit, and is admirably adapted for positions along the front of borders. The flowers are plentifully produced, they are rather large in size, and of a rich yellow hue.

In selecting from the Helianthuses considerable care is necessary because a large proportion of the kinds, while interesting and attractive, are for various reasons not suitable for the majority of gardens. Those of special merit are H. multiflorus grandiplenus, a handsome double form, and H. multiflorus simplex a fine single variety, which grow to a height of about four feet and bloom freely and continuously, their deep yellow flowers producing a rich effect; H. Miss Mellish, one of the most elegant and effective of the autumn sunflowers, and H. sparsifolius, which has a strong resemblance to the form immediately preceding it, but taller in growth and later in blooming. The plants attain to a height of about eight feet, are graceful in habit and the flowers are of large size and have two rows of ray florets. We saw this form in especially fine condition a short time since in the nurseries of Mr. Charles Turner, at Slough, where it was producing a fine effect, and the bloom herewith illustrated was from one of Mr. Turner's plants. It is important in the case of sunflowers with the habit of H. multiflorus to lift and divide them every two or three years, and to thin the growths after they have occupied the same position more than twelve months. The plants of Miss Mellish and sparsifolius should also be severely thinned, as it is only when they have room for their development that the plants appear to full advantage. The soil for all the kinds should be moderately rich, for, although sunflowers will exist in the poorest of soil, they will not grow or bloom satisfactorily.

Rudbeckias differ considerably in character, and include some kinds that are indispensable. One of the very best of those with yellow flowers is R. Newmani, a distinct species attaining a height of about two feet, elegant in aspect and producing a profusion of orange-yellow flowers. R. californica, an erect-growing species, attaining a height of about four feet, and bearing bright yellow flowers on long erect stems, has much to recommend it; one of much value is R. lacinata plenus, a distinct variety bearing a profusion of deep orange-yellow double flowers, and growing to a height of about six feet. R. maxima is tall and bears bright yellow flowers, and should be selected where a form of taller growth than those previously mentioned is required.

The Golden Rods or Solidagos are late in flowering and attractive in colouring, but it is important not to plant them too liberally. It is desirable to lift and replant them every second or third year, and to severely thin the growths early in the summer when they have not been replanted in the spring previous. Special attention may well be directed to the fact that when allowed to grow in large masses until long after they have exhausted the soil, they present anything but a satisfactory appearance. S. canadensis, S. Shorti, and S. serotina lepida are all of much merit, they have yellow flowers, and range in height from four to five feet, the exact height depending upon the soil and the length of time they have occupied the same position.

NEW PLANTS, ETC.

CYPRIPEDIUM CYNTHIA WESTONBIRT VAR.

A fine bold cypripedium, derived from C. Charlesianum and C. Charlesworthi. It is a strong grower, and has large blooms, with a spreading, flattish dorsal sepal. This latter is white, but has a median purple band, and is heavily shaded with green and brown, and marked with dark purple on the lower half. The petals and lip are green, heavily shaded with brown. A.M., R.H.S., October 12. Lieut.-Colonel Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

CATTLEYA HARDYANA THE BARON.

This beautiful variety has pure white sepals and petals, and a bold and handsome lip of rich purple colouring, with gold veins and golden blotches on either side of the throat. The flower shown was of fine size and excellent form. F.C.C., R.H.S., October 12. H. S. Goodson, Esq. (gardener, Mr. G. Day), Fairlawn, Putney.

CIRRHOPETALUM FASCINATOR.

A very distinct and interesting orchid producing but one flower on a scape. The flowers are green and purple, with fringed petals, and a very long narrow lip, extending about five inches. A.M., R.H.S., October 12. Sir J. Colman, Bart. (gardener, Mr. J. Collier), Gatton Park, Reigate.

CYPRIPEDIUM FAIR MAUDE.

The name given to this beautiful hybrid has been suggested by the names of the parents, i.e., C. Fairrieanum and C. Maudiæ. In this cypripedium there is evidence of a reversion from the albino to the typical C. Lawrenceanum, the albino form having been one parent of C. Maudiæ. In C. Fair Maude the boldness of the flower suggests C. Lawrenceanum, and so does the colour, and no one would have been surprised had C. Fairrieanum and C. Lawrenceanum been the parents. The flower stands up well, and has a broad dorsal sepal, coloured bright rose and purple on a white ground; petals deflexed and slightly curled at the tips, green and rose. A.M., R.H.S., October 12. Mrs. Norman Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne.

DENDROBIUM TAURINUM COLMANI.

An interesting and by no means easily managed orchid is the typical D. Taurinum, but the varietal form figured in our previous issue is more attractive than the species. It has the same formation and the twisted petals, but the colouring is white, shaded with dull rose and green. A.M., R.H.S., October 12. Sir J. Colman, Bart.

STREPTOCARPUS ALDENHAM HOUSE STRAIN.

This is a fine strain of the large, long-tubed varieties, the flowers being of large size and good shape, and borne on stout stalks. The plants are free flowering, and show a great variety of shades of colour, rose, pink, blue, and purple predominating. A.M., R.H.S., October 12. Hon. Vicary Gibbs (gardener, Mr. Edwin Beckett), Aldenham House, Elstree.

ROSE CLAUDIUS

A beautiful hybrid tea rose of great substance. The colour is deep rose-red, with carmine shading. The variety is particularly fine in the matter of fragrance. This variety received a gold medal on the occasion of the N.R.S. autumn show, and was then figured in our columns. A.M., R.H.S., October 12. Messrs. B. R. Cant and Sons, Colchester.

ASTER LUSTRE.

This free-flowering and attractive variety is one of the new double-flowering race, as it has a multiplicity of narrow florets that almost obliterate the disc. The colour is bright rosy-lilac. A.M., R.H.S., October 12. Mr. Edwin Beckett, Aldenham House Gardens, Elstree.

CHRYSANTHEMUMS.

White Queen.—A beautiful creamy-white Japanese chrysanthemum, with broad drooping florets. A charming variety of great elegance and refinement. F.C.C., N.C.S., October 6; A.M., R.H.S., October 12. Mr. Martin Silsbury, Shanklin, Isle of Wight.

Empress.—A large, loosely incurving Japanese variety of pale lemon yellow shade. A fine exhibition variety. F.C.C., N.C.S., October 6. Mr. Norman Davis, Framfield, Sussex.

Tom Edwards.—This big incurving Japanese variety is of rich deep yellow colour; it has broad petals, and makes up a grand exhibition bloom. F.C.C., R.H.S., October 6. Mr. Norman Davis, Framfield.

Mary Farnsworth.—A large and beautiful Japanese variety of distinct colour. It has long florets that are slightly upturned at the tip. The colour is pink, shading to golden-yellow. The variety ought to become a favourite front row bloom at exhibitions. A.M., R.H.S., October 12. Messrs. J. Stredwick and Son, St. Leonards.

RUBUS CANADENSIS.

A native of Eastern North America, this hardy bramble is one of the most distinct and attractive recently brought into cultivation. The growth resembles that of the raspberry, the sturdy canes rising to a height of 6ft. or 7ft. The neat leaves are trifoliate or quinfoliate, and glabrous on both surfaces; the flowers are often more than an inch across, white, with purple anthers, and these are followed by deep red or black fruits. Bot. Mag. t. 8264.

ALOE RUBROLUTEA.

An attractive species from German South-West Africa, and one that, when in flower, reaches a height of from 3ft. to 8ft. The first plant to flower in Europe was one sent by Mr. Dinter from Windhoek, to Sir T. Hanbury, at La Mortola, where it flowered in 1907. The inflorescence is a much-branched panicle composed of erect racemes of red flowers, the latter showing yellow tips to the segments as they expand. Bot. Mag. t. 8263.

MAHONIA ARGUTA.

Of doubtful hardiness, this species of mahonia is supposed to come from Central America. As it appears to need the shelter of a cool house during winter, it is hardly likely to become a popular garden shrub. The compound leaves have spiny-toothed leaflets, and the lax, branched panicles carry pale yellow flowers. The fruits are small blue berries. Bot. Mag. t. 8266.

CARALLUMA NEBROWNI.

This stapelia-like plant is a succulent species from German South-west Africa, from whence it was introduced by Mr. Dinter, who sent it to La Mostola, where it first flowered in 1907. The starry flowers are red-purple on the outside, and deep crimson, flecked with yellow inside. We wonder whether this species is named after Mr. N. E. Brown, of the Kew Herbarium? If so his name has been strangely perverted, and a precedent made for quaint mixtures of initials and surname; what is to prevent such titles as Epidendrum Rarolfei, Fieu-Wbottinghemsleyi, or Puccinia Gmassiei? Bot. Mag., t. 8,267.

CYCNOCHES DENSIFLORUM.

This interesting and showy Colombian species has long, pendulous racemes of greenish-yellow, purple-spotted male flowers, and short racemes of large, fleshy, pale green female flowers. The plant was collected by Mr. J. Birchenall near the River Opon, and sent, among others, to Messrs. Hugh Low and Co., from whom it was obtained by the Rev. J. C. B. Fletcher, Mundham, Chichester, with whom it flowered in November, 1908. Bot. Mag., t. 8,268.

ERLANGEA TOMENTOSA.

We referred to this plant some time ago as a new and useful subject for greenhouse and conservatory decoration during winter. It comes from Tropical East Africa, but apparently from some elevation, as it succeeds under cultivation when treated like winter-flowering eupatoriums. It has much the appearance of a eupatorium, but the flower heads are lilac-coloured, borne in loose corymbose panicles. Bot. Mag., t. 8,269.

SPIRÆA HENRYI.

This deciduous shrub is from Central China, and was discovered by Dr. Henry, at Hupeh, in 1885, but was introduced through Messrs. J. Veitch and Sons, through their collector, Mr. E. H. Wilson, who found it in 1900. It has proved quite hardy at Kew. As it flowers on the growths of the previous year, pruning, or thinning out of the growths should be done directly after flowering, which takes place in June. The long branches produce a short cluster of white flowers from almost every leaf axil, thus making beautiful long sprays of bloom. S. Henryi is easily propagated from cuttings of half-ripened wood. Bot. Mag., t. 8,270.

CLASSIFICATION OF SWEET PEAS FOR 1910.

The following is an up-to-date selection of varieties in commerce, drawn up by the Floral Committee of the National Sweet Pea Society. An asterisk denotes a variety that is not waved.

White.—Etta Dyke, Nora Unwin, *Dorothy Eckford. Crimson and Scarlet—The King, *King Edward, *Queen Alexandra. Rose and Carmine—John Ingman, Marjorie Willis, *Prince of Wales. Yellow and Buff—Clara Curtis, *James Grieve. Blue—A. J. Cook, *Lord Nelson. Blush—Mrs. Hardcastle Sykes. Cerise—Chrissie Unwin, *Coccinea. Pink—Countess Spencer, *Prima Donna. Cream-Pink—Constance Oliver, Mrs. H. Bell, *Queen of Spain. Orange Shades—Helen Lewis, St. George, *Miss Willmott. Lavender—Frank Dolby, Mrs. C. Foster, *Lady G. Hamilton. Violet and Purple—Rosie Adams, *Duke of Westminster. Magenta—Menie Christie. Mauve—The Marquis, *Mrs. Walter Wright. Maroon and Bronze—*Black Knight, *Hannah Dale. Picotee-Edged—Elsie Herbert, Mrs. C. W. Breadmore. Striped and Flaked (Red and Rose)—Aurora Spencer, Yankee, *Jessie Cuthbertson. Striped and Flaked (Purple and Blue)—*Prince Olaf. Fancy—*Sybil Eckford. Bicolor—Mrs. Andrew Ireland, *Jeannie Gordon. Marbled—*Helen Pierce.

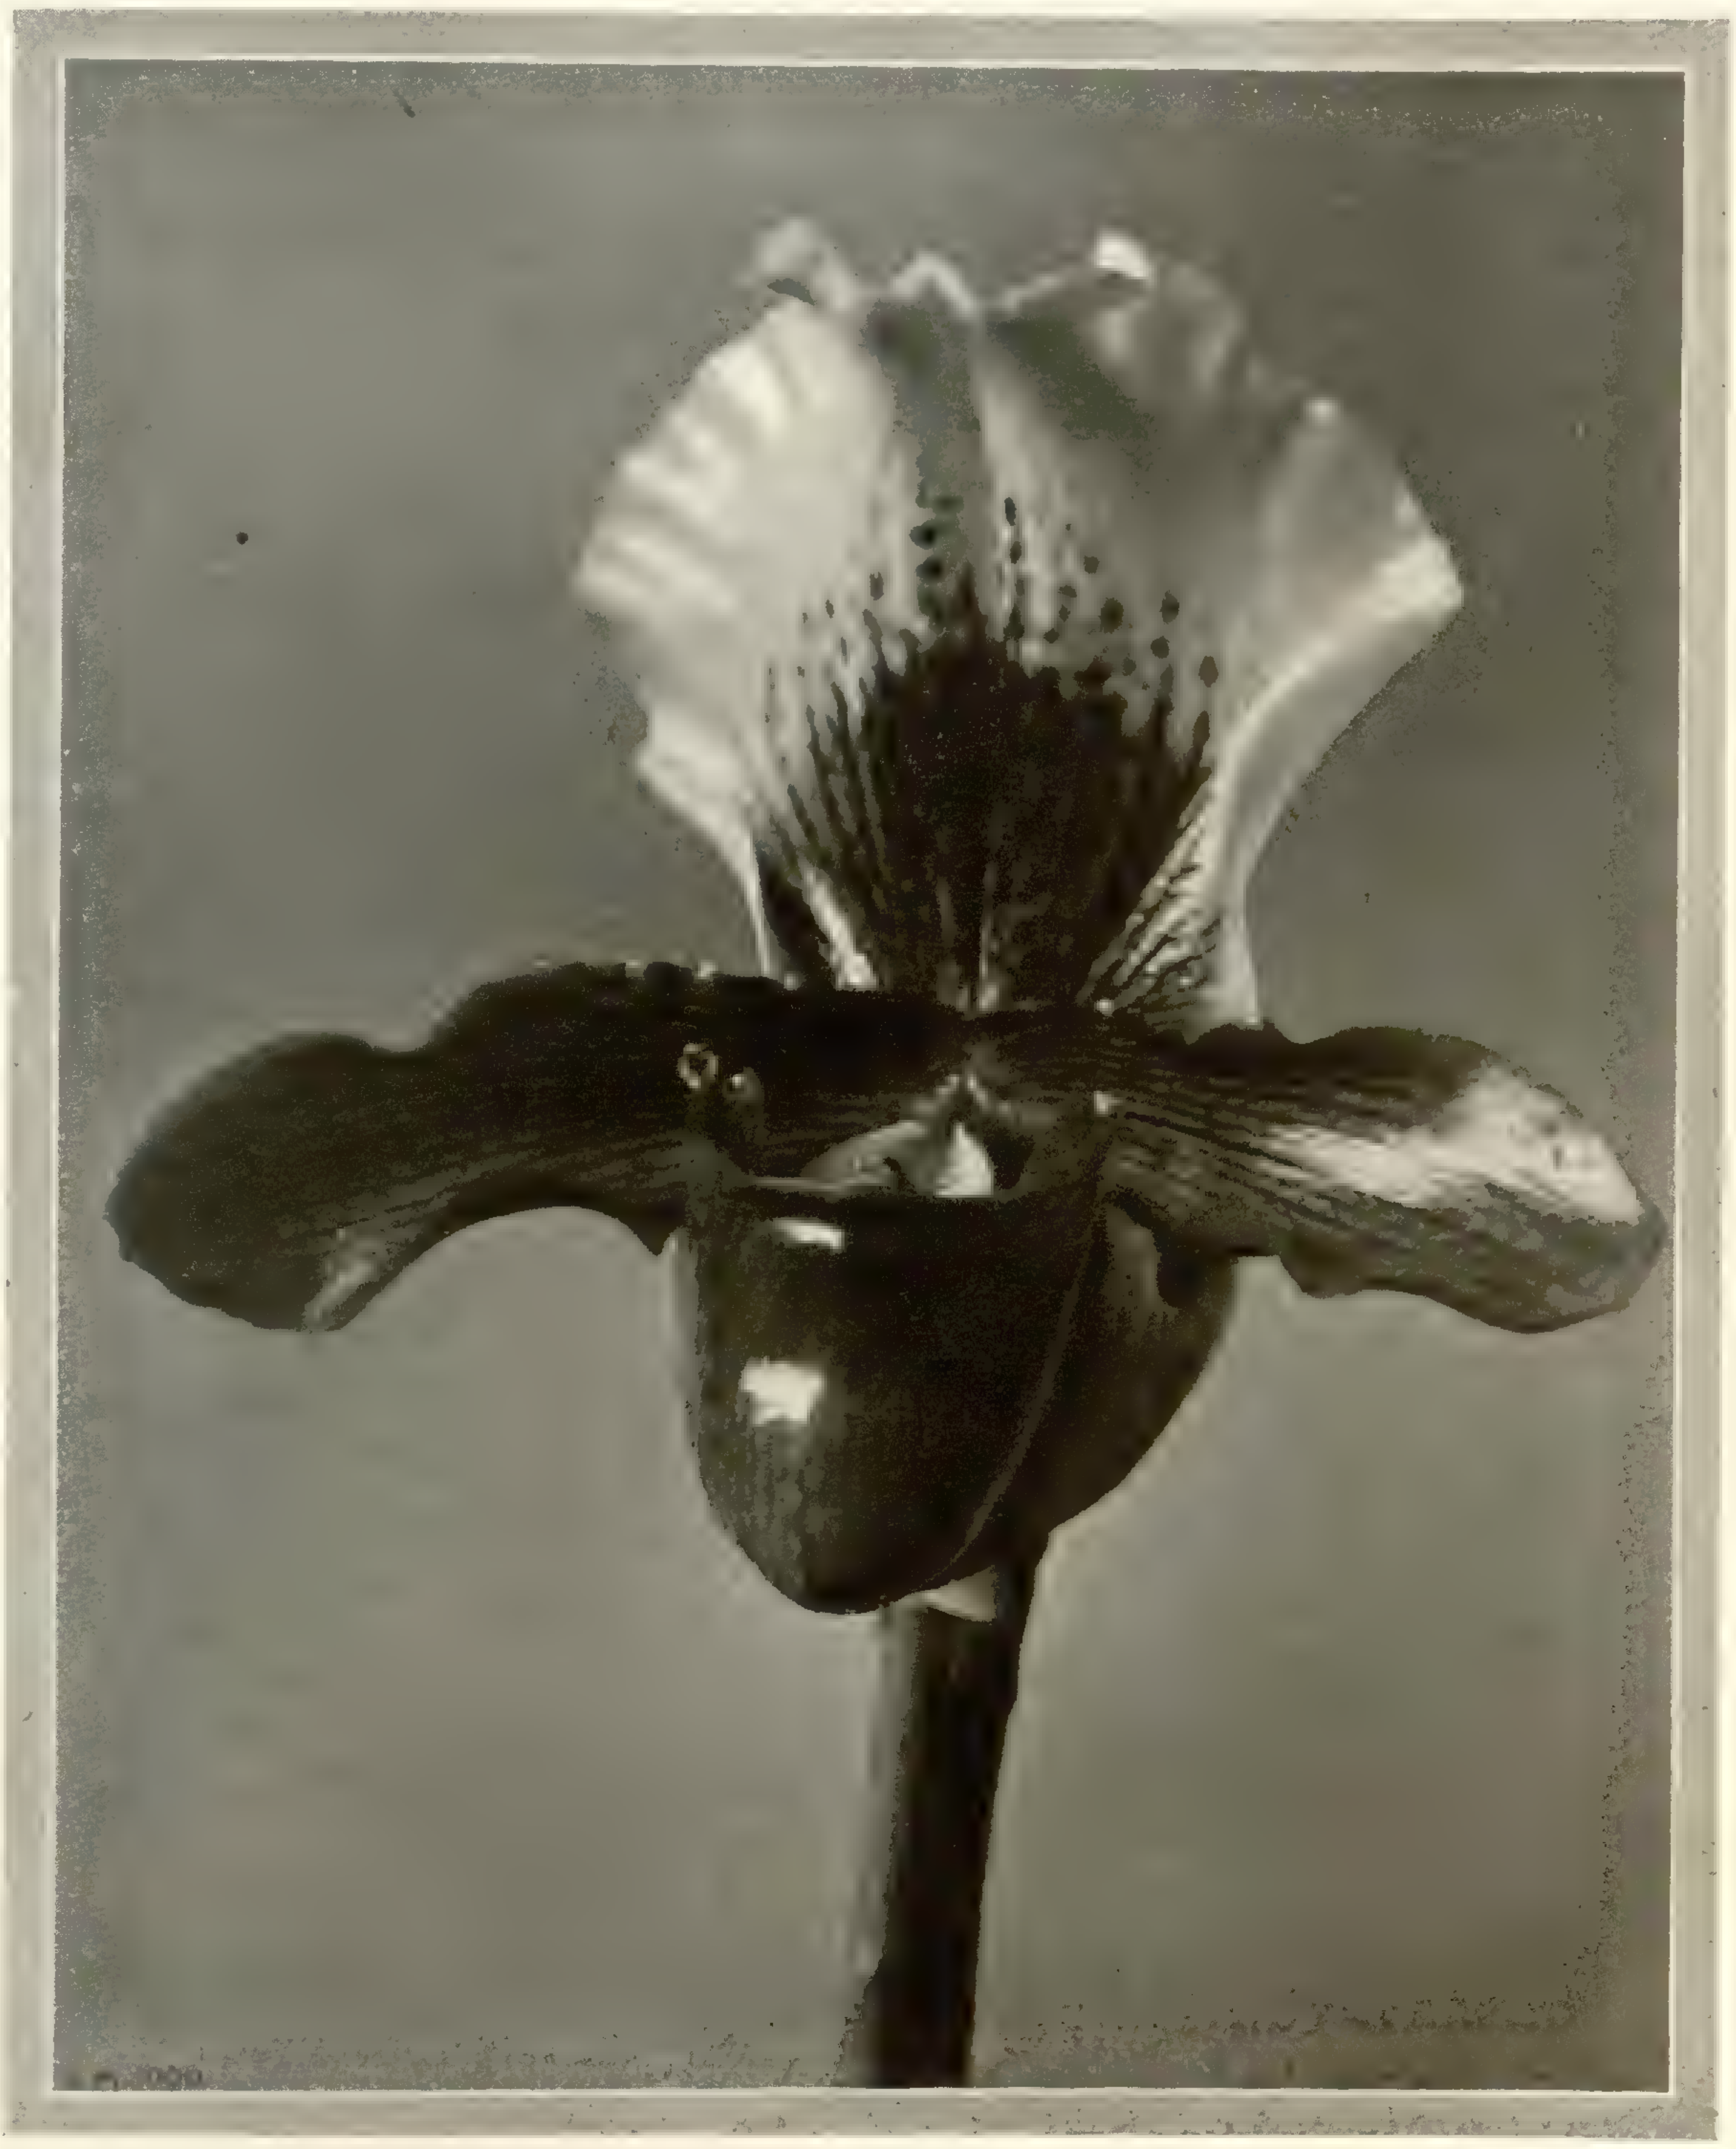
Too-much-Alike Varieties.

The following varieties have been bracketed as too much alike. "Not more than one of the grouped varieties shall be shown on the same stand at any exhibition of the National Sweet Pea Society."

White—Etta Dyke, Paradise White, Purity, Snowflake, White Spencer, White Waved. Crimson and Scarlet—Miss E. F. Drayson, Queen Alexandra, Scarlet (Baker's); Dodwell F. Browne, King Alfonso, King Edward Spencer, Paradise Crimson, Rosie Gilbert, Sunproof Crimson, Sunproof King Alfonso (Dobbie's), The King. Rose and Carmine—Albert Gilbert, Lady Farren, Marjorie Willis, Rosalind, Splendour Spencer; E. J. Castle, George Herbert, John Ingman, Mrs. W. King, Paradise Carmine, Phyllis Unwin, Rosie Sydenham, Rosy Morn, Spencer Carmine. Yellow and Buff—Harold, James Grieve, Mrs. Collier, Mrs. A. Malcolm, Yellow Hammer; Clara Curtis, Paradise Cream, Primrose Paradise, Primrose Spencer, Primrose Waved, Princess Juliana, Waved Cream (Malcolm's); Blue—Flora Norton, Miss Philbrick; Anglian Blue. Flora Norton Spencer, Kathleen McGowan, Zephyr; Mid-Blue, Zoe. Blush—Beauty (Bolton's), Bobby K., Countess of Northbrook, Florence Morse Spencer, Lorna Doone. Mrs. Hardcastle Sykes, Princess Victoria; Blush Spencer, Lady Althorp, Mrs. T. G. Baker, Paradise Regained, Sankey Spencer; Constance Oliver, Doris Usher, Nell Gwynne. Pink—Countess Spencer, Enchantress, Paradise, Pink Pearl. Cream Pink—A. B. Bantock, Earl of Plymouth, Holdfast Belle, Kitty Lea, Mrs. Hugh Dickson, Mrs. Henry Bell, Mrs. Routzahn Spencer, Queen (Sutton's), Romani Ronni. Orange—Dazzler, Edna Unwin, Gordon Ankentell, Ruby, St. George; Earl Spencer, Nancy Perkin. Lavender—Giant Lavender (Stark), Lady Grizel Hamilton, Lavender George Herbert, Masterpiece, Mrs. Charles Foster, Mrs. Walter Carter; Countess of Radnor, Lady Grisel Spencer. Magenta—Menie Christie, Mrs. Charles Mander. Mauve—Ida Townsend, Tennant Spencer, The Marquis. Maroon and Bronze—Anna Lumley, Black Knight Spencer, Douglas Unwin, Maroon Paradise, May Gerhold, Nubian, Othello Spencer. Picotee-Edged—Dainty Spencer, Distinction, Elsie Herbert, E. J. Deal, Lady Althorp Improved, Winifred Deal; Mrs. Townsend, Phenomenal; Evelyn Hemus, Mabel Cole, Mrs. C. W. Breadmore. Striped and Flaked (Purple and Blue)—Hester, Marbled Blue; President, Senator Spencer.

Varieties to be Excluded from Future Trials.

Her Majesty, Splendour, Duke of Sutherland, Monarch, Lottie Eckford, Maid of Honour, Ivy Miller, Stanley, Boreatton, Lord Rosebery, Cyril Breadmore, Mrs. Felton, Dora Cowper, Devonshire Cream, Ceres, Yellow Dorothy Eckford, Captain of the Blues, Boiton's Blue, New Countess, Princess May, Modesty, Duchess of Sutherland, Sensation, Countess of Aberdeen, Miss Bostock, Pride of St. Albans, Olive Bolton, Codsall Rose, Gorgeous, Miss B. Whiley, Mildred Ward, Countess of Latham, Coral Gem, Pink Gem, Vera Jeffrey.



CYPRIPEDIUM CYNTHIA WESTONBIRT VARIETY.

A handsome hybrid exhibited by Lieut.-Colonel Holford at R.H.S. Meeting, October 12, when it received an Award of Merit. Flowers white, purple, green, and brown.

THE BIRCH HALL VINE.

In looking at the excellent illustration on page 783 I cannot but notice how fine are the berries on each visible bunch, and what a remarkable crop the old vine is carrying. I dare say many others have come to the same conclusion as myself, that the cause of such a success is the abundance of light the shoots and leaves obtain owing to the thin training that has been adopted. In this way every leaf obtains its full share of sunlight, and thus fully does its share in feeding the plant. This is a practice not always rigidly followed in vine culture, especially by the amateur, in whose vinery can too often be seen a thick mass of weakly shoots, each striving to rob the other of what little sunlight is obtainable from above. Many gardeners, too, are guilty of overcrowding the growth of their vines, forgetting that one perfect leaf is worth much more than half a dozen that are not able to perform their allotted functions. I have seen shoots—laterals—allowed to grow 6ft. long before they were removed, owing to neglect in removing them when they were a few inches long. All such mistakes have an injurious effect upon the future of the grape crop. No vine can be treated long in such a manner without exhibiting disastrous results, all too often put down to old age, the structures, or an indifferent site, and so on.

E. Molyneux.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

AUTUMN-FLOWERING CATTLEYAS.—A few years ago the choice of winter and autumn-flowering cattleyas was very limited, indeed it was practically confined to C. labiata, C. Dowiana, and C. Bowringiana, with C. exoniensis as the only hybrid. At the present time, though the species have not been added to, an endless number of hybrids have been introduced, so that there is ample choice, and the cycle of the year has been completed, and cattleya flowers may, with a good selection of varieties, be had at practically all seasons. It is the autumn and winter-flowering kinds I would especially draw attention to, for it is at these seasons the private gardens are expected to yield of their best. Unfortunately, the mistaken impression is still abroad that orchid growing is an expensive luxury, and until we can get this error removed I am afraid very little advance will be made in considering orchids as really useful decorative subjects. People are, however, beginning to realise that after all orchids are plants, and not something half beast and half plant. In dealing with the autumn-flowering cattleyas and their allies we find these are the most tractable members of the genera to cultivate.

HYBRIDS.—The hybrids that have been derived from the use of C. Bowringiana are, with very few exceptions, robust growers, and when the plants are well grown they are not only suitable subjects for decorative purposes as plants, but the pyramidal racemes of flowers are exceedingly useful, and more durable than most cut flowers at this season of the year. The hybrids that are derived from L. Perrini and L. crispa are also worthy of recognition; the flowers of the former are rather small but are very useful for cutting. There are also the larger flowered kinds derived from C. labiata and C. Dowiana. C. Hardiana, C. Keincotiana, C. Fabia, C. Lord Rothschild, and many of the secondary hybrids give a considerable variation, and as most of these are now plentiful, they are procurable for a reasonable outlay.

REPOTTING.—Many of the autumn-flowering cattleyas commence rooting immediately the pseudo-bulbs reach maturity, but where plants are about to flower, they should not be disturbed for repotting until after flowering is over. If the roots have become advanced to any great extent care will be required to prevent them becoming broken or injured in the process of repotting. Ample drainage must be given, as they are all practically summer-growing kinds, and thus require liberal root moisture during the active season of growth. The compost should also be of a lasting nature.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CONSERVATORY. — This should now be gay with some of the earlier large-flowering chrysanthemums, Salvia splendens grandiflora, etc., etc., and every effort should be made to keep the atmosphere as dry as possible so as to prolong the flowering period of these plants. Up to the time of writing it has been a very difficult matter to keep anything in a dry state, whether inside or out, without keeping the pipes very hot. The rains and lack of sun have tended to make all classes of plants sappy, thus minimising their keeping qualities when in flower.

FIRING, ETC.—Those in charge of the stoking now will be well advised to pay close attention to their work at nights, as at any time we may expect fairly severe frosts. Where the glass is rather extensive and worked from one large boiler it is a very easy matter to turn a little heat on quite late at night if frost threatens, but in smaller establishments where there are several quite small boilers, then the matter has to be taken in hand earlier in the evening, or sitting up all night will be the result. All mats and other coverings should be kept in readiness to save running about for them just at the moment they are wanted, and at all times endeavour to keep them dry, as then they keep out twice as much frost as when wet.

ROSES.—Anyone contemplating buying roses (for pot culture) from the open ground would do well to obtain them at once, and after reducing the top growth somewhat, and shortening the strong roots, these should be potted in fairly rich loam, and plunged as advised a few weeks back for those already established in pots. They should be worked on the manetti stock, and a few really good varieties are: General Jacqueminot, Captain Hayward, Mrs. J. Laing, Frau Karl Druschki, Mrs. W. J. Grant, Kaiserin A. Victoria, Caroline Testout, and Madame Abel Chatenay. These are all well proved varieties. A few newer ones that I have found do well in pots are Madame Maurice de Luze, Mrs. Aaron Ward, Queen of Spain, Elizabeth Barnes, and Molly Sharman Crawford, while the following climbers can be successfully lifted and flowered in pots: Dorothy Perkins, Hiawatha, Electra, Tausendschon, and Blush Rambler.

BEGONIA GLOIRE DE LORRAINE, and any of the other types that are becoming well advanced in flower, should be kept in a less humid atmosphere, given plenty of air in bright weather to well harden the blooms and prevent the tendency to drop which often appears if the house is kept too close after the plants begin to flower freely. Later batches of these plants should be staked and tied as they require it, and if in fairly small pots they should be kept well fed with liquid manure.

FINE FOLIAGE BEGONIAS, Gloire de Sceaux, etc., should not be kept too moist overhead, only syringing them very occasionally on really fine days, though they must be kept well damped between the pots, or red spider and thrips may put in an appearance.

VIOLETS that have been planted in frames should be given all the light and air possible on fine days, never shutting the lights up quite tight even at night. All dead and decaying leaves must be regularly picked off, as well as all runners, and to prevent any undue damping, watering should only be done during a spell of really fine weather, and after this date very little will be needed till the turn of the year.

VIOLETS IN POTS should, when possible, be placed on a shelf in a cool house, and must on no account become dry at the roots or red-spider will attack them; if left in frames stand them up on pots to allow air to circulate around them as well as to keep the foliage near the light.

BATCHES OF LILIES, such as L. longiflorum and L. speciosum, that are being pushed forward with a view of having them in bloom by Christmas, must be given an even night temperature of about 50 to 55 deg., rising 10 deg. during the day with the sun. A little encouragement must also be given them in the way of weak liquid manure. —Thomas Stevenson, Woburn Place Gardens.

THE FLOWER GARDEN.

BAMBOOS.—Although during the winter of 1908-9 many bamboos suffered badly, this exception should not deter anyone from planting, as no plants give a greater and more beautiful effect in the garden. Choose a site where the position is somewhat sheltered from the north and east, and prepare the ground for planting by digging out holes sufficiently large, and filling up with some good fibrous soil, which should also contain sufficient grit to render it porous. The present is a suitable time to plant bamboos, especially pot-grown stock. The kinds and varieties one has to select from are numerous, but care should be taken in planting to place these in the right position, according to their heights, as many soon attain large dimensions when established. One of the hardiest with us is Bambusa fastuosa, a rapid grower and a delightful acquisition; Arundinaria Hindsi is also worth including, while a few others I might mention are Bambusa Metake, A. anceps, Arundinaria Fortunei (dwarf), A. nitida (tall and gracefully arching), Bambusa pygmæa (very dwarf, free, and hardy); Phyllostachys aurea, P. viridi-glaucescens, and P. nigra are each tall-growing, and all are of the hardiest constitution.

HEATHS.—Few plants are more highly esteemed in gardens or more interesting than the above, especially when grown in large masses; and, by careful selection of varieties, it is possible to have some of them in flower the whole season through. The present is a suitable time for making preparations for planting, and where the soil is of a heavy nature steps must be taken to improve it by adding a liberal quantity of suitable material, such as well-decayed leaves and turfy loam or peat. This will be found to suit them admirably. They may be planted with advantage in the foreground of the shrubberies, and they thrive exceptionally well where rhododendrons and other hard-wooded subjects grow, while their evergreen habit renders them at all seasons attractive. The many beautiful forms of the common heather, or ling, should always be included, as these are of the hardiest. Others I may mention include Erica cinerea, E. cinerea alba, E. vagans (the Cornish heather), and its white variety; while E. mediterranea, with its several varieties, is a robust, bushy-growing species.

SEASONABLE WORK.—No time must now be lost in removing all half-hardy subjects to their winter quarters, such as specimen bays, aloes, hydrangeas, cordylines, agapanthuses, etc., where these are grown in large pots or tubs for standing on the terraces, and other places in close proximity to the mansion. They will require but little water to keep them in a healthy state during the winter months. Attend to the final clipping of all hedges, so that they may present a neat appearance until active growth commences in the spring. Lift and dry dahlias, cannas, gladioli, etc., when cut down by frost, and keep them in cool, dry storage for the winter, where frost can be excluded. Continue to clear unsightly and decaying growths from the borders, and remove all weeds. Any vacant spaces which have been occupied by batches of annuals may be filled up with spring-flowering plants.—E. Beckett, Aldenham House Gardens.

HARDY FRUITS.

RENEWING WALL TREES.—Preparations for this work should be commenced at once, and be completed by the time the new trees are ready for planting. Trees growing against walls are expected to continue for many years in health and fruitfulness, and to ensure this as far as possible, some little extra care should be taken in preparing the position and soil before the new trees are planted. In many gardens, where the subsoil is of a gravelly nature, ample drainage is secured, but on stiff land with a clayey subsoil, artificial drainage must be provided. This may be accomplished by digging out a drain two and a-half or three feet deep, according to the nature of the soil, and running parallel with the wall, and from six to eight feet from it, laying in some three-inch land drain pipes, afterwards covering them with six inches of rubble, such as broken bricks, or the coarser portion of the cinder heap. A slight fall in the drain is necessary, and a clear outlet must be maintained.

WHEN PREPARING THE POSITIONS for the trees, dig out a space four feet square and two feet three inches deep, wheeling the soil on to another part of the garden, and then make the bottom of the hole firm with a rammer. A good practice which is often followed is to lay some flat pieces of stone over the bottom to prevent the roots penetrating downwards into the subsoil. Flat stones are not always at hand for this purpose, but a capital substitute is called cinder concrete, made by mixing some fine cinders, from which the finest of the ashes has been eliminated, with some Portland cement, using these at the rate of five parts of the former to one of the latter. Mixed with water, and laid over the bottom of the hole about three inches thick, with a slight fall from the wall, this will soon set, and become an impenetrable barrier against the roots.

SOIL.—In some districts the natural soil contains all the necessary constituents essential to the healthy growth and fruitfulness of the several kinds of fruit, while in other places, more or less of loam, mortar rubble, etc., must be incorporated before satisfactory results can be obtained. Where the soil is found to be of a clayey and retentive nature it is advisable to wheel away the whole of it from the position in which it is intended to plant fresh trees, and substitute a more suitable compost. This may be made up by thoroughly mixing some good turfy loam three parts, some well-broken up mortar rubble one part, and one part of thoroughly decomposed manure, adding a sixth part of wood ashes. This should be well mixed by turning over the heap three or four times, and should be kept under cover, or otherwise protected from the wet until wanted for use; the soil being then in a fairly dry state, the trees may be made firm in their new positions by treading or beating with a wooden rammer.

PLANTING.—To carry out this work successfully, the roots must not be kept out of the ground for an hour longer than can possibly be avoided; it is therefore necessary that everything should be in readiness for the work by the time the trees arrive from the nursery. Standard trees require to be supported, and the stakes for this purpose should be fixed in position before planting, thus preventing damage to the roots, which often takes place when the stakes are driven in afterwards. Trees which have been several days on the journey should be unpacked on arrival, and have their roots placed in a tank of water for a short time to freshen them up previous to planting.—GEO. WOOLGATE, Rolleston Hall Gardens.

THE COPPED HALL GRAPE STORING BOTTLE.

At this season of the year, when the chrysanthemums need so much room indoors, the question of cutting the grapes so as to render the vineries available for the Autumn Queen is one that has to be considered. Then again, later still, there are the late grapes to be cut and bottled, so that the vines may be rested and vineries cleared. If there is a proper grape room, or even a good shed or cupboard that serves the purpose, the task of putting the charcoal in the old beer bottle, and adding just enough water to feed the inserted stem that carries the bunch, occupies a good deal of time, and the work of fixing the rounded bottles so that they do not suddenly roll or tip up is also a serious item. But perhaps the greatest trouble after that of adjustment is to keep the water at a suitable level in the bottles without wetting the grapes. It is just here that everyone who has bottled grapes must have wished for a bottle specially adapted to the purpose, and one that could be supplied with water without removing the grapes. Such a bottle has been now invented, and tested at Copped Hall, Essex, and is being placed on the market by Messrs. W. Wood and Sons, of Wood Green, N., under the designation of the "Copped Hall Grape Storing Bottle." Imagine a modern baby's feeding bottle, with squared sides and base, and an elongated upturned business end, and with an opening in the flat top side. You have then some sort of an idea of what the new grape bottle is like. The neck holds the stem of the bunch securely, and as the aperture is higher than the round opening in the upper side of the bottle, it is not possible for water to run over and into the bunch, so long as the bottle is kept level. The opening offers a means of adding water without disturbing the bunch. The flat sides ensure stability, and a narrow lath tacked along over the bases of a row of bottles would prevent any possibility of capsizing, no matter how heavy the bunches.

NARCISSUS CULTURE FOR PROFIT.

(Concluded from page 791.)

◆

Cost of Cultivation.

As the annual rental and cost of labour differ considerably in different localities, it is impossible to give an estimate suited to all conditions; but as nearly as possible the expenses in the Fenland is £150 5s. per acre, which in some details are probably lower than those incurred in other parts of the country.

The planter is strongly recommended when purchasing to buy either "planting size" or bulbs as lifted at so much per ton, instead of securing first-size bulbs. As previously stated, the latter, when planted, will yield "stock,"—that is, they split up and increase in quantity, and this necessitates waiting for three or even four years before a profitable crop of first-size bulbs can again be secured. If bulbs are purchased "as lifted," and divided into four sizes, as already described, all of them can be planted. The second-size bulbs will produce "heads" the first year, the third size and "chips" will yield a large percentage of "heads" the following year, whilst the third season, by lifting those planted as "heads" three years previously, a large yield of planting stock will be secured. This gives a much quicker return on capital than is possible when first-size bulbs only are planted, and the initial outlay is also less.

Value of Produce.

This will vary according to the varieties grown, the quantity and quality of bulbs planted, the length of time they have been allowed to remain in the ground, and, lastly, the suitability of the land for bulb culture. As the several varieties differ so much in value, the best method of arriving at an estimate will be by percentage increase on cost of "seed" bulbs. Bulbs planted one year will increase from 30 to 50 per cent. in value; those planted two years from 75 to 100 per cent. In addition, there is the cut bloom which must be taken into consideration, and this may be expected to add from £15 to £20 per acre to the returns.

II.—CULTIVATION FOR BLOOM.

The chief difference in cultivation when growing for cut flowers is that less frequent lifting and replanting is necessary. The bulbs may remain two or three years—some few varieties even longer—and increase their yield annually. As a rule, however, after remaining three years, a shift is desirable, as the bulbs then become crowded and too small to bloom satisfactorily, while the land also becomes exhausted. The labour required for keeping the land free from weeds is the same as when growing for bulbs, but the annual cost of lifting, cleaning, sizing, and replanting is saved.

Marketing the Blooms.

Gathering and Bunching.—As the blooms expand they must be gathered and marketed whilst fresh. An effort should be made to have the bloom fit for market earlier than would be the case if left to take its natural course. This can be accomplished by pulling the flowers when in the bud state and opening them in water under glass, or by erecting a temporary covering of glass over the growing plants. The grower without glass is at a great disadvantage, and glass is absolutely necessary to obtain the best results, as without a greenhouse the grower is at the mercy of the elements at a time when much rough and stormy weather is frequently experienced. The cultivator with glass at his disposal can gather the flowers in the bud state, open them in water, and thus ensure all his blooms reaching the market clean and in good condition.

To avoid glutted markets, it is sometimes desirable to prolong the bloom for a few days; this is done by placing the buds in water in a cool, shaded shed. The best receptacles in which to place the blooms are narrow troughs or boxes divided into several sections, each about four inches wide.

In the Fen district the work of gathering and bunching is generally done by women and boys. The gathering should be done by boys whenever possible, as the women's skirts cause considerable damage among the growing blooms. As the bloom is gathered it is placed upright in boxes or baskets, then taken to the bunching room, where it is tied into bunches of twelve blooms each by the women workers. The aim of the buncher is to have all the blooms facing one way without presenting a crowded appearance, and the addition of a little narcissus foliage to each bunch is a considerable improvement. Foliage, however, must not be indiscriminately cut from the growing crop. Only a leaf or two should be selected from each plant; or a cheap vigorous variety, such as single Incomparabilis, may be grown purposely for the supply of foliage. The bloom when cut is benefited by having one night in water before being packed, and, in any case, it should certainly have an hour or two in water before being put into the boxes. The flowers then reach their destination in a much fresher condition than if cut and packed forthwith.

Packing.—Most commission salesmen supply boxes, and into these a certain number of bunches are put. All boxes should be papered, allowing sufficient paper to project over the sides and ends to cover the blooms completely when packed. The boxes should not be unduly crowded, as a lesser number of bunches nicely tied and carefully packed will realise more than an increased number of bunches crowded into a similar box. A small label stating the contents of the box should be tacked outside each, and the boxes then tied in bundles of two or three together. The work of gathering, bunching, and packing is generally done by the piece or per gross, and the cost will vary according to the rate of pay in the district, condition of crop, etc. From 1s. to 1s. 3d. per gross bunches is stated to be an average price.

The important points are to get the stems as long as possible, to stand them in water before packing, to bunch and pack them carefully, and not to overcrowd the boxes.

Value of the Crop.

Market prices vary considerably, and it is impossible to estimate these accurately; 9d. to 1s. per dozen bunches may be taken as an average, although the small cultivator will find that where special attention is paid to careful picking, packing, and grading, rather higher prices will be obtained. It is in these details that the small grower scores an advantage over the large establishments, where the flowers are apt to be handled with a certain amount of carelessness. The estimated income for three years in Fenland is £356 5s. per acre, and the estimated expenditure £291 4s. 6d., thus yielding a profit of £65 0s. 6d. for the three years, or an annual profit per acre of £21 13s. 6d.

In estimating the quantity of blooms obtainable from an acre considerable latitude must again be given, as the crop will vary according to varieties, good or indifferent culture, etc.; 200,000 blooms may be taken as an average yield per acre for the varieties specified, with the exception of Ornatus, which may be trusted to give two or three times that quantity.

Prizes for Amaryllis.—The council of the Royal Horticultural Society offer, subject to their general rules, the following prizes presented to them by Messrs. R. P. Ker and Sons, of Liverpool. Twelve pots of amaryllis (hippeastrums), each pot must contain one bulb only, and not more than one pot of any one variety can be included, size of pots optional. Prizes, £3, £2, and £1. The prizes will be competed for at the bulb show in March next, and the competition will be open to amateurs only.

EXHIBITIONS AND MEETINGS.

Conference of Gardeners' Associations.

A conference of Gardeners' Associations in affiliation with the Royal Horticultural Society was held in the lecture room of the Horticultural Hall on Tuesday, the 12th inst., with Mr. H. B. May in the chair. There was a large attendance of delegates, and much interest was taken in the proceedings.

The Chairman, in opening the proceedings, expressed the pleasure he felt in presiding over so large and representative a gathering, and tendered on behalf of the council of the Royal Horticultural Society a hearty welcome.

The first item on the programme was the suggestion from the Radlett Gardeners' Mutual Improvement Society, "that affiliated societies should organise meetings at a convenient centre in their respective counties prior to these annual conferences, to consider and formulate subjects for discussion thereat." The delegate of the Radlett society in submitting the suggestion, said it was desirable that the Royal Horticultural Society should organise such meetings in the counties throughout the United Kingdom, with a view to the holding of county shows. He felt that, if this was done, it would be possible to hold shows of considerable importance in the various counties. After some discussion, in which a number of delegates took part, the Chairman pointed out that such meetings should be organised by the societies themselves, and not by the Royal Horticultural Society. The initiative must come from those who were conversant with the local conditions, and then the central society would be prepared to assist with advice as far as practicable. As worded, he saw no objection to the suggestion, and on it being put to the meeting it was unanimously accepted.

The second matter on the agenda was a proposal to handicap those taking part in horticultural competitions. This proposal was made by the St. Barnabas Sutton Society, and it was submitted by Mr. Jay, who briefly referred to the advantages which, in the opinion of his society, would result from placing all on equal terms. This proposal failed to meet with any favour from the delegates, and the meeting passed on to consider the question, "Is it possible for the Royal Horticultural Society to obtain books for daughter societies at cheap rates?" The Chairman said there was no occasion to discuss the question, because he was in a position to at once say that the society was not able to obtain books otherwise than at the ordinary prices, less the usual discount.

The Croydon Horticultural Association submitted the following questions: "How can meetings be made more attractive and helpful to young men?" "What are societies doing to educate horticulturally the older schoolboys and the ex-schoolboys, and what can they do towards that end?" In submitting the first question, the delegate from Croydon said that at present the interest taken by young men in the meetings of the society was less than should be the case. The information to be gained at such meetings was of greater value to young men who were being trained than to head gardeners. An endeavour had been made to interest young men by offering prizes for essays, in which the competition was limited to them, but the results had not been satisfactory. A rather long discussion followed, and the opinion was freely expressed that young men devoted too much attention to football and other sports. One delegate said he did not find young gardeners take so much interest in sports as to allow them to interfere with their training and work. His men were certainly not unreasonable in asking for leave to attend sports. He thought much might be done in improving the attendance of young men by gardeners showing more interest in them, and as far as possible inducing them to attend the meetings. One speaker pointed out that the desirability of making the meetings more interesting and attractive had been overlooked, and he made several suggestions for their improvement. In the discussion on the second question some interesting particulars were given with regard to what had been done at Egham and Preston in encouraging a taste for the cultivation of flowers among children attending the schools.

There was some discussion on the question of "What constitutes a professional gardener, an amateur, and cottage gardener?" and the meeting was brought to a close with a vote of thanks to the chairman.

Aberdeen Natural History Society.

PARTNERSHIPS IN NATURE.

Dr. James W. H. Trail, Professor of Botany in the University of Aberdeen, delivered, on 8th inst., in the Botany Classroom, Aberdeen University, the first of a series of lectures which will constitute a feature in the ensuing session of the Aberdeen Natural History and Scientific Society. There was a crowded attendance, and Mr. Reay, president of the society, occupied the chair.

Professor Trail, in his introductory remarks, said one was familiar with the contest between various forms of plants and animals, each striving for its own place, for room to live in the world, but that evening he wished to take up a subject not less interesting and not less important in its way —not the struggle but the mutual help different forms of animals and plants gave to one another. It had not been left to the human race to discover that it was better to get on in life by helping one another, for many forms of animals, and even some forms of plants, had wrought that out in a practical manner, and had succeeded in making life what it could be to them by mutual help instead of struggle. Between plants and animals of different kinds there were often a good many points of contact. In some cases they were in direct conflict with one another; in others, they were in indirect conflict; but sometimes they were closely associated, as, for instance, in the forms that lived on and drew nourishment from one another. This relationship differed markedly from parasitism, in which only the one benefited and the other was injured, often very seriously, or might even be destroyed. The Doctor then proceeded to show on the screen a large number of plants where the partnership was mutually beneficial, where the partnership was not hurtful, and where it was necessary from the beginning.

Partnerships were formed between animals of distinct species, or between animals and plants, or between plants, usually of very different kinds. Those partnerships varied much from one another in kind, in importance to the well-being, or even to the life, of the partners, and in duration, some being very brief, others extending over long periods. Among the simplest types of partnerships was the habit of many animals of the same kind to associate themselves for mutual protection, or to capture their prey —wild horses, wolves, etc.—and many plants grew in crowded masses that crushed out and excluded other species. Numerous partnerships between animals of different species were well known, such as between hermit crabs and some sea anemones, and between certain ants and aphides, which they sought out and protected on their food plants, sometimes binding coverings of earth over them, and carrying the aphides to new situations suitable for their welfare. In this case the ants were repaid for their care of the aphides by a sweet fluid emitted by these insects. Partnerships between plants and animals were numerous, such as that involved in the transference of pollen from stamens to stigmas in many flowers whose structure was such as to supply nectar or pollen to certain kinds of winged insects fitted to carry pollen to stigmas in other flowers of the same species, and to exclude such "unbidden guests" as would consume the bait and leave the work undone. Other examples of partnerships of great importance to some animals and plants were seen in the methods of the distribution of seeds through the bodies usually of birds. The young plant in the seed was protected from injury by a strong covering, while the inducement to swallow the seed was offered in a fleshy pulp that was produced as the seed approached ripeness, and, when the little plant was fit to be removed from the parent, the enlarged part was rendered attractive by rapid storage of sugars and pleasant flavour, and usually by colours in marked contrast to the green of the leaves.

The parts thus altered to serve as the bait were very different in different plants, as, for example, an outer seed-coat where the seed was exposed to view (yew, nutmeg, etc.), the whole inner layers of the seed vessel (grape), or its middle layer (cherry and plum), the fruit-stalk bearing seed-like seed vessels on its surface (strawberry, casheu), or in its cup-shaped tube (rose-hip), the seed vessels sunk in and grown to the hollowed fleshy fruit-stalk (apple, gooseberry), the sepals of the mulberry, the stalk bearing many small flowers (fig), or the bracts (pineapple). It had recently been observed that ants did much to disperse the seeds of many plants, the attraction for them being fleshy swellings on the surface of seeds, or of small seed-like fruits. Those swellings contained substances used by ants for food, and the insects carried the seeds or fruits considerable distances, leaving the embryos unharmed by the removal of the parts gnawed away by the ants. Protection against injuries was gained by many plants by their being the homes of ants, which, running all over parts of them, were ready at all times to defend them against all enemies. Many bushes and trees in the tropics were thus protected, the ants dwelling in hollow stems or leaf-stalks, or in curious outgrowths from, or inflation of, leaves or stipules. Another mode of partnership between ants and plants was afforded by the "ant gardens" studied recently in the western tropics. Those consisted of various species of herbs or small shrubs growing from the nests of several kinds of ants upon the trunks of trees, often at many feet from the ground, yet built of earth carried up from the soil by the ants. The plants on those nests grew from seeds which there was reason to believe must often, perhaps in most cases, be brought by the ants, as most of the species scarcely seemed to grow elsewhere than on those nests, which they protected from being injured by the heavy tropical rain.

A curious example of mutual benefit was found in the growth of algæ cells in the substance of the coarse hairs on the backs of sloths, colouring them dull green, and rendering the animals much less conspicuous to their foes among the branches and leaves of the trees on which the sloths lived.

Professor Trail concluded his lecture by referring to partnerships between plants of widely different types, and peculiarly well-shown certain green plants and fungi. The storage of food in tubers of orchids, and probably many other plants, appeared to be due to fungi existing within the plant's tissues. Bacteria in tubers on roots of leguminosæ received shelter and stimulus from the root, and repaid the plant by supplying much food to it, fixing nitrogen from the air, and thus enabling the peas, clovers, and such like plants to enrich poor soils. Lichens, unlike true fungi, which were for the most part very short lived, were of extremely slow growth, and of very long duration. Their structure revealed a web of long tubes, as in fungi, woven around green or brown cells, identical in aspect with cells of algæ. Those two kinds of cells were not formed from one another. The lichen was formed by the partnership of fungus and algæ, the fungus protecting the algæ from drought and exposure, and the algæ producing the food required by both.

A most hearty and enthusiastic vote of thanks was accorded Dr. Trail for his lecture.

BRADFORD CHRYSANTHEMUM EXHIBITION in ST. GEORGE'S HALL, on FRIDAY and SATURDAY, November 12th and 13th.
£27 for 24 Japanese (on Boards).
Prize Money for Open Competition again Increased.
Entries Close November 6th.
Schedules with entry form post free from H. SPENCER, Hon. Secretary, Horton Park, Bradford.

BRISTOL CHRYSANTHEMUM SOCIETY.

46th EXHIBITION, NOVEMBER 3rd and 4th.

Schedules and particulars from all Nurserymen and Florists, or the Secretary, W. ELLIS GROVES, c/o Messrs. Garaway and Co., Durdham Down Nurseries, Bristol.

BUXTON AND DISTRICT CHRYSANTHEMUM SHOW,
WEDNESDAY, November 17th, 1909.
For Schedule and List of Prizes, address—
S. SHUFFLEBOTHAM, Secretary, 12, Eagle Parade, Buxton.

DEVIZES CHRYSANTHEMUM SHOW will be held in the CORN EXCHANGE, DEVIZES, on TUESDAY, Nov. 16th, 1909.
For 36 Blooms, Incurved (not less than 18 varieties), prizes, 120s., 100s., and 60s.
For 36 Blooms, Japanese (not less than 18 varieties), prizes, Cup, 70s., and 40s.
For Schedules, apply to A. J. RANDELL, Hon. Secretary, Exchange Place, Devizes.

HUDDERSFIELD AND DISTRICT CHRYSANTHEMUM SOCIETY.
The EIGHTEENTH EXHIBITION of the above society will be held in the TOWN HALL, HUDDERSFIELD, on FRIDAY and SATURDAY, November 12th and 13th, 1909. Schedules and Entry Forms may be obtained on application to JOHN BELL, Hon. Sec., Marsh, Huddersfield.

NATIONAL CHRYSANTHEMUM SOCIETY.
GREAT AUTUMN SHOW
at the
CRYSTAL PALACE,
November 3rd, 4th, and 5th, 1909.
Entries Close October 27th.
Write at once for Schedule to the Secretary, Mr. RICHARD A. WITTY, 72, Savernake Road, Gospel Oak, N.W.

SOUTH SHIELDS AND NORTHERN COUNTIES CHRYSANTHEMUM SOCIETY.
ANNUAL EXHIBITION in the ROYAL ASSEMBLY HALL, SOUTH SHIELDS, on WEDNESDAY and THURSDAY, 10th and 11th November, 1909.
£200 IN PRIZES. Seven Silver Cups, Medals, etc.
First Prize for 36 Japanese, £10.
Entries close November 5th.
Schedules and all particulars from ALLEN PURVIS, Albany Chambers, 63, King Street, South Shields; or J. ERNEST STOUT, Commercial Chambers, South Shields.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

Vegetable Show at Leamington.

The sixth annual show of vegetables held by Messrs. Rogers and Co., Lim., of Leamington, took place on Saturday, the 9th inst., and proved to be one of the finest and most interesting exhibitions of vegetables ever held in the country. Valuable prizes were offered, no less than £200 being divided among eight classes, which brought together many of our best exhibitors from all parts. For a collection of nine kinds of vegetables (potatoes excluded), Mr J. Hudson, Hinckley Road, Leicester, was a magnificent first, and not only was every dish of high class, but the staging was perfect; he put up celery, leeks, cauliflowers, onions, parsnips, beet, turnips, Brussels sprouts, and tomatoes. Mr. S. Cole, Althorp Gardens, Northampton, was a close second, his leeks, celery, carrots, and parsnips being very fine; Mr. E. Avery, The Gardens, Loudwater Park, Rickmansworth, third; and Mr. T. Folkes, The Gardens, Gaddesden Place, Hemel Hempstead, fourth. Four prizes were offered, viz., £20, £15, £10, and £5.

In another class for a collection of eight kinds, potatoes excluded, open to amateurs and allotment-holders, there were no less than fifty-one competitors, who made a marvellous display, and one cannot do full justice to such a fine competition. It must suffice to say it was quite the best class it has been our pleasure to see. Ten prizes were offered in this class, £15 being the first. So close were the leading exhibits that only the smallest margin divided the first four. After most careful judging, Mr. T. Jones, Bryn Penylan, Ruabon, was placed first, closely followed by Mr. T. H. Pugh, 12, Stone Street, Newtown (Mont.), Mr. W. H. Jones, 13, Brych Street, Newtown (Mont.), and Mr. W. Folkes, Ampthill, Beds. Each of these exhibitors had evidently put forth his full strength, and it was a grand contest. Other successful exhibitors were Mr. W. Coleman, Buckingham; Mr. Douglas Garratt, Frome; Mr. W. H. Leeson, Leicester; Mr. Jackson, Leicester; Mr. J. White, Bampton; Mr. J. Phillips, Derby; Mr. John Thompson, Stafford; and Mr. W. Kingston, Towcester, who were placed in the order of their names.

In the open class for three onions, £50 was offered in eight prizes, £15 being the first, and, needless to say, this had the effect of bringing together a very fine lot. Leamington Giant, a very fine strain, was the variety asked for. In this and a smaller class no fewer than 1,767 bulbs were arranged. The first prize was won by Mr. S. J. Baker, The Gardens, Weir House, Exeter, with splendidly-finished specimens, very large and shapely; Mr. T. Avery second with some remarkable bulbs, but not quite so well-finished; Mr. G. Hall, Simla Gardens, Paignton, S. Devon, third; Mr. C. Liddiard, Chilton Foliat, Hungerford, Berks, fourth; Mr. S. Gordon, Monreith Gardens, Whauphill, Wigtownshire, fifth; W. R. Baker, The Gardens, Hoopern House, Exeter, sixth; Mr. R. Mairs, The Gardens, Shobrook Park, Crediton, Devon, seventh; and Mr. H. Folkes, eighth. In the class for amateur and cottagers, six prizes were offered, and here again the competition was remarkable, both in number and quality. Mr. T. Jones again occupied the premier position with very handsome and well-finished specimens; Mr. C. Liddiard, second; Mr. Kingston, third; Mr. D. Garratt, fourth; Mr. J. Thompson, fifth; and Mr. H. Keep, Aldermaston, Berks, sixth.

In the class for three sticks of celery, there were fifty competitors; forty-eight for six beet, forty-seven for six leeks, and thirty-six for carrots. The leeks and celery were especially fine, but carrots, except in a few cases, were below the average.

The exhibition proved a great source of attraction, and the large Winter Hall in which it was held was crowded.

Royal Scottish Arboricultural Society.

(ABERDEEN BRANCH.)

A meeting of the members of this branch was held in the University Buildings, Aberdeen, on Saturday, 16th inst. Mr. Sydney J. Gammell, of Drumtochty and Countesswells, presided over a good attendance. The Chairman announced the appointment of a secretary and treasurer in the person of Mr. George D. Massie, solicitor, Aberdeen, and the branch unanimously confirmed the appointment.

Mr. W. Dawson, lecturer in forestry at the Aberdeen University, the interim secretary, intimated that at the next meeting of the society, on December 11, Sir John Fleming would give a lecture, and his subject would be, "When Afforestation Comes." Mr. Alexander Robson, Aberdeen, thought the subject to be dealt with by such an authority as Sir John Fleming—(Sir John is the head of a great firm of wood merchants in Aberdeen and Dundee, and also has large interests in Norway)—was worthy of a large audience. He therefore moved, "That it be in the option of the society to admit strangers to any lecture likely to be of special public interest, and that such lectures be advertised at the society's expense." This was duly seconded. The Chairman, in supporting the motion, felt it would be an advantage to popularise the society among people who were not already members of it, but who might be willing to join. The motion was unanimously adopted. Mr. Dawson was heartily thanked for the admirable way in which he had carried out the duties of interim secretary.

Following the business meeting, Dr. James W. H. Trail, professor of botany at the University of Aberdeen, gave a lecture on "The Origin and Growth of the Woody Stem." The learned doctor dealt with the structure of stems, and explained how stems increased in length and in diameter. The lecturer also traced the relationship between the structure of herbaceous stems and woody stems, using illustrations of such plants as potato, clover, monkshood, etc. He further explained the fall of the leaf, showing that it was due to a layer of cork being built across the stalk. The structure of coniferous timber was also explained, and the lecture throughout, which was of much interest, was illustrated by a large number of lantern slides and by slides shown by the projection-microscope. Hearty thanks to Dr. Trail closed a very instructive meeting.

British Gardeners' Association.

LONDON BRANCH.

The monthly meeting of the above branch was held at Carr's Restaurant on October 14, Mr. E. F. Hawes in the chair.

The formal business being concluded, the progress of the sub-committee which is collecting information for the purpose of putting into practical form the proposals of Mr. North, discussed at last month's meeting, was reported.

Mr. Frogbrook and Mr. North both testified to the many inequalities which have been brought to light as a result of the committee's investigations into the hours of labour and rates of pay of gardeners employed by the municipal authorities. The chairman then read a circular letter, drawn up by the executive council, which is to be sent to all prospective candidates for the forthcoming borough and county council elections. The object of the circular is to ascertain the views of candidates with regard to a programme submitted. A standard rate of pay for gardeners, with 30s. as a minimum, is one of the chief objects aimed at. The chairman also drew attention to the manner in which the interests of horticulture had been neglected by the State, and he proposed giving a paper at the next meeting dealing with this question. The proposal was unanimously agreed to. The amalgamation of the Richmond branch with the London branch was next discussed. Mr. Tidy, who represented the Richmond branch, said it was the unanimous wish of the members of his branch to unite with the London branch on the grounds that the two branches were so close together that it was incurring needless expense to hold meetings at both places. Mr. Frogbrook objected to this proposal. He believed a number of branches were advantageous for recruiting purposes, and that some members of the Richmond branch might not wish to incur the expense of coming to London. The chairman pointed out that the matter had already been fully discussed at Richmond, and that it was proposed to open another branch in some good centre a little further out, possibly at Twickenham. The matter was eventually referred to the Executive Council.

Owing to indisposition, Mr. A. C. Hill, head gardener to Sir Edward Poynter, Bart., Kensington, was unable to be present to read his paper on "Roses for Town Gardens," and the paper was read by the chairman. Mr. Hill has been a successful grower and exhibitor of roses for the past fourteen years, and he dealt with the subject of rose-growing in London in a most comprehensive and practical manner. The discussion which followed was opened by Mr. Frogbrook, who gave some interesting details of his experience. Mr. Morrell outlined the system of rose-growing so successfully carried out in Hyde Park.

A vote of thanks to Mr. Hill for his valuable paper was proposed by Mr. Bryan, seconded by Mr. Gibson, and carried with applause.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, OCTOBER 12.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Dr. A. B. Rendle, Messrs. E. M. Holmes, J. T. Bennett Poë, W. Fawcett, A. Worsley, J. Fraser, J. W. Odell, and F. J. Chittenden (hon. secretary).

FASCIATION IN TROPÆOLUM.—Mr. J. W. Odell showed a specimen of Tropæolum tuberosum with a very broadly fasciated stem. He found that when grown in heavy soil this plant very frequently shows fasciation.

EUCALYPTUS WITH INTUMESCENCE.—Mr. Worsley showed leaves of young plants of Eucalyptus pulverulenta having small wart-like growths upon the surface. This condition somewhat resembles that shown by vines at times, and is due to excess of moisture in the air.

DATURA STRAMONIUM.—Mr. E. M. Holmes showed a plant of the Thorn-apple with slightly pubescent foliage, which had been attacked by aphides in great numbers, so that the fruit had, owing to their presence, assumed a very unusual appearance.

SPIRALLY-TWISTED GENTIAN, ETC.—Mr. Chittenden showed a stem of Gentiana asclepiadea, from Wisley, very strongly spirally twisted, and bearing the very numerous leaves in a loose spiral round the stem. He also showed regular flowers from the apex of the stem of pentstemon, similar in character to those often formed in the peloric foxglove. The flowers usually had two or three ovaries, and twice or thrice the usual number of stamens.

MALFORMATION IN RUBUS.—Mr. J. Fraser, F.L.S., referred to a specimen of Rubus rhamnifolius which he had exhibited last year with a shortened inflorescence, and which had died since. He showed further specimens from other bushes, however, and remarked upon them as follows:—(1) Rubus rhamnifolius plants dying owing to some injury caused to the roots. The flower branches or panicles are exceedingly short, and throwing out roots at the base or at the top bud in an endeavour to form new stools there. (2) R. carpinifolius in the same condition. These conditions may possibly be due to the attack of nematode worms. (3) R. nitidus var. opacus. Flowering stems dying like the previous two. The terminal flower buds have been galled by Phytoptus sp., and the flowers have been arrested in growth, whilst the sepals have undergone phyllody. The short flowering branches have very much reduced reflexed leaves, the petioles of which are filled with starch granules in excess, and the inflorescence in a condition to form new rooting stools. (4) R. mucronatus var. nudicaulis, with patches of dense, velvety hairs on the stems and leaves caused by Phytoptus sp.

CARBOLIC ACID AS A FUNGICIDE.—A letter was read from Mr. Kitley, of the Oldfield Nurseries, Bath, recounting the results of experiments carried out with tomatoes in which the fungi causing "sleepy disease" and other diseases were prevented from developing by watering the soil with a solution of one teaspoonful of carbolic acid to four gallons of water at intervals.

Reading Gardeners' Association.

The second fortnightly meeting of this session was held in the Abbey Hall, on October 11, when, notwithstanding the very wet evening, a large assemblage of members attended, Mr. A. F. Bailey (chairman) presiding. The Chairman drew attention to the large poster displayed in the hall, and informed the members that arrangements for the exhibition to be held in the Small Town Hall, Reading, on Wednesday, November 17, were being energetically pushed forward. The hon. secretary now had tickets ready for disposal, and he (the chairman) hoped the members would make speedy application for any tickets they might require.

The lecturer for the evening was Mr. J. Goatley, head gardener to Lord Northcliffe, Sutton Place, Guildford, and his subject, "Herbaceous Borders." It will be remembered that when, in July last, by kind permission of Lord Northcliffe, the association visited Sutton Place, it was the herbaceous borders and extensive wild garden that so delighted the members of the association. Having, therefore, already had an ocular demonstration of the lecturer's skill in the laying out and treatment of borders, it was only to be expected that he would be listened to with much attention.

In a brief notice such as this, it is impossible to deal with the extensive subject which was handled in such a masterly manner by Mr. Goatley, but suffice to say that excellent advice was given on position, preparation, time of planting, harmonious blending of colours, avoidance of formalism, the dangers of overcrowding, the necessity of careful and proper labelling, etc., etc. The lecturer also admonished his audience against the allurements of cheap plants, purchase "absolutely the best obtainable" being his motto. To young gardeners he advised the noting in a book such particulars as the height, duration, time of flowering, and other features of any perennials which might come under their care. This information would prove invaluable in after years.

Mr. Goatley is a strong advocate of the planting of bulbs in the herbaceous border, by this means, he suggested, the flowering period is extended for quite two months. Aconites, leucojums, galanthus, crocuses, chionodoxas, early narcissi, tulips, hyacinths, being followed by later flowering narcissi, Darwin and May-flowering tulips, and liliums. In conclusion, Mr. Goatley referred to the splendid herbaceous border it had been his privilege to inspect during the past summer when visiting the Royal Gardens at Frogmore.

A most interesting and educational discussion followed, sustained by Messrs. Tunbridge, W. J. Townsend, Stanton, Hinton, Exler, T. Judd, E. J. Dore, J. Wynn, Alexander, and others.

A nice assortment of perennial asters, and a fine collection of peaches and plums was exhibited by Mr. R. A. Hatton, head gardener to Sir E. Ridley, Bill Hill, Wokingham. The fruit being awarded a certificate for cultural merit. Mr. F. Townsend, head gardener to the vice-president, staged a very beautiful group of Primula obconica, and Mr. A. Giles, gardener to H. W. Dunlop, Esq., Earley, exhibited a nice box of cactus dahlias; these two exhibits were not entered for certificates.

Several new members were elected. Votes of thanks to the lecturer and the exhibitors concluded the meeting.

Birmingham Gardeners' Association.

OCTOBER 11.

The autumn session of this association was inaugurated by the newly-appointed president, Professor G. S. West, professor of botany at the University, Birmingham. His address was on "Deserts and Desert Plants," and it was illustrated by lantern slides. Mr. Thomas Humphreys, curator, Botanical Gardens, Edgbaston, occupied the chair, and there was an unusually good attendance of the members. The Professor apologised for the necessarily condensed nature of his wide subject. The geographical features of the vast extent of the deserts of the world were firstly described and illustrated, followed by a few succinct observations pertaining to the flora indigenous to the zones of each desert land. A hearty vote of thanks was tendered to the Professor for his lucid and interesting dissertation. A brief discussion followed.

Mr. C. R. Bick, Bickenhill Nursery, Acocks Green, brought a plant of Burbank's Wonderberry laden with its black-coloured fruit, which, however, did not commend itself to the gastronomic tendencies of the company.

Several young gardeners were elected as members of the association.

Bristol Gardeners' Association.

A very successful meeting was held at St. John's Parish Rooms, when Dr. Shingleton Smith presided over the largest attendance of the session. Mr. J. C. House, Westbury-on-Trym, gave a lecture upon "The Hardy Flower Garden All the Year Round."

The lecturer gave very clearly the definition of the two words "perennial" and "herbaceous." The early autumn months Mr. House recommended as the most suitable for planting a new border, and early winter for renovating old borders. Geometrical lines, he said, should be avoided, but at the same time there might be a kind of regularity. Planting was best done in groups, blending the shades of colour. The lecturer also gave an outline of a colour scheme, naming scarlet for the centre, the other shades gradually leading up to that colour, such as purple, followed with cream and white, and then orange. Mr. House directed special attention to planting small examples rather than large clumps, and said that a small piece of Michaelmas daisy turned out of a thumb pot would make a plant three feet high and through in one season. Delphiniums and pyrethrums were named as being unsafe to plant between September and February, but most other subjects, including moon daisies, asters, helianthus, eryngiums, poppies, and aconitum might be planted with safety in the winter months, leaving all tender subjects till the spring.

Mr. House staged a splendid bank of herbaceous flowers, for whch he was awarded a special certificate. Mr. Binfield was first, and Mr. Curtis second for three bunches of hardy flowers. Mr. Curtis had three points, and Messrs. Gosling and Venn two each for orchids. Three new members were elected.

A largely attended meeting was held on October 14, at St. John's Parish Rooms, presided over by Dr. Shaw. The lecturer was Mr. Shackleton, of Forde Abbey, Chard, who gave a capital discourse upon "Sweet Peas." Position, the lecturer said, is the first matter to be considered, choosing one, if possible, that is partly shaded from mid-day sun. Sweet peas delight in a fairly heavy loam, and in preparing the ground the manure should be selected according to the soil, a light soil requiring heavy manure, and one that is heavy should have manure that will lighten it. Trench the ground deeply, placing the animal manure in layers, and mixing as the work proceeds, dissolved bones, soot, and superphosphates. The best time to sow is mid-February, using five-inch pots, and putting five or six seeds in each. Place the pots in a cold frame. Mr. Shackleton advised planting in clumps as preferable to lines, being less formal and more pleasing in effect. An ordinary drain-pipe placed in the centre of each clump, he said, was very useful to convey water to the roots. As a stimulant sulphate of ammonia may be applied at intervals during the season, watering freely. When gathering the flowers cut with a slight upward movement. The "curl" may be banished by cutting down the plants affected, which will make new breaks.

For two dishes of apples Mr. Binfield was first, Mr. Scott second. For orchids Messrs. Gosling and Curtis were allowed three points each, and Mr. Woodward two points. Mr. House showed some splendid spikes of Tritomas Star of Baden Baden and speciosa (true), and Cimicifuga simplex. Votes of thanks to lecturer and chairman closed an interesting meeting.

Swanage Horticultural Society.

The fifth balance-sheet of this society presented at the recent annual meeting, shows that a balance of £12 3s. 3d. remains in hand, making a profit of £11 on the year's working. Liberal subscriptions, donations, and special prizes, and a £26 gate have gone far to secure this success. The prospects for 1910 are excellent, and sweet peas will be made a great feature at the annual exhibition to be held next August Bank Holiday.

Bournemouth Gardeners' Association.

At the recent fortnightly meeting of this association a most interesting and instructive lecture on "Tea Planting and Manufacture in Assam" was given by Mr. G. C. Kentish, of Parkstone, Dorset. Numerous views of the various processes through which the tea is put before it is shipped to this and other countries were thrown on a screen. The lecture was given in such a clear manner, and the details so simply and concisely described, that the members present could almost imagine that they were actually at the scene of operations.

Mr. Kentish is a large tea planter in Assam, and was, of course, able to deal with the subject in a masterly manner. He described the jungle which exists and must be cleared away before any tea plantation can be formed. A view of a jungle was shown on the screen. The whole of the large trees and dense undergrowth must be cut down, and, after a period of several months, burned before the ground can be broken and made ready for the tea plants. All this work, and that necessary to the cultivation and manufacture of the tea leaves, is done by coolies. Continuing, the lecturer said that the tea plant grows to a height of about 10ft., but it is cut down so that it resembles a black currant bush, as grown in England. The plant flowers in October, and the seed ripens the following October. The leaves are fit to gather the third year after the bush is cut down. The leaves average about six inches in length in Assam, but the China tea leaves are less than two inches long.

Only the two top leaves and the point bud are gathered from each branch; the bud is covered with fine golden hairs. These buds are duly separated, and make the fine tea known as Golden Pekoe. Green tea is not oxidised, but black tea is. Younger shoots grow from the branches lower down after the gathering of the extreme ends of the branches, and, in due time, these lateral shoots bear leaves fit to gather. The leaves are placed on bamboo frames to dry in immense sheds, through which a strong current of air is driven by means of huge fans. The leaves are further dried on a furnace, where they are browned, but not burned; this causes the leaves to curl when a temperature of about 300 degrees is used. If the leaves are dried and browned to the required degree, they readily unfurl themselves, as we see them do in our teapots.

Mr. Kentish gave many more interesting details in connection with the treatment of the tea plants and their leaves before we receive them at our tables, and at the close of his lecture answered many questions put to him by the members present, who all greatly enjoyed his lecture. A very hearty vote of thanks was accorded him, and one to Mr. Garner, who presided, brought the meeting to a close.

Beckenham Horticultural Society.

The first lecture of the winter session was given on Friday, the 8th inst., by Mr. George Bunyard, V.M.H., his subject being "Flowering Trees and Shrubs." The president of the society, the Rev. Canon Arnott, occupied the chair, and there was a good attendance.

The lecturer made a strong appeal for a more extended use of the beautiful flowering trees and shrubs now to be obtained, as he considered these were very much neglected. Mr. Bunyard drew attention to a great many species and varieties that, perhaps, were not so well known as they deserved to be, such as the wych hazels, Garrya elliptica, Prunus Davidiana, the double-flowered peaches, Magnolia conspicua, Laburnum Vossi, etc., etc. Berried plants were also given attention, and many beautiful trees and shrubs for autumn leaf-colour, notably the Scarlet Oak, Berberis Thunbergii, Rhus cotinus, etc., etc. Some few roses were dealt with. The new Lyon rose was given an excellent character, especially for remaining fresh a long time after cutting. The lecturer said that planting of many of the flowering shrubs should be done in a bold way, and three or five in a clump would be most effective. If the soil is very poor a little well-pulverised manure might be added. With reference to Rhododendron Pink Pearl, it was considered a good plan to lift and replant it every year; Mrs. Sterling was cited as a good companion to Pink Pearl.

Cut specimens of many beautiful things were furnished by Mr. Bunyard for purposes of illustration, and were carefully examined after the lecture. A very hearty vote of thanks was accorded Mr. Bunyard, who, in turn, moved a like compliment to the president. Mr. Bunyard presented to the library a copy of his recently-published book on "Flowering Trees and Shrubs." Mr. Leech, of Wood Hall Gardens, Dulwich, also presented a work on "Mendelism," and hearty thanks were accorded for these gifts.

Mr. Abrahams was awarded a certificate for a collection of tomatoes.

On Friday, the 15th inst., H. Sherley-Price, M.I.M.E., M.I.E.E., Vice-President of the Society (the Rev. Stewart-Fleming in the chair) gave a lecture on the "Cocoanut Palm and its Products Illustrated." There was a good attendance, including some ladies, and a number of the more advanced boys of the Council's schools had the privilege of attending, and availed themselves of it.

The platform presented quite a museum, so numerous were the items. Pretty well everything connected with the cocoanut industry was here to be seen, and the method of production in many cases explained by the aid of diagrams, which the lecturer had very kindly prepared for the purpose. Some most exquisite ornaments—i.e., goblets, bowls, cups, etc., in their mountings of precious metals—were much admired. The lecturer stated that probably no other tree contributed so much for utility and food to humanity as the cocoanut tree (Cocos nucifera), which is not to be confounded with Theobroma cacao, from whence our breakfast beverage comes. The lecturer gave figures of the total imports to this country for 1908, which were:—Coir fibre, 18,280cwt., value £9,057; coir yarn, 322,344cwt., value £273,754; nuts, 366,972cwt., value £48,353; oil, 758,412cwt., value, £1,081,146. At the close of this most instructive address, Mr. Sherley-Price was heartily applauded. Votes of thanks were given both lecturer and chairman.

Mr. Webster contributed a collection of clean, unblemished fruit, grapes, pears, and apples, with a dish of the brightly-coloured Dartmouth crab, and was awarded a special certificate. Mr. Chandler contributed a dozen vases of early chrysanthemums, and a certificate was awarded in this case.

East Anglian Horticultural Club.

At the October meeting of this club the members were all congratulating Mr. Lewis Smith (Shotesham) and Mr. Frank Neave (Lingwood) upon the success they had brought back from the R.H.S. meeting. The members had responded loyally to the appeal of the committee for fruit for exhibition, and the fact that the "East Anglians" were top in all England, and came next to salubrious Jersey, speaks well for the district as a fruit-growing centre. Mr. Smith gave a good report of the several exhibits, and the representatives of other societies which he came in contact with. The exhibit was placed upon the tables at the meeting for those members to see who desired it.

After this question had been disposed of the President alluded to the decease of Mr. T. G. Bishop, who was manager at Messrs. Daniels Bros.' Nursery. Mr. Bishop took a great interest in the club's work, and had contributed some most educational papers. A vote of sympathy with the widow was passed. Mr. Edward Peake introduced the names of a few members of the botanical section, who would contribute short papers. Mr. Goude discoursed upon Begonia Gloire de Lorraine. Mr. H. Perry dealt with the way plants breathe and feed. Mr. W. Shoesmith treated ably on the bog plants grown at Cringleford, and Mr. C. Burtenshaw gave the way to form a rock garden. Mr. W. Shoesmith (Cringleford) had the honour of being the first holder of the Dawson Paul Challenge Cup, which covers a series of three exhibits (spring, summer, and autumn) he also had the best orchid at the meeting. There were many fine examples of fruit. Mr. G. Moore, Hethersett, had some fine beautifully-coloured Worcester Pearmains; Mr. W. Laws, Eaton, had a bright display of early-flowering chrysanthemums. Pot plants were a good class, while vegetables in sprouts, carrots, and beet were well represented.

Dundee Horticultural Society.

The report which the committee had to submit to the members assembled in annual meeting was by no means of a cheerful character. The treasurer's report, submitted by Mr. J. S. Ritchie, showed that the income for the current year amounted to £1,138 17s. 5d., and of this sum £14 6s. was received as subscriptions, and the sum of £765 1s. 10d. was taken at the gate. The expenditure amounted to £1,181 8s. 10d., less £27 16s. overpaid for music, and it included £183 19s. 6d. paid for military display, and £161 19s. for music. Although the weather was exceptionally fine, the amount received at the gate was not sufficient to justify so large an outlay. The actual balance on the year's work was, according to Ex-Bailie Mitchell, who presided, £5. At the election of officers Ex-Bailie Mitchell was elected president, in succession to Mr. J. Scott Gray, who retired this year. Mr. W. F. Hill was re-elected secretary, Mr. Ritchie re-elected treasurer, and Mr. William Steele again appointed show manager.

United Horticultural Benefit and Provident Society.

The quarterly meeting of this society was held at the Horticultural Hall, Vincent Square, Westminster, S.W., on Monday evening, October 11, Mr. C. H. Curtis in the chair. The death certificate of Mr. James Swingler was produced, and the amount standing to his credit, viz., £30 4s. 1d., was granted to his widow. The deceased was a lapsed member since 1892. The sick pay for the month was £34 10s. The usual quarterly grants from the benevolent fund were passed for payment.

The annual dinner will be held at the Waldorf Hotel on the 28th inst., at 6.30 p.m., when it is hoped that as many members and friends as possible will attend. J. B. Slade, Esq. (of Messrs. Protheroe and Morris) will presido.

CATALOGUES RECEIVED.

GEO. BUNYARD AND CO., MAIDSTONE.—Fruit trees occupy the major part of this catalogue, and besides descriptions of the best varieties of the various kinds, there are notes upon common fruit tree diseases and pests, and the best remedies for them. Roses are also listed.

H. CANNELL AND SONS, SWANLEY, KENT.—A comprehensive list of bulbs and flowering roots, together with lists of strawberries, violets, roses, etc.

R. H. BATH, LIM., WISBECH.—In this bulb and rose catalogue the bulbs occupy the most space. The choicer varieties of tulips and daffodils are described and offered, as well as the popular varieties.

JAS. BACKHOUSE AND SON, LIM., YORK.—This catalogue of roses is beautifully illustrated, well arranged, and has a capital index.

JAS. VEITCH AND SONS, CHELSEA.—A handy illustrated and well-indexed catalogue of roses.

R. WALLACE AND CO., COLCHESTER.—This useful catalogue gives special attention to liliums, tulips, montbretias, and choice hardy plants. Many novelties are described, and the new Lilium tenuifolium Golden Gleam is illustrated.

CHAS. BLICK, WARREN NURSERIES, HAYES.—Mr. Blick's first catalogue of carnations is a descriptive one, and of interest because of the novelties in yellow-ground and other sections it includes.

LITTLE AND BALLANTYNE, CARLISLE.—Bulbs, fruit trees, hardy perennials, and roses are listed in this autumn catalogue.

JOHN R. BOX, DERBY ROAD, CROYDON.—A catalogue of Dutch, French, and English bulbs and flower roots for autumn planting.

PERNET-DUCHER, VENISSIEUX LES LYON, FRANCE.—A descriptive catalogue of roses, in English, with coloured plate of the new H.T. rose, Entente Cordiale.

ANSWERS TO CORRESPONDENTS.

CHRYSANTHEMUMS AND DAHLIAS.—A. L., Fairlie: We shall be better able to help you if you tell us for what special purpose you propose to grow the chrysanthemums and dahlias.

PLANTS FOR ROOMS.—S. E. B., Leytonstone: A few of those plants that have been found especially valuable for use in dwelling rooms are Aspidistra lurida, A. l. variegata, Araucaria excelsa, Aralia Sieboldi, and A. S. variegata, Ficus elastica and its variegated form, Dracæna indivisa, D. australis, D. Eckhautei, Chamærops Fortunei, C. humilis, Corypha australis, Phœnix rupicola, Kentia Belmoreana, and K. Forsteriana.

MOSS AND LICHEN ON APPLE TREES.—A. L., Fairlie: The best method of cleaning fruit trees that are infested with lichen and mossy growth is to spray them with a caustic solution while they are leafless and before the buds commence to swell in spring. The mixture is made by using ½lb. of sulphate of iron, ¼lb. lime, 2lb. caustic soda, 5 pints paraffin, and water to make up 10 gallons of mixture. Dissolve the iron sulphate in about eight gallons of water, then add the lime, previously slaking it, making it into milk, and straining. When these have been mixed, add the paraffin and churn well, and finally add the caustic soda. The paraffin is useful in killing any scale insects there may be on the trees, and the sulphate of iron serves to emulsify the paraffin. This is one of the Woburn washes, and has been proved to be an excellent and safe mixture.

CHOICE DELPHINIUMS.—D. P. L., Leicester: Take advantage of the first opportunity that serves to lift and pot up the choice varieties of delphiniums, and plunge these in ashes in a cold frame, where, given plenty of air on all favourable occasions, they will keep safe through the winter. In early spring, when growth commences, part up the roots, and pot each portion that can be separated with some roots attached. Keep these a little closer for a while, then ventilate freely again, and put out the plants where they are to grow and flower, in April or May.

ANCHUSA ITALICA.—T. J. C., Tavistock: The finer varieties of Anchusa italica may be readily multiplied by means of root cuttings. The latter may be made now, and should be prepared like seakale thongs, only in shorter pieces. Roots may be lifted at once, potted up, and placed in a cold frame. Great care must be taken to keep slugs and snails away from the stock when growth starts.

BEST VARIETY OF CHRYSANTHEMUM MAXIMUM.—A. W., Alnwick: There are several very fine varieties of Chrysanthemum maximum offered by hardy plant specialists, but which is the very best is somewhat a matter of personal taste. The variety King Edward VII. is a very useful one, and we do not know another that combines so many good points. It grows very freely, and blooms profusely over a long season.

HARDY PERENNIALS.—A. E. N., Diss: A well-arranged, freely illustrated, and useful book on the subject is "Easily Grown Hardy Perennials." This may be obtained post free for 5s. 6d. from Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.

HOLLYHOCKS FROM SEED.—G. P., Reading: There are at least two methods of raising hollyhocks from seeds, and one is to sow the seeds as soon as ripe in pots or pans, and place these in a cold frame, or to sow the seeds in gentle heat in early March, prick out and harden off the seedlings, and plant them out as soon as large enough to care for themselves.

ORANGE-BUFF SWEET PEAS.—F. T. E., Chester: Sweet peas of somewhat similar colour to Henry Eckford are Earl Spencer and Nancy Perkin, but these are both waved varieties, and are very similar. Whether they are to be distributed this season or not we cannot say. They are not listed in any catalogues we have received. Of more bril-

The G. J. Eveson Coal & Coke Co., Ltd., Birmingham.

liant colouring than either is Orange King, a variety raised by Messrs. Bide and Son, of Farnham, but as seen in the Reading trials this year, it was not fixed. We believe it will not be sent out this season, but it certainly is a variety to be obtained as soon as possible.

MUSCAT GRAPES.—B. L. W., Maidenhead: Fire heat must certainly be used in the vinery where Muscat grapes are hanging, both for finishing up the bunches and ripening the wood. At the same time the ventilators should be freely used on all favourable occasions, leaving a little top ventilation on at night, but closing the front ventilators, because, in a low-lying district like yours a great deal of damp would enter the house through them. A minimum night temperature of 50 degrees should be maintained.

NAMES OF PLANTS.

R. T., Boston.—1, Calceolaria Burbidgei; 2, Fuchsia triphylla.

M. R. E., Redcar.—1, Pyrus Aria; 2, Abies Douglasi; 3, Euonymus radicans.

O. F. J., Weston-super-Mare.—1, Helenium pumilum; 2, H. striatum; 3, Helianthus decapetalus; 4, Aster vimineus; 5, A. puniceus.

G. B., Chichester.—1, Cypripedium Spicerianum; 2, C. œnanthum superbum; 3, Dendrobium Phalænopsis; 4, D. formosum giganteum; 5, Oncidium varicosum.

NAMES OF FRUITS.

J. J., Devonport.—1, Beurre Superfin; 2, Beurre Diel.

E. C., Wellingborough.—1, Smart's Prince Arthur; 2, Hollandbury.

F. H. C., Oswestry.—1, King of the Pippins; 2, Court of Wick; 3, Beurre Rance.

T. P., Chelmsford.—1, Ribston Pippin; 2, Mère de Ménage; 3, King of Tomkin's County.

M. C., Huntingdon.—1, Margil; 2, Blenheim Pippin; 3, Chelmsford Wonder; 4, Claygate Pearmain.

H. T. J., Hitchin.—1, Alfriston; 2, Bramley's Seedling; 3, Worcester Pearmain; 4, Lane's Prince Albert.

TRADE NOTES.

We understand that the partnership hitherto existing between William Bull and Edward Bull, trading as William Bull and Sons, new plant, orchid, seed, and bulb merchants, at King's Road, Chelsea, has been dissolved by mutual consent, owing to the ill-health of Mr. William Bull, and the business will in future be carried on by Mr. Edward Bull, solely, under the same name as heretofore.

We are informed that, owing to the partnership lately existing between Mr. C. D. McKay and Mr. Alfred Watkins having expired, Mr. McKay has transferred his energies to Messrs. Cooper, Taber, and Co., Lim., and become a shareholder in that company.

Secretaries of Horticultural Societies are reminded that the "Gardening Year Book" is in an advanced stage of preparation, and that it is important they should return the forms sent to them some time since with as little delay as possible. The directory of "Horticultural and Botanical Societies," which forms so useful a part of the work, is annually subjected to a thorough revision to ensure it being thoroughly trustworthy, and societies from whom no information has been received are consequently omitted. We shall be glad to receive notification of the formation of new societies, and the names of officers. These, as in the case of the forms, should be at once sent to the Editor of "Gardening Year Book," 148 and 149, Aldersgate Street, E.C.

TWO GOOD BOOKS FOR THE SEASON.

"The great value of this book, its artistic charms apart, lies in the minute particulars simply set forth, of the various methods of cultivation, propagation." —*Yorkshire Post.*

EASILY-GROWN HARDY PERENNIALS.

By G. H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

Price **5/-** net; Post Free, packed in box, **5/6**

Some Features of the Work :—

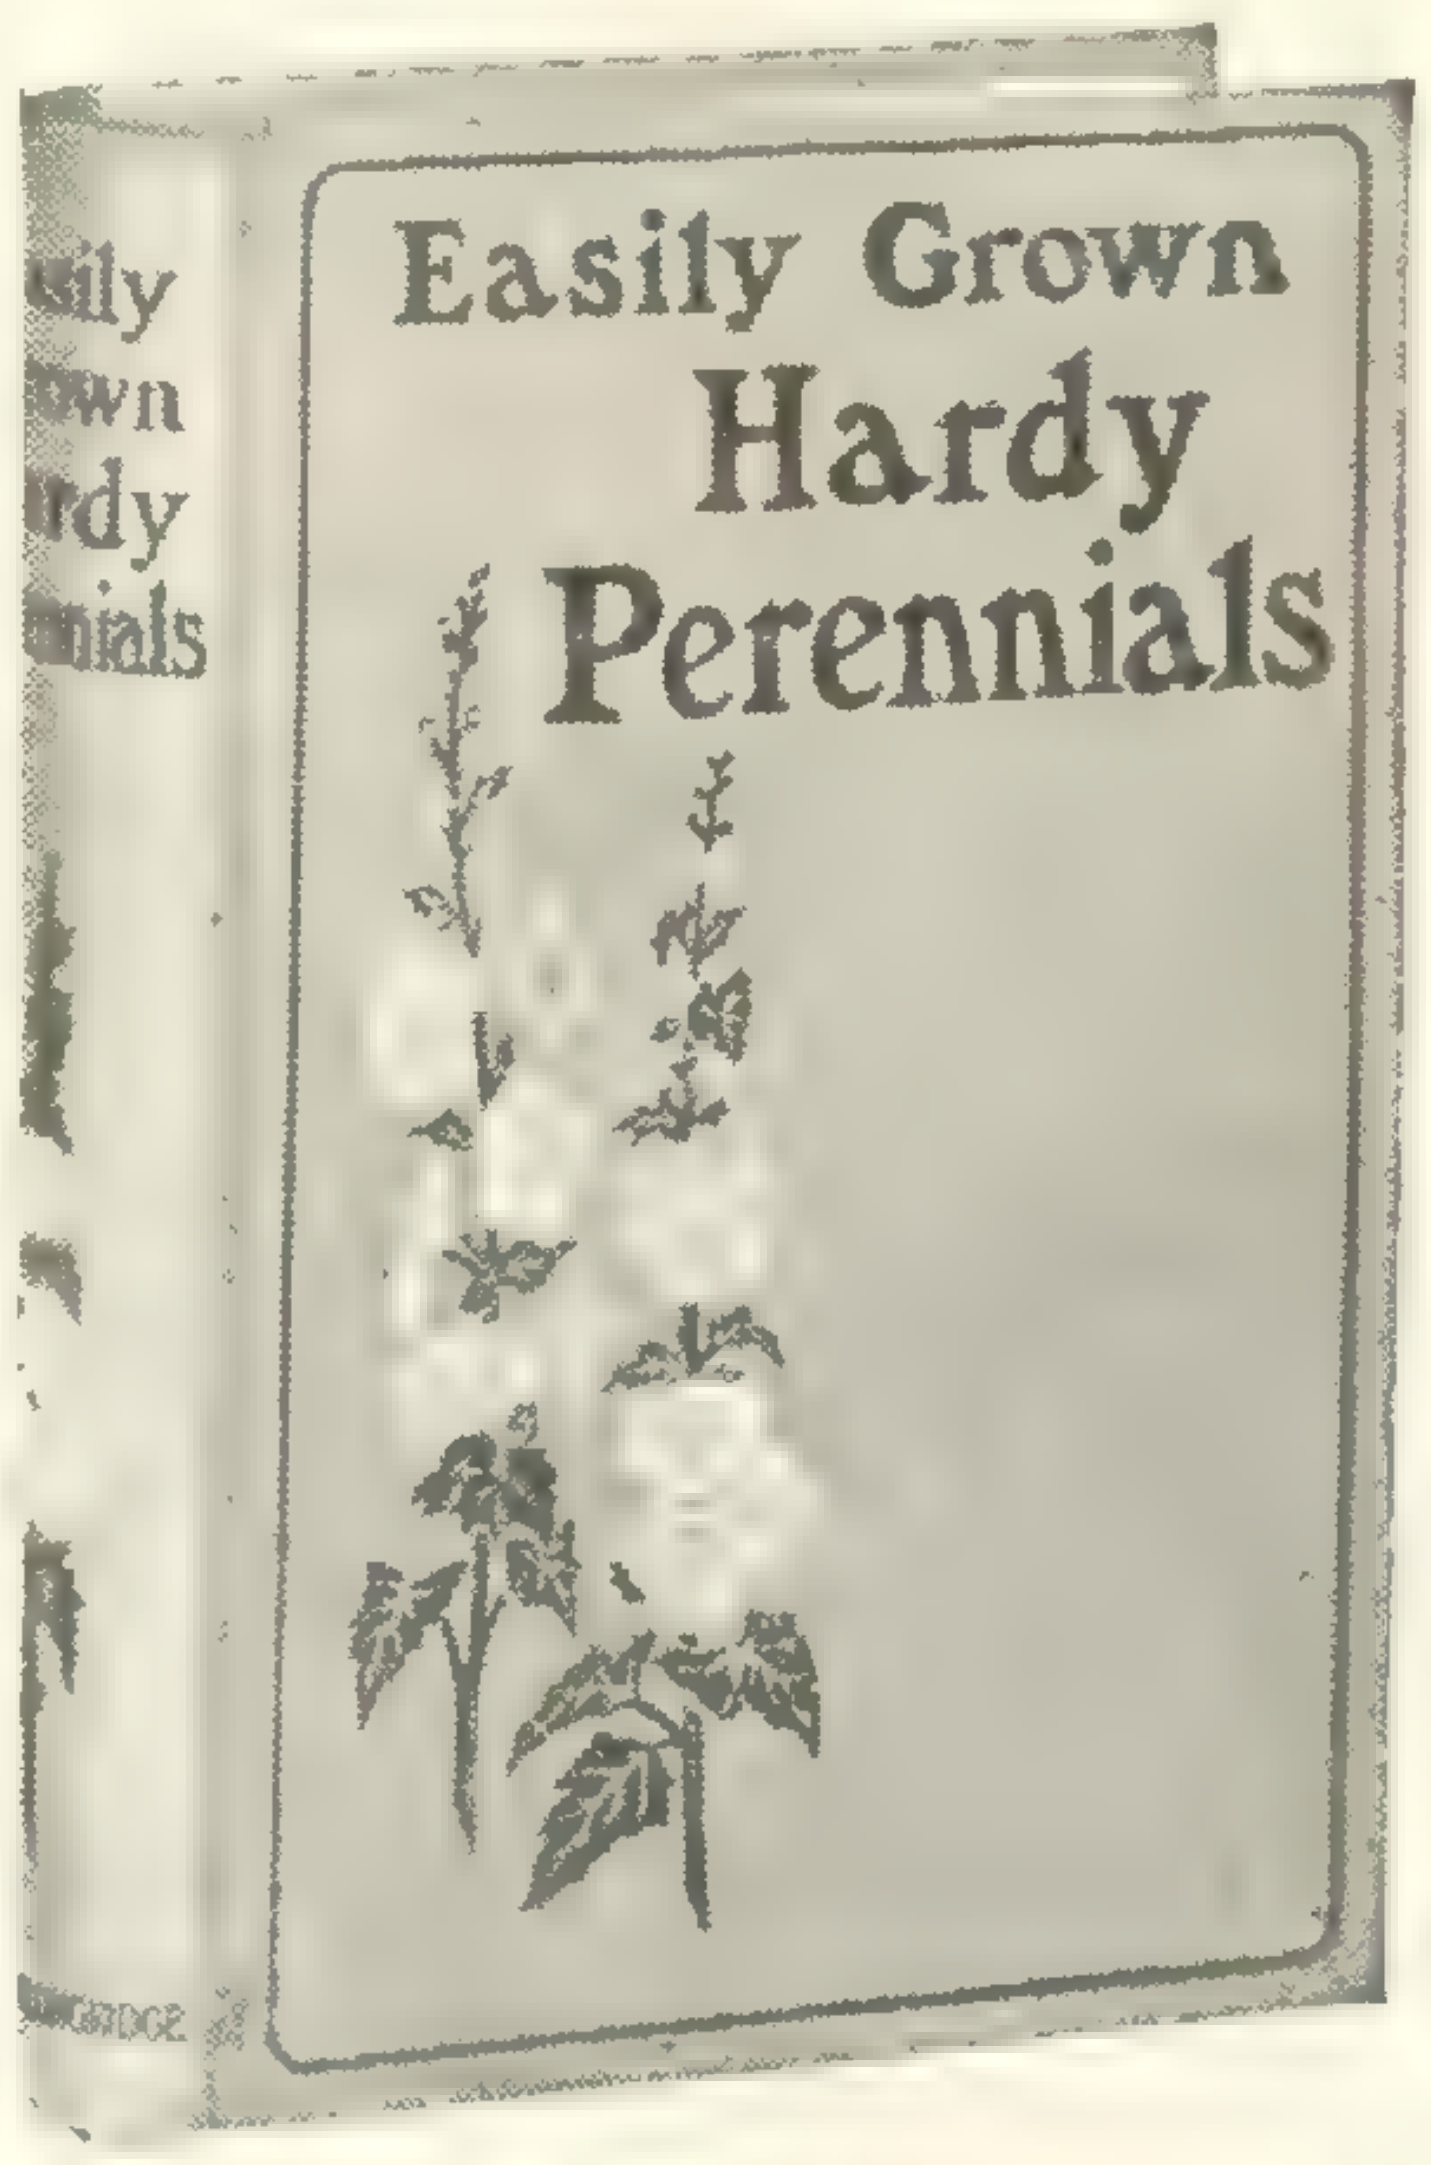
Soil and Position.—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

Planting.—The best time and method of planting are also clearly set forth.

Pests.—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

Propagation.—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

Illustrations.—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



Botanical Name.— Gives the botanical or generic name of each genus of plants described in the book.

Common or Popular Names.—Supplies the common or popular English names of all the plants described.

Natural Order.—The botanical family to which kind belongs.

Habit and Uses.—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

Species and Varieties.—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

476 PAGES, AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.

"The cultural details are very valuable."—*Gardeners' Chronicle.*

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

GARDENER seeks SITUATION, Single-handed, or Second; 11 years' experience; good references; age 25; single. A. RANDALL, 40, Victoria Place, East Street, Epsom

GENTLEMAN wishes to highly recommend his GARDENER; good all-round hand, Single-handed or with help, Inside and Out; understands Cows; leaving through giving up estate; age 35; married. MONK, Dabbs Hill, South Harrow.

GARDENER, single, requires SITUATION, kitchen garden or pleasure grounds; 12 years' experience; abstainer; good references; age 30. H. DAVIES, Victoria Nurseries, The Downs, Luton, Beds.

GARDENER (Second, or Single-handed, or with help); age 27; life experience in all branches Inside and Out; highest references from good places; disengaged. H. LYTH, Betley, Crewe.

GARDENER (Second, Inside and Out) seeks SITUATION; 10 years good experience; 7 years in present place; good references. T. JARRATT, Waverley Road, Weybridge, Surrey.

GARDENER (42) seeks SITUATION, with one under, or good single-handed with help; life experience with Fruit, Flowers, Kitchen Garden; 19 years present place; leaving no fault; good references; married when suited. COVENTRY, Reading Road, Pangbourne, Berks.

GARDENER, age 28, requires SITUATION in Kitchen Garden or Pleasure Grounds; single handed; well experienced; abstainer; good references. REESTON, care of Garner, Stratford Road, Hockley Heath, Warwickshire.

GARDENER, good all-round, Inside and Out; 6 years' good character; leaving through death. F. COSSINS, Placewood, Sutton Valence, Maidstone.

FOREMAN, age 27, disengaged; 11 years' experience in good places; good references from same.—X. Y. Z., 37, Stamford Road, Fulham, S.W.

JOURNEYMAN (Inside), under Foreman; experience in Plant Houses, etc.; 4½ years last place; excellent reference; age 20; Bothy preferred. Apply BEATRIP, Blendon Cottage, Bexley, Kent.

YOUNG MAN, age 24, requires SITUATION as UNDER GARDENER; 8 years' experience, Inside and Out; good references. A. BISHOP, 164, Bollo Bridge Road, Acton, W.

GARDENER (Under) wants SITUATION Inside and Out; age 18; strong and active; three years' experience; good references. F. COOLING, Fulbeck, Grantham, Lincolnshire.

UNDER-GARDENER, or GROOM, or COACHMAN; AUGUSTUS F. KIRCHER, age 25; good references, and previous experience both in garden and stables. Capt. S. G. Reid, The Elms, Yalding, Kent.

A. H. DICKS, Parkhurst, Great Barr, wishes to recommend J. MARSH for General Work; 4½ years' experience; age 21. 65, Emery Street, Walsall.

GARDEN LABOURER wants SITUATION; married, no family; good experience of outside work, both kitchen garden and pleasure grounds; good scythe and spade hand; good reference. LING, Epperstone Road, Lowdham, Notts.

GARDENER recommends strong YOUNG MAN as General, Inside and Out; bothy preferred; 2½ years present place; age 20. J. KEITH, Gladstone Cots., Lower Road, Sunninghill.

HANDYMAN seeks SITUATION on Gentleman's Estate; good carpenter and joiner; own tools; abstainer; age 26. W. BARRIER, 17, Lennard Road, Penge.

SITUATION required, Kitchen Garden or Pleasure Grounds; used to horse machine and scythe, etc.; 12 years' experience; abstainer; single; age 31; good ref. H. DAVIS, Victoria Nurseries, The Downs, Luton, Beds.

SITUATION required, pleasure grounds or otherwise; used to horse machine, scythe, etc.; married; age 27; 10 years' experience; good refs. E. HUMPHREY, The Gardens, Upper Gatton Park, Merstham, Surrey.

YOUNG MAN, married, no children, seeks SITUATION as PAINTER, GLAZIER, and GARDENER on Estate; good references. RUST, 13, Charnwood Terrace, Bernard Street, Carrington, Notts.

YOUNG MAN (18) seeks SITUATION in gentleman's garden; 3 years in present situation; highly recommended. C. COLESHILL, 3, Wolsey Road, Hampton Hill.

YOUTH, 17, strong, desires situation on small farm, garden, or holding; no previous experience; live in; nominal wages to start. C. L., 24, Reynolds Road, Peckham Rye, S.E.

Situations Vacant.

WANTED at once, a strong, active, willing YOUNG MAN, one used to Lawns and Kitchen Garden; abstainer; wages £1 2s. per week. C. FLOYD, The Lodge, Ynyspeullwch, Clydach-on-Tawe, Glam.

WANTED, a good, all-round MAN to Grow Plants for Market. State wages required and reference, G. JACOB, Witney, Oxon.

WANTED, a HANDY MAN to look after Horse, and fill up time Inside and Out in the nursery; one used to the work preferred. State wages and last situation. JACOB, Witney, Oxon.

SITUATION COUPON

To the Advertisement Manager of "The Gardeners' Magazine,"

THE

SMALL HOLDER'S GUIDE.

A COMPLETE ILLUSTRATED GUIDE TO THE SUBJECT OF SMALL HOLDINGS AND THEIR SUCCESSFUL MANAGEMENT.

Edited by T. W. SANDERS, F.L.S., Editor of "Farm and Garden."

PROSPECTS FOR SMALL HOLDINGS.—Definition of a Small Holding—Degree of Success to be Expected—Who May Succeed?

LAND FOR SMALL HOLDINGS.—Adaptation to Circumstances—Importance of a Market—Size of Holdings—Capital Required.

PASTORAL HOLDINGS.—Entire Living on Grass Holdings—To Supplement Wages—Improvement of Grass Land.

MARKET GARDENING HOLDINGS.—Successful Holdings—Importance of Spade Work—Intensive Culture—Culture under Glass.

MIXED FARM HOLDINGS.—Why Ordinary Farming is Unsuitable—General Advice.

DAIRYING ON SMALL HOLDINGS.—The Most Paying Branch—The Cows, and the Number to Keep.

PIGS, CALVES, SHEEP, AND HORSES.—An Example of Success—The Breed of Pigs to Keep—Rearing Calves—What to make of the Calves—Suitable Sheep and Horses.

FRUIT GROWING.—How to Proceed—Planting in Grass—What to Grow—Bush Fruit—Packing and Grading.

POULTRY KEEPING.—How to Make Poultry Pay—Breed and Strain—What to Aim at—Turkeys—Ducks and Geese.

BEE-KEEPING.—Up-to-date Methods—How to Start—Outlay on Appliances—The Returns to be Expected.

GOATS.—Why Goats should be Kept—Value of the Milk—Hints on Starting.

RABBIT KEEPING.—The Best Breed—How to Start—Housing and Feeding.

FRENCH GARDENING.—What is French Gardening?—Can it be done in England?—Large Capital Required—What the Small Holder can do.

SIDE LINES FOR SMALL HOLDERS.—Carting—Higgling—Hay Cutting—Basket Making, etc.

CO-OPERATION FOR SMALL HOLDERS.—Co-operation Purchase—Co-operation Distribution—How to Start a Co-operative Society.

HOW TO GET A SMALL HOLDING.—How to Apply for Land—Qualification of Applicants—Acquisition of Land—Purchase of Holdings.

NOTES OF THE WEEK.

Dressed Flowers.

At a recent meeting of the Royal Horticultural Society's Floral Committee the question of the propriety of dressing flowers, that is, of manipulating their petals so as, in the grower's opinion, to display them to the best advantage, came prominently to the fore. The unanimous opinion was in favour of disqualification for awards of such blooms, and a resolution was formulated and passed without a dissentient that the practice should involve such disqualification in the future. As a practical result, a certain number of exhibits, more or less meritorious in other respects, were passed over, and we certainly think justifiably, since flowers should be judged by their natural form and not by the results of purely artificial treatment. The verdict is the more justifiable since a First Class Certificate or an Award of Merit from the society stamps the plant concerned as worthy of popular culture, and it is clear that considerable disappointment to the purchaser, on the strength of that award, is likely to result if he grows the plant naturally, only to find, perhaps, that the chief charm of its flower is due to manipulation and correction of possible faults. A rose, for instance, in the bud, may promise exceedingly well, but as it develops, the outer petals lose their colour before the inner ones are perfect. To choose such a half-opened flower and open it out by hand to represent a mature bloom is therefore misleading, since naturally no such perfect bloom would appear upon the plant. In point of fact, every flower should be passed over which is not presented for the judges' opinion upon purely natural and spontaneous lines. Much has been done in this direction, but not enough. Chrysanthemums still come forward whose huge blooms are supported beneath by wire rings, which, in some cases, transform a loose, pendulous mass of petals into a compact and more handsome one, which the amateur, unacquainted with such dodges, would never obtain. Carnations, whose calyces are addicted to splitting, the petals thus losing their symmetrical arrangement, are cunningly aided by rubber rings, and so on. In the dahlia, too, the cactus section especially, the flowers are exhibited in deftly arranged groups, with wired stalks, that alter the habit of the flower, which in this case, as is well known, is only too apt to modestly hide its blushes, of whatever hue those blushes may happen to be, under the foliage, so that the effect in the garden is terribly handicapped thereby. The Royal Horticultural Society, happily, is doing much to remedy these misleading factors by insisting upon trials in the open at Wisley, but there are many other and minor societies who would do well to make rules, to ensure, as far as possible, that their prizes and recommendations are based upon genuine merit and not such fictitious merit as is involved in dressed flowers and artificial supports. Our floral wealth nowadays is so great that we can afford to be dainty, and it is so abundantly proved that the selective cultivator can eliminate faults by careful selection, that it is wise to discourage those who, instead of doing this, endeavour to steal a march upon the public by leaving the faults alone and covering them by artifice. That this cannot be done with impunity affords an additional proof of the value of experienced committees, who, by virtue of their experience, recognise at a glance that an ostensibly perfect bloom is inherently defective, and owes its chief charm to manipulation or adventitious aids. That for the purposes of public exhibition supports of various kinds may be mechanically essential must be granted, but these should certainly be eliminated when it is a question of judging the flowers purely per se.

MR. WILLIAM FYFE.

Mr. William Fyfe, whose portrait is given herewith, has accomplished such splendid work in the course of his active career as to obtain a foremost position in the front rank of practical horticulturists, and to be recognised as one of the leading authorities on matters that belong to the garden. Some seventeen or eighteen years have elapsed since Mr. Fyfe was appointed by the late Lord Wantage to the charge of the gardens of Lockinge Park, and during this period he has, by means of his cultural skill and great administrative ability, very materially enhanced the reputation they have for so long enjoyed. In mentioning this, it is interesting to recall the fact that he had occupied a prominent position in the Lockinge Park gardens before he assumed charge of them; for, previous to his making a name for himself at Ditton and doing excellent work at Overstone Park, he was general foreman. During the period he was engaged in the duties of that position the Lockinge Park melon, which has enjoyed a high degree of popularity extending over a quite exceptional period was raised and distributed. The fact that Mr. Fyfe was appointed to the position of head of the gardening staff some years after his leaving to fill responsible positions elsewhere, is evidence that in the discharge of his duties he made a very favourable impression upon his employers during the first period of his being in the gardens of this historic Berkshire estate. During the time Mr. Fyfe has been in charge of the gardening establishment the whole of the departments have been so well maintained that it would be difficult to mention one that might be referred to as of exceptional excellence in comparison with the others. For many years Mr. Fyfe was a remarkably successful exhibitor of vegetables, and was a formidable competitor in many a hard-fought contest for the premier position in the great classes for them. We need not recapitulate Mr. Fyfe's successes as an exhibitor of vegetables, but it may be said that by the manner in which he staged his collections he did much to bring about a great and salutary reform in the method of presenting the products of the kitchen garden to public notice. Mr. Fyfe has been not less successful as a cultivator and exhibitor of fruits than of vegetables, and throughout the occupancy of his present position the vineries at Lockinge Park have been regarded by practical horticulturists as one of the great attractions of the gardens. As a plantsman Mr. Fyfe has achieved high distinction, and as a cultivator of Fortune's Yellow rose he has not, so far as we are aware, an equal. For a very considerable period Mr. Fyfe has been a member of the Royal Horticultural Society's Fruit Committee, and was a member of the committee that organised the dinner of gardeners on the occasion of the vegetable exhibition and conference at the Chiswick Gardens just prior to their being given up by the Royal Horticultural Society.

Mr. J. W. Gallagher, who was appointed mycologist to the Agricultural Department of the Federated Malay States in 1907, has, we learn from the "Kew Bulletin," been appointed director of the department, in succession to Mr. J. B. Carruthers, who has recently been transferred to Trinidad.

Modifications of Colours in Plants.—Professor H. Kraemer, in reviewing the work that has been accomplished in the control of colour in plants, referred to the factors which influence the colour in flowers and gave the results of his own experiments, which were begun in the autumn of 1904, and have been continued up to the present time. Various soils were experimented with, including an artificial soil, and sand to which a special nutrient was added. The chemicals used to modify the colour principles were supplied to the plants in the form of solutions of varying strength, or added to the soil in the solid form, solution gradually taking place. Probably the most striking result obtained by the use of chemicals was the production of a red colour in the petals of the white rose, Kaiserin Victoria. The red occurred in the basal portion of the petals, and was produced in the flowers of plants which were supplied with potassium hydrate, potassium carbonate, calcium hydrate, and lead acetate. Blue flowers were produced by the red-flowering form hydrangea (H. Otaksa), growing in both sand and garden soil, when supplied with potassium and aluminium sulphate, aluminium sulphate, and calcium hydrate.

The National Chrysanthemum Society will hold its annual exhibition at the Crystal Palace, Sydenham, during the ensuing week, and the opening day will be on Wednesday, November 3. As chrysanthemums are opening well, and give promise of being of high quality, the exhibition should be one of the finest November shows the society has held for some years past.

Presentation of Fruit to the Lord Mayor.—On the 20th inst. the customary presentation of fruit to the Lord Mayor was made by the Fruiterers' Company. In asking the Lord Mayor to accept the fruit the Master, Dr. Orwin, said the function indicated a friendly settlement of a long-standing dispute between the officers of the Corporation and those connected with the Fruiterers' Company. Subsequently the Master, Wardens, and Court of the Fruiterers' Company were entertained at dinner by the Lord Mayor and Lady Mayoress.

Secretaries of Horticultural Societies are reminded that the "Gardening Year Book" is in an advanced stage of preparation, and that it is important they should return the forms sent to them some time since with as little delay as possible. The directory of "Horticultural and Botanical Societies," which forms so useful a part of the work, is annually subjected to a thorough revision to ensure it being thoroughly trustworthy, and societies from whom no information has been received are consequently omitted. We shall be glad to receive notification of the formation of new societies, and the names of officers. These, as in the case of the forms, should be at once sent to the Editor of "Gardening Year Book," 148 and 149, Aldersgate Street, E.C.

Young Gardeners' Essays.—In view of the discussion at the recent conference of Gardeners' Mutual Improvement Associations, on the desirability of encouraging young gardeners to take an active part in the work of these organisations, the reading of papers by young members of the Croydon Gardeners' Association is of much interest. In the preparation of their programme for the current session the committee of this association invited the younger members to send in essays on horticultural topics, to be read at the meeting held on October 19. Mr. P. Rintoul, of the Falkland Park Gardens, and Mr. E. Strudwick responded thereto. The first-named selected for the subject of his essay "Perpetual Flowering or Tree Carnations," and the latter "Begonia Gloire de Lorraine." Both essays were well written, and the advice they contained was such as to show that the writers were well acquainted with the cultural requirements of the respective subjects. Many societies annually give awards for essays written by the younger members, and it would probably be well were the number of societies who do so greatly augmented.

The Crystal Palace Company.—In a communication having reference to the forthcoming exhibition of the National Chrysanthemum Society, Mr. E. T. Husey, the receiver, writes: "I have read paragraphs and letters in many newspapers regarding the winding-up order made by Mr. Justice Swinfen Eady, and I should be obliged if you would allow me to inform the public by means of this letter that the order only refers to the Crystal Palace Company, and does not affect the Crystal Palace itself, or me, its receiver. I should like, further, to state that it is intended that the business of the Palace will go on as before; in fact, I am at this moment in negotiation with influential people, with the object of holding at the Palace next year a function of world-wide interest."

Ancient British Oak Stake.—To the many examples of oak of historical interest already contained in the museums in the Royal Gardens, Kew, has been added one other of local interest, through the generosity of Mr. Montagu Sharp, in the form of an ancient British stake, extracted from the bed of the Thames at Brentford. This stake is described as follows by the donor in "Archæological Journal" for March, 1906: "It is part of an oak sapling, is 3ft. long and 15in. in circumference, roughly pointed at the lower end, and black as ink. There is little sign of decay, though, in the process of drying, through exposure to the air, rifts or splits down the way of grain have appeared. The remainder of the sapling, which stood in and above the water, has, of course, long ago decayed or been broken off, but the stump owes its preservation to having been buried in the bed of the river. Its upper end, which projected a couple of inches above the bed, is frayed from contact with the dredger, or keels of passing vessels, and the action of river drift. The condition of some of the other stumps is not so good, it varies very much; the cores, however, are fairly sound and hard."

Wages of Gardeners in Public Parks.—Mr. J. Weathers, F.R.H.S., secretary of the British Gardeners' Association, of which the Earl of Plymouth is the president, has sent the following letter to candidates for election on borough councils: "I am directed by the executive council of the British Gardeners' Association to ask if you will be good enough to express an opinion in favour of qualified gardeners, as represented by members of this association, receiving a minimum wage of 30s. per week, when employed by Borough Councils and other public bodies. May I draw your attention to the fact that in raising and cultivating the large numbers and varieties of plants, flowers, trees, and shrubs which beautify our parks and open spaces, and contribute so largely to the health, recreation, and education of borough and town residents, great and constant care and skill are necessary to maintain the high standard of excellence that has been achieved in public gardening. To obtain this requisite skill and cultural knowledge, gardeners have to undergo several years of practical training and study. For this reason they not unnaturally consider themselves entitled to better remuneration than the unskilled labourers who sweep the streets. May I hope that you are prepared to assist in obtaining for the gardener a just and reasonable recognition of his labours? If so, perhaps you will kindly fill up the enclosed form, and favour me with its return at your early convenience, so that it may be possible to report your answer to our members in due course."

Burpee's New Californian Seed Ranch.—So many people in the United Kingdom know something about the big wholesale seedsmen, Messrs. Atlee Burpee and Co., Philadelphia, U.S.A., and not a few have the pleasure of knowing Mr. Atlee Burpee personally, as he has on several occasions visited this country at sweet pea time. It will be, therefore, a matter of interest to all these to know that the firm has recently purchased a forty-acre farm near Lompoc, Santa Barbara, California, where they will grow some of their stock seeds, and make various experiments. Mr. Edwin Lonsdale, who has for some time had charge of the Girard College grounds at Philadelphia, will take charge of the new ranch, and his training at Girard, and his official association with the Society of American Florists and the Florists' Club of Philadelphia, eminently fit him for the work. The latter will also include the oversight of the large acreage of seed crops grown in various parts of California on contract for the Burpee Company.

NATURALISING BULBS.

No one will dispute, I think, the assertion that many species of bulbous plants present a much more artistic effect when seen growing in more or less extensive colonies in the grass, wild garden, woodland, orchard, etc., than when arranged in formal flower beds and borders.

Happily, this delightful method of plant cultivation is extending rapidly, and this is due in great measure to the example set in various parts of the country by those who are responsible for the maintenance of our public parks and gardens.

I am afraid that many amateurs are deterred from entering upon this work through writers advising the thorough preparation of the soil, the removal of the turf, the addition of manure, deep digging, followed by planting the bulbs, and the return of the turf to its original position. Those who can afford to employ a gardener simply give the order if they wish the work carried out, but, on the other hand, the prospect of so much hard work is not looked upon with favour, and the idea is frequently abandoned.

Experiments made by myself in a Surrey garden some years ago went to show that elaborate preparations are quite unnecessary. Two plots of grass land were planted with narcissi, scillas, aconites, etc. One plot was treated as prescribed above, while the other was planted in this way: Sharp pointed trowels were driven into the soil four inches deep, the turf being only partially lifted and held in position until the bulbs were inserted and it was then replaced. On the completion of the planting the horse-roller was passed over the plot, followed by a top-dressing of short stable manure. The plots were treated alike with phosphates when the bulbs were seen pushing through the grass early in the spring, and there was no appreciable difference in the results. Further, the No. 2 plot developed with equal rapidity in subsequent years.

In addition to paddocks, orchards, and woodlands, raised portions under trees in the dressed garden, grass banks, hedgerows, etc., all offer suitable sites for substantial colonies, and it is superfluous to point out that formality must be avoided in their arrangement, or that the more irregular their outline the more beautiful the effect. The grass is the proper home of the daffodil, and it is impossible to produce an incongruous effect in it, plant them where we will. Varieties that I have found to behave splendidly under these conditions are pallidus præcox, Barri conspicuus, Horsfieldi, Golden Spur, obvallaris, and princeps. The last-named is sold at a very cheap rate, and gives us a mass of bloom at a very early date. The old double and single forms cannot be ignored, and somehow they appeal to us in a different way to their modern and more aggressive brethren.

I have not been able to admire tulips in the grass or wild garden, and possibly I may be told I have a perverted taste. The charm and beauty of the crocuses is enhanced when ground of an undulating character is selected for their home. The winter aconite (Eranthus hyemalis), fritillarias, snowflakes, Milla uniflora, erythroniums, muscaris, and chionodoxas may be pressed into service. Especially desirable is the delightful Scilla siberica, which supplies us with the richest of blue carpets over many weeks in spring. Nowhere have I seen such splendid colonies as those which exist under giant trees in the Royal Gardens, Kew. With regard to snowdrops we have nothing to compare with the old forms in freedom of flowering, and they should be grown on a liberal scale in every garden. To those who do not possess woodlands and orchards, I would suggest that semi-wild spots can be created where vegetation of diverse character is allowed to grow more or less naturally.

With respect to the time to plant, it may be said that from the end of September to the middle of November is a most suitable period, and planting is a very easy and pleasant process when done immediately after heavy rains have fallen.

WALTER H. AGGETT.

NEW PLANTS, ETC.

◆

CHRYSANTHEMUMS.

Favourite.—This promises to make a very useful Japanese variety. It has broad reflexing florets that turn up a little at the tips. The colour is a very distinct and beautiful shade of old gold. No doubt this will be seen in even better form than was shown on this occasion. Commendation, N.C.S., October 25. Mr. W. J. Godfrey, Exmouth.

Shanklin Sunshine.—A large reflexing Japanese variety, with fairly broad bright yellow florets. The blooms are large, deep, and shapely. F.C.C., N.C.S., October 25. Mr. Martin Silsbury, Shanklin, Isle of Wight.

Mr. Thornton.—A charming and graceful Japanese variety, with long, drooping florets of a delicate creamy-white shade. A splendid exhibition flower of large size and much refinement. F.C.C., N.C.S., October 25; A.M., R.H.S., October 26. Mr. Henry Perkins, Henley-on-Thames.

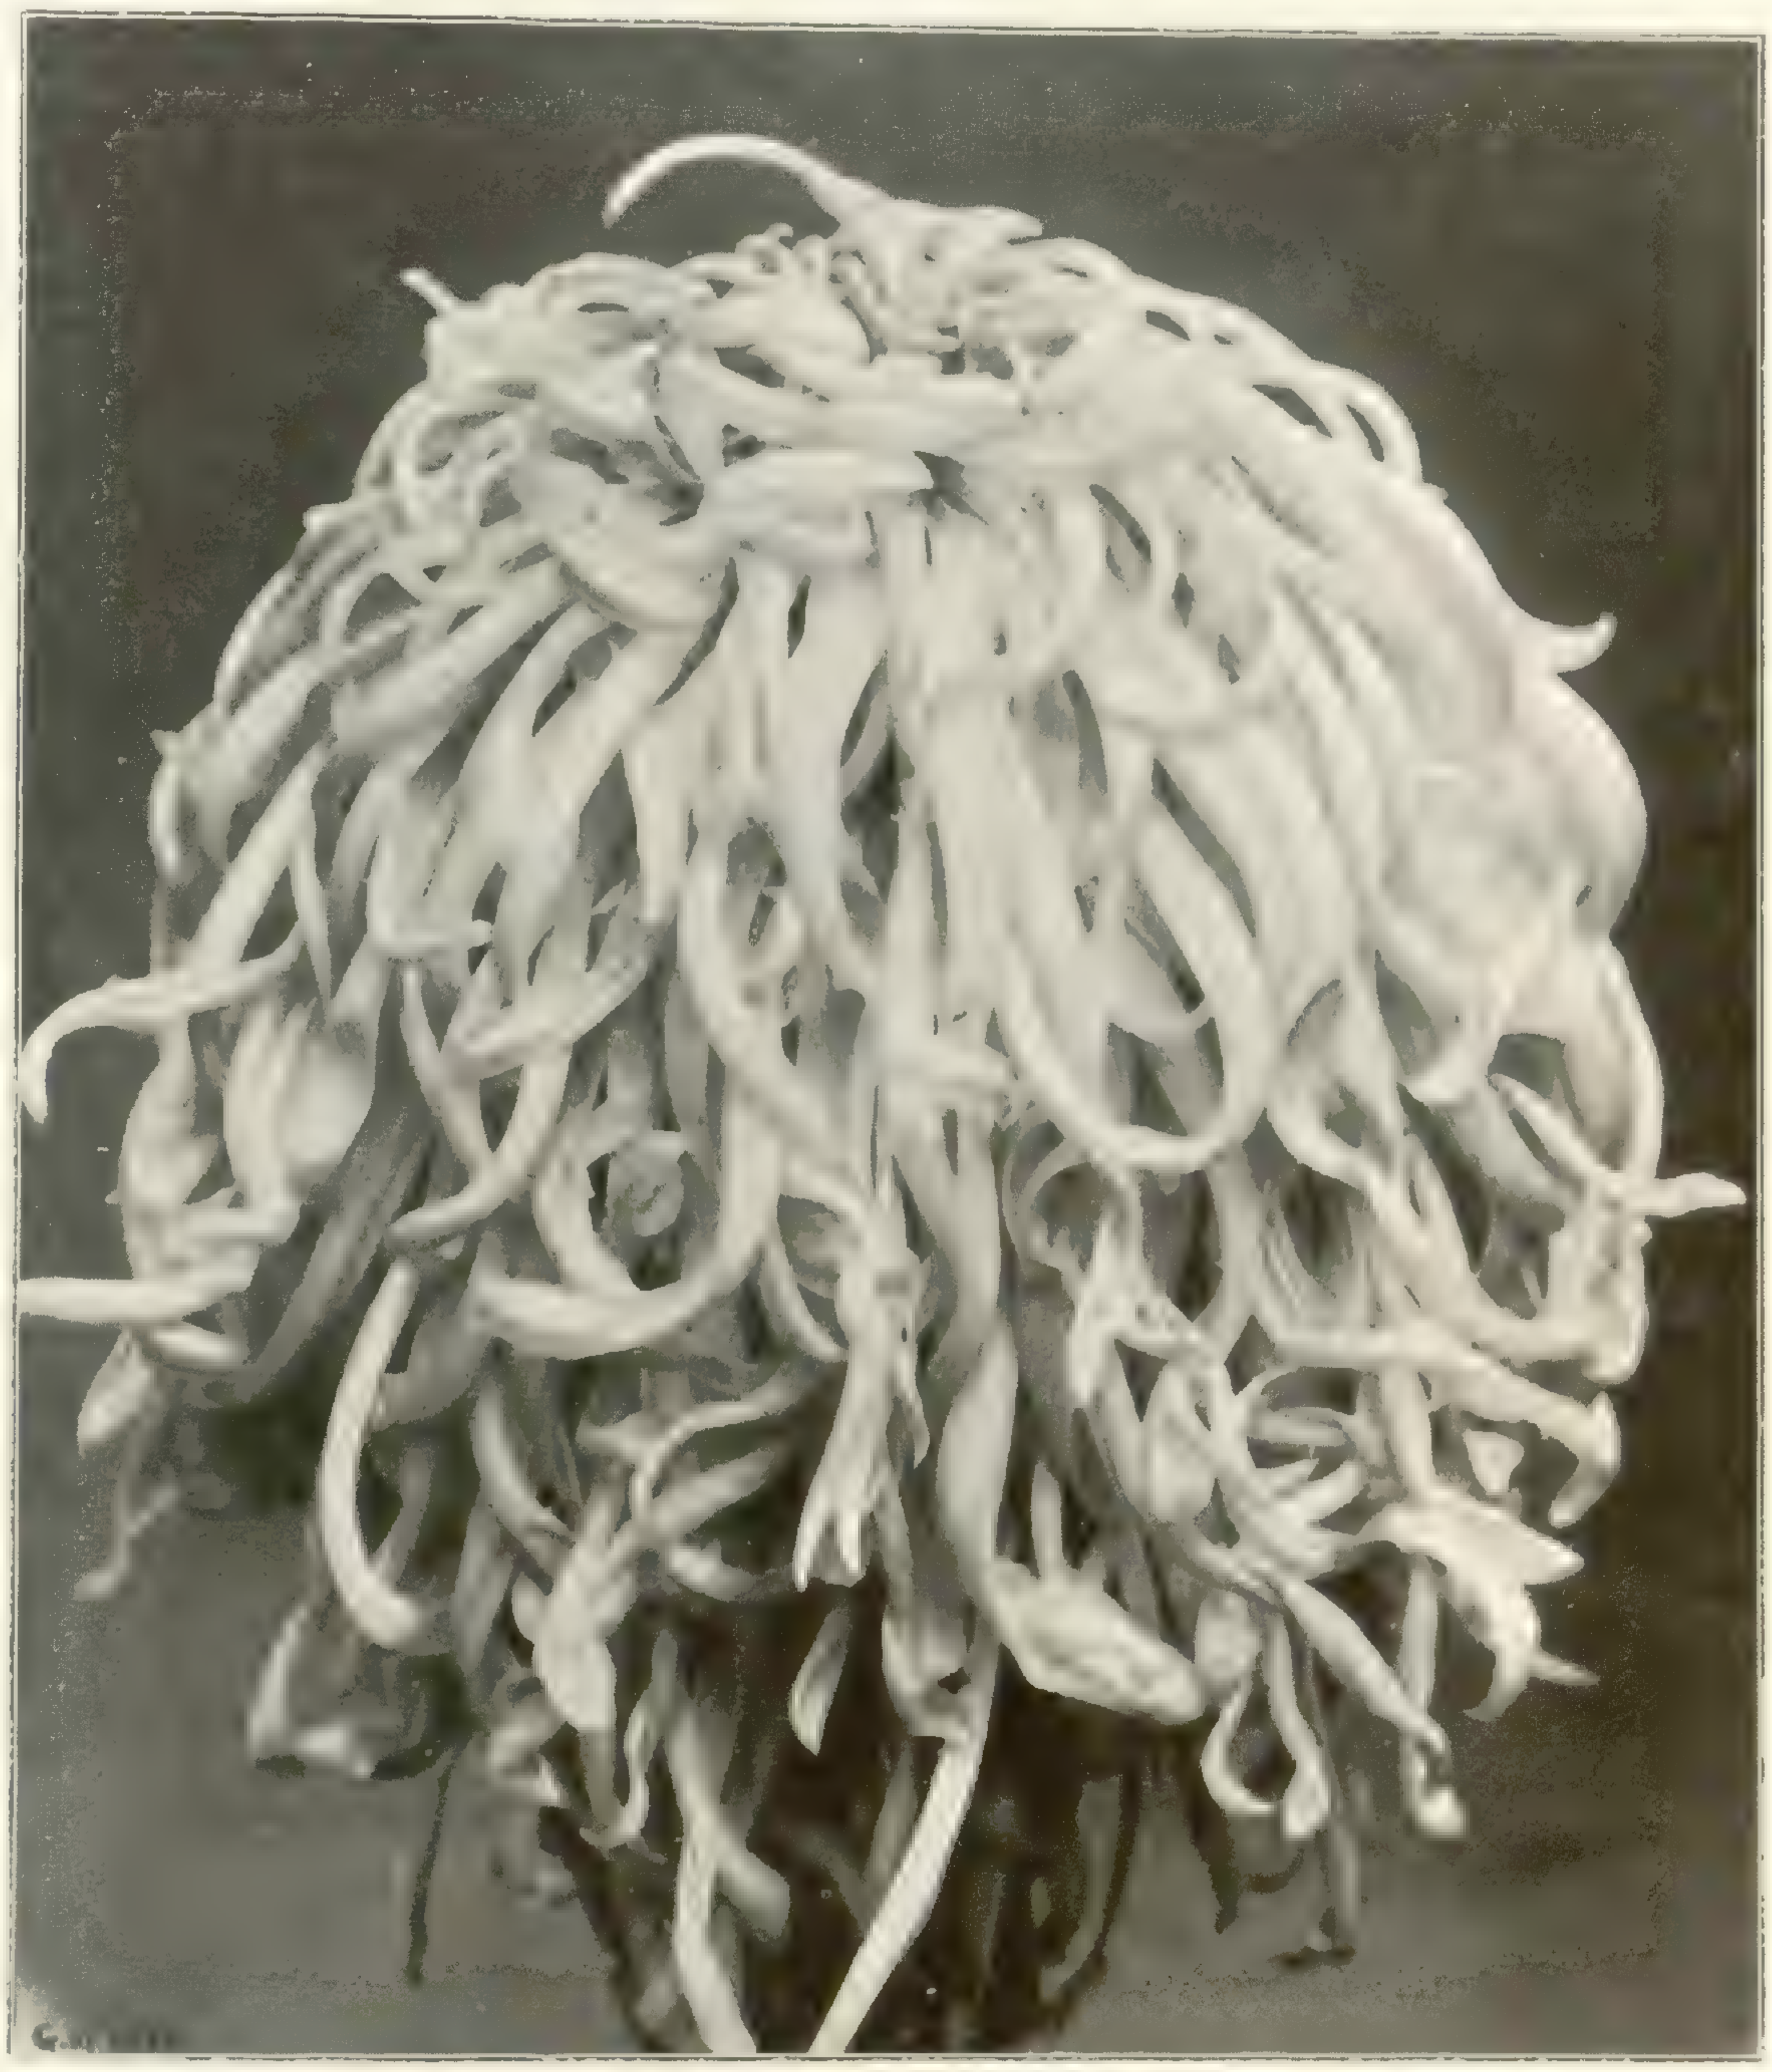
Miss Lily Hail.—A bold incurving Japanese variety with very broad petals. These are rosy on the inner surface, but the reverse, silvery-lilac colour, is the one most in evidence. A good exhibition variety. Commendation, N.C.S., October 25. Mr. Norman Davis, Framfield.

David Ingamells.—A grand reflexed Japanese variety that makes up a firm, long-keeping flower. The colour is rich golden-yellow, and the bloom, if rather short petalled, is full-sized, deep, and refined. F.C.C., N.C.S., October 25. Mr. Norman Davis.

Henry Poulton.—A long-petalled Japanese variety, with a dull bronzy-gold reverse that is, however, brighter in the case of the centre florets. The beauty of the flower lies in its rich crimson colouring, the shade being very effective. Commendation, N.C.S., October 25. Mr. Norman Davis.

Rufus.—A very large Japanese single variety, very elegant, and of great decorative value. The colour is golden-yellow, the outer half of the florets being heavily shaded with bright chestnut-red. Commendation, N.C.S., October 25. Mr. W. J. Godfrey, Exmouth.

Miss Mary Pope.—A delightful soft pink single variety, producing an abundance of extremely pretty flowers in free sprays. Both in daylight and by artificial light it is one of the prettiest of singles, and one that is sure to become a favourite with ladies and florists. F.C.C., N.C.S., October 25. Mr. W. J. Godfrey, Exmouth.



NEW JAPANESE CHRYSANTHEMUM MR. THORNTON.

A distinct variety, with finely formed cream-white flowers, raised by Mr. H. Perkins, Henley-on-Thames. F.C.C., N.C.S., October 25; A.M., R.H.S., October 26.

AGAVE WRIGHTI.

A low-growing species, with long tapering, spine-tipped leaves, and a spike, 10ft. high, of green and white flowers. Bot. Mag., t. 8,271.

THE BEST CHRYSANTHEMUMS FROM AN ÆSTHETIC POINT OF VIEW.

The following is the paper read by Mr. D. B. Crane at the Chrysanthemum Conference held by the National Chrysanthemum Society at Essex Hall.

There are certain essentials that are necessary in the chrysanthemum from a commercial point of view that are quite unnecessary when regarded from the point of view of a private grower. Mr. Percy A. Cragg has told us what these essentials are, and it is a good thing, perhaps, that we can take a broader and more comprehensive view of this excellent autumn-flowering subject when determining what should be grown in order that we may obtain the greatest pleasure and satisfaction to ourselves.

The grower must not confine his attention exclusively to the Japanese varieties, as this would be severely reducing the limit of his supplies, and would also exclude from his use many of the most beautiful chrysanthemums that are to be found in our gardens. The superabundance of good Japanese kinds begins to pall on one as the season advances, therefore the possession of a number of good things of other types provides a welcome relief.

New forms and colours in the Japanese section should always be welcomed, and even if these new sorts are not good self-coloured flowers, but represent new tones, either tinted or flushed, or overlaid, or suffused with novel shades on pleasing ground colours, they should not be discarded, but be received with pleasure, because they enable the floral artist to create some novel colour effect. The more formal incurved chrysanthemums are seldom met with in gardens, and yet their unique globular blooms should be cultivated if only for contrasting purposes. The type of incurved to which I refer are the members of the "Rundle" family. What more exquisite and refined chrysanthemums are there than these dainty little incurved blossoms? Twenty years ago these small-flowered incurved chrysanthemums were grown in most gardens, and I am at a loss to understand the reason for their exclusion from the majority of private collections to-day. Chrysanthemum specialists would promote their own well-being and add very considerably to the pleasure of private growers, were they to give us a few more such beautiful incurved varieties, equal in every respect to the "Rundle" family. From my own point of view the big, unwieldy exhibition incurved blooms have little value for the private grower.

What of the anemone-flowered chrysanthemums? These types of the "Autumn Queen" are being relegated to less conspicuous positions at most of our leading exhibitions throughout the country, and there are many chrysanthemum shows where there is not a sufficient representation of these quaint and curious decorative flowers. This is a fact to be deplored, because they are essentially decorative, and embrace in an ordinary selection grace and beauty of form of the most refined character. We are so accustomed to see the anemone-flowered kinds represented by large, disbudded blooms, that few growers are aware of the beauty of these varieties when grown in a free manner, and the sprays partially disbudded. The large-flowered anemones are most attractive, but the Japanese anemones are quite fascinating because of their curious and quaint forms. The section little heard of nowadays is the anemone-pompons. Formerly they were grown quite freely by both private growers and exhibitors, and only those who have seen a bush-like plant bearing a large number of dainty blossoms have the faintest idea how beautiful are they, especially when gathered in sprays that have been not too severely disbudded. If, as the outcome of this conference, renewed interest in the anemone-flowered chrysanthemums could be enlisted, the present proceedings would be amply justified.

Of the reflexed kinds, little that is favourable can be said. The infinite variety available in other sections has naturally ousted them from their once popular position. Except for the brilliant scarlet-crimson "Cullingfordi" or the golden-yellow "Golden Elsie" there is little that is attractive in the type.

The single-flowered chrysanthemums have come to stay, and this is quite easy to understand when we remember the charming varieties that are now available for all. I think I am safe in stating that in no section of the chrysanthemums has there been greater development than in the single-flowered section. Some years ago the N.C.S. divided the singles into two sections, viz., large-flowered, and small-flowered. Very few varieties were small enough to come within the small-flowered measurement of two inches, and, in consequence, additions to this section are very few indeed. The majority of the newer introductions measure from three to four inches across, and with blossoms of this size, either individually or in sprays, it is possible to make very beautiful floral pictures. Market growers tell me that the "eye" or disc of most of the single flowers is too large, and that you see little in them but this offensive over-large "eye." There may be some reason for this statement in regard to some of the flowers, but, generally speaking, such a charge is hardly fair to these beautiful flowers. What is necessàry, however, is that the disc should be bright, and in this way more useful for contrasting with the ray florets of the flower. There are plenty of varieties that have dull and dirty looking discs, and it is these that should be avoided and preference given to brighter-looking flowers. We can pick and choose nowadays, as there is a plethora of good things. Some growers will insist upon recognising only those flowers having flat petals, that are neatly disposed round the disc. This is the florist's ideal, and does not always coincide with the floral artist's ideas. What is the objection to flowers having fluted or grooved florets? I see none. Some of the blossoms are very dainty, and those with grooved florets particularly so. They have a quite cactus-like appearance. When gathered in beautiful sprays these flowers will make a very charming decoration.

The pompons are seldom spoken of in appreciative terms at these times. They are flowers that some growers are disposed to say are only "suitable for the little amateur." This is quite a mistaken idea, except that the "little amateur" has the advantage. A wise selection of these compact little flowers, that are invariably borne in profusion on plants with a good habit, is calculated to add very considerably to the charms of the long range of decorative chrysanthemums. What is prettier in the late autumn than the chaste and beautiful varieties Snowdrop and Primrose League? In some of the North London shows the pompons are shown as well as we have ever seen them, and they make a delightful break away from the large flowers of the Japanese and incurved sorts.

A section that is seldom referred to by writers and others is that confined to what are generally called the Spidery chrysanthemums. This includes beautiful little flowers that are also known as thread-petalled, boutonnière and æsthetic chrysanthemums. Several of these varieties bearing dainty little blossoms deserve extended culture. Their value also lies in the fact that most of them come into flower later than the majority of the mid-season kinds. For late November and December uses they have an especial value.

Essentials in the æsthetic or more beautiful chrysanthemums are the following: The plants should be free-flowering, and possess a good bushy habit and sound constitution. Preference should be given to varieties that develop their blossoms on long, erect footstalks, so that disbudding should be unnecessary. Colour should be distinct, bright, and pleasing. The blooms need not necessarily be self-coloured, as there are so many uses to which flowers of varied tones of colour can be put. Small to medium-sized blooms are to be preferred, as many of the numerous receptacles of the home could not possibly accommodate the large blooms of the market-growers. It is for this reason that the pompons, anemone-pompons, singles, and spidery chrysanthemums have a value that the larger flowers do not possess. Decorative chrysanthemums resulting from a terminal bud selection are much to be preferred. Their colour is invariably brighter and better, and the flowers seldom damp in the manner that blossoms do from a crown bud selection. In the case of plants that have to be disbudded in order to obtain the best results, it is well not to observe a too rigid system of disbudding, as much of the grace and beauty of the flowers is thereby lost.

In the foregoing remarks sufficient has been said respecting the points of merit of the smaller-flowered types of the chrysanthemum. Given ordinary good culture, there is not the slightest doubt that plants of these types will give a yield of beautiful blossoms that would come as a pleasant surprise to many. It is difficult to understand why market growers refrain from cultivating these interesting representatives of the Autumn Queen, and the only reason that can be attributed for this apparent lack of interest is that commercially they are not a success. I am confident, however, were they taken in hand in practical fashion, and the different types used in decorations at some of the leading society functions, that a taste would be created for them and a demand made for continuous or more frequent supplies as a consequence.

At this point it may be well to call attention to some of the more conspicuous examples of the better, though, perhaps, smaller-flowered decorative chrysanthemums that merit recognition.

Beginning with the early-flowering Japanese or decorative varieties, good examples of yellows are Carrie, bright yellow; Clara, deep canary yellow; and Maggie, fine rich yellow, the latter so pretty in sprays. Of white varieties there are several very chaste and beautiful, notable examples being Roi de Blancs, Doris Peto, and Mychett White. These are varied in their form and character, each having a beauty peculiarly its own. Of crimson kinds there are several good things, the better varieties being Ethel Blades, bright chestnut; Goacher's Crimson, rich crimson; Wells' Scarlet, brilliant scarlet terra-cotta; and Howard H. Crane, a good bright chestnut variety for October flowering. Flowers of bronze and terra-cotta colour are well represented by Rosie, bronzy terra-cotta; Nina Blick, bright reddish-bronze (this should be disbudded); and Mr. A. Willis, tinted red on yellow ground. Of orange shades there are many excellent sorts. Some of the better kinds are Diana, deep bronzy orange; Polly, deep orange and yellow; and Harrie, bronzy orange on gold ground. Pink varieties are very pretty, those worthy of note being Normandie, delicate pink; Provence, bright pink, tipped gold; and Merstham Pink, pearl pink, tipped gold. Rose-coloured kinds are seen in excellent form in Pride of Keston, deep rose, with silvery reverse; Mignon (Nonin), delicate rosy mauve; and Fée Parisienne, deep mauve. Claret is the best of the claret shades of colour, and is a very effective variety. Varieties representing colours other than those already mentioned, and worthy of especial mention are Fée Japonaise, creamy white, very dainty; Perle Chatillonaise, creamy white, tinted blush, and its recent sport, J. Bannister, reddish copper on lemon-yellow ground—the two last-mentioned varieties should be disbudded. Cactus, a pretty little fiery terra-cotta flower; Ethel, primrose with cerise colouring at base of florets; and Norbert Puvrez, golden salmon, very early, make a representative collection.

(To be continued.)

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read the Second Edition of CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE, by D. B. Crane, price 2s. 6d. net; or by post, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

PLUM ENEMIES.

There are two very serious enemies to which plums are subject in a particularly virulent form this year, and these have damaged and depleted the already scanty crop of plums in many quarters. I refer to the Mealy Plum Aphis (Hyalopterus pruni), which I have never known so abundant and destructive as in the present season, and to the brown rot of plums (Monilia fructigena), of which the same remark may be made, large bunches of infected fruit being frequently met with on certain varieties in many orchards, covered with their countless myriads of spores, constituting not only a serious loss in themselves, but a more serious menace to the trees and crop for another year.

[Photo: Mrs. Aubrey Le Blond.

WATER VISTA IN THE GARDEN OF VILLA D'ESTE, TIVOLI.

Mealy Aphis.

This aphis made its appearance this year during the second week in July, being a little later than usual, owing doubtless, to the wet, inclement weather. In colour the insects are pale green and covered over with a whitish meal, looking, when present in large numbers, as if the leaf had been dredged over with greenish flour. They attack the underside of the leaves of the plum trees. Generally the young and tender leaves at the tips of the shoots are the most affected, being, I suppose, more easily pierced by the mouth of the insect and probably also because they are more full of sap. The leaves are not curled by the attack as a general rule, though they seem to have been much more distorted this year than usual, so that it is comparatively easy to get a spray fluid to reach the insects.

As I mentioned, the leaves seem more curled this year, and I have searched many of such curled leaves to see if they have been rendered so by the attack of the leaf curling aphis (Aphis pruni), but have failed to find any trace of the latter, so I have been forced to the conclusion that the Mealy aphis has been the culprit.

The extremely low temperature we have been lately experiencing may be a contributory factor, however, by retarding the quick growth of the leaves, which might enable them to grow out to nearly their proper size and condition.

When once a leaf is infected, the aphides are produced at a tremendous rate by means of the viviparous females which for a time are wingless; afterwards winged ones appear, probably when the food supply on a particular leaf or shoot is becoming short, and they need to seek fresh supplies.

It is not by reason of the damage to the leaf, however, that this pest is generally serious, though that has had its evil consequences this season in the wholesale dying back of the young wood; but, because of the honey dew it exudes in large quantities, covering the lower leaves and the fruit, and forming a convenient medium for the soot fungus to render the fruit very dirty and unsightly. This not only makes the fruit look very bad, but it must have a very injurious effect on the general health of the tree where many leaves are coated with this filthy mess, as the stoma of the leaves are quite choked up, suspending the transpiratory processes which are so necessary to the well-being of the leaf and therefore of the tree.

As previously stated, it is comparatively easy to get a spray fluid to reach the aphides on the flat underside of the leaf, but considerable force must be used and great care also observed as the mealy covering of the insects seems to shed the liquid and so prevent the whole surface from being thoroughly wetted. I have repeatedly stood and watched while large quantities of wash have been thrown in an apparently efficient manner, so that one would have been positive all the leaves were thoroughly saturated, and I have been surprised at the numbers of places on the leaves which escaped the fluid. Of course, this may be partly due to the fact that one leaf, driven by the power of the jet against another, to some extent shields the latter from the effect of the spray.

Mr. Theobald mentions that it is most difficult to kill this pest with paraffin emulsion, and almost impossible with quassia and soft soap. He speaks of the addition of liver of sulphur as successful. I wanted to make quite sure of killing the aphides, and also to avoid injuring the fruit which was still on the trees, so I did not use the paraffin emulsion, but added liver of sulphur to an ordinary soft soap and quassia wash, at the rate of 4lb. per 100 gallons of wash.

This composition proved thoroughly successful, making a fine job of clearing out the pest, and not in any way injuring either fruit or leaves.

I have since been informed by a friend that he used Woburn tobacco for this infection, and was thoroughly rewarded, clearing the trees of the aphides. I did not hear the strength used, but I presume it would be that recommended for apple sucker, viz., 1lb. to 100 gallons of wash.

It is of paramount importance to attack the aphides on their first appearance before they have time to gain a stronghold in the tree, and before honeydew is deposited on the lower leaves, as no amount of spraying afterwards will clean this stuff off, either from them or from the fruit, which is therefore ruined in appearance if not in reality.

In early autumn these aphides suddenly migrate to some other host plant, entirely leaving the plum trees for that other host whatever it may be. All that is now to be seen of them on the leaves as I examined them a day or two ago (that is to say, on those trees which were not sprayed) is the skins of those which have perished by the ravages of the minute parasite which attacks them in common with most other aphides. In addition to these skins, curious black marks will often be seen on the leaves, a sign of the presence at some time of a curious slug-like larva, belonging, I believe, to one of the lace-wing flies, which has destroyed the aphides from off the leaf.

These curious little insects have been very plentiful this season, and have done an immense amount of good in clearing the aphides out of black currants as well as plums and apples. The same may be said also of the lady birds, which have been of great value owing to their great numbers, and the fact that both in the larval and in the adult state they are very voracious feeders on all kinds of aphides. Notwithstanding these natural enemies, however, the mealy aphis increases at such an enormous rate that it is not safe to leave matters to take their own course, and so spraying must be done to hold the pest at all in check.

Victorias are about the worst infected by this plague, though Czars seem to have it very badly, and Early Rivers in some plantations has been bad with us, and so to some extent has Pond's Seedling. Naturally, with a bad infestation on these varieties, most of the other sorts have now and then isolated shoots affected, but, as a general rule, nothing more. One fact has struck me very forcibly: almost all the young trees in the nursery, making vigorous growth, often four to five feet in length, have been badly attacked by this mealy aphis, and the shoots have been killed in some cases to the extent of a foot in length from the tip.

It may be many years before we again experience such a disastrous season from a climatic point of view, a season especially favouring the attacks of all pests and detrimental to the health of the tree, but if we should happen to have again a serious infestation of this mealy aphis, it is satisfactory to know that, taken in time, it is so easily disposed of in the manner I have described in this short article.

Pilgrim's Hatch. F. W. HAMMOND.

(To be continued.)

Gerbera Jamesoni.—This fine Transvaal daisy thrives remarkably well if planted at the foot of the front wall of a pit or forcing house, with a southern or south-west aspect. A row of it planted in such a position, and in fairly good soil, will, when established, surprise many with the quantity of flowers the plants produce. The flower stems will attain a height of two to three feet, and the blooms lend themselves readily to decorative purposes. The flowers have also good lasting properties in the cut state, and also on the plants, and they possess a shade of colour quite their own. The beautiful hybrids which have been shown at the various meetings of the R.H.S. promise a great future for these plants, and given such a position as described they should come into favour for cut flowers. Frequent waterings during summer, when the growth is being made, and the protection of the low walls of the pits will carry them safely through the season, and should severe weather or excessive wet prevail, the plants, when in such a position, can easily be protected.—T. H. SLADE.

GARDEN FLOWERS.

Now that the planting season is with us it is time that growers of hardy flowers, and especially those who are about to prepare new borders, should take into consideration what plants may be added to their stock during the present time.

It is almost unnecessary to speak of the flowers which are to be seen every day, or to refer to such well known subjects as the delphiniums, phloxes, helianthuses of the more common types, the pentstemons, or other popular plants, of which there are so many fine varieties. These have their values in the border, and are really indispensable. It is, however, more profitable just now to allude to others, which, while known to specialists, are not so commonly cultivated, and might be included with advantage to the average garden of the present day.

Among the flowers which are not too well known may be ranked the adonises, although A. vernalis is fairly plentiful. The fine A. amurensis, a very early bloomer, and the later A. pyrenaica, will give a variety in point of time, although yielding flowers of the same shade for spring decoration. Attention may also be called to a fine variety of Anthericum liliastrum, called A. l. giganteum, a beautiful plant fully three feet high, with large white flowers. Then the tall Artemisia lactiflora is proving a good hardy autumnal blooming plant, with its branching heads of creamy-white.

The reader's notice may also be called to the new varieties of Aster amellus, one of the finest of the hardy starworts. Quite a number of good varieties are in commerce now, and they are not enumerated for want of space, although they cannot be passed unnoticed. A. Beauty of Colwall has been noticed before in these columns, and it ought to be secured because of its double lavender flowers. Astilbe Davidi is coming to be so well known that it appears well nigh unnecessary to mention it now. Yet there are many who do not know its long reddish-purple spikes of flower. Give it a moist position, and it will surprise those who have not seen it before.

A lovely hardy calceolaria, few as yet grow, although it has been worthily praised before now, is C. Golden Glory, which is superb in the front row of the border, with its handsome golden flowers all summer and autumn.

Among campanulas there are now quite a host of good varieties of C. persicifolia, such as dumosa and Moerheimi; while, among the dwarfer members, carpatica White Star, and the miniature C. Stansfieldi are worth noting by all. Of Chrysanthemum maximum varieties there are many fine forms. King Edward VII. remains one of the finest of its class, but Gladys Mawson, another of more recent introduction, seems to surpass any of the others I have seen. Following these in alphabetical order one may refer to the noble cimicifuga, of which americana, davurica, japonica, and racemosa are charming things, with their panicles of white flowers. Corydalis nobilis, albeit not by any means new, is a plant to be remembered by those planting at this time as a front or second row plant.

Then one might say a word on behalf of the yellow Delphinium sulphureum, a distinct and pretty thing in the border, although not so imposing in its beauty as the hybrid flowers of the larkspur race. Dictamnus caucasicus, a finer thing than D. Fraxinella, is not new, but it so far surpasses the old Fraxinella that it is worthy of a reminder when we come to plant our borders.

Erigeron speciosus major, a starwort-like plant of much beauty, is another good border flower which wants still to be more known.

Then the eremuri would call for a column to themselves, and, omitting some which are very expensive, we may remind planters of E. Bungei praecox, yellow; E. Himrob, pink; E. Olgæ, white and pink; together with the noble E. Elwesianus, a variety of robustus. E. Shelfordi, coppery-yellow and bronze, and some other new ones, may also be added if funds will allow. These are all noble flowers, much easier to cultivate in the border than was at first supposed.

A very handsome hardy geranium, although a little tender in some places, is G. Traversi, with rosy flowers and a great beauty for near the front of a warm border.

A truly handsome helenium, by name Riverton Gem, should be remembered as a great improvement upon H. autumnale striatum, as it was called when introduced. It has deep coloured, distinct looking flowers. Hemerocallis Dr. Regel is a fine member of a class of plants now more than ever popular. Its fine apricot flowers in autumn give it much value.

Incarvillea grandiflora has proved so good that it will deserve notice now, although not new. The flowers, on a dwarfer plant, are much finer than those of I. Delavayi. Attention may be called to the various coloured perennial lupines now in commerce. Of all the pinks I have seen I yet prefer that called Moerheimi. But for their biennial habit the different species of meconopsis would be universally popular, but those who can ought nevertheless to secure the yellow M. integrifolia, and the better known blue one, Wallichi.

Perennial poppies of the P. orientale class are favourites, and my own preference among the pink ones is that called Jenny Mawson, which few people have as yet seen in growth. The GARDENERS' MAGAZINE has so lately described some of the new hardy primulas that it is superfluous to say much about them, save that P. Forresti and P. Littoniana promise to be real acquisitions to our garden flowers, and should be generally planted.

Of new and good saxifrages there is no end, and soon the raisers may cease naming varieties of the mossy section. Among the others S. Stribyni and S. thessalica are good species for the rock garden, but only suitable for the front of a choice border. Senecios are growing in number, but S. clivorum and the taller S. tanguticus are good things in their own way, as also is the fine S. Wilsoni.

One of the best of recent introductions among hardy flowers has been Stenanthium robustum, which gives fine plumes three feet or so high, of a beautiful white, passing off to rose. This is proving hardy well to the north, and is a charming thing indeed. Although not very new, the handsome early variety of Stokesia cyanea, called præcox, is proving a boon to admirers of the stokesia in late districts. It is fine of a truth with its handsome purple-blue flowers. Thalictrum Delavayi, which has been grown for three or four years at least, is a good meadow rue, with violet-rose flowers and maidenhair fern-like leaves.

Such are a few of the many plants which at the present time deserve the notice of the planter who is not content with the policy of keeping in the old rut, and who strives by adding something not met with every day to give his garden some features which will appeal to those who come to enjoy its beauties and its novelties.

S. ARNOTT.

GREENHOUSE CLIMBERS AT KEW.

It is now generally recognised that a good selection of suitable climbers plays a very important part in the embellishment of the greenhouse or conservatory. A fault of some climbers is that they are of exceedingly vigorous growth, so that owing to the pruning necessary to keep them within reasonable bounds in a house of limited extent they produce a large amount of foliage and comparatively few flowers.

At Kew, in No. 4 greenhouse, the selection of climbers, or rather of roof and rafter plants, is a very judicious one, so that at nearly all seasons there is an attractive display of flowers above the head of the spectator, as well as on the floor and stages of the structure. By the end of September some are, of course, past their best, but the following are all very beautiful, and, at least in some cases, they bid fair to keep up a good display for a long time yet.

The porcelain blue flowers of Cape Leadwort (Plumbago capensis) are freely borne for such a lengthened period, and their delightful colour is so much admired by everyone that it must on no account be omitted from any list of roof plants for the greenhouse, however rigid the selection may be. P. capensis alba, the white variety of the preceding, is of more recent introduction than the type, but owing to there being far more white than blue flowers in the greenhouse, it is never likely to become as popular as the older form. In growth, freedom of flowering, and all particulars except the colour of the blossoms, the white variety of Plumbago capensis is a counterpart of the typical kind.

Fuchsia General Roberts, though well suited for growing into specimens, also makes an exceptionally good roof plant, the large, bold flowers being freely produced, and as they hang suspended by particularly long stalks they are seen to very great advantage. In this the sepals are a kind of carmine red, with a purplish corolla. Fuchsia Monarch is somewhat like the preceding in habit and other particulars, but in colour the flowers are more of a self red. Fuchsia simplicicaulis is a Peruvian species of loose, rambling habit of growth, which is seen at its very best when trained to a roof. The flowers, borne in much elongated clusters, are themselves of considerable length, while their colour is reddish-carmine.

Lonicera sempervirens minor, a North American honeysuckle, when treated as a greenhouse climber, continues to bear its clusters of scarlet and yellow flowers throughout the summer and well on into the autumn. It can be readily kept within reasonable bounds. Lonicera Etrusca superba is a vigorous grower, which needs considerable space for its development. It is the strongest growing of the climbers here referred to. The flowers are yellowish.

The Abutilon Boule de Neige, concerning whose early history I can find nothing, except that it was distributed by M. Lemoine, of Nancy, in the early seventies, is bearing a great number of its white, bell-shaped blossoms, as, indeed, it has been doing for months. Abutilon Golden Fleece, as implied by the varietal name, has yellow flowers, and it therefore makes a good companion to Boule de Neige.

Time was when Bougainvillea glabra was regarded as a stove plant, but it is now recognised that it is more satisfactory in the greenhouse. In a lower temperature and well exposed to sunshine and air, the showy bracts are much richer in colour than when they develop in a warmer and more shady structure.

Tibouchina semi-deandra, also know as Lasiandra macrantha and Pleroma macrantha, is another native of Brazil, and the preceding remarks as to the cultural requirements of the bougainvilleas will apply with equal force to it. Trained to the end of the greenhouse, and thus forming a screen plant, this tibouchina is plentifully sprinkled with its large rich violet-purple blossoms. The typical form is the best for treating in this manner, for there is a dwarfer variety, known as floribunda, which flowers more freely as small plants, but is not so well adapted for training to roof or rafter.

Manettia bicolor is as prolific in names as the last, for it is also known as Manettia luteo rubra and Manettia inflata. It is an old plant in gardens, having been sent home by William Lobb in the early forties when travelling in South America for the Messrs. Veitch. For many years it was treated as a stove plant, but of late it is often given greenhouse treatment, and succeeds perfectly in this way. The small tubular flowers, vermilion-scarlet and yellow in colour, are borne for months together.

Begonia fuchsioides was first introduced from New Granada to Kew in 1847, having been sent home by the collector Purdie. It is very beautiful when secured to a tall stake or trained up a rafter in a small house. The small rich scarlet flowers are borne in drooping panicles. Altogether this begonia forms a very graceful specimen, but the present-day fancy being for large flowers, it is not met with as frequently as it was years ago.

Lantana salviæfolia is the same thing as Lantana delicatissima of parks and gardens. It is a delightful pillar and roof plant for the greenhouse, and is in this way at its very best at Kew, where it has been much admired for some years. K.

NEW WATER GARDEN AT THE VILLA GAMBERAIA, SETTIGNANO.

LAWNS.—Those who desire to make a new lawn or bowling green, or to renovate and maintain existing ones in good condition, can have no better guide than "LAWNS AND GREENS," by T. W. Sanders, price 1s. net, by post 1s. 2d.; bound in cloth 1s. 6d., by post 1s. 9d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

ITALIAN GARDENS.

The wonderful gardens of Italy are of such world-wide renown that a lecture upon them by such an authority as Mr. H. Inigo Triggs was heartily welcomed by the members and guests of the Horticultural Club at the opening dinner of the season in the Hotel Windsor on the 12th inst. Sir J. T. D. Llewelyn, the president, being unavoidably absent, Mr. E. White took the chair, and a good audience was present. Mr. Triggs, as the author of the recently issued splendid folio work, "The Art of Garden Design in Italy," in which country he has spent a long period, was naturally not only in a position to deal fully with the subject by his intimate personal knowledge, but was also able to bring the manifold beautiful features of Italian architecture, as applied to open-air gardens, home to his hearers by a series of magnificent lantern slides, reproducing some of the best illustrations in his book.

PARTERRE IN THE DUKE OF GENTI'S GARDEN, NEAR VITERBO,
With the famous fountain Il Triboli in the centre.

He started by pointing out that these gardens, many of them dating from the fifteenth and sixteenth centuries, were regarded from a very different point of view to that of the present-day garden lover, with whom the plants are the main objects of interest. The Italian gardens were designed practically as architectural extensions on ornamental and artistic lines of the design of the house itself, as was clearly seen by the plans which from time to time were thrown on the screen. In harmony with this idea, the vegetation introduced was mostly trimmed and formalised to fit, topiarian work being regarded as one of the chief functions of the gardener, while the backgrounds of foliage were often Stone pines, and cypresses of more or less rigid and stiff outline.

Free growing, clinging and rambling plants, which nowadays form so great a feature, and add so much to the beauty of our British gardens, would have hidden too much of that architecture which was made the principal feature, and it must not be forgotten that at that date most of these remained to be introduced to the horticultural world. In this particular respect the Italians have, perhaps, been wise to maintain the first principles of the great artists and architects who were called in by the Popes, cardinals, and nobles to carry out their designs, as it would seem, absolutely regardless of expense, the result being that in nearly all cases, the traveller is privileged to see these miracles of art much as they were at their completion.

The chief illustrations were derived from the renowned gardens of the Vatican, the Quirinal, and the Villa Papa Giulio at Rome, the Bobola Gardens, the Villa Campi, and Villa de Castillo, at Florence, the Isola Bella on Lago Maggiore, Villa Imperiali Sampierdarena, the Villa d'Este, Tivoli, and others, which presented the most beautiful effects of combined landscape and architectural design.

In some cases these gardens have become by foreign alliances modified, in the sense that the formal parterres have been devoted to floriculture on modern lines with charming effect. An instance of this is seen in the sixteenth century Villa Gamberaia at Settignano, a view of which is given. Here Princess Ghyka became the owner in 1895, and by her taste has formed a most beautiful combination of well-designed architecture, enhanced by the beauties of judiciously chosen flowers and foliage.

The Villa d'Este, Tivoli, erected in 1549 by Ippolito d'Este, Cardinal of Ferrara, presents a number of beautiful effects, one of which, a water vista, is herewith illustrated. As an example of the lavish way in which money and labour was expended, it may be mentioned that the water supply here was obtained by diverting part of the River Anio, while the greater part of the adjacent village was swept away to make room for the gardens. The villa itself was never completed, being only intended for a temporary summer residence. The gardens, the joint design of Pirro Legorio, Giacomo della Porta, and the famous hydraulic engineer, Orazio Olivieri, present not merely a series of enchanting views, but a number of quaint devices in the shape of a hydraulic organ, aviaries with artificially moved birds, and so on. A view is also given at the Villa Campi at Florence, designed on simpler lines, the dominating feature in these gardens being a fine avenue of tall steeple-like cypresses. The garden, as is shown in the illustration, is now much neglected, but still very beautiful. We also give an illustration from a photograph taken in the garden of the Duke of Genti, a fine specimen of the formal garden associated with artistic balustrades, temples, fountains, and statuary. The gardens of Isola Bella or the Beautiful Island on Lago Maggiore are simply exquisite, both in themselves and their surroundings, while the statuary, fountains, and architectural masterpieces combine to form innumerable pictures which must be seen to be appreciated. At Villa Gori Siena, topiary work appears in the curious form of a holly tunnel, practically an avenue of large hollies trimmed exteriorly to form a semi-cylindrical mass and interiorly to form a tunnel. Elsewhere in the gardens a raised plateau forms the platform of a theatre, the side wings and back of which are formed of high, flatly trimmed trees, set diagonally at such an angle to the spectators as to permit the actors to make their entrances and exits in the orthodox fashion.

Mr. Triggs deprecates the introduction of the Italian style here in view of the different views entertained as to what constitutes a garden proper, though the study of it is salutary when, as in Italy, it is a question of harmonising architectural adjuncts outside the house with those of the house itself. The Italian style, however, he considered, had much to recommend it in the design of large squares in towns, and would, he felt, be far better than the indifferent borders devoted to hardy perennials, many of which were unable to flourish under the conditions that usually obtain in towns. In conclusion, he pointed out that we had every reason in this country to be pleased with the innumerable lovely gardens scattered over the country, constituting an inexhaustible fund of blended sylvan and architectural charm such as no other country in the world can boast of. In Italy the gardens may be magnificent, but probably those of note do not exceed about two hundred in number all told.

Chas. T. Druery, V.M.H., F.L.S.

PARTERRE OF THE GARDEN OF VILLA CAMPI, FLORENCE.

Black Bryony (Tamus communis).—Though a native British plant—the only representative of the Yam family—that should not disqualify this handsome plant for a place in the wild garden if there is a suitable place for it to run about. Its shining heart-shaped leaves, which turn a dark purple in the autumn, while the stem is almost encased in scarlet berries, make it by no means an unattractive plant. In these days of good farming, when all hedges are kept vigorously trimmed, it is seldom seen in the country, though at one time common, especially on chalky soils.—Alger Petts.

UNCOMMON CLIMBING ROSES.

Varieties of roses possessing points of excellence are always welcome to the rose grower when they belong to that class known as uncommon, yet desirable, whether they are new or old. The following I know from experience are of much merit. Eliza Robichon (Barbier 1903) belongs to the Wichuraiana type, and is remarkable like all varieties of that section for its free and compact growth. The blooms are semi-double, freely produced, and in colour are rose, shaded yellow.

Rubin (J. C. Schmidt, 1900) belongs to the polyantha type, is free in growth, flowers abundantly, and the blooms last a long time in a fresh condition. The colour is a rich deep crimson, flushed rose, and the plant is especially neat in growth and flower formation.

Wedding Bells (Walsh, 1904), also a polyantha, is shell pink, the base of petals white. With age the blooms change to a rosy hue. Semi-double, very free, and of good growth.

The Wallflower (Paul and Son, 1901), quite one of the best of pillar roses, is soft rosy-crimson, bearing huge trusses of large blooms, very distinct and effective. Rêve d'Or (Ducher, 1869) is too much neglected. For a south wall, screen, or as a pillar, it is unsurpassed for quick growth, and gives its deep chrome-yellow blossoms in profusion.

Tea Rambler (Paul and Son, 1902).—A beautiful variety, coppery-pink, with a salmon flush, is exceptionally free flowering, the brightly coloured blooms forming wreaths of the most delightful character.

Banksiæflora has buff-yellow flowers, changing to white with age; the blooms are semi-double, produced in clusters the whole of the summer, and it has especially sweet fragrance.

Reine Olga de Wurtemberg, a showy variety, commences to flower early, and continues for a long time, in fact, right into the autumn, which is an advantage. The clusters of rosy-crimson blossoms are very attractive.

Climbing La France is so little cultivated that its merits deserve to be more widely known. The blooms are equal in point of quality to those produced by plants of the original dwarf type.

Bar le Duc (Soupert et Notting, 1907).—This polyantha variety promises to become popular. It is distinct from any climbing rose that I know, both in habit of growth and in its formation of the bunches of flowers as well as in the individual blossoms. The interior of the petals is a bright brick crimson, paling with age, yet always attractive. The medium-sized blooms are produced in rather thin clusters. The habit of growth is vigorous, and the foliage ample.

Madame Alice Garnier is a polyantha variety that was sent out in 1907, and in habit of growth, colour of its leaves, and form of flowering it much resembles the Wichuraiana type. With me it promises to make a capital pillar rose. The buds are pink with a yellowish ground, and as the flowers expand the colour is pink, suffused yellow or primrose; quite full in the centre, making a cushionlike bloom. I note some catalogues describe the flowers as small. I do not agree with this, as with me they measure three inches in diameter.

E. Molyneux.

Swanmore Park.

DARLEY DALE NURSERIES.

This notice of a famous and extensive nursery might well have been entitled "A Trip to Siberia," because the largest of the several nursery branches belonging to Messrs. James Smith and Sons, of Darley Dale, near Matlock, is called the Siberia Nursery. The name is thoroughly deserved, for the land is at an elevation of about 1,100 feet, in one of the finest parts of the beautiful Peak district. There can be no question as to the hardiness of the stock grown at Siberia and the other branches in this hilly country, and it is equally certain that wherever the stock goes it will do well under reasonable treatment.

The firm has no fewer than fourteen branches in and round Darley Dale, and Siberia, the largest, is about 100 acres in extent. There are the Home, Siberia North, Canada, Butcher's Lane, Station, Church Town, Hall Moor, Bent, Hill Top, Wheatley Roundhills, Willsitch, and Hall Dale nurseries, and the total area under nursery stock is about 250 acres. It is a very difficult matter to obtain land in the neighbourhood, and so areas of varying size have been taken as they fell vacant and the continuous advance of the business made extension necessary.

A BRAKE OF WHITE HEATHER (ERICA VAGANS ALBA MULTIFLORA) AT THE DARLEY DALE NURSERIES.

It was in 1827 that the firm of Messrs. James Smith and Sons was founded at Darley Dale, but for two generations previous to this the same family had conducted business as nurserymen at Matlock Moor and Ashover, the present proprietors' grandfather transferring the business from Ashover to Darley Dale in 1827. Mr. James Smith, who now so ably conducts the business, has abundant energy, good business ability, and a wide knowledge of the nursery trade. Formerly it was necessary to ride round on horseback to keep an oversight of the many and widespread branch nurseries, but Mr. J. Smith was quick to see the advantage of an automobile, and now the tour is made in a motor, and valuable time is saved. All the packing is done in a splendidly equipped and huge shed near the offices of the firm, and everything is done to expedite the work, which from now onwards is very heavy, both in respect of home and foreign orders.

Hardy ornamental trees and shrubs, roses, forest trees, and herbaceous plants are the subjects to be found in the Darley Dale Nurseries. There is no "inside stuff," but all possible skill and every bit of energy goes to the task of making the various stocks the finest it is possible to produce. Cleanliness is a first principle at Darley Dale. Quarters are not cleaned up because they have become weedy and untidy—they are never allowed to become dirty, and it matters little at what season you visit the nurseries you will find lads and men hoeing, if the weather serves. A visit to such a nursery is enjoyable, for the proprietor has not to be continually making excuses for the weediness of one quarter, or the unpruned and untied stocks in another.

Although all the stock is wondrously clean and healthy, and possesses a sturdy vigour not often seen, there are certain subjects in which the firm specialises, and the chief of these are hardy heaths, rhododendrons, and forest trees. If for no other purpose alone a visit to Darley Dale to see the hardy heaths would be time well spent. Half a million plants, in about fifty species and varieties are available for sale, but the cultivation of these beautiful shrubs is far more extensive than these figures imply. One of the "side lines" of the firm is the sale of white heather, and it is an open secret that a considerable portion of the tons of bloom that are despatched each year goes to Scotland, and is sold there as white Scotch heather. These heaths grow remarkably well, and several acres are filled with them in the Siberia Nursery, while smaller areas are to be found in the other branches, so that the season of bloom is greatly extended. There is a difference of from ten to fourteen days in the time of flowering between the same varieties at the Home Nurseries and at Siberia. The deep-coloured Erica mediterranea hybrida, and such fine white varieties of Erica vulgaris as alba, Hammondi, pilosa, Serlei, and tomentosa are superb as seen in great breadths in full bloom. E. vulgaris Alporti, deep crimson; the pretty golden-leaved E. v. aurea; and the very showy copper-tinted E. v. cuprea, are also fine, the two last being very effective at all seasons. At Darley Dale there are hardy heaths in bloom almost the whole year through, the spring-flowering varieties of E. carnea and E. mediterranea carrying on the season until the E. vagans varieties begin, and these, in turn, are followed by the many forms, white and coloured, of E. vulgaris, which continue to the end of October.

Rhododendrons are another special feature, and there are very many acres of them, all low bushes. One remarkable thing about the Darley Dale Nurseries is that there does not appear to be any old plants. Everything is regularly transplanted, and as the young stock becomes saleable it rarely lacks customers. The common R. ponticum, in various sizes, is grown by hundreds of thousands for covert planting, and the great seed beds and beds of tiny seedlings are of great interest. The choice named varieties of rhododendrons are well represented, the collection extending to about a hundred and fifty of the best, and the stock comprising some 300,000 plants. Such varieties as R. alba splendens, R. caucasicum album, R. Cunninghami, and R. Jacksoni are very largely grown for forcing. Of the two new pink varieties, Pink Pearl and Strategist, there are excellent stocks. Both Ghent, mollis, and pontic azaleas thrive here, and notwithstanding the comparatively sunless season, they, as well as the rhododendrons, have set their bloom buds well. All the peat-loving plants do well at Darley Dale, and besides those already referred to there are the gaultherias, menziesias, empetrums, ledums, andromedas, and kalmias in great abundance, while one part of the upland nursery is fragrant with Sweet Gale.

Many folks take special pains with and care of the choicer plants, but show a weakness in dealing with the commoner ones. Not so at Darley Dale. The privets show how careful the firm is to sustain its high reputation, for one may examine minutely the great blocks of these hedge and covert plants and find that all are excellent, shrubby from the base, and very sturdy. The same remarks apply to the Caucasian, colchican, round-leaved, large-leaved, and Portugal laurels; all are sturdy, branched from the base, and covered with intense green leaves. The growths are not long and rank, but comparatively short, stout, and close-jointed.

Coniferous trees and shrubs are grown by the million. Larch, Scots fir, Corsican, Douglas, Weymouth, and Stone pines, and Norway spruce are cultivated in bewildering numbers, and suggest that there are some folks, at any rate, who are undertaking the work of afforestation and estate planting. All kinds of forest trees are largely grown, and the great quarters of oak, chestnut, birch, ash, alder, elms, lime, maple, poplar, and sycamore are of surprising extent and quality. The stocks of ornamental trees and shrubs afford ample evidence of the great demand there now is for these beautiful subjects. Some of the most striking plants at Darley Dale are the coloured conifers, notably Cupressus Lawsoniana argentea, the silvery C. L. Darleyensis, C. L. aurea-variegata, C. L. lutea, and the very deep golden C. L. lutea Smithi, Abies excelsa lutea, A. Parryana glauca, Juniperus chinensis aurea, J. japonica aurea, Pinus Cembra aurea—raised at Darley Dale, the scarce P. sylvestris aurea, as well as the delightful gold and silver retinosporas, thuias, and yews. Numbers of these grown on the slopes of the home nursery provide a fine piece of colour in the landscape of the dale. Turning for a moment to ornamental deciduous trees, one is struck by the beauty of the golden and scarlet oaks, the golden Populus Van Geerti aurea, the home-raised fern-leaved and golden varieties of the mountain ash, the purple beeches, Cornus Spathei aurea, the coloured maples, and the various willows that have bark of striking colour. Willows, by the way, are grown largely in a boggy part of the Siberia Nursery especially for the supply of withes for packing purposes.

Of the large stocks of all the best varieties of hollies it would be an easy matter to write at length, but the euonymuses and ivies would be quarrelling for similar reference, and the berberis and box would call for detailed accounts, so it must suffice to say that these are all finely represented and in great variety.

The flowering trees and shrubs stocked at Darley Dale would provide plenty of material for an extended notice. Stoutly staked and in the highest nursery there are standards of all the loveliest of the fine flowering pears, apples, cherries, plums, and laburnums. These should thrive anywhere, for they are brought up to stand the mountain cold and the hill-top gales, and they are hardy enough to face any local conditions in this country. The guelder roses and the shrubby veronicas call for special mention, while the lilacs and the spiræas are both largely and well grown, and there are excellent collections of the best varieties. And so one might continue through the whole catalogue of trees and shrubs grown at the Darley Dale Nurseries, for it is the boast of the firm, and no idle one, that everything catalogued is grown at one or other of their branches.

The stock books are kept in remarkably strict fashion, and the proprietor is able at a glance to tell whether he has millions or only one plant of any given subject, and in which branch or branches it is to be found. This is very necessary in the case of a widespread establishment, not only for the purpose of supply, but also for the purpose of saving unnecessary running about from one place to another when a varied order has to be filled. Great care is taken in the preparation of the ground for the various kinds of plants, and in the successional cropping of the various areas. Some parts of these mountain nurseries formerly proved difficult to manage, but as the increasing demand made the use of every square yard of space imperative, the present proprietor had the soil analysed, and so found out why the land was unfit, or in what it was deficient. The remedy was applied, and now these awkward plots yield their quota of useful plants.

In conclusion, we may point out that the stock of 30,000 roses at Darley Dale is growing at an elevation of 800ft. above sea level, and that the area devoted to select varieties of hardy fruits is at a similar altitude. Finally, though the nursery is somewhat off the beaten track of business life, it is in the midst of exquisite scenery and historic associations. There is a hearty welcome for all who come, and a day among the hills and in the clear bracing air of upland and dale, coupled with the inspection of fine stock grown in a remarkable nursery, will not readily be forgotten.

ROSES AND ORNAMENTAL TREES IN MESSRS. JAMES SMITH AND SONS' WHEATLEY NURSERY, DARLEY DALE.

AMONG THE CHOICE RHODODENDRONS AT MESSRS. JAMES SMITH AND SONS' WHEATLEY NURSERY.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe. Sixth Edition, revised to January, 1909, and including the new varieties.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

INBREEDING OF CUCUMBERS.

We gather from "The Weekly Florists' Review" that sensational results from inbreeding of cucumbers under glass were recently made public by Professor W. J. Green, of the Ohio Agricultural Experiment Station.

Nearly 100 growers were present, representing half-a-dozen States, and all paid close attention to Professor Green's modest explanation of the manner in which he has secured results of great value to the greenhouse interests by taking a course directly the opposite to the established method of procedure in matters of selection for improving varieties of vegetables.

The advice has been to avoid inbreeding, and to seek crosses with plants of similar variety grown some distance away. This did not give the results that Professor Green sought, in his efforts to improve the variety of White Spine cucumbers grown in hothouses, so he tried the plan of keeping the product of certain promising vines pure by pollenising from blossoms on the same vine. This he accomplished by keeping the blossoms covered before and after artificial pollenising, to avoid a cross from near-by vines of less purity of strain.

As a result of his experiments, Professor Green stated that he believes that scarcely a variety of cucumber on the market to-day is pure, but that all are crosses more or less detrimental to the quality of fruit. The "bad blood" in the ordinary hothouse cucumbers shows in the vines producing fruits badly bloated in the centre, crooked fruits which must be sold as seconds and culls, and cucumbers almost as round as balls, which are often thrown away.

Straight cucumbers, small at the stem end, of uniform size the whole length, of a delicate dark green colour, wholly ideal in every way, will be the rule, and not the exception, if Professor Green succeeds in his experiment, which so far has been a perfect success.

He first took one vine and was careful to keep the variety pure. Seeds from this vine were planted in a house by itself, so that bees could not get in with pollen from ordinary vines. The result was twenty-four vines in full fruitage, all producing the perfected variety of cucumbers. Samples were exhibited at the Cleveland Convention of Greenhouse Vegetable Growers, and were looked upon with envious eyes by many of the growers, few of whom have been able to grow fall cucumbers in paying quantities.

The spring and early summer crop of cucumbers is the life-saver of the average "greenhouser" who depends entirely on vegetables for his income. Lettuce and tomatoes just about pay expenses, and a full crop is absolutely necessary to make the year a profitable one.

The selling value of this crop is much lessened by the large number of poor fruits produced, especially toward the end of the season. Anything which will improve the quality of the product will prove a little gold mine to growers, and that is why they paid such close attention to Professor Green's story of his experiments.

Professor Green stated informally that he believes many other varieties of greenhouse vegetables can be got back to purer and better strains by judicious inbreeding.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEEDLING ODONTOGLOSSUMS. — The raising of odontoglossums from seed has become fairly general in gardens, so much so that it is necessary to include this branch under the general notes. Plants that are reaching their flowering stage, and are requiring more root room should be attended to as soon as the new roots are being emitted from the base of the newly-developing growth. I would lay particular stress on this point, because it is, in my opinion, the best stage at which to attend to any repotting, for the plants are then best able to become re-established, and there is the least possible likelihood of injury. Where good lasting compost is used at every potting, and the roots have become well established, it is not desirable to disturb the roots more than is absolutely necessary. Select a pot of suitable size, and shift the plants on in the usual way, first removing any algæ or decaying moss on the surface of the old compost. See that ample drainage is used, and the pots thoroughly clean. The period between seed germination and the appearance of the first pseudo-bulb is a time of slow progress. It usually takes two years, and the first year is an anxious time for the grower, but as soon as the first three or four leaves have developed more advance is made. I find that by treating the seedling odontoglossums as seedlings are usually treated in other genera of plants, i.e., give the plants a shift as soon as they have rooted through the compost to the edge of the pots, that greater progress is made than is the case where they are not so liberally treated.

SMALL SEEDLINGS.—Those small seedlings that require potting should be attended to without delay, as this gives them an opportunity of becoming re-established before much artificial heat has to be used. The plants should be given a position within reasonable distance of the roof glass. Care must be observed to shade any newly-potted plants from strong light until they have become rooted into the new compost. Carefully spray overhead once or twice a day whenever the outside conditions permit. The smallest seedlings must be kept in a light position during the winter months, and the temperature should be a few degrees warmer than in the ordinary odontoglossum house. Ripe seed may be sown, but it is advisable that only a portion of the seed from the capsule should be sown now. The remainder may be sown after the turn of the days.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

GENERAL REMARKS.—In the short, dull days from now to the New Year great care must be taken in watering. With plenty of moisture in the atmosphere stove plants will exist at this season with but very little water at the roots. Flowering plants, if possible, should be separated from foliage plants at this season, because the moisture necessary in the atmosphere for the latter is undesirable for the other. Regularly feed all winter-flowering plants until they are coming into bloom, as, the pots being full of roots, this assistance is necessary to develop the flowers.

FERNS.—The majority of ferns will now have ceased growth, and it will be necessary to keep the atmosphere drier, and to give less water at the roots, yet they ought not to be allowed to become dry. Adiantums that were closely cut down and have been resting somewhat may now be started into growth by putting them in an intermediate house, and when growth has become active give weak liquid manure. Place adiantums for cutting in a cool position, in full light, and afford a fair amount of fresh air. Examine specimen plants regularly for decayed fronds, or they soon are spoiled by damp if allowed to remain. Water early in the day. The warm fernery may be kept at a temperature of 60 to 65 degrees during the day, but on cold nights 55 degrees will suffice. Kinds susceptible to damp, such as gymnogrammas, northochlænas, and cheilanthuses, should be placed in a position free from damp.

EUPHORBIA JACQUINÆFLORA.—This plant requires light, heat, and careful watering at this season, for during the short, dark days it is very liable to die if kept constantly wet at the roots.

ACHIMENES.—These are among the prettiest of our tender summer-flowering plants, and although included in the stove list, they do not exactly require stove heat for their successful culture. One of the principal points to consider is that the roots are tender, and require a soil light in texture for them to penetrate easily. As the flowers will now be over, gradually decrease the supply of water until the foliage has practically died away; then store the pots full of soil and tubers, just as they are, in some cool house, from which frost can be excluded. They will need no more attention until spring. They are easily propagated by seeds, shoots, or leaf cuttings, and by division of the tubercles, as each scale will produce a plant.—Wm. Fyfe, Lockinge Park Gardens.

FRUITS UNDER GLASS.

PEACHES AND NECTARINES.—As the foliage will now have fallen from trees in the early and second houses, these may be pruned, and, if it is necessary, root prune also. This latter is most important if the growth has been rank, and the trees perhaps not so fruitful as they might be, and may prove the very thing to restore fertility. If the trees have been root pruned in the past it will be necessary to commence with the trench about a foot beyond where the roots were pruned before, when it will be soon seen whether any large roots have got away. In any case, it will be advisable to work down to the bottom of the border, all around the tree, and sever any gross roots with a sharp knife. When returning the soil mix up a little fresh material, and add a little burnt earth or brick rubbish to it, as this assists very materially in keeping the soil sweet. The soil should be well rammed, and if dry be given a good watering. Root pruning gives an excellent opportunity always of ascertaining the general condition of the border, and should be dealt with accordingly. The branches should be cleaned of all old ties. Cut out as much of the old wood as possible, leaving the young shoots which have been tied in during the current season. Thin these latter as necessary, retaining all the ripest and straightest growths to be tied in for next season's crop. The wood should then be well sprayed with some insecticide, taking care that every portion receives the spray. It is not often mealy bug is found on well-developed trees, but if any be present some stronger measures must be taken to ensure its complete eradication. If scale be present use a small brush and some strong insecticide to remove it. When the trellis, roof, and walls have been cleaned the tying and training of the branches may be done. Tie the main branches in position with stout tar string, and the smaller branches with twisted matting; the branches should be tied in as regularly as is possible, and not nearer than four inches apart, better if five or six inches. Tie just tight enough to keep in position, and use small bamboo rods or tar string running the opposite way to the wires for the support of the shoots that come halfway between the wires. After this is done the border should be cleaned, and a light top-dressing of loam and some approved fertiliser be given, and the house will be ready for starting at the appointed time.

PLANTING NEW HOUSES AND VARIETIES.—As in the case with vines, so with peaches, the borders are often made too large at first, and this should be guarded against, especially when imported soil is used, as this makes a great difference to the cost. Draining is essential, especially on heavy land. The surrounding land may have been drained, but not to such an extent as may be neecssary for indoor culture. The borders should be well made, and if really good loam from an old pasture be obtainable no manure will be necessary, but a goodly proportion of lime rubble should be added. The loam should be chopped up, and the finer portions be placed immediately around the roots when planting. Good healthy trees should be procured, absolutely free from gumming or any other evils, and they should be planted about the same depth as they have been in the nursery. The following are sterling peaches: Hales' Early, Grosse Mignonne, Dymond, Violet Hative, and Early Rivers. Nectarines: Early Rivers, Lord Napier, Elruge, and Cardinal. These are suitable for a good-sized early house, while for a later house Pine Apple, Violette Hative, Humboldt, and Victoria nectarines, and Dymond, Alexandra, Noblesse, Barrington, Princess of Wales, Crimson Galande peaches will afford a good succession.

TOMATOES.—Keep these growing in a dry, warm, and airy house. Pollenate the flowers as they open, and do not allow the soil to become dry or the flowers will drop.

STRAWBERRIES IN POTS. — These should be placed in cold frames or turned on their sides, as we are having more rain than is good for them. Look out for worms, as these are apt to destroy many roots if left undisturbed, but if the pots have been standing on a hard base this trouble will have been avoided.

CUCUMBERS.—The temperature should not be allowed to go higher than 75 degrees, nor lower than 65 degrees. Keep the growths well tied in, and cut the fruits as fast as they become ready, standing their stalks in saucers of water to keep them fresh and crisp. Fumigate both these and tomatoes at least once every fortnight, as it is better to give a mild fumigation to keep down aphis than to give a heavy one to get rid of it.—W. A. Cook, Leonardslee Gardens.

THE KITCHEN GARDEN.

MUSHROOMS.—The earliest beds that were made up and spawned in the mushroom house are now giving good supplies. To keep these going satisfactorily a pure and humid atmosphere is essential. Carefully syringe the walls and pathways of the house twice each day, and use any means of retaining moisture without making the surface of the beds wet, otherwise damping may be serious. Collect manure and prepare it for successional beds. So much depends upon their condition as to the length of their bearing properties, but, in any case, it is not safe to depend on inside beds over a month's duration of heavy cropping, that provision of new beds should be made accordingly.

ASPARAGUS BEDS.—Growth will be sufficiently matured for cutting down. Have the stems and weeds cleared away during a dry day, and put the beds in order for the winter. I do not recommend the addition of rotten manure now, especially on cold clayey land. Where this vegetable is expected during winter a commencement may be made for forcing a batch over a mild hotbed in a compost of sandy soil. Do not allow the roots to in any way suffer from want of moisture or failure will be the result. Preserve a genial humid atmosphere and a temperature of about 60 degrees, admitting a little air on warm days.

SEAKALE.—Select some of the most matured crowns, and place ten or twelve in a large pot in a sandy compost, and put them in the warmest part of the mushroom house. The early crowns are often slow in commencing growth, but frequent waterings with warm water and daily syringing will excite them.

RHUBARB.—As fruit becomes scarce a call will be made for rhubarb, so choose some of the earliest crowns, lift them, and introduce them to heat. If a mild hotbed can be arranged in a pit for this first batch it will be advantageous. Failing this, plant the crowns in the mushroom house and treat them as recommended for seakale. Have a number of roots lifted and exposed to the weather, as this will have a tendency to make them respond more readily to forcing, and will provide a successional supply to the above.

SALADS.—The provision of salads will be more difficult during the next few months. Chicory is one of the plants to be relied upon, and a quantity of roots may be lifted now and potted up, placing five or six in a ten-inch pot, and putting some in heat, but where light is excluded. Endive is also of great importance, and a useful method in dealing with this salading is to plant it out in shallow boxes, similar to those used for potato sets, as these can be placed in heat as required, and moved about at will according to demand. Lettuce will require to be blanched carefully. Six-inch pots placed over them as they stand is convenient, but if hard weather sets in it is better to treat them similarly to endive by placing them in a dark position inside. Make frequent sowings of mustard and cress.

PARSLEY.—The continuous wet and sunless time has prevented parsley from building up suitable growth to stand severe frosty weather. See that the stock of this important herb is in accordance with the possible requirements by having reserve stocks placed in frames or pits that can be effectively protected if necessary, or if scarcity follows.—CHARLES FLACK, Cholmondely Castle Gardens.

OLD VERSUS YOUNG VINES.

It has been my privilege to see the splendid vines at Swanmore Park, and I can fully bear out all that Mr. Molyneux says in respect to their fine, healthy condition, and his remarks respecting the utility of old vines when well cared for. I used to greatly admire the excellent bunches of Madresfield Court and Muscat of Alexandria grown by Mr. Molyneux. There were four points in each bunch that always arrested my attention, namely, size of bunch, size of berry, good form, and high finish. For more than ten years I had charge of the gardens at Cadlands Park, and when I entered on my duties there I found that preparations had been made to replace the old vines in two houses with young ones. One house contained Muscats; the rods were not very handsome to look at, and the laterals were rather weakly. The flowering stage was approaching, and as the bunches looked promising, I determined to give the old vines a few years' trial. Results well warranted the course taken. The vines were gently forced and their strength gradually increased. The bunches were of good size, the berries large, and the latter always coloured well by the end of August. In a few instances I took up young rods to replace the old ones, but the average annual crop from each vine, which had rods about 16ft. long, weighed nearly thirty pounds. At the end of the ten years, when I relinquished my charge, the vines were in every way more satisfactory than when I first took them in hand. Mr. Molyneux once saw these Muscats, and I believe his remark was, "these vines prove that the finest bunches are not always borne on the biggest wood." The bunches were certainly not borne on other than very medium strength wood, but it always matured grandly, and was studded with plump buds.

Many tons of chalk in large lumps had been put under the borders, and nearly all the soil was imported from the Isle of Wight. As surface roots were scarce, I covered the borders with a layer of fibrous turves of medium thickness, and so quickly secured a net-work of small roots under them. Half of the border was inside and half outside. The vines are a little more than thirty years old. I, too, always prune back the leading rod of a young vine to about 2ft. from its base every year until the top of the house is reached. I am now treating two vineries in this way. I like to see the bottom part of the rod thicker than the middle portion. GEO. GARNER.

BOLTON.
The 23rd GREAT EXHIBITION OF CHRYSANTHEMUMS, ORCHIDS, FRUIT, etc., November 19th and 20th in the ALBERT HALL.
Upwards of £160 Cash Prizes, 3 Silver Cups, R.H.S. Medals (affiliated societys), and valuable Orchids. Special Cash Prizes for Roman Hyacinths offered by several Nurserymen.
Entries close Nov. 13th.
Schedules on application to the Secretary, GEORGE CORBETT, Heaton Grange, Bolton.

BROMLEY AND DISTRICT CHRYSANTHEMUM SOCIETY.
THE 28TH ANNUAL EXHIBITION
Will be held in the
GRAND HALL, BROMLEY,
On WEDNESDAY and THURSDAY, Nov. 10th, and 11th, 1909.
Entries close November 6th.
Schedules, etc., of the Hon. Sec.,
R. S. PATTERSON,
The Gardens,
Bromley Palace, Kent.

BUXTON AND DISTRICT CHRYSANTHEMUM SHOW,
WEDNESDAY, November 10th, 1909.
For Schedule and List of Prizes, address—
S. SHUFFLEBOTHAM, Secretary, 12, Eagle Parade, Buxton.

SCOTTISH HORTICULTURAL ASSOCIATION.

CHRYSANTHEMUM EXHIBITION.

The Association will hold its next Great Chrysanthemum Exhibition in the WAVERLEY MARKET, EDINBURGH, on the 18th, 19th, and 20th November, 1909.

Copies of the Prize List, which contains all particulars as to Prizes, conditions of competition, etc., may be obtained on application to the Secretary,
A. D. RICHARDSON,
19, Waverley Market, Edinburgh.
Entries close on 10th November.

BRADFORD CHRYSANTHEMUM EXHIBITION in ST. GEORGE'S HALL, on FRIDAY and SATURDAY, November 12th and 13th.
£27 for 24 Japanese (on Boards).
Prize Money for Open Competition again Increased.
Entries Close November 6th.
Schedules with entry form post free from H. SPENCER, Hon. Secretary, Horton Park, Bradford.

LOWER MARKET,
EXETER.

DEVON AND EXETER HORTICULTURAL SOCIETY'S
FLOWER, FRUIT, ETC., SHOW,
THURSDAY and FRIDAY,
November 11th and 12th.
SILVER CHALLENGE CUP, VALUE £30, FOR CUT BLOOMS. SPECIAL PRIZES for CIDER APPLES.
ENTRIES CLOSE 6th NOVEMBER, 1909.
Schedules, etc., from A. HAROLD WARD, Hon. Secretary, 9, Bedford Circus, Exeter.

HUDDERSFIELD AND DISTRICT CHRYSANTHEMUM SOCIETY.
The EIGHTEENTH EXHIBITION of the above Society will be held in the TOWN HALL, HUDDERSFIELD, on FRIDAY and SATURDAY, November 12th and 13th, 1909. Schedules and Entry Forms may be obtained on application to JOHN BELL, Hon. Sec., Marsh, Huddersfield.

SHEFFIELD CHRYSANTHEMUM SOCIETY'S GREAT ANNUAL SHOW.
CORN EXCHANGE, SHEFFIELD,
FRIDAY and SATURDAY, Nov. 12th and 13th.
UPWARDS OF £200 IN PRIZES.
Schedules and particulars free on application to Secretary.
C. COOK, City Road, Sheffield.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

On Tuesday, October 26, the Royal Horticultural Hall was once again well filled with exhibits. Hardy flowers and dahlias were plentiful, and had just missed the frost of the early morning. Orchids made a good display, and fruit was fairly well shown; while perennial asters and begonias were leading features.

FLORAL COMMITTEE.

A wonderful exhibit of Michaelmas daisies made right across the end of the hall by Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, was a fine feature of the meeting. Mr. Beckett put up big arrangements of each variety, so as to show the habit and freedom of flowering, and in this way the flowers appealed to the visitors. It goes without saying that the daisies were finely grown as well as very finely staged. The greater number of the varieties were small-flowered and of particularly graceful habit, and many were Aldenham-raised kinds. A few that were especially pretty were Desire, Bianca, white (A.M.), Ringdove, Amity, Simplicity, Maidenhood, White Diana, Grey Dawn, Star Shower, and Comeliness; a large flowered variety named Climax was also wonderfully fine.

A brilliant exhibit of the very useful winter-flowering begonias that have resulted from the use of B. socotrana as a parent was made by Messrs. James Veitch and Sons, Chelsea. This firm filled a whole table with plants of their own raising and growing, and these were beautifully flowered. B. Mrs. Heal was the brightest of the lot, and was smothered with large single carmine blooms; B. Julius, B. Elatior, B. Winter Perfection, B. Success, B. Ensign, and the compact B. Ideala. Mrs. Stewart Mackenzie, Haywards Heath, showed some finely-grown and freely-flowered winter-flowering begonias, B. Ideala being especially good. Mr. A. L. Gwillim, Cambria Nursery, New Eltham, brought up some exquisite double and frilled begonia blooms, arranging these on flat boards.

Michaelmas daisies and early-flowering chrysanthemums made a good show, as set up by Messrs. Barr and Sons, Covent Garden, with Crocus asturicus, Cimicifuga simplex, kniphofias, vallotas, and the climbing Aconitum volubile, with deep purple blue flowers. Messrs. H. Cannell and Sons, Swanley, brought up a collection of winter-flowering begonias, the chief kinds being B. Dregei, B. Vesuvé, B. Coralle, B. Ruby, and B. Pink Gem. Mr. G. Mallett, Cheddar, submitted a vase of finely developed spikes of Lilium sulphureum cut from the open field.

Mr. W. Leggett, West Bergholt, Colchester, had a set of fragrant rose blooms, practically the last of the season. Mr. G. Reuthe, Keston, showed some very pretty nerines, herbaceous lobelias, and perennial asters. The useful and ever-blooming Viola cornuta purpurea was again well shown by Messrs. Gunn and Sons, Olton, who also put up some fine vases of early-flowering chrysanthemums, Roi des Jaunes, Market White, Cranford White, and Ethel Blades standing out conspicuously. Begonia Ideala was magnificently shown by Mr. A. V. Coombe, gardener to Lady de Ramsey, Norwich; there were six plants, each about 2ft. through, and rather more in height, and grandly bloomed.

Begonia blooms from the open ground—the last for the season, for a frost on Tuesday morning put an end to them—were delightful, as shown by Messrs. Thomas S. Ware, Feltham; these were on boards, backed by Michaelmas daisies; the colours were superb. A bold group of chrysanthemums was put up opposite the entrance by Messrs. Wells and Co., Merstham. It consisted of big Japanese blooms. decorative varieties, and baskets and bowls of the later of the early-flowering varieties. Mrs. R. Luxford (A.M)., Keith Luxford, Frank Payne, and Alice Lemon were conspicuous large Japanese varieties, but the single yellow Altrincham Yellow (A.M.) was the great attraction of the group.

Messrs. J. Cheal and Sons, Crawley, managed to get in with dahlias before the frost, and they made a pretty final display of single varieties of these autumn flowers.

showing the leading sorts, and putting these up in triangular bunches. The same firm displayed an attractive collection of sprays of shrubs with coloured and otherwise ornamental foliage. The pæony-flowered dahlias from Messrs. Bakers, Wolverhampton, made a brave bit of colour, and among the many varieties Lady Savile, Faust, Pius X., Codsall Gem, Mrs. J. Chamberlain, The Warrior, and Mrs. A. Worsley were very showy. Succulents and various alpine shrubs were exhibited in a rock garden by Messrs. J. Peed and Son, West Norwood.

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, again showed Michaelmas daisies well, and also had a very bright lot of early chrysanthemums and some large Japanese blooms of Sir Frank Crisp, Master James, F. W. Lever, and others, a very pretty exhibit. Gleichenias were very well shown by Messrs. J. Hill and Son, Barrowfield Nursery, Edmonton, who filled the side of one table with these graceful ferns of G. flabellata, G. dichotoma, G. longipinnata, and G. Mendeli; there were specimens of considerable size and great beauty. Messrs. Ambrose Palmer and Co., Mount Street, Grosvenor Square, had a mixed display of chrysanthemums and fruit.

Messrs. W. Cutbush and Son, Highgate, presented a group of cut perpetual carnations, their best varieties being Beacon, White Enchantress, Mrs. Burnett, The President, White Perfection, Mikado, Aurora, and the large maroon-coloured Lady Nora Brassey. Messrs. Stuart Low and Co., Bush Hill Park, Enfield, displayed Otaheite oranges, a fine batch of the graceful Phœnix Roebelini, and a few perpetual flowering carnations, the latter including the new scarlet D. P. Bassett. A batch of Lomaria spicant serratum varieties, very useful and pretty was brought up by Messrs. H. B. May and Sons, Edmonton, who also again exhibited standards and bush plants of named varieties of veronicas.

A bold group of Michaelmas daisies, physalis, pentstemons, and solidagos was put up in good style by Messrs. W. Cutbush and Son, Highgate. Mr. F. Brazier half-filled one of the annexes with a splendid display of big bunches of early chrysanthemums, pentstemons, phloxes, and Michaelmas daisies; the vases and plants of Savoie, a new and delightful white (faintly blush tinted) October chrysanthemum was a special feature of this display; it is a very elegant, free-flowering, and useful plant.

ORCHID COMMITTEE.

A glorious exhibit of finely grown orchids was contributed by Lieut.-Colonel Holford, Westonbirt, Tetbury, Gloucester, and beautifully set up by Mr. H. Alexander, the able grower. All along the background Oncidium varicosum Rogersi was freely used, the long arching sprays of golden blossoms serving to show up the grand lot of cattleyas that made up the bulk of the display. The group demonstrated the beauty and value of the fine hybrid Cattleya Fabia (labiata and aurea), for of this grand orchid there were sixty splendid specimens carrying a total of about three hundred mauve and purple and gold flowers. Altogether there were about two hundred plants in this exhibit, and a hundred and thirty were cattleya species and hybrids, and these, including C. Fabia, gave a hundred and seventy-five spikes, and rather over six hundred flowers. Beautiful orchids included with those already noted were Cattleya fulvescens Westonbirt var., C. Undine, C. Mrs. Pitt, C. labiata G. C. Whitelegge, C. Mantini, Lælio-cattleya Arethusa, L.-c. Priam, Brasso-cattleya Digbyana-gigas with two big blooms; the lovely Cymbidium erythrostylum, Cypripedium Hera Euryades, C. Hitchinsiæ Holford's var., the pale yellow C. Rossetti, C. triumphans magnificum, C. Chas. Rickman magnificum, and the beautiful C. Niobe Westonbirt var.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, had in their group of orchids such interesting things as Bulbophyllum Godseffianum, Cypripedium Mdme. George Truffaut, Odontoglossum blandum, O. Uro Skinneri album, Cirrhopetalum appendiculatum, Grobya galeata, Cycnoches chlorochilon Oncidium Lanceanum, etc. Messrs. Jas. Veitch and Sons, Chelsea, had a bright exhibit of orchids, consisting largely of Cattleya labiata and Odontoglossum grande. Cattleya Bowringiana and Cypripedium Fairrieanum were also well represented, and examples of Brasso-cattleya Digbyano-gigas, Cypripedium elatior (Leeanum and Baron Schroder), C. Thalia, and C. insigne Sanderæ.

Messrs. Jas. Cypher and Sons, Cheltenham, contributed a useful lot of cypripediums associated with Dendrobium phalænopsis, oncidiums, and cattleyas. Among the former we noted C. Niobe superba, C. Maudiæ, C. Fairrieanum in considerable numbers, C. Triumphans, C. Minos Veitchi, C. Milo Westonbirt var., C. nitens magnificum, and C. insigne Harefield Hall. Mr. Edward V. Low, Vale Bridge, Haywards Heath, showed a few very choice orchids, the white forms of Cattleya labiata being prominent, notably C. l. Redleyensis, C. l. G. G. Whitelegge, C. l. Daphne, C. l. alba var. Purity, C. l. R. I. Measures, and Cypripedium Olivia.

Mr. G. F. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, put up a large group of orchids, and set up the plants ligntly and to good advantage, though a few more ferns to hide the pots would have been an improvement. In this display were Cattleya Mantini, C. Bowringiana, C. labiata, C. gigas, Odontoglossum crispum, O. grande, the lovely Odontioda Charlesworthi, Cypripedium Maudiæ, and C. Fairrieanum. In the group of orchids submitted by Messrs. Sander and Sons, St. Albans, we noted a fine Vanda cærulea, Dendrobium formosum giganteum, white and coloured forms of Cattleya labiata, Lycaste macrophylla, Anguloa uniflora, Cattleya Klondyke (Harrisonæ and Marriottiana), and C. Empress Frederick var. Sanderæ, the latter a lovely white-petalled variety.

Epidendrum vitellinum majus made a brilliant centre to Messrs. Charlesworth and Co.'s group of orchids, and round this useful orchid were grouped Odontoglossum crispum, O. Lambeauianum, the bright Odontioda Bradshawiæ, Cypripedium Madame Alfred Bleu, C. Jeanette, C. Arthurianum, C. purpurata, Miltonia vexillaria Leopoldi, and Cattleya Empress Frederick gigantea.

M. Mertens, Mont St. Amand, Ghent, brought over some pretty hybrid odontoglossums, all unnamed, as usual. Cymbidium Gammieanum, a natural hybrid, with spikes of greenish-buff flowers, was shown by Major G. C. Robertson, Widmerpool Hall, Notts, and this secured a Cultural Commendation.

Some very fine plants of Cattleya Bowringiana, carrying beautiful spikes of richly-hued flowers, were shown by Messrs. J. and A. A. McBean, Cooksbridge, Sussex, who also showed some cypripediums, odontoglossums, and Cattleya Portia Perfection. Cattleya Fabia Blenheim var. was shown by the Duke of Marlborough; this is a light form. Mr. W. Hopkins, gardener to Francis Wellesley, Esq., Woking, exhibited several pretty white forms of Cattleya labiata, The Empress being very pure.

Mr. A. Young, gardener to E. R. Ashton, Esq., Broadlands, Camden Park, Tunbridge Wells, put up a very pretty exhibit of orchids, and his plants were well displayed. Among other good things thus shown were Cattleya Bowringiana, C. labiata, C. Iris, Odontoglossum grande, Oncidium varicosum Rogersi, Vanda cærulea, various odontoglossums, Epidendrum vitellinum majus, and some masdevallias. This was an excellent "first" display.

FRUIT AND VEGETABLE COMMITTEE.

Messrs. Laxton Brothers, Bedford, had an extensive exhibit of fruit, and their display was well arranged. Prominent among the many kinds on view were Allington Pippin, Queen, Charles Ross, Blenheim Pippin, Newton Wonder, Emperor Alexander, and Golden Spire apples, and Conference and Beurre Superfin pears. Mr. J. Aikman Paton, Soulscut, Castle Kennedy, N.B., brought up hybrids of Solanum tuberosa and S. Commersoni, these being in flower, and bearing violet-hued flowers. The cross had white tubers. So far this cross has been quite immune from disease.

An interesting collection of onions was submitted by Messrs. G. Massey and Sons, Spalding, the leading varieties being Record, Ailsa Craig, Golden Globe, and Cranston's Excelsior. From the Horticultural College, Swanley, Kent, came a collection of apples, including popular culinary and dessert varieties.

Mr. A. E. Humphreys Owen, Glansevern, Berrier, R.S.O., was awarded a silver Banksian medal for a dozen dishes of apples. Mr. G. Kelf, gardener to M. Drummond, Esq., Welwyn, showed about three dozen dishes of apples, and the same number of pears; the former were somewhat small, but many of the pears were quite good. Messrs. W. Seabrook and Sons, Chelmsford, put up a very fine collection of well-grown apples and pears, the former being represented by excellent samples of Lord Derby, Ribston Pippin, Queen, Ecklinville, Mother, Royal Jubilee, Chelmsford Wonder, Bismarck, Blenheim Pippin, Emperor Alexander, May Queen, New Hawthornden, Peasgood's Nonsuch, and Allington Pippin.

Mr. Henry Whiteley, St. Marychurch, Torquay, submitted a collection of about one hundred varieties of apples, these including about twenty of the newer sorts. Wolfe River apple, from Vancouver, was shown, and there were good dishes of Bramley's Seedling, Peasgood's Nonsuch, Royal Jubilee, Emperor Alexander, Crimson Bramley's (very bright), Hambling's Seedling, James Grieve, Charles Ross, Houblon, Rival, Langley Pippin, and Adam's Pearmain.

In the competitive classes Mr. J. G. Williams, Pendley Manor, Tring, was placed first for six dishes of the newer apples, leading with Norfolk Beauty, Charles Ross, Christmas Pearmain, Rival, Baron Wolsey, Hambling's Seedling; Mr. W. H. Bacon, gardener to Sir Marcus Samuel, Maidstone, second; and Mr. H. Whiteley, third. Mr. Crump, Madresfield Court Gardens, Malvern, led for one dish of new cooking apples with King Edward VII.; Mr. J. Mayne, Bicton, second, with the same variety. For one dish of a dessert variety Mr. Bacon led with Charles Ross, Mr. Crump second with Wm. Crump (Cox's Orange and Worcester Pearmain). Mr. Bacon led with one dessert pear with St. Luke, and Mr. J. G. Williams was second with Princess. For three dishes of new pears, Mr. A. R. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge, scored with St. Luke, Le Lectier, and Charles Ernest, all in good condition; Mr. W. H. Bacon second.

AWARDS.

Award of Merit.—To Chrysanthemums Mrs. R. Luxford and Altrincham Yellow, from Messrs. W. Wells and Co., Merstham.

To Chrysanthemum Mr. Thornton, from Mr. H. Perkins, Henley-on-Thames.

To Perpetual Carnation May Day, from Messrs. J. Peed and Son, Norwood; Messrs. Bath, Lim., Wisbech; and Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

To Perennial Aster Bianca, from Mr. Edwin Beckett, V.M.H., Aldenham House Gardens, Elstree.

To Columnea magnifica, from Sir Trevor Lawrence, Bart (Mr. Bain, gardener), Burford Lodge, Dorking.

To Cypripedium Elatior Rex, from Messrs. James Veitch and Sons, Chelsea.

To Cypripedium Beacon magnificum, from Lieut.-Colonel Holford (Mr. Alexander, grower), Westonbirt, Gloucester.

MEDALS.

Gold.—To Lieut.-Colonel Holford, Westonbirt, Gloucester, for orchids.

Silver-gilt Flora.—To Hon. Vicary Gibbs, Aldenham House, Elstree, for Michaelmas daisies; to Messrs. J. Hill and Sons, Edmonton, for ferns; to Messrs. J. Veitch and Sons, Chelsea, for winter-flowering begonias; to Mr. C. Ashton, Tunbridge Wells, for orchids; to H. S. Goodson, Esq., Fairlawn, Putney, for orchids.

Silver-gilt Banksian.—To Messrs. Seabrook and Sons, Chelmsford, for apples and pears: to Messrs. W. Wells and Co., Merstham, for chrysanthemums.

Silver Flora.—To Messrs. Sander and Sons, St. Albans, for orchids; to Mr. E. V. Low, Haywards Heath, for orchids; to Messrs. Cypher and Sons, Cheltenham, for orchids; to Messrs. James Veitch and Sons, Chelsea, for orchids; to Mr. F. Brazier, Caterham, for asters and chrysanthemums; to Messrs. W. Cutbush and Son, Highgate, for carnations and hardy flowers; to Mr. H. J. Jones, Lewisham, for asters and chrysanthemums; to Messrs. H. B. May and Sons, Edmonton, for ferns and veronicas; to Messrs. T. S. Ware, Lim., Feltham, for begonias.

Silver Knightian.—To Messrs. Laxton Brothers, Bedford, for fruit; to Mr. H. Whiteley, Torquay, for apples.

Silver Banksian.—To Messrs. G. Massey and Son, Spalding, for onions; to Mr. A. C. Humphreys-Owen, Glansevern, Berrier, R.S.O., for apples; to Messrs. S. Low and Co., Enfield, for orchids; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. J. and A. A. McBean, Cooksbridge, for orchids; to Messrs. Bakers, Wolverhampton, for dahlias; to Messrs. J. Cheal and Sons, Crawley, for dahlias and autumn-coloured foliage; to Messrs. Gunn and Son, Olton, for chrysanthemums; to Mr. L. R. Russell, Richmond, for berried plants; to Mr. D. Russell, Brentwood, for hollies, etc.

Royal Horticultural Society, Ireland.

The winter show of the Royal Horticultural Society of Ireland, which consisted principally of fruit, vegetables, and chrysanthemums, was held at Balls Bridge, in the buildings of the Royal Dublin Society,on the 20th and 22nd inst. On the day of opening the weather left nothing to be desired, but, considering the very high character and great variety of the various exhibits, and the excellent arrangements made in connection with the whole exhibition, one would expect to see the hall thronged to excess. However, the attendance was comparatively good, and it must be said that the competitions in the various classes for fruit and vegetables were exceedingly good in the great majority of cases. The main hall of the building presented a very attractive appearance, with the contributions to the fruit classes arranged in the middle, and the collections furnished by the various nurserymen on the sides.

With chrysanthemums the time was rather between seasons, as late-flowering varieties were scarcely at their best, and the finest of the early outdoor kinds were over; yet in some classes exceedingly good blooms were to be seen. J. Jameson, Esq., J.P., of Malahide, was most successful, winning first prize in five classes. The blooms from this exhibitor included examples of Mrs. A. T. Millar, a splendid white, and Mrs. N. Davis, Mrs. L. Thorn, Algernon Davis, Mrs. W. Knox, Melchet Beauty, and Reginald Vallis. The challenge cup presented by Messrs. Hopkins and Hopkins for twelve vases of early-flowering varieties was won by Mrs. Mead Coffey, of Blackrock. Other winners in these classes were Mr. W. Ross, Mr. F. V. Westby, Mrs. Redmond, and Miss J. Field. The competition in the class for twelve vases of hardy cut flowers was of particular interest, as the flowers staged afforded an indication of the flowers to be had from the open quarters during this dull season. The first prize was awarded to Mr. E. Lee, the second going to Captain Riall. In this competition were violets, roses, asters, chrsyanthemums, ceanothus, Senecio pulcher, Solanum jasminoides, and bright scarlet berries of Skimmia japonica, etc.

The collections of eighteen dishes of apples, on decorated tables, proved an attractive and very pretty feature. The competition was a very keen one, there being seven entries, and Mr. J. Jameson, J.P., was awarded the first prize for grand fruit embellished with ampelopsis trails and smilax, and small pots of crotons and ferns intermingled. Mr. Michael Hennerty was a close second. The class for collections of twelve dishes of cooking apples was a good one, magnificent fruit being included in most of the entries. In this class the Earl of Bessborough occupied the post of honour; Clara Lady Fitzgerald was second; and Mr. W. Coffey, third. Remarkable among the dishes staged by the first prize winner were those of Lane's Prince Albert, of grand colour and size; Blenheim Pippin, Peasgood's Nonsuch, and Hambling Seedling. In the second prize lot were Warner's King, Royal Jubilee, Cox's Pomona, Mère de Ménage, Annie Elizabeth, etc., of wonderful size and uniformity, while in the lot gaining third was perhaps the grandest and largest dish of apples in the show, the variety being Peasgood's Nonsuch.

In the classes for separate dishes of cooking apples the entries were numerous, and many of the competitions were particularly keen. The entries in the classes for Warner's King, Peasgood's Nonsuch, The Queen, Bismarck, Lane's Prince Albert, and Bramley's were particularly good, the number averaging about fifteen in each. Indeed, in some of these competitions one would consider all the fruit shown to be of first-class merit, notably so in The Queen and Newton Wonder classes. Among the dessert varieties James Grieve showed up well, and was a large class; Charles Ross proved itself another ideal exhibition apple, with an ideal form and rich colour. Perhaps better samples of Worcester Pearmain may have been seen before in Dublin, but Allington Pippin, Lady Sudeley, and American Mother looked grandly finished. The principal winners in these classes for a dish of cooking and dessert apples were Mrs. Goodbody, Major J. C. Hickman, Mr. E. Bewley, Mr. D. M'Carthy, the Right. Hon. Lord Plunket, Sir R. Palmer, Clara Lady Fitzgerald, etc.

The competition for the prizes for pears was also well in keeping with the great excellence of the other features of the show. Mrs. Goodbody was here again successful in gaining first for a dish of Conference of fine quality. For a dish of Pitmaston Duchess the Rev. Robert Bradshaw was awarded first in a class in which twenty-two dishes of splendid fruit made a formidable array against him. Mr. E. Dolier gained first for a dish of Louise Bonne of Jersey, and for Doyenne du Comice the Earl of Meath carried away premier honours. For cooking pears C. M. Doyne was awarded first for fine fruits of Catillac. Other winners in classes for pears were Sir E. Cochrane and E. Bewley. Grapes were well shown by Mr. F. V. Westby and Mr. Ernest Bewley, both of whom were awarded first prizes.

In the competition for packing fruit for market the various lots of apples were generally neatly put up, and the quality of fruit was uniformly even and good. This competition showed general improvement on other times. The principal winner was Mr. Fitz W. A. Scott, who was awarded four first prizes.

There were many medals and awards to nursery exhibits, and others. Gold medals to Messrs. A. Dickson and Sons, and to Messrs. Ramsay and Son, while Messrs. Browett, Edmandson Brothers, and S. A. Jones obtained silver medals.

National Chrysanthemum Society.

There was a well-attended meeting of the Floral Committee at Essex Hall on Monday, October 25, and there was a quite good display of flowers, and a fair number of novelties.

Mr. Norman Davis, Framfield, submitted a number of good flowers, his Miss Lily Hall, Henry Poulton, and the golden David Ingamells being the finest. Mr. G. Carpenter, Byfleet, Surrey, sent a few pretty flowers, his Mrs. J. C. Stoop, creamy-white, being very graceful. Mr. Silsbury, Isle of Wight, showed Shanklin Sunshine and Brilliant, the former a good yellow. Messrs. J. Stredwick and Son, St. Leonards, brought up a few blooms, their Mary Farnworth again attracting attention. Mr. Henry Perkins, Henley, gained a F.C.C. for the graceful creamy-white Mr. Thornton. Messrs. Wells and Co., Merstham, and Mr. W. J. Godfrey, Exmouth, both displayed flowers, and the latter scored with two single varieties, Rufus and Miss Mary Pope.

Mr. J. Lawrence, Shoreham; Mr. G. Mileham, Leatherhead; and Mr. D. B. Crane, Highgate, each showed single varieties, and several of these the committee desired to see again. Mr. H. Redden, Manor House Gardens, West Wickham, showed some single and some decorative varieties, and Mr. W. Seward, Hanwell, had a richly coloured crimson Japanese variety named Arthur Slade.

At the meeting of the Executive Committee, held at Carr's Restaurant, in the evening, Mr. Thomas Bevan presided. The Secretary reported a balance of about £90 in hand. Mr. C. H. Curtis formally reported the holding of the conference at Essex Hall early in October, and the success of the meeting, both as regards papers read, discussion, and display of flowers. The Secretary stated that the cost of the conference was a little over £8. It was reported that the Market Show Committee, now disbanded, had handed over the balance it had in hand to the general funds, for the purpose of providing a class or classes for market flowers. It was agreed that the Dean Memorial Medal be awarded at the November show for the best competitive exhibit of Japanese flowers. Five new members were elected.

National Vegetable Society.

OCTOBER 26.

A committee meeting of this society was held on the 26th inst., in one of the committee rooms of the Royal Horticultural Society, Mr. A. Dean, V.M.H., in the chair. Messrs. George Gordon, V.M.H., R. Hooper Pearson, J. Harrison Dick, E. Beckett, V.M.H., C. Foster, S. Mortimer, G. Hobday, F. Harvey, G. Wythes, V.M.H., treasurer, and E. G. Quick, secretary. Several important letters were read from various sources, and the Chairman reported as to the grant of the R.H.S. hall for the proposed show, and a long discussion arose as to the dates and other matters. These were not finally settled. It was announced that some excellent offers of prizes had been received from leading seed merchants, and in most cases accepted by the committee, and terms arranged, an important item being that representatives of the firms or donors of special prizes from seedsmen should be asked to be present at the staging. Mr. G. Gordon pointed out the importance of exhibitors being members of the society, as they would then greatly assist its work. Another matter decided was an entrance fee for small exhibits or classes, grouped together, although there was a general feeling that the society should endeavour to greatly increase its members, and by so doing obtain more support from those interested in this important branch of horticulture. The Treasurer reported as to the state of the funds, and several members were elected.

Beckenham Horticultural Society.

On Friday, the 22nd inst., Mr. E. H. Jenkins, of the Queen's Road Nursery, Hampton Hill, Kingston, lectured to a well-filled room on "Herbaceous Plants," Mr. V. B. Chalk presiding. The lecturer said he did not propose to deal with the making and planting of borders, but rather to take various plants as types of others, and speak more fully upon them. This he did most lucidly. The Christmas rose, Helleborus niger, was often to be seen in a debilitated condition, and was said to be impatient of removal, this being the outcome of taking the work in hand at a wrong time. If these plants were lifted in September, and divided almost into single crowns, they would do splendidly, but if manipulated in the springtime, as is sometimes recommended, they would not be a success. The lecturer cited the late Mr. Brocklebank, near Manchester, who lifted and divided into single crowns every two years, and probably no one grew them to such perfection. A sharp cutting instrument should not be used for dividing for fear of cutting the cross roots, but the best way was to take two small forks and insert them back to back and wrench them asunder in that way. The section known as the Lenten roses may be treated from September to March and April, their root system differing from the aforesaid section. With regard to pæonies, September was given as the best month for transplanting them. The best time to deal with the flag irises (Iris germanica) is March and April; these should be denuded of a good deal of the back growth, and several of the young leads placed together for a clump.

The Anemone japonica, phloxes, delphiniums, and pyrethrums were instructively treated. At the close Mr. Jenkins was very heartily applauded, and a vote of thanks accorded him.

Mr. V. B. Chalk exhibited from his farm a very fine sample (half-bushel) of Dalmeny Acme potatoes, which have turned out ten tons per acre, and no disease. A special certificate was awarded to Mr. Chalk.

Bournemouth Gardeners' Society.

A concert in aid of the Royal Gardeners' Orphan Fund is always included in the half-yearly programme of meetings of the above society, and this was given on October 19, when all the artistes gave their services free. The different items made up a long programme, both ladies and gentlemen giving solos, which were greatly appreciated and vigorously encored. The conjuring tricks and character songs were highly amusing and much applauded.

In the interval a collection was made on behalf of the funds of this most deserving cause, and two pounds nineteen shillings and sevenpence was collected. No charge is made for admission.

J. H. Ralph Smythe, Esq., J.P., the president, was chairman. and very ably conducted the proceedings. He made an eloquent appeal to those present to support the Royal Gardeners' Orphan Fund according to their ability, and remarked that, though gardening was considered to be a very healthy occupation, gardeners were only human after all, and they succumbed to diseases and old age like other persons, and some were, moreover, taken when comparatively young, leaving behind them their widows and young children, often enough quite unprovided for. Then, said Mr. Smythe, this society steps in and takes the place of the father to the children, as far as it possibly can do so. In further remarks, the Chairman intimated that two children from the immediate neighbourhood of Bournemouth were, at the present time, receiving assistance from the fund.

In addition to the gardeners' wives and friends, there was a good attendance of the public. On the motion of the chairman, a very hearty vote of thanks was accorded the ladies and gentlemen who gave their services so ably and so freely.

Birmingham Gardeners.

OCTOBER 18.

Mr. J. Udale, Instructor in Horticulture to the Worcestershire Education Committee, gave a lecture on the result of ten years' experiments with hardy fruits and vegetables in the County Experimental Garden, Droitwich, before a large and appreciative assembly of the members. By the use of carefully compiled proportions of various inorganic and organic manures, extending over a series of years, Mr. Udale was able to demonstrate the comparative values of the respective applications in the cultivation of certain kinds of vegetables, potatoes especially. The lecture was illustrated by lantern slides. Similar illustrations and statistics were also given regarding the pruning and non-pruning of apples, pears, and plums, with the resultant crops. At the conclusion of Mr. Udale's remarks, the Chairman (Mr. T. Humphreys), in a few eulogistic terms, testified to the value of the practical details so lucidly given by the lecturer, and not for the first time, on the cultivation of fruits and vegetables before the society. Mr. Udale readily endorsed a suggestion that the members visit the experimental garden at Droitwich next year in the blossoming and autumn seasons.

ROYAL HORTICULTURAL SOCIETY'S SCHOOL OF HORTICULTURE.

In view of the wide interest of the general public in the Royal Horticultural Society's School of Horticulture at Wisley (near Weybridge), where both the science and practice of gardening are taught to thirty young men almost entirely at the society's expense, the following list of successes gained this summer by the second-year students will be of interest to your readers:

Diploma Examination (in order of merit).—A. W. Simmonds (diploma and demonstratorship of £40 for one year); W. G. Kent (diploma and prize); J. Ridley (diploma and prize); H. W. Abbiss (diploma and prize); G. A. S. Brookes (diploma); S. B. Gorringe (diploma); H. L. Robson (diploma); N. A. Phillips (diploma).

Nicholson Prize for Observation.—A. W. Simmonds.

General Examination.—J. W. McCaig (scholarship of £25 per annum for two years, silver-gilt medal, certificate, and prize); W. Miles (certificate and prize); W. G. Kent (certificate and prize); H. L. Robson (certificate and prize); A. W. Simmonds (certificate and prize); and twelve other certificates.

In the unavoidable absence of the president, these awards were distributed a few days ago by Harry J. Veitch, Esq., V.M.H., who was accompanied by other members of the council, together with the Right Hon. Arthur C. Dyke Acland, ex-Minister of Education, who gave a short address. Mr. James Hudson, V.M.H., also gave advice arising from a life-long experience as a practical and scientific gardener. It is also worthy of note that Mr. Seaton, after a three years' course, was this summer appointed by the British Columbia Government to superintend one of their public parks, at a commencing salary of £200 a year. W. Wilks, Secretary, R.H.S.

OBITUARY.

◆

MR. DAVID THOMSON, V.M.H.

It is with much regret that we have to record the death of Mr. David Thomson, V.M.H., which occurred at his residence, at Eskbank, on the 22nd inst., in his 86th year. Mr. Thomson obtained prominence in horticultural circles when gardener at Archerfield, East Lothian, the seat of Mrs. N. Hamilton Ogilvy. Here he displayed his remarkable skill in the cultivation of fruit and vegetables, and his great taste in flower garden arrangement. At this time also he evidenced his ability as a writer on horticultural topics. In taking charge of the gardens of Drumlanrig, one of the seats of the Duke of Buccleuch, Mr. Thomson had increased opportunities for the display of his great and varied talents, and possessing much energy he made the most of them. Fruits and vegetables were grown to the highest degree of excellence, the flower garden acquired fame throughout the United Kingdom, and the cultivation of stove and greenhouse plants and of orchids was carried on on a large scale, and with quite exceptional success. Mr. Thomson was a contributor to the horticultural journals, the author of several books, and for some time the editor of the monthly known as "The Gardener." Mr. Thomson was one of the original recipients of the Victoria Medal of Honour in Horticulture, and he was awarded the Neill Prize and the Veitch Memorial Medal. Mr. Thomson retired from the management of the Drumlanrig gardens twelve years ago, and has since resided at Eskbank, near Dalkeith, and until the close of his life continued to take a keen interest in the art of which he was so great an ornament.

NOTES OF OBSERVATION.

◆

Narcissus Macleaii. — One hears but little nowadays of this small hybrid daffodil, and it seems almost forgotten in the passion for the newer varieties which are now so numerous. Yet those who like a type not met with every day, and yet not so expensive as most of the new flowers, might think of this interesting little plant, which was first received in this country by Mr. Alexander Macleay, as far back as 1819, when it came from France. It has been well described as "a charming little characteristic daffodil," and it may be selected as one of a representative collection, especially of one comprising the best of the dwarf narcissi. Its height is given as some four inches, but I have had it a little more, but never more than six, so far as I can recollect, in the course of over twenty years' experience of it. It has rather small flowers, with a yellow, goblet-shaped cup, and white perianth segments. For rockwork it is admirable, and in the border is suitable for planting near the margin, while it looks exceedingly well in the grass also. Its price is moderate, somewhere about threepence each, but the wonder is that one which has been grown so long is not still cheaper. It appears to require no special soil.—S. Arnott.

Apple Norfolk Beauty. — One more season is proving this apple to be what it is claimed to be, a constant cropper. It cannot be said that the present is a good apple year, varieties like Warner's King, that promised so well early in the season, have failed to swell to their full size, and in many cases are badly marked with apple scab. Not so Norfolk Beauty, the fruit may not be quite so large as it is in some seasons, but it is quite clean; at least, that is my experience. A well-known nurseryman, who said last year he could not get the trees to fruit in a young state, and was slightly sceptical of its freedom in this respect, saw the original tree at Gunton Park this year in September, and was much impressed with its crop of clean, handsome fruit. I at once, on seeing this apple growing, said it would in time supersede Warner's King, and I am certain the day is not far distant when this will be so. The habit of growth is desirable, vigorous, yet not too robust. If not pruned too hard, and the branches allowed plenty of space, full crops of fruit will be assured. Its cooking qualities are beyond question, and are such that it is an apple that requires no sugar to make it palatable. —E. Molyneux.

Arabis albida nana compacta.—This is an excellent variety of the white Rock Cress for many purposes in the garden, as its growth is compact and convenient for such uses as bedding edgings or for groups where plants of close, compact growth are required. It flowers very freely, and a single plant will soon form a neat, rounded mass of white, not more than six or eight inches in height. It is not so suitable for covering large stones or for places where a trailing growth is required, but there are few who cannot find some use for this neat little white-flowering variety. It appears to come wonderfully true from seeds, as the seedlings of last year which are in bloom here are remarkably uniform in height and in freedom of flower. One of my friends having a long knowledge of plants informs me that it closely resembles the plant grown long ago as A. alpina. It is, of course, distinct from the present-day A. alpina, of which the double arabis, now so popular, may be taken as the favourite form. It will grow in any soil, but flowers with more freedom in a dry one, and in full sun.—S. Arnott.

There is no better guide to the kitchen garden than Vegetables and their Cultivation, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the **Gardeners' Magazine**, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the **Gardeners' Magazine**, "Endeleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the **Gardeners' Magazine**. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

WINTER DRESSING FOR VINE RODS.—A. H. P., Newnham: You should thoroughly clean the rods of loose bark, but do not scrape or otherwise injure them. After this give them a thorough washing with a warm and fairly strong soft-soap solution, and if insect pests have been prevalent then apply a dressing of one of the insecticides or compounds advertised for the purpose. We have not much faith in the old method of plastering the rods with a mixture of clay, cow manure, and sulphur, and we believe that the recipes containing tar, turpentine, and paraffin are dangerous in the hands of all except the most experienced and careful people, and therefore their use is attended with considerable risk.

COX'S APPLES.—H. T., Salisbury: Cox's Orange Pippin and Cox's Pomona apples were both raised by a Mr. Cox, who, after following the business of brewer at Bermondsey for many years, retired to Lawn Cottage, Colnbrook, near Slough, Bucks, and devoted the remainder of his life to gardening pursuits. It was here that he raised the two apples named, in 1830, and both are said to have been raised from pips of Ribston Pippin. In 1836 Mr. Cox gave the varieties to Messrs. E Small and Son, nurserymen, of Colnbrook, and they were distributed by that firm in 1840. It is interesting to remember that in the earlier days of its cultivation, while the value of the variety for dessert purposes was recognised, Cox's Orange Pippin was strongly recommended as a culinary variety when grown on the crab stock. We may add that this fine apple did not obtain much popularity until the late Mr. Charles Turner entered business as a nurseryman at Slough, and pushed its sale, and made its good qualities known.

SEEDLING GLADIOLI.—C. R., Swanage: Place the seed vessels on paper spread over the stage of a greenhouse, giving them a dry and sunny position. Here the seeds will finish ripening, and when they are quite ripe keep them in a cool, dry cupboard until the spring, when, early in March they should be sown in gentle heat. Move the seedlings to cooler quarters as soon as they are well up, and so gradually harden them that during summer and autumn the pans may be stood out of doors. Thin sowing is essential, and if the seeds are placed an inch apart each way there will be room for the seedlings to develop. Small corms will be produced by the end of the autumn, and these must be ripened and stored ready for planting out the following March in nursery beds.

QUASSIA SOLUTION FOR USE UNDER GLASS.—J. B. J., Everton: Where a considerable number of plants have to be dealt with under glass, and especially where climbers have become infested, the following quassia solution is a capital one for getting rid of aphis, etc. Soak half a pound of quassia chips in two gallons of cold water all night, and then bring the whole to the boil, and allow it to boil for ten minutes, strain the liquid, and while it is still hot add half a pound of soft soap, and thoroughly stir. Use the mixture while warm, and about a quarter of an hour after it has been used vigorously syringe the plants treated with clean tepid water.

RED SPIDER ON PEACHES.—A. H. P., Newnham: The same mixture would do for peaches, and no doubt for cucumbers also, but we have not tried it for the latter. It would be an easy matter to test it upon one or two infested leaves, and carefully watch the results.

RAISING FIGS FROM CUTTINGS.—L. G. W., Olney: For the production of a batch of young fig trees from cuttings, the latter should be taken early in the spring and consist of well ripened shoots. The cuttings should be from three to four inches long, the lower part to be cut off horizontally immediately below a joint, and the upper part in a slanting direction just above a joint. Insert singly in three-inch pots filled with fibrous loam, to which moderate proportions of leaf-mould and sand have been added, and place them in a pit or house where they will have the assistance of a temperature of about 65 degrees. If the pots can be stood upon or plunged in a hotbed the rooting process will be accelerated. As soon as they are well rooted shift into five or six-inch pots, and give them a light and rather airy position, and supply liberally with water. By the end of the year they will range from twelve to fifteen inches high, and in the following spring shift into pots one size larger, and cut them back to within ten or twelve inches of the base. The shoots produced from the upper buds will form the framework of the plants, and if more than three are produced reduce to that number, selecting those near the top to be retained. During the summer pinch out the points of the young shoots when five or six inches long, and repeat the pinching during the summer, as may be rendered desirable by the progress of the growths that are produced by the shoots that have been stopped. It will in most cases be necessary to repot the plants in the course of the summer, using pots one size larger. The following season these young figs may be treated as regular stock, and they will produce good fruits.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

F. C. J., Shanklin.—Helleborus corsicus.

R. R. W., Bexley.—1, Ruscus aculeatus; 2, R. racemosus.

G. B., Bath. — 1, Aster puniceus; 2, A. Nova-Angliæ pulchellus; 3, A. diffusus horizontalis.

F. Y., Chippenham.—1, Colchicum autumnale; 2, Kerria japonica; 3, Cypripedium œnanthum superbum; 4, C. Euryades.

E. E. M., Bedford.—1, Cupressus Lawsonianus; 2, Cedrus atlantica glauca; 3, Funkia Sieboldi; 4, Gnaphalium lanatum.

H. B. S., Taunton.—1, Cratægus Lelandi; 2, Euonymus japonicus; 3, a weigela; 4, a philadelphus—send these latter when in flower next year.

NAMES OF FRUITS.

When sending fruits for naming will our readers be good enough to send good specimens, as without these it is not possible to accurately determine the varieties. Pack firmly, using light tin or wood boxes, and send not more than six varieties at once. Label each specimen and enclose letter with the fruit, whether a separate notification is sent or not. Address the packages to the Editor, **Gardeners' Magazine**, as advised in the notice at the head of "Answers to Correspondents."

G. W., Newbury.—Beurre Superfin.

C. K., Burlish.—1, Ashmead's Kernel; 2, Catshead; 3, Grenadier; 4, Haggerstone Pippin; 5, rotten; 6, Thompson's.

G. E. W., Amersham.—1, Duchesse d'Angoulême; 2, Marie Louise; 3, Easter Beurre; 4, Beurre Clairgeau; 5, Clapp's Favourite; 6, Doyenne du Comice; 7, not recognised; 8, Souvenir du Congres.

G. B., Dublin.—1, Rotten, unrecognisable; 2, Fondante d'Automne; 5, Baron de Mello; 7, Durondeau; 8, Beurre Bosc.

J. T., Suffolk.—1, Green Chisel; 2, Gold Medal; 3, Grenadier; 4, Blenheim Pippin; 5, Dutch Mignonne; 6, Emperor Alexander.

A. W., Cardiff.—1, Winter Majetin; 2, Golden Noble; 3, Kerry Pippin; 4, Blenheim Pippin; 5, Adam's Pearmain; 6, Duchess' Favourite.

W. E. T. C., Taunton.—1, Pitmaston Duchess; 2, Queen; 3, Hawthornden; 4, not recognised; 5, Devonshire Striped; 6, Curry Codlin; 7, Incomparable Red.

B. R., Bawtry.—1, Duchesse d'Angoulême; 2, Figue de Naples; 3, Marie Louise; 4, rotten; 5, Braddick's Nonpareil; 6, Hollandbury; 7, Fondante d'Automne.

H. G., Barrow-in-Furness.—You have a long way exceeded the number of specimens that should be sent for naming at any one time, i.e., six., and we suggest you send a contribution to the Gardeners' Orphan Fund as a recognition of services rendered. 1, King of the Pippins; 2, Kerry Pippin; 7, Baron de Mello; 8, Durondeau; 9, Doyenne du Comice; 10, Cadie's Everlasting; 11, Zephirin Gregoire; 13, Emile d'Heyst; 14, Winter Majetin; 15, Beurre Gris d'Hiver; 16, probably Flemish Beauty; 17, Clapp's Favourite; 21, Hormead's Pearmain; 22, not recognised; 25, Colonel Vaughan; 27, Scarlet Nonpareil; 31, Colmar; 34, Directeur Alphand.

WINTER JASMINE.

Jasminum nudiflorum is often referred to as one of our old English flowers, but the jasmine mentioned by old writers, whether of romance, poetry, or horticulture, is the white jasmine, which was introduced into this country from the East—Persia or North-West India—about the middle of the sixteenth century. The yellow, Winter Jasmine, was one of the numerous plants introduced from China in the middle of the last century, and it may be reckoned one of the most popular of those introductions. Its method of cultivation needs no description, as it will grow in any soil or position, and I obtain my most abundant supply of winter blossom from a wall which scarcely sees the sun even at midsummer. It is therefore very valuable for planting against walls where few other things will thrive. For cutting for the winter it is specially appreciated by those who have a limited supply of flowers under glass, or none at all, as its slender sprays may be cut from late in November till March, shoots picked with the buds just beginning to show colour, or even before, opening well in water in a warm room and lasting for a fortnight. Though sharp frost will destroy all the open blossoms, as well as those just ready to open, a fresh lot will come out during a genial period of weather afterwards. The cutting of its slender branches is a good form of pruning, but it needs a little more than this when it has filled its allotted space, for if the long, flexible branches, whether they have flowered or not, are cut back to two or three buds or shoots in the early spring, the number of long flowering shoots for next winter will be increased, while the shrub will be kept in bounds and will not get so untidy as it often does. Its blossom looks best in the winter when it is grown in connection with some evergreen to serve as a foil. Apart from a wall it looks well running over ivy-covered stumps, rose pergolas, etc. The flowering shoots should not be nailed or tied in, as when in flower they look so much better growing free.

The Winter Jasmine is one of the most easily propagated of all shrubs, sprays or branches allowed to fall to the ground often taking root before we are aware of it.

CATALOGUES RECEIVED.

CHAS. TURNER, ROYAL NURSERIES, SLOUGH. —A list of such good old florists' flowers as auriculas, carnations, picotees, cloves, and pinks. A catalogue of roses is to hand from the same nurseryman.

B. S. WILLIAMS AND SON, UPPER HOLLOWAY, N.—From this firm we have received an illustrated bulb list in which collections are made a speciality.

JOHN JEFFERIES AND SON, LIM., CIRENCESTER.—In this bulb catalogue considerable space is devoted to gladioli and liliums, but the more popular daffodils, etc., are not overlooked.

G. COOLING AND SONS, BATH.—Rather more than half this catalogue is devoted to roses, and the rest to fruit trees and ornamental shrubs.

THOS. RIVERS AND SON, SAWBRIDGEWORTH. This excellent catalogue is in three parts; the first is devoted to fruits, with descriptions and times of flowering; the second to roses; and the third to shrubs.

FRANK CANT AND CO., BRAISWICK NURSERIES, COLCHESTER. — A very comprehensive catalogue of roses. Each variety is described, its special merit noticed, and the name of introducer and date of introduction given.

E. J. HICKS, TWYFORD, BERKS.—A useful list of roses grouped in their various sections.

Send for Illustrated Catalogue, free. BOULTON and PAUL, Ltd., Manufacturers, Norwich.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Rose Tribe.

Few people probably, when enjoying the fragrance of the rose and recognising it as the veritable Queen of Flowers, or when viewing it at our rose exhibitions in all its multiplicity of form and tints and habits, as ramblers, standards, or bushes, are aware that even this wealth of beauty is but one phase of many of the great family to which the rose belongs. In that particular phase, indeed, actual utility plays no part save in the way of decoration, while probably no other plant family in the world has been so lavish in providing luscious fruits, and thus contributing to the pleasures of the palate as well as those of the eye and nose. To justify this we have but to mention that all the wonderful varieties of apples, pears, quinces, medlars, peaches, nectarines, almonds, apricots, plums, cherries, strawberries, raspberries, and blackberries are really roses pure and simple, as an examination of any of their flowers easily shows. The essential difference is that in all these cases we see the hard, leathery seed vessel of the Queen of Flowers, modified and associated with attractive pulp, constituting the fruit, as it is popularly termed, though in point of fact, it is the unattractive seed, the pip, the stone, or the superposed dots of the strawberry section which is really the fruit proper. What we enjoy are mere secondary adjuncts designed to assist dispersion of this precious seed by inducing voracious birds or other animals to devour them and eventually scatter the indigestible seeds far and wide. Much as we may marvel at the beautiful diversity which the selective cultivator has brought about in the rose of our exhibitions through hybridisation and cross-fertilisation, there is still more reason for wondering admiration in the great changes which evolution has effected in the form of the seed, and the mode in which the environing husk has been varied. In the apple and pear tribe we have a number of smooth leather-coated seeds or "pips," embedded in the centre and surrounded by a hard internal skin, the "core." In the peaches, plums, and cherries we find this transformed into a single hard-shelled nut-like seed, the stone, and in the strawberry we find an entirely different arrangement of a mass of luscious pulp in the surface of which there is embedded in shallow cavities large numbers of hard little grains which are the seeds proper. Without examination of the flower no one examining these widely different fruits could imagine that they all belonged to one and the same order, and yet they do so undoubtedly. Incidentally, it may be mentioned that in Rosa rugosa, the Japanese rose of our gardens, we see a sort of link between the rose proper and the apple, the fruit being very apple-like, rosy cheeked, soft pulped, and edible, the hard rough seeds, such as we find in the hips and haws of our hedges, remaining, however, unaltered and quite unlike the smooth pips of the apple. The allusion to hips and haws is justified by the fact that these, too, are really rose fruits or seed vessels, since outside the recognised roses and the fruits we have mentioned, the great rose family embraces all the hawthorns, blackthorns, whitethorns, and pyracanthas, which beautify the landscape late in the spring with their floral snowdrifts, or in their varietal forms, red, crimson,single and double,ornament our parks and gardens with brilliant masses of colour of various intensities. Pick but a single flower of any of these, magnify it a few times, and it is indistinguishable from its larger sisters of the regal type. Lower down in grade, but beautiful enough to justify their association, we have as other members of the tribe the spiræas, geums, potentillas, rubus, etc., while the lovely wild rose, vulgarly called the dog rose, gives us the family type in all its unsophisticated beauty all over the country. Many species of the rose tribe grow in the tropics, and are not so familiar as those named, which form but a small quota of the 82 genera and about 1,000 species which constitute the family as a whole. A chapter, and a long one, might be added concerning the wonderful chemical products of this family, from attar of roses to the deadliest of poisons, prussic acid, to say nothing of the infinite number of subtle flavourings in the fruits, but space precludes more than a mere allusion to this phase of this wonderful tribe.

MR. J. H. WITTY.

Mr. J. H. Witty, a genial and handsome man, and "bearded like the pard," is well known in horticultural circles as a great lover of chrysanthemums and the capable superintendent of one of the big Metropolitan cemeteries. Mr. Witty is a Yorkshireman, and served his apprenticeship at Dixon's Nursery at Beverley, and from thence went to Clumber, the Duke of Newcastle's seat at Worksop. London soon attracted him, however, and he became employed at Videon's nursery at Maida Vale. Presently he took charge of the decorating, etc., at Grosvenor House, the town residence of the Duke of Westminster. His next appointment was to the charge of the gardens, etc., at Stafford House, the residence of the Duke of Sutherland, where the King, then Prince of Wales, was staying during repairs to Marlborough House. His love for floral decorating and "furnishing" next led him to Messrs. Wimsett's nursery at Chelsea, and while with this firm he had plenty of opportunity for adding to his knowledge in this particular direction. About this time Mr. Rogers was making Battersea Park famous for its summer bedding, especially the carpet bedding, and so to Battersea Park Mr. Witty went for further and new experiences, and stayed four years, until he was appointed gardener and deputy-superintendent of Highgate Cemetery, a position he most satisfactorily filled for eleven years. He was next employed as superintendent of Nunhead Cemetery, and during his twelve years' stay there he won golden opinions from all with whom he had to do. Since 1901 Mr. Witty has been superintendent of the Highgate Cemetery, and he obtained some notoriety in connection with the famous Druce case, as it was his business to open the vault, produce the body for the experts' examination, and return it to its resting-place. Mr. Witty had some curious and interesting chrysanthemums a few years ago, and he has interested himself in lobelias and fuchsias. For very many years he has been a prominent member of the Executive and Floral Committees of the National Chrysanthemum Society, and he was for several years vice-chairman of the General Committee. He was one of the founders of the Highgate Chrysanthemum Society, and also instituted the Brookfield Horticultural Society at Highgate. Mr. Witty has associated himself with the British Gardeners' Association, and is a member of the Council of that body; he is also a member of the committee of the Royal Gardeners' Orphan Fund. Quite recently Mr. Witty has blossomed out in a new direction, for in connection with the Highgate Cemetery he now controls a market and nursery establishment at Swain's Lane and Townsend Yard, Highgate, where tomatoes, cucumbers, sweet peas, and chrysanthemums are the chief subjects grown.

Black Scab of Potatoes.—In reply to a question in the House of Commons on Monday with reference to the disease of black scab in potatoes, Captain Norton said: The disease is unfortunately very prevalent in allotments and cottage gardens in Cheshire, North Shropshire, Staffordshire, South Lancashire, and parts of Warwickshire, Derbyshire, and Notts. It has been found in certain parts of Fife, but to a much smaller extent. A few isolated cases have been reported from other parts of the country. In none of the districts named does the disease exist except to a very small extent in fields under rotation. We hope that our information as to the results of the investigations which have been instituted will be available in the course of the present week, and they will be at once communicated to every occupier of premises on which the disease is known to exist.

French Horticulture.—In view of the important position to which horticulture has attained in France a Technical Commission of Horticulture has been created by decree of the President. The duties of this Commission will be to deal with all questions relating to plant improvement, cultural methods, and the transport and marketing of produce at home and abroad. The Commission will consist of thirty members, and will include the president of the National Horticultural Society of France and the director of the National School of Horticulture at Versailles.

"**British Fern Gazette**" is the title of the new quarterly publication of the British Pteridological Society, and under the editorship of Mr. C. T. Druery, V.M.H., it should prove most useful to the members of that body. At the annual meeting of this society at Kendal in August last, a resolution was passed that a quarterly publication should be established and issued dealing with British species, particularly from the varietal point of view. The object of this society has been the encouragement of the cultivation of the finer forms, but as its records simply embraced reports of annual meetings, with only occasional additional contributions of papers by its members, it was felt that its utility was too circumscribed, and that in view of the greatly increased popularity of the varietal forms as decorative plants, it was essential to arrange for greater publicity. The contents of the issue now before us includes articles on the life history of ferns, fern collecting, and wild sports of British ferns, and, as the whole of the letterpress is from the pen of Mr. Druery, it is not necessary to say that the pages contain much to interest. We are promised articles by several of the leading authorities in the next issue. The annual subscription of five shillings to the society includes the four issues of the publication. For the information of those who may wish to communicate with the editor, we would mention that Mr. Druery's address is Stanwix-bank, Shaa Road, Acton, W.

Supervision of Trees in Kensington.—For the third consecutive year the Metropolitan Public Gardens Association have been appointed by the Royal Borough of Kensington to supervise the pruning and lopping of trees in the public thoroughfares of the borough during the winter season.

Exeter Gardeners' Association.—At the annual meeting of the Exeter Gardeners' Association, it was announced that the committee had decided to discontinue the award of money prizes at the fortnightly meetings, but to give awards of merit instead. The "question nights," had, it was reported, proved most attractive to members, for the discussion on the various points raised by the questions had been very instructive. The society was successful in bringing its year's work to a close with a balance in hand. Mr. W. B. Heberden and Mr. P. C. M. Veitch were re-elected president and vice-president, and Mr. Chorley and Mr. Mackay were reappointed secretary and treasurer respectively.

Warley Garden in Spring and Summer. — Mr. Bernard Quaritch, Grafton Street, London, W., announces for publication a series of forty-one views of Miss Willmott's interesting garden at Great Warley. The illustrations are from photographs taken by Miss Willmott, and have been reproduced in collotype; and the work will form a handsome folio. Early in December is mentioned as the time of its issue.

National Carnation and Picotee Society.—We are informed by Mr. Henwood, the hon. secretary, that at a committee meeting held an Saturday, October 30, it was unanimously decided that the show for 1910 be held at the Royal Horticultural Hall on Tuesday, July 26, and that the schedule remain as for 1909, with the addition of a class open to amateurs only, for twelve distinct varieties of selfs, fancies, and yellow ground picotees. The first prize will be the Martin Smith Memorial Challenge Cup and Medal, the challenge cup to be held for the year.

National Auricula and Primula Society.—A committee meeting of this society was held on Saturday, October 30, when it was resolved to hold the show for 1910 on Tuesday, May 3, in conjunction with the Royal Horticultural Society's exhibition.

The Colonisation of a River Bank.—At the meeting of the Royal Horticultural Society's Scientific Committee, Mr. J. Fraser made some remarks concerning the colonisation of the bank of the river Thames. A piece of the bank had fallen away, and this year upon the newly-bared earth the following plants had appeared. The first two are exceedingly uncommon colonists of such places. Platanus acerifolia, or London Plane; Coronilla varia; seedlings of Salix alba, fragilis, caprea, cinerea, viminalis; Alnus rotundifolia, Mill; A. glutinosa, Gærtn; Radiculas, Nasturtium aquaticum, sylvestris, palustris, amphibia; Melilotus altissima and indica; Solanum Dulcamara and nigrum; Mentha aquatica subglabra and arvensis; Polygonums, Convolvulus and Persicaria; Parietaria officinalis, Angelica sylvestris, Lycopus europæus, Sambucus nigra, Senecio aquaticus, Scrophularia aquatica, Œnanthe crocata, Lythrum Salicaria, and Barbarea vulgaris.

"**Some Beautiful Shrubs**" is the title of a lecture to be given by Mr. E. Beckett, V.M.H., at the meeting of the Royal Horticultural Society on Tuesday next. The lecture will be illustrated by lantern slides, and will commence at 3 p.m.

Smoke and Sunlight.—In their paper on "Air Pollution by Smoke," read at the Health Congress at Leeds, Professor J. B. Cohen and Mr. A. G. Ruston gave some very interesting particulars relating to the effect of suspended impurities in the air in diminishing the amount of sunlight in Leeds. In 1907 the number of hours of bright sunshine was 1,167 hours in the town, while four miles north-west it reached 1,402 hours. With reference to the amount of daylight the investigations showed that over a period of four winter months the smoke in an industrial centre absorbed one-quarter of the sunlight, as compared with a station one mile away. During the month of June last the amount of daylight in the centre of the town often fell to one-half as compared with Garforth, several miles beyond its boundaries.

British Gardeners' Association.—On Friday next, the 12th inst., Mr. E. F. Hawes will deliver an address in the Temperance Hall, Leicester, at 7 p.m., on the "Aims and Objects of the British Gardeners' Association." Mr. W. H. Divers, of Belvoir Castle Gardens, will preside.

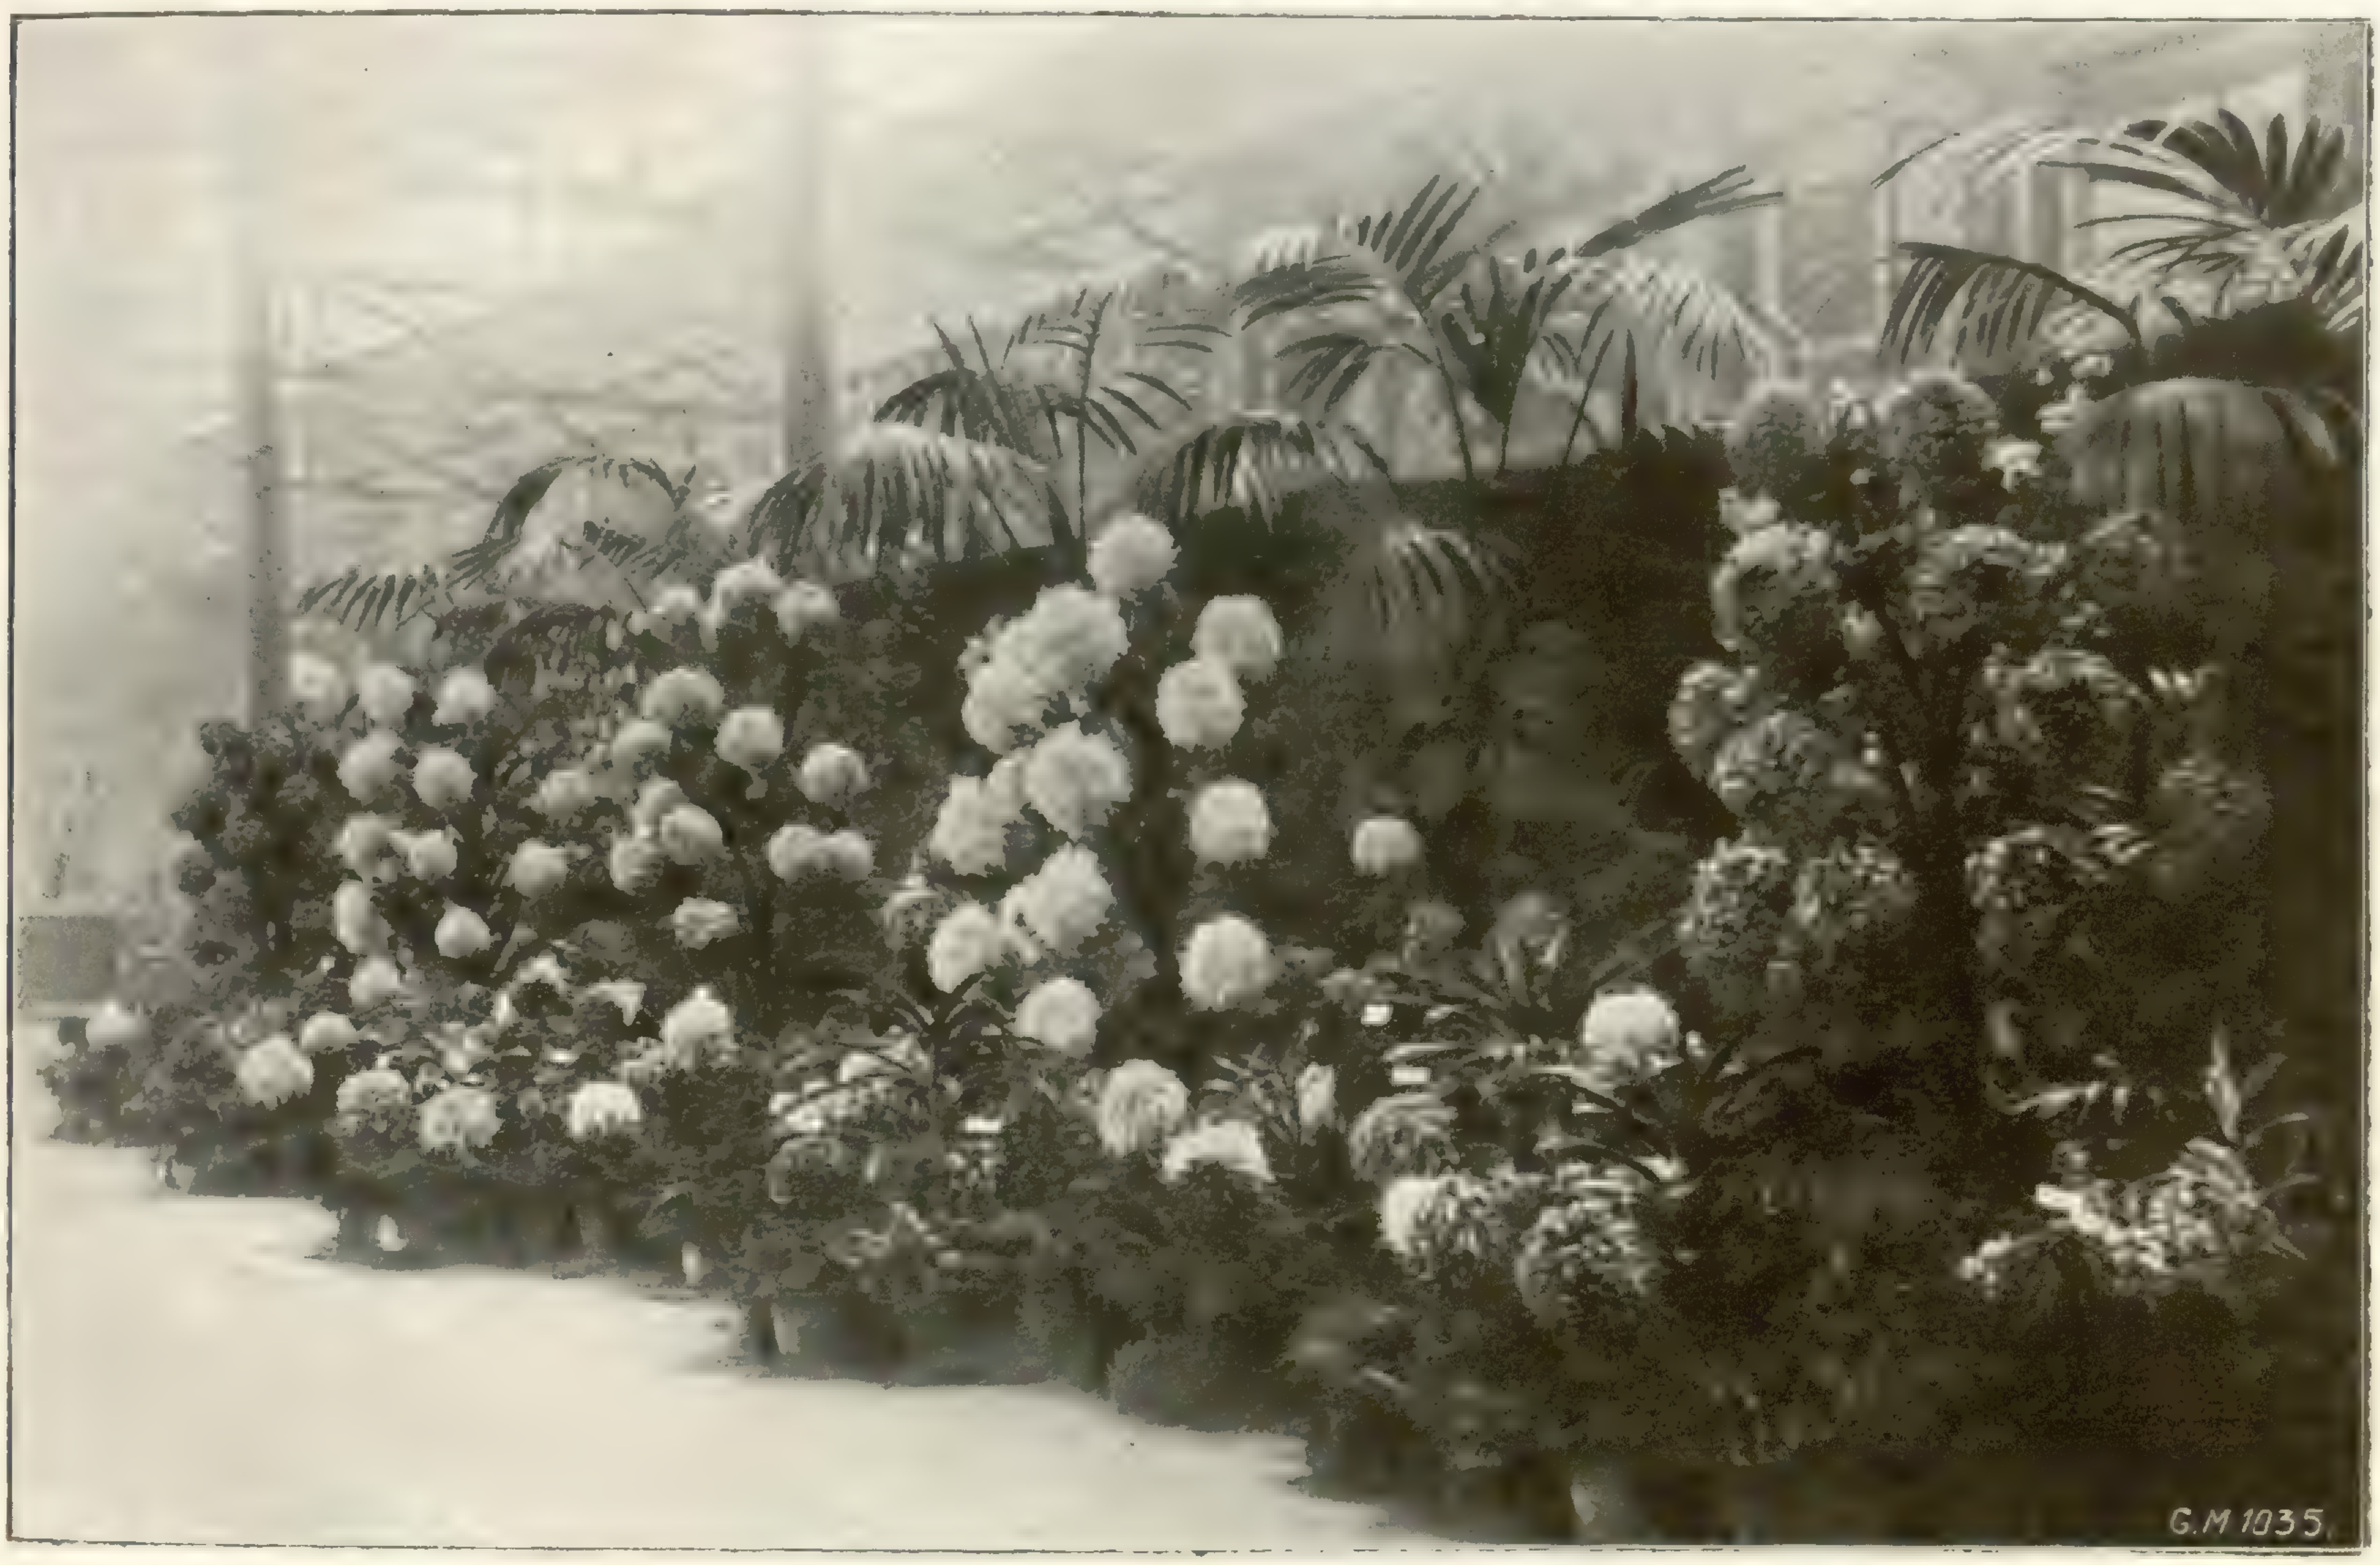
Aldgate's Old Fig Tree.—In an interesting note on the Aldgate Ward School the "City Press" makes the following reference to the old fig tree that for so long a period was a characteristic feature of the school building: "Aldgate is scarcely an Arcady, but there is something arcadian in Aldgate sitting under its own fig tree. The tree (unfortunately there was no vine to keep it company), under which Aldgateians sat and meditated, long grew in front of the ward school in Jewry Street —how long nobody knew. It was generally believed that the tree had a past—quite a respectable one, of course. Indeed, it was somehow understood that it was one of the trees that adorned the grounds of the ancient abbey of Holy Trinity, which for many centuries held religious sway in the Aldgate neighbourhood. The ward seminary was erected on a part of the site of the abbey and its gardens, and when the school was built, the tree was evidently allowed to remain. Certainly it formed a beautiful adjunct to the building. The school, a picturesque old-world structure, has been demolished to provide space for an extension of the Sir John Cass Foundation, and the old fig tree has disappeared no one knows where. Its loss will be regretted by many. Luckily, however, it has left a successor. Two or three years ago Mr. A. M. Sly, then one of the churchwardens of St. Katharine Cree, took a cutting from the tree, and planted it in the churchyard of that parish, where it is in a flourishing state, though we fear the offspring can never become so interesting or so hallowed as its poor old parent."

NATIONAL CHRYSANTHEMUM SOCIETY.

The exhibition held at the Crystal Palace on November 3, 4, and 5, suffered somewhat from being spread out rather too much through the transepts of the great building. The competition was very fair, and there were some excellent blooms in the Japanese classes. Fruits were scarcely up to the average, but vegetables were remarkably good, and the trade displays were a great success. The members of the society rallied round the executive, and this year a large number of the leading growers gave their services free as judges. Mr. R. H. Witty, the secretary, and Mr. Caselton, each rendered most efficient service, and in a pleasant manner also.

LUNCHEON.

The official luncheon over which the president Sir Albert Rollit, presided, was well attended by the officers and members of the society and the Crystal Palace authorities.



G.M 1035

MR. NORMAN DAVIS'S LARGE GOLD MEDAL EXHIBIT OF CHRYSANTHEMUMS
At the National Chrysanthemum Society's Show, Crystal Palace, November 3, 4, and 5.

In proposing "The Judges," Sir Albert made an excellent speech, pointing out the great work the N.C.S. had performed in improving and extending the cultivation of chrysanthemums. He showed how the judgment of new varieties, and the awards made by the society, and the proper allotment of prizes by competent judges had given the society a prominent and dignified position in the horticultural world, and so long as such awards were made with care and impartiality the future of the society, as the premier one in the cult of the chrysanthemum was assured. Sir Albert referred to the long association of the society with the Crystal Palace, and expressed a hope that such associations would long continue, as there was no place so well suited to a big show as the Crystal Palace. He referred to the show, and pointed out that, though the amateurs' classes, especially the smaller ones, were not well filled, there was a grand display in the leading open classes, and Japanese blooms were rarely better seen, while the displays of chrysanthemums, and Messrs. Cannell's exhibit of British fruit were worthy of the exhibitors and the society.

Messrs. D. B. Crane and R. Felton responded for "The Judges," and in response to the toast of "The Exhibitors," Mr. Robt. Cannell and Mr. P. Ladds responded, the former making a brief and humorous speech. Mr. Norman Davis proposed "The Crystal Palace Company," to which Mr. Starr and Mr. Caselton responded. "The President," proposed by Mr. T. Bevan, brought the brief and pleasant proceedings to a close.

GROUPS.

In the class for a floral display of chrysanthemums and suitable foliage plants there was, unfortunately, only one competitor—Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham, who was awarded first prize for his effective display, made on a space of 200 sq. feet. Mr. Howe's conical arrangement of Japanese and decorative chrysanthemums was relieved by crotons, palms, dracænas, etc., and encircled by suitable foliage plants, and small vases of single and Japanese blooms.

In the class for a display of cut blooms made by affiliated societies, there was but one entry, and this, from the Dulwich Society, was awarded the first prize and challenge trophy. The members of this society put up a few good Japanese varieties, but a good many poor ones also; their decorative and single varieties were good, and the arrangement pleasing.

VASE CLASS.

The premier place for a dozen vases of Japanese blooms, three blooms of each variety, was secured by Mr. W. Iggulden, Frome, Somerset, who led with excellent specimens of C. H. Totty, Mdme. G. Rivol, Lady Talbot, Mrs. Norman Davis, Gladys Blackburne, William Gee, Mdme. Paolo Radaelli, F. S. Vallis, Reg. Vallis, Mrs. A. T. Miller, Frank Payne, and the new golden-yellow Mrs. Wm. Iggulden; the second prize fell to Mr. G. Hall, gardener to the Executors of Lady Ashburton, Melchet Court, Romsey, who had Algernon Davis, Edith Smith, Mrs. A. T. Miller, F. S. Vallis, and Annie Hamilton in good form; Mr. W. Higgs, gardener to J. B. Hankey, Esq., Feltham Park, Leatherhead, third; and Mr. A. Smith, gardener to Mdme. Stuart, Convent Gardens, Roehampton, fourth.

JAPANESE BLOOMS.

There was a fine competition in the class for forty-eight Japanese blooms distinct, and here the Holmes Cup was won by a newcomer, Mr. T. Waller, gardener to A. C. Hammersley, Esq., Abney House, Bourne End, who had a glorious lot of flowers, his finest being Mrs. Crossley, F. S. Vallis, Miss Alice Edwards, Mary Inglis, H. Perkins, Mildred Ware, Valerie Greenham, Miss Faith Moore, Mrs. A. T. Miller, Norman Davis, Rev. R. D. Eves, G. Terry, Lady Talbot, Pres. Viger, and Mrs. G. Mileham. To this fine stand the Dean Memorial Medal was also awarded. Mr. T. Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addlestone, was a fine second, with Lady Talbot, Miss Thorne, Jas. Lock, Miss M. Hankey, Sir F. Crisp, T. Stevenson, and F. S. Vallis in grand condition; Mr. G. Hall third, and Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, fourth.

In Messrs. Wells' class for six Japanese blooms of recent introduction Mr. W. Mease led with Merstham Blush, Pockett's Emperor, Rose Pockett, C. H. Totty, Leslie Morrison, and Mrs. L. Thorn; Mr. G. Hunt, gardener to Pantia Ralli, Esq., Ashtead Park, Epsom, second.

Mr. T. Waller continued his successes in the class for two dozen Japanese blooms, and won with good bright colours, showing Mrs.

A. Etherington, Madame G. Rivol, Mrs. A. T. Miller, F. S. Vallis, Edith Smith, President Viger, and Bessie Godfrey. Mr. T. Stevenson was again a capital second, and he had lovely crimson and yellow varieties; Mr. W. Rigby, gardener to the Rev. A. C. Cooper-Marsdin, Wickham Road, Beckenham, third. Mr. W. Rigby led in the class for a dozen Japanese, and he had Mrs. Penford, Bessie Godfrey, and Lady Talbot in good form; Mr. J. Kirkwood, gardener to E. Wormald, Esq., Grass Farm House, Finchley, second, and Mr. W. Mease, third; seven entries.

INCURVED BLOOMS.

There was only one exhibit of thirty-six incurved blooms distinct, and this was from Mr. W. Higgs, who secured first prize with blooms that were not up to his usual form, being rather rough. His best were Topaze Orientale, G. F. Evans, Embleme Poitevine, Clara Wells, Lady Isabel, C. H. Curtis, Buttercup, Mrs. Hankey, and H. H. Thorp. Mr. Higgs again holds the Holmes Cup.

Mr. Higgs scored for a dozen vases of incurved blooms, three flowers in a vase, with fine specimens of Buttercup, Mrs. B. Hankey, Mrs. G. Denyer, H. W. Thorp, Miss E. Holden, Topaze Orientale, Nellie Southam, Romance, Mrs. J. Hygate, Embleme Poitevine, Lady Isabel, and Clara Wells; only one exhibitor.

Mr. W. Mease led for twelve incurved blooms, winning with shapely flowers of G. F. Evans, Mrs. Bryce, Buttercup, etc.; Mr. W. Higgs second, and Mr. J. A. Humphries, gardener to J. L. Burgess, Esq., Hill House, Maisey Hampton, third. For six flowers of one incurved variety, Mr. Higgs scored with H. W. Thorp; Mr. G. Hunt second with Clara Wells; Mr. G. Mileham third with Buttercup.

DECORATIVE EXHIBITS.

Mr. T. W. Stone, gardener to W. H. Stone, Esq., Donnington, Sydenham, scored for a table decoration with bronze and golden flowers; Mrs. A. Robinson, Norhyrst, Park Hill, Carshalton, second; and Mrs. A. D. Ruff, Sharnbrook, Beds, third. In another table decoration class Mrs. Brewster, St. Peters, Canterbury, gained the premier award with white flowers.

Mr. J. A. Humphries led for a vase of pompons and foliage; Mr. T. G. Oliver, Tollington Park, scored for a vase of singles and spidery varieties; and Miss J. Martin, Lancaster Road, Norwood, led for a vase of berries and autumn foliage with a grand exhibit of gladwyns, honesty, privet, physalis, and oak and bracken foliage. Mrs. Brewster was second, and Mr. Humphries third in the latter class.

Mr. J. W. Harrison, gardener to R. Girvan, Esq., Laurie Park Gardens, Sydenham, scored for a large vase of single chrysanthemums. Mr. W. Iggulden led for a vase of five large Japanese blooms with a grand display of Mdme. P. Radaelli; Mr. G. Mileham second with J. Lock; and Mr. Fairweather third with Reg. Vallis. For a vase of yellow Japanese blooms Mr. D. Fairweather was a capital first with F. S. Vallis, and for a vase of white Japanese varieties the chief award fell to Mr. Broom for Mrs. A. T. Miller.

OTHER CLASSES.

Mr. J. A. Humphries annexed the premier award for six vases of market chrysanthemums with fine sets of Soleil d'Octobre, Crimson Source d'Or, Caprice du Printemps, Chas. Davies, Moneymaker, and Viviand Morel. Mr. J. Broom, gardener to Miss Langworthy, Gays House, Holyport, scored for reflexed varieties, and was followed by Mr. J. A. Humphries. Mr. A. C. Horton, gardener to J. L. Boyd, Esq., North Frith, Tonbridge, had easily the best two dozen large anemone blooms in vases, and he showed Sir W. Raleigh, Owen's Perfection, John Bunyan, and Ernest Cooper in good condition; Mr. Henderson, gardener to C. Douglas Clark, Esq., Eccles Hill, Bromley, second, and Mr. J. Humphries third.

Mr. A. C. Horton also led for a dozen large-flowered anemone blooms, and was followed in order by Mr. J. A. Humphries and Mr. A. Henderson. For large-flowered Japanese anemones Mr. A. C. Horton was again successful, and showed those varieties capitally; Mr. J. Humphries second.

Mr. F. Fitzwater gardener to F. Beaby, Esq., Bushey Lodge, Teddington, had the best six vases of pompons, and his varieties were Mdlle. Elise Dordon, Mdlle. Marthe, Prince of Orange, Wm. Sabey, W. Westlake, and Comte de Morney; Mr. J. A. Humphries second. Anemone pompons were best shown by Mr. F. Fitzwater, and singles (a dozen vases) by Mr. F. Brazier, whose best were Brazier's Beauty, Mary Richardson, Chas. Graves, and Nellie Riding. Mr. Fairweather, gardener to the Marquis Conyngham, Bifrons, Canterbury, was second for singles. Mr. T. Stevenson was first, Mr. J. A. Humphries second, and Mr. Brazier third for six vases of singles.

AMATEURS.

Mr. W. Rigby led in the amateurs' section for eighteen Japanese blooms, with Mr. Dennis, gardener to A. Grove, Esq., M.P., Pollard's Park, Chalfont St. Giles, second; Mr. E. Houlton, Croxted House, Dulwich; Mr. C. Fox, Richmond Lodge, Eridge Road, Tunbridge Wells; Mr. W. Gooding, Four Elms, Edenbridge; Mr. E. Wildman, Gordon Avenue, St. Margarets; and Mr. C. Gooch, gardener to T. Wickham Jones, Esq., Frocester Lodge, S. Norwood; were the leading prize winners in the other amateur classes.

FRUITS AND VEGETABLES.

Mr. A. C. Horton was awarded first place for three bunches of black grapes, for Mrs. Pince, finely coloured; Mr. W. Lintott, Marden Park Gardens, Caterham, second, with Alicante; and Mr. W. Howe third with the latter variety. Mr, Horton scored for dessert pears, and Mr. J. Clement, gardener to W. E. Allen, Esq., Commonwood House, Chippenham, had the best apples.

In Messrs. Webb's classes for vegetables, eight kinds, Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, was a fine first with grand onions, tomatoes, leeks, potatoes, sprouts, carrots, and celery; Mr. A. Basile, gardener to Rev. O. Turner, Woburn Park, Weybridge, second; and Mr. W. Waterton gardener to R. H. Comyns, Esq., Heath Farm House, Watford, third.

Mr Robert Sydenham offered numerous prizes for vegetables, and in his class for eight kinds of vegetables Mr. Silas Cole, gardener to Earl Spencer, Althorp Park, Northampton, won the chief award with wonderful Lyon leeks, St. Valery carrots, Wroxton sprouts, Ailsa Craig onions, Autumn Giant cauliflowers, Hollow Crown parsnips, and Clayworth Prize celery, and potatoes; Mr. Basile a good second, and Mr. T. Avery, gardener to J. Kerr, Esq., Loudwater Park, Rickmansworth, third.

In the single dish classes Mr. Avery led for onions; Mr. Cole for leeks; Mr. Bedford, The Braes, Berkhamsted, for beet; Mr. Cole for parsnips; Mr. Basile for sprouts; Mr. Cole for celery; Mr. Basile for red cabbage and for savoys, and also for cauliflowers.

NON-COMPETITIVE.

The non-competitive exhibits once again were a fine feature of the show, and we deeply regret that the severe pressure on our space prevents us from dealing with these in anything like the detail their merits deserve.

Prominent in front of the big orchestra was the large exhibit put up in very artistic manner by Mr. H. J. Jones, Ryecroft Nursery, Lewisham. This display consisted of big bouquets of big blooms of Mrs. A. T. Miller, Mrs. T. Thorn, Reginald Vallis, Master David, Sir F. Crisp, and Buttercup, these being very striking. Singles and decorative varieties were very pleasingly grouped in baskets, vases, etc., and formed the front of a very elegant display. Mr. Philip Ladds, Bexley, had a fine exhibit of small market-grown plants of chrysanthemums, heaths, etc., surmounted by large stands and vases of reflexed, Japanese, and incurved blooms. Messrs. Hobbies Lim., Dereham, contributed a display of late roses, and though the blooms were small, their delicious fragrance was delightful.

Mr. Norman Davis,. Framfield, Sussex, once again put up a delightful exhibit, and his large stand of splendid blooms of Mrs. A. T. Miller, Miss Lilian Hall, Mrs. N. Davis, and the golden Lady Edward Letchworth contained some of the best flowers in the show. In the front there were excellent examples of Algernon Davis, W. Dixon, G. J. Bruzard, J. Lock, etc., and singles were used with ferns and palms to make up a very attractive and artistic display. The Agent-General for British Columbia, Salisbury House, Finsbury Circus, E.C., put up a fine lot of Columbian fruit, the samples of Rome Beauty, Golden Russet, Grime's Golden, Jonathan, and King of Tompkins County apples being particularly good.

Messrs. H. Cannell and Sons, Swanley, had a very good group of apples, pears, and plums, the colour of some of the specimens being especially good. The same firm put up a large exhibit of chrysanthemums and zonal pelargoniums, but the feature of the group consisted of a very fine lot of flowers of single varieties, notably The Lion, Miss Eastwood, Red Start, E. Hottel, Mrs. Maconochie, Frances Mountstephen, and Miss Nellie Curtis. Messrs. J. Peed and Son, West Norwood, had three exhibits, one of perpetual carnations, one of hardy fruits, and a large circular group of chrysanthemums and foliage plants.

Mr. W. J. Godfrey brought up from Exmouth a number of good things, including such Japanese varieties as Laura Hill, Acquisition, G. J. Champion, J. W. Molyneux, Lady Talbot, Frank Molyneux—very showy, May Donellan, and Mrs. A. Arnold, among many others of merit. Messrs. W. Wells and Co., Merstham, had a display of chrysanthemums, showing the plants in bloom; single and decorative varieties were a fine feature, but the feature of the group was the assemblage of blooms of the new pink Japanese variety, Alice Lemon. Messrs. H. Scott and Sons, Woodside, S.E., contributed an interesting exhibit of rustic work, pergolas, garden seats, and sundries. Mr. G. W. Riley, Herne Hill, showed greenhouses, garden seats, arches, etc. Mr. J. Hawes, Clapton, exhibited his patent watercans. Messrs. Pattison and Co., Streatham, S.W., showed their patent horse boots. Mr. Williams, Oxford Road, Ealing, submitted rustic table decorations.

Messrs. Butler Brothers, Burr Farm Nurseries, Bexley, had a very fine lot of market-grown chrysanthemums, all beautifully grown, each dwarf plant carrying from six to nine pretty flowers, all in 48-sized pots. Mr. F. Brazier, Caterham, set up single and decorative chrysanthemums and Michaelmas daisies. Messrs. J. Laing and Sons, Forest Hill, contributed tuberous begonias. Mr. H. W. Thorp, Durrington, Worthing, had Japanese and incurved blooms set up, for the most part in rigid lines.

MEDALS.

Special Gold Medal. — The gold medal offered by Messrs. Clay and Sons for the best non-competitive exhibit in the show, was awarded to Mr. H. J. Jones, Lewisham.

Large Gold.—Mr. Norman Davis, Framfield; and Mr. H. J. Jones, Lewisham.

Gold.—Messrs. W. Wells and Co., Merstham; Mr. W. J. Godfrey, Exmouth; Messrs. H. Cannell and Sons, Swanley (chrysanthemums); and Mr. P. Ladds, Bexley.

Silver-gilt.—Messrs. Butler Brothers, Burr Farm Nursery; Messrs. H. Cannell and Sons, Swanley (fruit); Messrs. H. Scott and Sons (sundries); and Messrs. Hobbies, Lim. (roses).

Large Silver.—Mr. Thorpe, Durrington, Worthing; Messrs. J. Peed and Sons, for fruit and for chrysanthemums; Mr. Riley, Herne Hill (sundries).

Silver.—Mr. F. Brazier, Caterham; and Messrs. J. Peed and Sons, carnations.

CULINARY PEAS.

Knowing how rapidly varieties of culinary peas increase, and also that the more they increase the greater is the difficulty of making a selection of the best, I grew thirty-eight varieties on a plot of newly trenched, heavily manured, stiff soil this year quite in the open, without any protection whatever, for the purpose of testing sturdiness of growth, freedom of production, size of pod, together with the number of peas in each pod, and, above all, the flavour.

I did not grow them with the view of testing earliness, neither did I treat them from an exhibition point of view. Abundant space was given each variety both between the rows and in the rows. Naturally those who require exhibition peas adopt different methods, but by no means all who require peas are exhibitors, and therefore these look upon the culture from a different point of view.

Sowing commenced in the open during the first week in April, and was continued at brief intervals, and as each variety became fit for use its value was noted, with the following result: Dwarf Triumph (Toogood and Sons) is a second early variety, growing 3ft. high; it bears a heavy crop of short pods, which give eight full-sized peas; a capital variety for a limited space. Dr. McLean is also a second early, of well-known quality, and one which, in the rage for huge pods, may be overlooked. This variety bore a heavy crop of short pods, containing as many as nine peas of excellent flavour. Thomas Laxton, 3ft. high, is a useful short-podded variety, bearing a heavy crop, but in dry weather it is quickly over. Dr. Kitchen (Toogood) is 3ft. high; a useful maincrop marrowfat variety, producing an abundance of medium-sized pods well filled with finely flavoured peas.

Harvestman (Carter and Co.) is 5ft. high, and freely produces its medium-sized, exceedingly well filled pods. It is of remarkable flavour, and I look upon this pea as an acquisition. Evergreen Delicatesse (Carter and Co.) grows 2½ft. high, and is an extraordinary variety, because the short, freely-produced pods contain nine peas of first-class flavour. Snowdrop (Carter and Co.) is a 4ft. pea, and a really good early variety, giving short pods of the Ne Plus Ultra type; of robust growth and capital quality. Newtonian (Dickson's), 4ft. high, is a quite good mid-season variety, carrying a full crop of pods with extra large peas of a deep green colour and high flavour. Distinction (Daniels), 4ft., bears slightly curved pods, which contain ten peas. Kaiser (Webb), 3½ft., is quite one of the best peas grown, it bears heavy crops of slightly curved pods which contain nine peas of the finest flavour. Stourbridge Marrow (Webb), 6ft., gives extra large peas of excellent flavour, and, as a tall growing variety, is very good.

Matchless Marrowfat (Sutton), 3ft., is a great favourite for general crop; the freely-borne pods are quite straight, dark green in colour, and are well filled with highly-flavoured peas. Ideal (Sutton), 3½ft., produces its pods freely in pairs, each containing eight or nine full-sized peas of the best flavour. Prodigy (Veitch), 7ft., is a green wrinkled marrow of robust growth; the pods contain nine peas of fine quality; good for general crop. Autocrat (Veitch), 4ft., as a late pea, is not excelled by any variety for freedom of growth and crop of well-filled pods. Alderman, 7ft., bears a heavy crop of excellent pods, each containing ten peas. As a general crop variety, this pea is quite one of the best. The Gladstone, 4ft., as a late pea, is difficult to excel; it bears an abundance of large pods, which contain ten peas of good flavour.

Quite Content (Beckett), 6ft., is much the best of the large-podded varieties, giving straight deep-green pods that are usually well filled with large peas of indisputable flavour. As an exhibition pea this variety stands at the head of all. Duke of Albany is still unrivalled as a general variety for both exhibition and home use. Goldfinder, 6ft., is a pea not nearly well enough known, although quite old, originating in Devonshire and first brought to notice by Messrs. R. Veitch and Sons. As a general utility pea, it is unrivalled for crop, quality, and the manner in which it resists mildew; it can be grown early or late and deserves to be widely known.

Swanmore Park. E. Molyneux.

A USEFUL LATE CULINARY PEA, THE GLADSTONE.

The pods are shown about two-thirds the size they attain under good garden culture.

GARDENING SOCIETIES AND THE RISING GENERATION

The fact that gardening is now a recognised subject for instruction in elementary schools proves that education authorities realise the value of such teaching, not with the object of making professional gardeners of the boys so much as to give them at an impressionable age a taste for horticulture that it is hoped will grow and expand after school days are over. It is only those people who are averse to education of any kind that criticise this modern departure, which would merit its introduction if it did nothing more than encourage lads to be handy and useful; and so excellent are the results up to now that the village school without its garden attached will soon be an exception. As a hobby and an occupation for spare time there is so much to be said for gardening that it at once becomes a fit and proper subject in any school curriculum, and, apart from its value as a manual process, more than one enlightened teacher has shown how a garden can be used to give life and reality to other lessons in the school.

So far so good, but boys leave school at an early age, and it is only in the last year or two that they take an active part in the gardening, which is necessarily of an elementary character. It is not to be expected that every boy member of a school gardening class has a particular bent for horticulture, or even a liking for it, but some, perhaps the majority, have, and the question is what is being done to continue the horticultural education begun at school? A very important epoch in the life of a lad is the period from when he leaves the elementary school until he begins to realise the responsibilities of manhood. Perhaps he wants looking after more in this period than in any other during his career, and the use he makes of his teens makes all the difference to what he eventually becomes. In these days of education the facilities for self-improvement are numerous, and no man has an excuse for growing up ignorant, but there is a tendency on the part of a good many lads to think that, when they have passed out of the elementary school they have done with education, and have no need to learn anything more. This is unfortunate, and all the influence of parents and employers should be brought to bear on youths with the object of inducing them to take advantage of the opportunities placed before them. I say this in all sincerity, for there is hardly a grown-up man to-day who does not wish he had learnt more when he was a youth, and it is impossible to fix old heads on young shoulders.

What are the facilities for the youths of this generation to acquire knowledge in horticulture after the schoolmaster has done with them? I do not refer here alone to those who follow gardening as an occupation, but others to whom gardening may be a recreation and a joy, and who will be better men and better citizens if they have a knowledge of and a taste for horticulture.

As a means to the end in view evening school gardens have been tried in a number of counties, but for some reason or other it cannot be said that they have been highly successful. In fact, I question whether there is any county where they are on the increase, and in some where they did flourish for a time they have decreased with the wearing away of the novelty. Whether it was through the lack of local interest or the want of funds, or whether there was something wanting in the methods of teaching are open questions; but the fact remains that evening school gardens have not developed as it was expected they would at the outset, and in a good many villages the experiment has been given up as a failure.

What are local gardening societies doing in the way of educating the youths and encouraging them to take a living interest in horticulture? This was one of the questions submitted at the recent conference of gardeners' associations, and I doubt if there was any one of greater importance, though I do not see from the report of the proceedings that the discussion supplied much in the way of an answer to the question. It is gratifying to realise that many gardening associations have a distinct educational side, and, through monthly meetings and other means they are doing a good deal in the way of imparting knowledge to their members, but it seems as if even the most advanced of these societies are in need of something in the way of a juvenile branch to attract the lads, and "grow them on," to use a technical phrase, with the hope that in later years, as men, they will help to swell the ranks of the association, and make it more powerful.

To give an idea of what I mean, I may mention the case of a village I know where a few enthusiastic persons started, several years ago, a children's gardening society. By interesting the parents they have induced the latter to give the boys and girls plots of ground for the cultivation of vegetables and flowers. Seeds are supplied to the youngsters by the society, the plots are inspected from time to time throughout the season, an annual show of the children's produce is held, and, during the winter, when active operations are impossible, weekly meetings are held, and the lads are entertained in an interesting way with simple lessons on gardening, botany, and nature study. I cannot help thinking that if this kind of thing were more general it would supply a satisfactory answer to the question asked at the conference, "What are societies doing to educate, horticulturally, the older schoolboys and ex-schoolboys, and what can they do towards that end?"

Going further, it must be admitted that many horticultural societies, particularly in rural districts, have no educational side whatever, apart from the annual exhibition. Certain funds are collected, an annual show is held, a certain amount of prize money is distributed, there are the usual side shows and amusements, and the society disbands, as it were, until the time comes to again call the general meeting and arrangements are made for the next show. What is done for the rising generation at these shows generally consists of providing a class for wild flowers for the children; and more often than not the beautiful things from the woods and hedgerows are bundled together in ugly bunches, and it is doubtful whether half the juvenile exhibitors could tell you even the common names of a quarter of the flowers they show. In a good many cases, I am afraid, village shows are merely a monopoly. A few exhibitors, who are perhaps the best gardeners, or who may have some advantages not enjoyed by their fellows, take all the prizes, and the whole institution stagnates for the want of life and vigour. It can hardly be otherwise if a society exists for nothing more than the mere holding of an annual flower show and fête, and the distribution of so much prize money. It is a pity that it should be so, because the possibilities of even village societies in the way of education are great, and one would like to see every gardening association with a juvenile department that could receive the lads from the village school, and carry on the horticultural education begun in the latter institution.

H.

Fuchsias.—If cuttings were put in early in September they should be nicely rooted by now, and if they are required to make specimen plants next season, either for the conservatory or flower garden, no time should be lost in getting them potted off singly, as they make much better plants thus treated than when left in store pots all the winter. A light compost should be used; pot fairly firm, and afterwards place in a pit or house, where a temperature of about 50 degrees is maintained. The old plants will now be shedding their foliage, and any dark shed quite free from frost will do to store them in for the winter.—Thomas Stevenson, Woburn Place Gardens.

THE MYSTERY OF COLOUR.

"Colour is food for the eye," as an eminent scientist has said, "without which the vision would so weary that the brain would become a prey to melancholy, and even bodily health decay." Indeed, many doctors state that we have not yet sufficiently learned or appreciated the medical value of hues; experiments have been tried now and again, but on no vast scale, and have gone to prove that red, yellow, green, violet, and blue, as well as white and black, have a real influence upon both mind and body.

To the gardener there is practical as well as poetic interest in all this; it is not too much to say that by the right use of flower colours he can add to the cheerfulness and well-being of the occupants of the home. Naturally, the beds and borders immediately before and behind the house are the most important in this respect, but the whole of the pleasure grounds should possess healthful influence, and distant masses of brilliance, if sufficiently large, are certain of effect as seen from the building.

Many English residences, small as well as large, are grey or white, and, if these have on either side a north aspect, the absence of sunshine upon them leaves a sad note in the landscape; to plant dark evergreens by such homes, and then have few gay-coloured flowering plants, and those few dotted about so that they give no display, is to make the scene additionally mournful, and miss a fine opportunity, for white walls and deep green foliage are the perfect background for gold and vermilion, or carmine and purple blossoms.

Scarlet is, no doubt, the most valuable hue, but it is infinitely improved by being associated with a great deal of orange and of gold, the absence of sunshine scarcely proving noticeable where the two latter are represented in sufficient quantity. Crimson is much less advisable, unless it is largely accompanied by purple and mauve, which lead the warm tone down to white, grey, or cream. A Crimson Rambler on a grey house does not materially enliven it therefore, but the scarlet of the geranium certainly achieves wonders; there is great need of a scarlet-blooming climber sufficiently hardy for north or north-east walls; the gorgeous Flame Flower, Tropæolum speciosum, should always be trained up painted wire netting, but is so uncertain that it may die, or prove flowerless.

Last year a noteworthy experiment was tried upon a north front of a dull grey house; this was the partial covering of the walls with a trellis painted vermilion. When yellow variegated euonymus had partly clothed the base, and the white rose Aimée Vibert had mounted above it, the effect was altogether admirable. A few golden privets were induced to thrive in a side border facing west, and scarlet geraniums, orange and yellow day lilies, and montbretias were lavishly employed in the beds, aided by golden calceolarias and pansies. Tropæolum speciosum flourished on the east side of an outstanding rustic porch, where it received shelter, and amber-tiled window boxes, filled with fuchsias helped in the whole result.

There are other houses that suffer from an excess of colour. We are all familiar with the crude appearance of some of the red bricks and roofing tiles used in the building of modern villas; until the walls are well covered by verdure they stand out as crude, eye-scorching objects in the summer landscape. Quantities of evergreen shrubs should be planted near these dwellings, especial colour value being yielded by the blush-white rhododendrons. The pale pink, blue-shaded, of the hydrangea, is also, strange to say, one of the loveliest softening effects against the brick, but this plant is only suitable for warm localities and aspects; blush pæonies, or the yellow and rose pæonies that look a soft flesh shade when viewed as a mass, are also excellent, while there are some blush, pale salmon, and lemon hollyhocks that can be cordially recommended. Though the show is rarely to be seen, the front beds and borders before new red brick houses should be given up to salmon, blush, apricot, and cream flowers as much as possible, mingled with plenty of silver and cream variegated foliage. Creamy-white roses, especially those with evergreen leaves, are the best climbers; Clematises montana and vitalba, white wistaria, and Solanum jasminoides can be highly recommended.

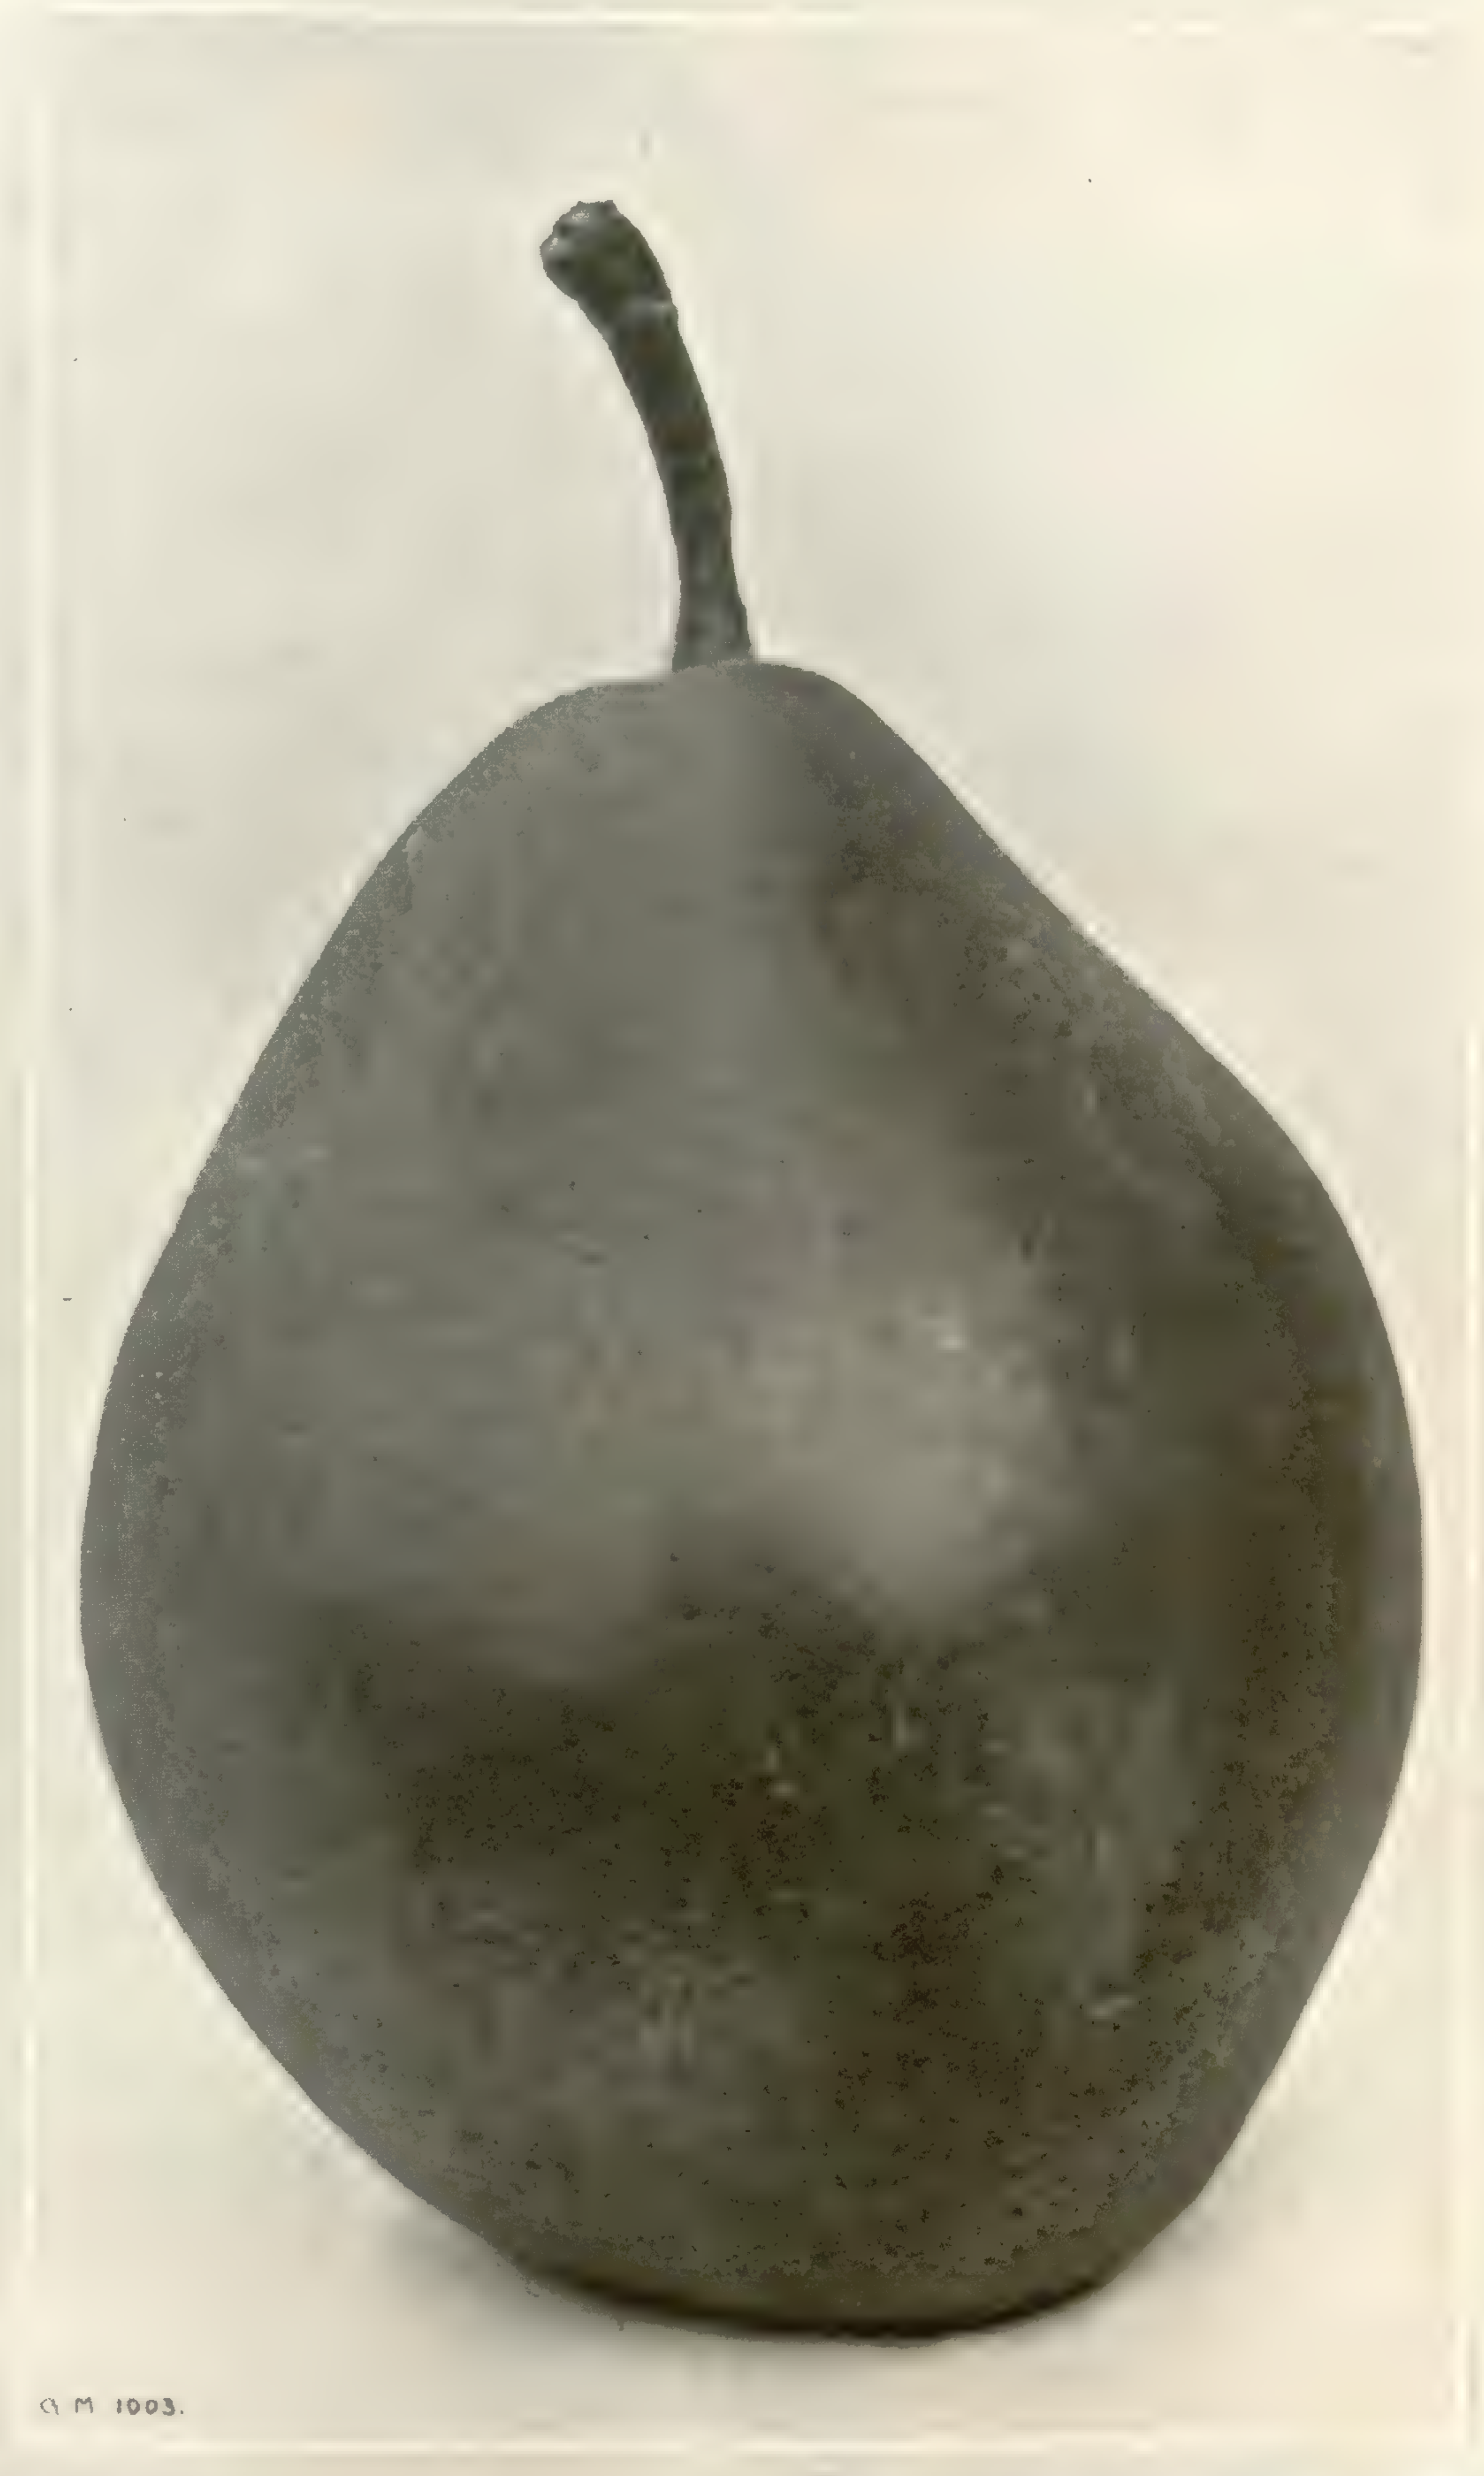
Perhaps it is when we try to place blue in the garden that the mystery of colour is most clearly evidenced; we imagine that on a green lawn it will look inharmonious, but, no, the verdant hue of the turf has a great deal of blue in its composition, especially when moisture-laden, and the deeper green of evergreen shrubs seems to pass the shade on into the delphinium masses. When used near scarlet, whether of bricks or blossoms, Royal blue needs to be accompanied by cream and apricot, that soft tint which is unlike orange; for example, a border of cornflowers and lobelia will be charming in front of a red house only if there is a background of cream and buff-apricot roses. So-called orange day lilies are dull enough in tone to be useful companions for this bright blue.

A white house with only lemon-yellow and amber flowers and dark evergreens and crimson-tinted shrubs and climbers about it will be charming either in sun or shade: the common Berberis aquifolium is one of the most useful of all subjects, because it offers yellow blossom and red-tinted leaves later; the trees near should be Prunus Pissardi, copper beech, and laburnums, gorse and broom will form a satisfactory portion of the undergrowth; maroon hollyhocks will offer a striking summer mass. Dahlias of the same tint, also chrysanthemums, can be relied on to supplement the colour of sunflowers, heleniums, and rudbeckias later. It should always be remembered that the mystery of hues, warm and cold, in sun and in shade, is a great subject worthy of zealous study.

M. H.

PEAR ST. LUKE.

This very fine October pear has been remarkably well shown recently, and has fully justified the high reputation already gained. On Tuesday, October 26, it figured at Westminster in the classes for newer pears, and, as shown by Mr. A. Allan, gardener to Lord Hillingdon, Uxbridge, in his first prize set of three dishes, and by Mr. W. H. Bacon, gardener to Sir Marcus Samuel, The Mote, Maidstone, as the first prize single dish of dessert pears, it proved a great attraction. The variety was raised some years ago by Messrs. T. Rivers and Son, and it yearly grows more popular. Messrs. G. Bunyard and Co., Maidstone, exhibited it finely at a meeting of the Royal Horticultural Society held early in October, and it is one of their fruits we now illustrate. The Maidstone firm describe St. Luke as "very large, of rich mellow flavour, melting and good, and handsome russety fruit."



DESSERT PEAR ST. LUKE.

A typical fruit selected from the fine collection of apples and pears exhibited by Messrs. G. Bunyard and Co., Lim., at a recent meeting of the Royal Horticultural Society.

ROSA RUGOSA.

During autumn the various species of Rosa are conspicuous by reason of their bright-coloured fruits, and of the many in cultivation perhaps none are more attractive than the Japanese R. rugosa and its several varieties and hybrids. In all cases the fruits are highly coloured, but they differ in shape, for, whilst those of the type are round, smooth, and apple-shaped, those of some of the hybrids are considerably narrower and longer, whilst some are hairy. The colour is a bright coral red, and the larger fruits of the type are an inch and a-half in diameter. The outer fleshy portion contains a great deal more pulp than the fruits of most species, and in some parts of the continent this pulp has been used for making jelly, which is said to be very palatable.

Rosa rugosa is an excellent shrub for gardens or for cover planting, whilst it forms a very useful informal hedge. The flowers are large and showy, and the ripe fruits are attractive in autumn.

The hybrids raised between R. rugosa and various garden roses are also very floriferous, and are first rate shrubbery plants. They also have the advantage of being hardier than the ordinary garden roses of the tea, hybrid tea, and H.P. classes, and can be grown in countries which are too cold for those sorts. Two of the best of these hybrids are the semi-double white, Blanc Double de Coubert, and the semi-double red, Mrs. Anthony Waterer. The latter claims General Jacqueminot for its second parent, and much of the rich colour of that variety is noticeable in the partly-opened buds of Mrs. A. Waterer.

W. Dallimore.

NEW PLANTS, ETC.

COLUMNEA MAGNIFICA.

This should prove a useful and popular plant, especially with amateurs who possess a cool greenhouse. It is a gesneraceous plant, and as shown was rather over a foot high, and the growths carried an abundance of axillary, tubular flowers of deep and brilliant orange colour. The mouth of each flower is very interesting, as several of the lobes combine to form a sort of hood, while three other lobes form a lip, the central one being more defined than the others. It is a very showy species, and deserving of extended cultivation. A.M., R.H.S., October 26. Sir Trevor Lawrence, Bart. (gardener, Mr. Bain), Burford Lodge, Dorking.

SINGLE CHRYSANTHEMUM ALTRINCHAM YELLOW.
A.M., R.H.S., Oct. 26, Messrs. W. Wells and Co., Merstham. Flowers deep soft yellow.

CHRYSANTHEMUMS.

Altrincham Yellow. — A large-flowered single variety, very free flowering, and elegant. The colour is deep soft yellow. Equally valuable for conservatory decoration and the supply of cut flowers. A.M., R.H.S., October 26. Messrs. W. Wells and Co., Merstham.

Mrs. R. Luxford.—A medium-sized Japanese variety, with long drooping and curling florets of a bright chestnut-red colour, with golden reverse. The variety is a very handsome one. A.M., R.H.S., October 26. Messrs. W. Wells and Co., Merstham.

CYPRIPEDIUM BEACON MAGNIFICUM.

An effective hybrid between C. J. Howes and C. nitens-Leeanum. It is somewhat like C. Charlesianum. The dorsal sepal is bright green over the lower half, and white above, the green area being also spotted with dark purple-brown. The petals and lip are light greenish-yellow, with purple-brown shading. A.M., R.H.S., October 26. Lieut.-Colonel Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury.

CYPRIPEDIUM ELATIOR REX.

A very pretty secondary hybrid from C. Leeanum and C. Baron Schroder. It has a flower of particularly fine form, and excellent substance. The broad dorsal sepal is pure white, with a green, purple spotted base. The broad petals and the lip are soft greenish-yellow, shaded with purple and brown. We understand this hybrid has now passed into Mr. Francis Wellesley's collection at Westfield, Woking. A.M., R.H.S., October 26. Messrs. James Veitch and Sons, Chelsea.

CARNATION MAY DAY.

There is every reason to believe that this new rich pink carnation will become as popular as Mrs. T. W. Lawson and Enchantress. It is a good grower, and flowers freely, and its flowers are of better form than is the case of many of the perpetual varieties. A.M., R.H.S., October 26. Messrs. R. H. Bath, Lim., Wisbech; Messrs. J. Peed and Son, West Norwood; Messrs. Stuart Low and Co. Enfield.

ASTER BIANCA.

This graceful seedling, from the perennial Aster diffusus horizontalis, has larger flowers than the type, and these are quite white, and about half an inch across. The growth is spreading, the sprays extending horizontally. A.M., R.H.S., October 26. Hon. Vicary Gibbs (gardener, Mr. E. Beckett), Aldenham House, Elstree.

APHELANDRA TETRAGONA.

A bold and effective tropical shrub from South America. It was originally called Justicia tetragona, and then Justicia cristata, but is now referred to aphelandra. A two-year-old plant that flowered at Kew in May, 1908, bore, on one growth nearly 4ft. high, thirteen spikes of brilliant red-pink flowers. These spikes varied from four to seven inches in length. The flowers are tubular, and double-lipped, the lower lip being recurved and almost an inch long. A showy stove plant, with large ovate-lanceolate leaves. Bot. Mag., t. 8,272.

MEGACLENIUM PURPUREORACHIS.

An extraordinary orchid found by Mr. Louis Gentil on the Upper Lomami, a tributary of the River Congo, in 1903. It was not known as a flowering plant until 1908, when a specimen bloomed at Glasnevin. Subsequently it was flowered at Burford Lodge, and exhibited by Sir Trevor Lawrence, Bart., at a meeting of the Royal Horticultural Society held in April, 1909. The small velvety brown flowers are not especially attractive, but the rachis on which they appear is broad, undulate, flattened, and spirally twisted, dull yellow, freely marked with purple. Bot. Mag., t. 8,273.

EUPHORBIA LEDIENI.

A freely-branched succulent plant from South Africa. It was first given specific rank in 1907, but appears to have been in cultivation since 1866, and has been at Kew since 1868. It has stout, grooved stems and branches, stout spikes in pairs, and little clusters of small yellow flowers. Bot. Mag., t. 8,275.

PELIOSANTHES VIOLACEA VAR. CLARKEI.

A graceful orchid-like plant from South-eastern Asia. The plant has a short rootstock, from which the foot-long leaves rise singly. The spikes of semi-pendulous purple flowers also rise independently from the underground leaf stalk. Bot. Mag., t. 8,276.

LÆLIO-CATTLEYA CANHAMIANA.

Hybrids between lælias and cattleyas are now quite numerous, but, notwithstanding their increase, there are few that can compare with, not to say improve upon, the fine old Lælio-cattleya Canhamiana. It first appeared about 1885, and was raised at Messrs. J. Veitch and Sons' Chelsea Nursery. The parentage was not recorded, but the presumption that Lælia purpurata and Cattleya Mossiæ were the parents has long since been verified. In those days Mr. Canham was orchid foreman at Chelsea, and Reichenbach described the hybrid as a lælia. In more recent years the hybrid has been repeatedly raised in various establishments, and when the finest varieties of the parental species have been used, then the result has been a distinct improvement on the original. Messrs. Charlesworth and Co., Haywards Heath, have raised some very beautiful varieties of this hybrid by using one of the white forms of Cattleya Mossiæ as a parent. In the illustration given herewith one of these fine white petalled varieties is figured; it is L.-c. Canhamiana alba, and as in the case of L.-c. Canhamiana albida and L.-c. Canhamiana Rex, the parents were Lælia purpurata alba and Cattleya Mossiæ Reineckiana. This beautiful variety has white sepals and petals, and a purple, gold-marked white-fringed lip.

ROSE GOSSIP.

Among the recent introductions there are two of the newer climbers that have been exceptionally good lately. Flowers of Fairfield may justly be called a perpetual Crimson Rambler, while Delight is a great advance upon Hiawatha here, also much later and apparently more perpetual than most of the hybrid Wichuraianas. This is really good and I can recommend it with confidence.

I cannot induce Florence Pemberton to nearly approach the form I have often seen. But there are many roses that seem made for a certain district; just the same as some seasons suit a variety much better than others. Some old favourites that have been pleasing this season may interest your readers. I have had Marguerite de St. Amand good; of course, smaller than the present day roses, but still perfect in shape. Elie Morel and President Willermoz are a couple of old pinks that are very early and opened well during the cold weather at the end of June. Abbé Brameral and Géant des Battailes have been very glowing. Jean Lambert has produced a few of the best flowers I have seen. What a glowing rose this was considered over twenty years ago. I do not find it in the most complete German catalogues now. Emilie Hausburg has produced a few of its exquisitely-shaped flowers. Souvenir de Marie Zazaya, a rose of 1904, reminds me very much of this old favourite; but the newer variety is an advance in every way, and a much more vigorous grower. The other day I saw a fine plant of Sombreuil (1851) in the corner of an old garden. I could only discover that "it had always been there." With us this rose came too early, and the buds do not expand properly, so that it was a surprise to find it had opened so well during the present chilly season. Souvenir de Charles Montault is another that was doing well in this garden, and so was Lord Raglan. Guilletta—I am not sure of the spelling of this—was one mass of flower, resembling smaller and paler blossoms of Mrs. Paul.

It has been my pleasure during this season to look over several beds of roses that were removed from around an old house last winter. Coarse, bramble-like stumps many of them were, but the owner kept them out of sentiment, and many favourites were brought to mind. All were upon their own roots; indeed, I doubt if foster stocks were used at all when they were propagated. I would like to note here that old standards and dwarfs taken up carefully, trimmed rather hard, both root and wood, will often break into astonishing vigour when put upon fresh soil. Of course, we gradually weed out older and sometimes inferior varieties to make room for the newer introductions. Still I do not think we transplant our older plants often enough for their good.

Now for a word or two about the grand newer roses of the last five years. Lyon needs no more praise except to say that it improves upon acquaintance. In Mrs. Arthur Goodwin we have another of the Soleil d'Or seedlings that has come very well here. It lacks nothing in habit of growth and freedom in flowering. The flowers are not nearly so large as Lyon, but are deeper in respect to the coral-orange and shrimp-pink shade. This is particularly sweet scented. So, too, is Dr. O'Donel Browne, a deep cherry-red crimson, of very large size, and splendid habit. Grace Molyneux is most pleasing in its creamy-white and soft saffron-pink shadings. It is also very floriferous and sweet scented. Not so large and double as might be wished, but one that promises to open well, and be a good autumnal rose.

Among the Wichuraianas there are several grand additions, and these hardy roses have been most pleasing this season. Several crosses between Souvenir de Catherine Guillot, Laurette Messimy, and

LÆLIO-CATTLEYA CANHAMIANA ALBA.

Flowers white, purple, and gold; as shown by Messrs. Charlesworth and Co., Haywards Heath.

Eugène Resal are particularly prominent. I intend to watch these closely and note those which flower more or less continuously. For the autumn Joseph Billiard should be in every collection; it has a large single bloom upon small trusses, and is a glowing orange-crimson, with yellow centre and showy stamens. Crepuscule, one of the newer Noisettes, is grand; a deep buff-orange, very clear, hardy, and a continuous bloomer. S.

HARDY FLOWERS IN SHRUBBERIES.

During September and October many pleasure gardens are not so beautiful, attractive, and interesting as they might be for want of a little forethought, a little money, and a little judicious arrangement of the materials within our reach. The autumnal tints met with in azaleas, acers, cherries, birch, deciduous berberis, etc., are no doubt pleasing in their way, but they incline us to thoughts of the approach of winter, of frost, snow, rain, wind, and do not give us the appetising interest we feel in connection with full blown and expanding blossoms of a more or less telling colour at this period of the year.

These facts were forcibly pressed upon my notice lately on visiting a small but well-kept place where flowering trees and shrubs, herbaceous and alpine plants, and bulbs are utilised to great advantage in maintaining a succession of flowers throughout the year. At the time of my visit the shrubbery beds and borders were gay with Lilium tigrinum, L. speciosum album, and L. s. rubrum, gladioli, asters, sunflowers, hollyhocks, all of which are grown in fair-sized groups. Perhaps the most telling plant was Lilium tigrinum, with its orange-scarlet flowers, borne on stout stems about 4ft. in height. This lilium is one of the easiest to cultivate, and is exceedingly cheap; good-sized bulbs costing about 10s. per 100. It is effective in the distance, beautiful under close inspection, and unequalled for an autumn display of colour. With all these points in its favour it is passing strange it is not more frequently met with? As it grows equally well in both heavy clay and sandy peat, and anything between these two extremes, no special preparation of the soil is necessary for its growth. In making a plantation of this, or any other strong growing lilium, the aim should be to secure a mass of colour, and in order to obtain this, clumps of from 12 to 24 bulbs at a foot apart, should be put in now, or as early as possible, and covered with about four inches of soil.

The different forms of L. speciosum are also admirably adapted for shrubbery beds and borders, and in peaty soils do remarkably well, affording a wealth of variously coloured flowers in autumn. Among the asters (Michaelmas daisies) I like A. Robert Parker, A. cordifolius elegans, A. c. Photograph, A. acris. A. diffusus horizontalis, and A. ericoides Clio for grouping among shrubs. A. Robert Parker attains a height of about 5ft.; A. cordifolius elegans and Photograph, about 4ft.; A. diffusus horizontalis and A. ericoides Clio, about 3ft.; and A. acris, 2ft.

The introduction of these bulbs and herbaceous plants in good sized groups in shrubbery beds and borders, would be a desirable change to the monotonous effect of many old-fashioned shrubberies met with in various parts of the country, and would give life and colour to the surroundings during a rather dull period of the year, as well as afford material to cut from for house decoration. Pedestrian.

THE BEST CHRYSANTHEMUMS FROM AN ÆSTHETIC POINT OF VIEW.

(Concluded from page 842.)

The better early-flowering pompons for cut flower purposes are: Veuve Clicquot, brick-red and yellow, beautiful form; Orange Pet, gold-shaded orange, very free-flowering; Mignon, a miniature-flowered yellow kind, extremely free and pretty; Little Bob, crimson brown, small, and very decorative; Reggie, cream; White Lady, blush white; Lyon, rosy purple; Anastasia, a miniature-flowered light purple kind; Golden Beauty, golden-yellow, beautiful form; and Mr. Selly, rosy pink.

Of early-flowering singles there is now an abundant supply. A dozen varieties worthy of recognition are Jessie Wallace, old rose and salmon; Surrey, salmon cerise, lovely under artificial light; Pathfinder, bronzy buff, beautiful in sprays; Dr. Ingram, terra-cotta, of good form; Eric, bronze on yellow ground; Firebrand, bright chestnut, has long stalks; Spitfire, a flower with several rows of florets, bright fiery crimson, shading to red with gold points to florets; Nellie Riding, reddish-bronze, shaded gold; Kathleen, golden-salmon, beautiful under artificial light; Pride of Merstham, reddish-purple, useful for its colour; Kate Carter, a large salmon-coloured flower, faintly shaded chestnut with yellow zone round disc; and Jeanette, a pretty blush.

Mid-season or late October and November-flowering decorative chrysanthemums embrace a very large number of charming varieties, and to make selections of the better kinds renders the task a somewhat difficult one. Nevertheless, I am pleased to select from among the many noteworthy varieties the following:

Japanese kinds should be represented by Gladys Roult, a very pretty snow-white kind; Kathleen Thompson, rich chestnut, tipped gold; Market Red, bright red; Mr. W. Hubert, pretty salmon-pink; Source d'Or, rich terra-cotta; Lizzie Adcock, golden-yellow sport from the last-named; Maxim, bright, reddish-crimson; Moneymaker, white; Phœbus, rich golden-yellow; Felton's Favourite, beautiful white; R. F. Felton, richest golden-yellow; and Noreen Jay, brilliant crimson-scarlet.

Incurved varieties that are worthy of inclusion in this list are: Mrs. Geo. Rundle, pure white, small, but charming for decorative work; Mr. Geo. Glenny, primrose-yellow; and Mrs. Dixon, golden-yellow, all three members of one family.

Reflexed are best seen in Golden Elsie, rich yellow, very free; and Cullingfordi, a well-known late November variety of a brilliant scarlet-crimson colour.

Japanese anemones and large-flowered anemone chrysanthemums should be given especial attention, and the following varieties are useful for cut flowers when the plants are grown in a free manner: Madame Robt. Owen, pure white; Mrs. Caterer, a chaste white kind, very free; Sir Walter Raleigh, pale blush centre, tipped gold; J. Thorpe, jun., rich golden-yellow; Descartes, bright crimson-red; Gluck, orange-yellow; Owen's Perfection, lilac, tinged gold, guard petals bright lilac; Kathleen May, rich glowing crimson, a beautiful decorative variety; John Bunyan, very fine rich yellow variety; and W. W. Astor, blush guard florets, disc yellow, shaded rose.

Anemone pompons should be encouraged, a few of the better kinds being Marie Stuart, blush, sulphur centre; Emily Rowbottom, blush white sport from the first-mentioned, beautiful in sprays; Firefly, small scarlet-red flowers, very free; Antonius, bright yellow; Calliope, ruby red; and Gem of Earlswood, rosy blush, citron-yellow disc.

Single-flowered chrysanthemums to bloom in November make a goodly list in themselves. We have a preference for the following large-flowered kinds; Edith Pagram, rich pink; White Edith Pagram, white and bronze; Edith Pagram, reddish-bronze. These three kinds are members of the same family as the name suggests. Other kinds are Felicity, pure ivory-white; Pink Felicity, a lovely bright pink variety, possessing exquisite form; Mary Richardson, reddish terra-cotta; Metta, deep magenta red with white zone round disc; Miss Irene Cragg, white, a beautiful variety; Sylvia Slade, lake with white zone round disc, beautiful in sprays; Reginald, bright lemon-yellow of good form, evolved on long footstalks; and Merstham Jewel, bright bronzy-red with effective yellow disc, beautiful when partially disbudded.

Of the small-flowered singles a few of the better kinds should be mentioned, notably Mary Anderson, pale blush; Mrs. J. Ferguson, pink; and Miss Annie Holden, pale-yellow, all members of one family, and of beautiful form; Emily Wells, clear pink; Gretchen, pure white with green eye, a dainty little thing; Little Nell, pure white, free, erect stems; Treasure, bright yellow, small flowers, late November; Terra-Cotta, bright terra-cotta; and Lily Riddle, scarlet terra-cotta, flowering in late October.

The better pompons for November displays should include such sorts as Florence Carr, a lovely deep bronze flower of good form; Katie Mannings, charming rosy bronze; Mdlle. Elise Dordan, silvery-pink, so well-known to all growers; Model of Perfection, rose lilac; Snowdrop, pure white; Primrose League, pale yellow sport from the last-named; Eynsford Gem, purple rose; and Rosinante, blush rose, which should be disbudded; it is extremely free-flowering.

The list would not be complete without a few of the spidery kinds, and the better varieties in this section are undoubtedly Cheveaux d'Or, golden-yellow, very fine; Jessie Madeline, Cole, soft canary-yellow; rather large flowers; Mr. W. Filkins, golden-yellow, very dainty; Mrs. Jas. Carter, a thread-petalled yellow kind; Sam Caswell, a lilac pink flower of similar form; Mrs. W. Butters, a fluffy white flower; and King of Plumes, deep golden-yellow, the largest of the type.

Really late kinds are comparatively few, Japanese sorts should include Heston White, white; Allman's Yellow, yellow; Negoya, yellow; Framfield Pink, pink; Tuxedo, bronze; True Gold, rich yellow, stiff stems; Mdlle. L. Charvet, light pink; and Western King, a glistening white. Good decorative singles are represented by Thirza Cherry, soft blush mauve, long tubular florets; Aurora Boreale, orange, shaded crimson; Framfield Beauty, deep rich velvety crimson; Nora Davies, reddish terra-cotta; G. W. Forbes, rich crimson amaranth; J. T. Angus, rosy cerise of medium size; Robert Morgan, an intense rosy amaranth of large size; and Wyndham, a good pure white kind.

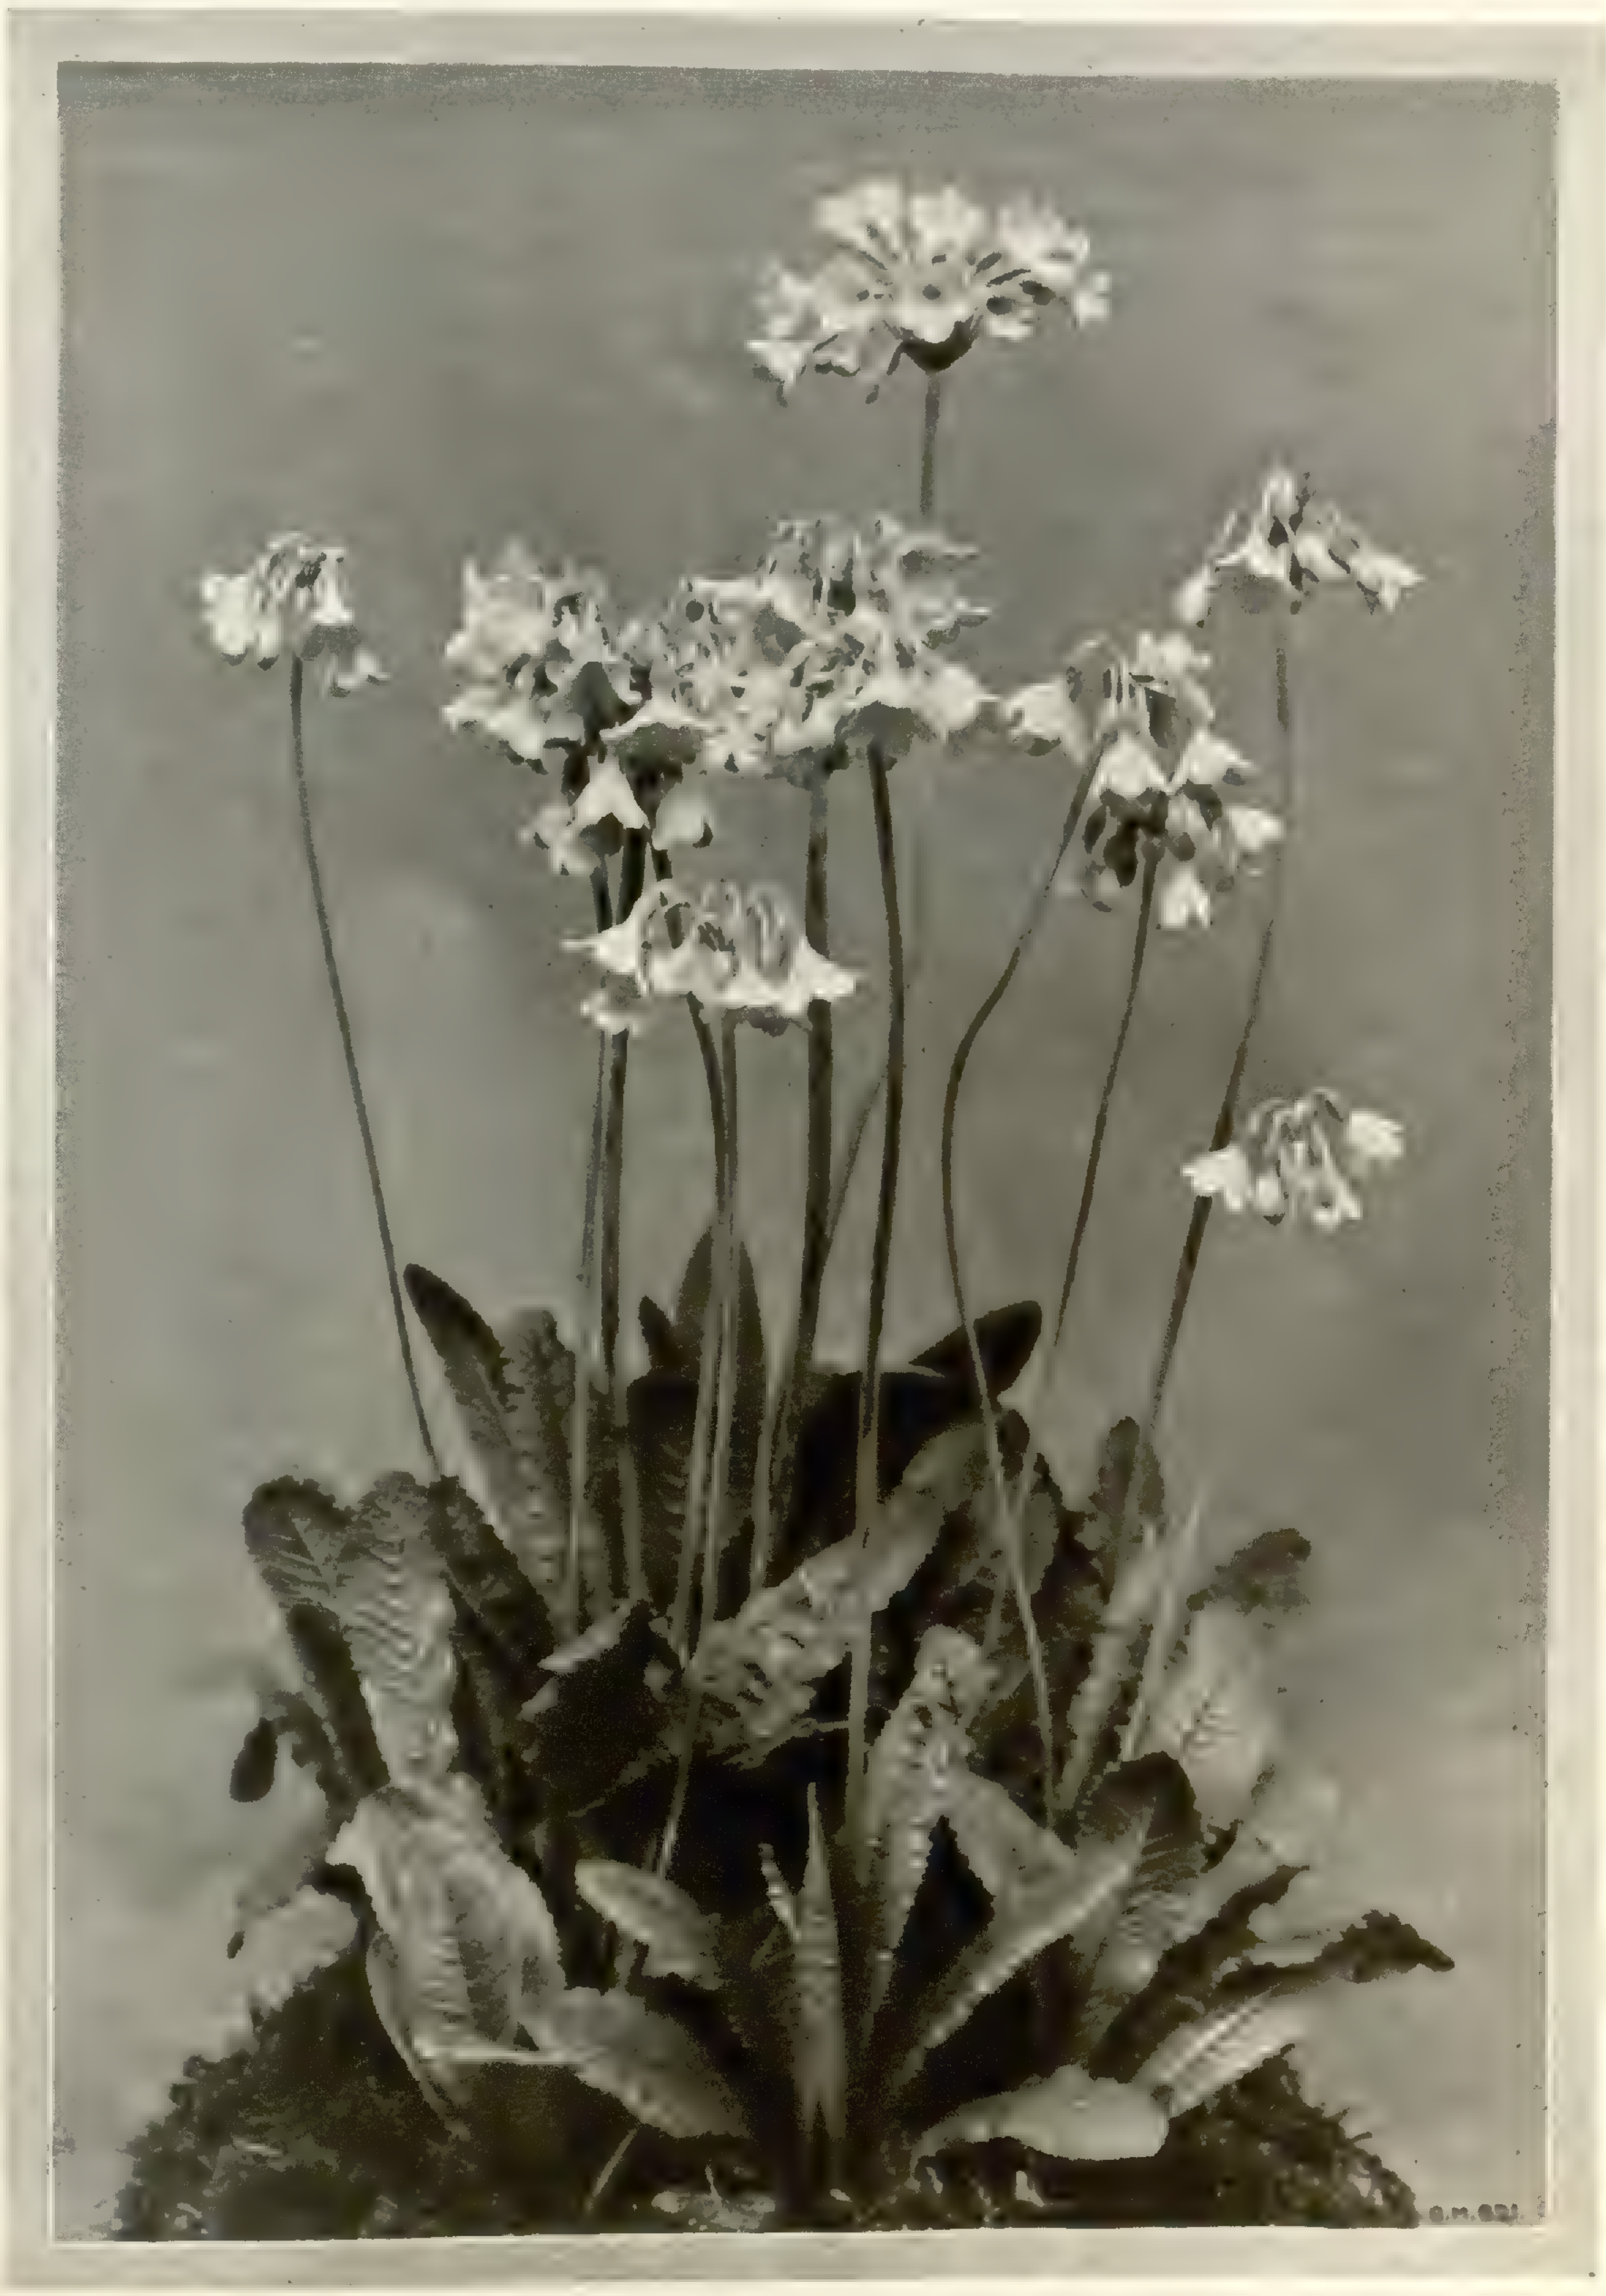
These somewhat lengthy lists should provide food for reflection for those who wish to maintain a supply of beautiful chrysanthemums over a long period. The newer varieties should be enquired after, and they should supersede the old and less interesting kinds from time to time, as occasion offers.

COTONEASTER FRANCHETI.

This is one of the more recently introduced species of cotoneaster, as it was received from Yunnan but a few years ago. It has, however, already found for itself a place in our gardens, for it is of fine decorative appearance by reason of its bright red fruits. It attains a height of four or five feet, and bears oval leaves three-quarters of an inch or an inch in length, which are hairy or pubescent on the under surface. The flowers are white, and borne during May and June, while the ripe fruits are red and at their best during late August and September. It thrives in loamy soil, and is adapted for planting either singly or several plants together as a group in the shrubbery. Cuttings of half ripe wood may be rooted in summer or young plants may be raised from seeds which mature freely. W. D.

PRIMULA SIKKIMENSIS.

Found in the Sikkim Himalaya and introduced in 1850, the delightful Primula sikkimensis is one of the most distinct and elegant of the many members of a large family. The drooping pale yellow flowers, borne in umbels on slender scapes, always arrest attention by reason of their elegance and beauty. Not only is it a charming hardy plant for the rock garden and for moist sheltered places, but it is very useful when grown in pots in a frame or cool house for conservatory decoration early in the summer. It thrives best in peaty soil, and is seen at its best when grown in colonies in such soil, in a shaded position near the margin of a lake, pond, or stream. In some gardens it does not last long, and in such cases it is desirable to treat the plant as a biennial, and raise a new stock each year. P. sikkimensis is quite easy to propagate either by division or from seeds. The latter are best sown as soon as ripe in a cold frame, while division is best carried out in the spring time just as the new leaves begin to push forth. Where it does really well P. sikkimensis will often produce umbels containing from forty to sixty flowers, and it is then particularly fine. Our illustration shows a well-grown specimen exhibited in the spring by Mr. G. Reuthe, Keston.



PRIMULA SIKKIMENSIS.
— Flowers pale yellow.

HARDY ORNAMENTAL VINES.

During recent years a decided impetus has been given to the cultivation of hardy vines, due in great part to the introduction of new species and varieties, which exhibit many diverse forms of leafage, and in the autumn the majority of them take on very rich colours.

It is in this latter respect that the potentiality of ornamental vines for garden decoration chiefly lies. Throughout the summer months they present a pleasing and interesting appearance, chiefly owing to their different shapes and varying shades of green, but with the approach of autumn the leaf-colouring undergoes a marked development, the normal green becomes suffused with shades of purple, orange, pink, red, crimson, or violet, or these in many combinations often in one and the same species. This galaxy of colouring is most pleasing where the various kinds are allowed to interlace with each other.

In order to secure these autumn tints to the full, it is necessary to plant the vines in positions where they secure the fullest sunlight, and no objects must be allowed to shade them at any season, and if it is possible to plant so that the beholder may view the leaves with the sunlight passing through them; with these conditions their lustrous colours are most fully revealed. Probably these conditions are more readily fulfilled upon the pergola than under any other system of planting. Lightness and grace characterise the growth of each, and it is upon such a structure that their individuality is most clearly shown, and in view of the interest taken at present in all hardy subjects, the distinctive character of the vine pergola as an adjunct to the autumn garden is one that readily appeals to all.

The best rooting medium is ordinary garden soil to which a moderate dressing of well-decayed farmyard manure is added; in practice, the aim of the cultivator is to lay a good foundation and to cover the structure as soon as possible, this being soon secured by planting in rich soil, while the development of the autumn colours is favourably influenced in future years by a judicious process of semi-starvation. A porous soil is that in which vines succeed best, and as several of the following kinds are not over hardy, the addition of a liberal drainage material is recommended where soils are inclined to heaviness. The best season for planting vines in the open is late in spring and early in the autumn, and as the plants are usually supplied in pots they may be safely planted at any time from April to November.

The following kinds embrace those in general cultivation: Vitis bipinnata, a small-leaved species having slender shoots and deep three-cleft leaves; the normal colour is bronzy-green, which deepens along the margin to reddish-crimson in autumn. V. heterophylla dissecta, leaves small, deeply five cleft and much cut, bright green, changing to yellow and orange in autumn. V. Henryi, leaves five-parted, small, coloured purplish-red, with silver midribs; the growths are slender, and it is most distinct. V. melagophylla has large compound leaves of a bright green colour, upon slender, reddish footstalks; a graceful and fast-growing vine. V. Thomsoni has its leaves five-cleft, as in V. Henryi; in colour pale green, changing to pink and reddish-crimson in autumn. It is only a moderate grower.

Of the large-leaved kinds V. æstivalis is characterised by having the underside of the young leaves covered with silvery tomentum, the upper surface being coloured pink and pale green; the mature leaf resembles those of V. vinifera, in having five irregular lobes. V. vinifera purpurea has five-lobed leaves that are toothed; the leaf colouring is rich bronzy purple. V. armata has medium size leaves, heart shaped, bronzy-green, changing to crimson in autumn; the leaf-stalks are covered with small prickle-like structures. V. amurensis produces large, rounded leaves, which change to rich shades of pink and yellow in autumn. V. Coignettiæ differs from the latter in being more heart-shaped, while the autumn colours are most rich and varied. V. Coignettiæ purpurea is a very richly coloured form, in which violet-crimson predominates. V. Thunbergi and V. Coignettiæ are the two largest- leaved species of hardy vines, and both are rampant growers when established; the autumn tints of V. Thunbergi are bright scarlet and crimson.

Walmsgate Gardens.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

THE COOL HOUSE.—Since the introduction of so many useful garden-raised hybrid odontoglossums, it naturally follows that we have a wider range of plants flowering during the winter months of the year, and as they are practically all more vigorous in constitution than even the most easily grown species, little difficulty is found in their successful cultivation, which fact should ultimately lead to their general use. The plants that are now pushing up their flower scapes must be carefully protected from slugs and snails; these pests are frequently introduced in the egg stage with the sphagnum moss and potting compost, when the plants are repotted, and they are capable of doing a considerable amount of damage to the tender flower scapes. It is a good plan to wrap a small piece of cotton wool around the base of the flower scape or round the base of the leaf where the flower scape is advancing. This is not claimed as a sure preventive, but cotton wool forms an obstacle which the slugs find difficult to surmount. Some lettuce leaves, bran, or brewer's grains placed on pieces of glass or broken crocks, and laid about the stages form good feeding grounds, where, with the aid of a light at night, slugs are easily caught and destroyed.

FLOWERING PLANTS.—Plants that are pushing up their flower scapes at the present time, and during the winter, should be placed in a position where they may obtain all the available light. One frequently hears complaints about odontoglossum flowers lacking in texture, and not lasting when cut for decorative purposes. There can be no doubt that the cause is due to the pseudo-bulbs not being properly ripened. It is only natural where growths are obtained which a few years ago would have been considered impossible in size and substance, that to induce a corresponding return for such advancement we must procure proper maturity. I have experienced the difficulties of growing orchids in town localities and districts where the light for the next few months is more or less obscured, and I am in sympathy with those who so work. It is far better to remove flower scapes from odontoglossums if they are likely to expand in the depth of winter, where the conditions are unfavourable, and where the flowers produced during this period cannot even under the most favourable outside conditions give satisfaction.

HEAT AND MOISTURE.—Care must also be taken to prevent sudden fluctuations of temperature, as the sudden changes of the outside temperature naturally affect the inside conditions. Damping the floors and stages should not be done unless the normal temperature of the house has been reached. No hard and fast lines as to how often during the day a house should be damped can be laid down, because the conditions under which plants are grown are so varied, and outside conditions change so quickly.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

WINTER-FLOWERING CARNATIONS.—These will now be throwing up their flower stems pretty freely, consequently they must be given regular attention as to tying. The flower stems should be loosely slung to a central stake, and at the same time any loose growths should receive support. Some varieties that are particularly susceptible to rust should be isolated from the rest, and have all affected parts carefully cut away, afterwards spraying them over with some fungicide; this method will in time free the plants from their very undesirable pest. Liquid manure may be given whenever watering is necessary, though just now they will not require a great deal unless they happen to be near the hot-water pipes. Ventilate freely on all fine days, and keep up a night temperature of from 50 degrees to 55 degrees, according to the state of the weather outside.

CHRYSANTHEMUMS.—These are now making a good show, and the large-flowering ones must be carefully examined and have all damped petals removed, or the loss of good flowers will follow; keep the houses as dry and cool as is consistent with the weather outside, so as to prolong the flowering season as far as possible. Up to the time of writing there has been no frost to damage anything outside, consequently many of the late-flowering decorative varieties have been standing in the open, but as room permits they should now be removed indoors, giving them all the room possible. Some of the varieties, such as K. Thompson, Princess Victoria, Dazzler, J. W. Crossley, Winter Cheer, etc., may with advantage be disbudded to one bloom on a stem, and these will give some good-sized blooms for decoration when the bulk of the large-flowering varieties are over. Do not stint liquid manure for these late batches, as many of them will be quite two months before they are well into bloom; the clear water will be the best for those that are now opening.

CYCLAMEN AND PRIMULAS.—Plants that have been growing in frames will do better if removed to a shelf or stage in a cool greenhouse; remove any dead or decaying foliage, and see that all pots are cleaned as they go in. If the primulas are showing signs of blooming they may be placed in a slightly warmer house than the cyclamen. Primula obconica I have found does better if given even a slightly warmer temperature than Primula sinensis. The new and popular P. kewensis, being very nearly hardy, does best if placed in a house where fire heat is only given during very severe weather.

BULBS.—Some of the earlier bulbs, such as Roman hyacinths, Paper White and Van Sion narcissi, and Van Thol tulips, that were potted up very early, should now be advanced enough in root growth to warrant their being removed to a house or warm pit for gentle forcing; it is advisable to bring them along gently at first, giving more heat as the flower buds appear.

AZALEA INDICA, ERICAS, ETC.—These have been quite safe in some sheltered spot out of doors or under temporary shelters, but provision must now be made for them in a cool greenhouse; very little fire heat is necessary for these subjects, in fact, they greatly resent a really dry atmosphere, so unless they are wanted early a house with a north aspect will suit them well. One or two of the early-flowering azaleas, such as Deutche Pearl, Fielder's White, and indica alba, may be introduced into a slightly warmer house, where they can be syringed overhead, when they will soon come into flower, and provide bloom for cutting or useful plants for conservatory decoration.—T. Stevenson, Woburn Place Gardens.

THE FLOWER GARDEN.

SPRING BEDDING.—Although up to the time of writing frost has not occurred to necessarily compel the removal of the plants that have done duty through the summer months, it is now advisable to clear the beds and replant with spring flowers, thus enabling the plants to become well established before winter. All plants of the latter, such as myosotis, wallflowers, arabis, etc., should be lifted with nice balls of soil, and planted with a trowel, the holes being made sufficiently large to receive them without difficulty; make the soil firm in the process of planting. These will require planting fairly close without being crowded, and in many cases bulbs should be arranged with them to stand out and relieve the flatness and contribute to the colour effect. For this purpose there are many good tulips belonging to the early-flowering section which produce fine self-coloured flowers on long stalks, and these should be planted as early as possible after the other subjects. This should be done by means of a large dibber, and holes should be made about four inches deep, and planted about ten inches apart each way, and the bulbs should be lightly covered with fine soil. Hyacinths are perhaps the most effective when in flower, and, whether massed in one colour, or planted to form a design, as illustrated in the London Parks, make bold displays. These require a good soil, well drained, to be satisfactory, and the bulbs should be buried five to six inches deep, and eight to nine inches each way. Many of the tulips make striking beds when planted by themselves, especially the double-flowering varieties and those with variegated foliage. Polyanthuses should also be included; these give abundance of flowers, which last over a considerable period, and a good strain should always be grown which produces the best and largest flowers. These in all cases should be eagerly sought after, as many are distinct improvements on the older existing varieties.

PLANTING.—For displaying many of the hardy climbers there is no better method than training them up substantial poles. Not only do these show them off to their best advantage, but also make a striking change when placed about the shrubberies. The present is a suitable time for fixing the poles in position and planting the subjects to cover them. The best poles to use are larch, and for larger climbing subjects, such as many of the rambling roses, Clematis Jackmani, etc., should be at least ten to twelve feet out of the ground, and additional support given them by means of struts, which also break the formality, and enable more growth to be used without overcrowding. The ground should be well worked, and some good turfy loam and road scrapings added. There are many plants to choose from suitable for this purpose, including roses, vines, honeysuckles, Clematis Jackmani, which produces a wealth of flower when the roses are past, C. orientalis tangutica, a yellow flowering species, and a decided acquisition; the coccinea hybrids, as Countess of Onslow, Duchess of Albany, and Akebia quinata. Several of the newer introductions from Western China, as Actinidia chinensis and others, should be included. Many good rubus, including Ichangensis, Lambertiana, Parkeri; loniceras, Polygonum multiflorum, and some of the beautiful vines, are also most desirable.—E. Beckett, Aldenham House Gardens.

HARDY FRUITS.

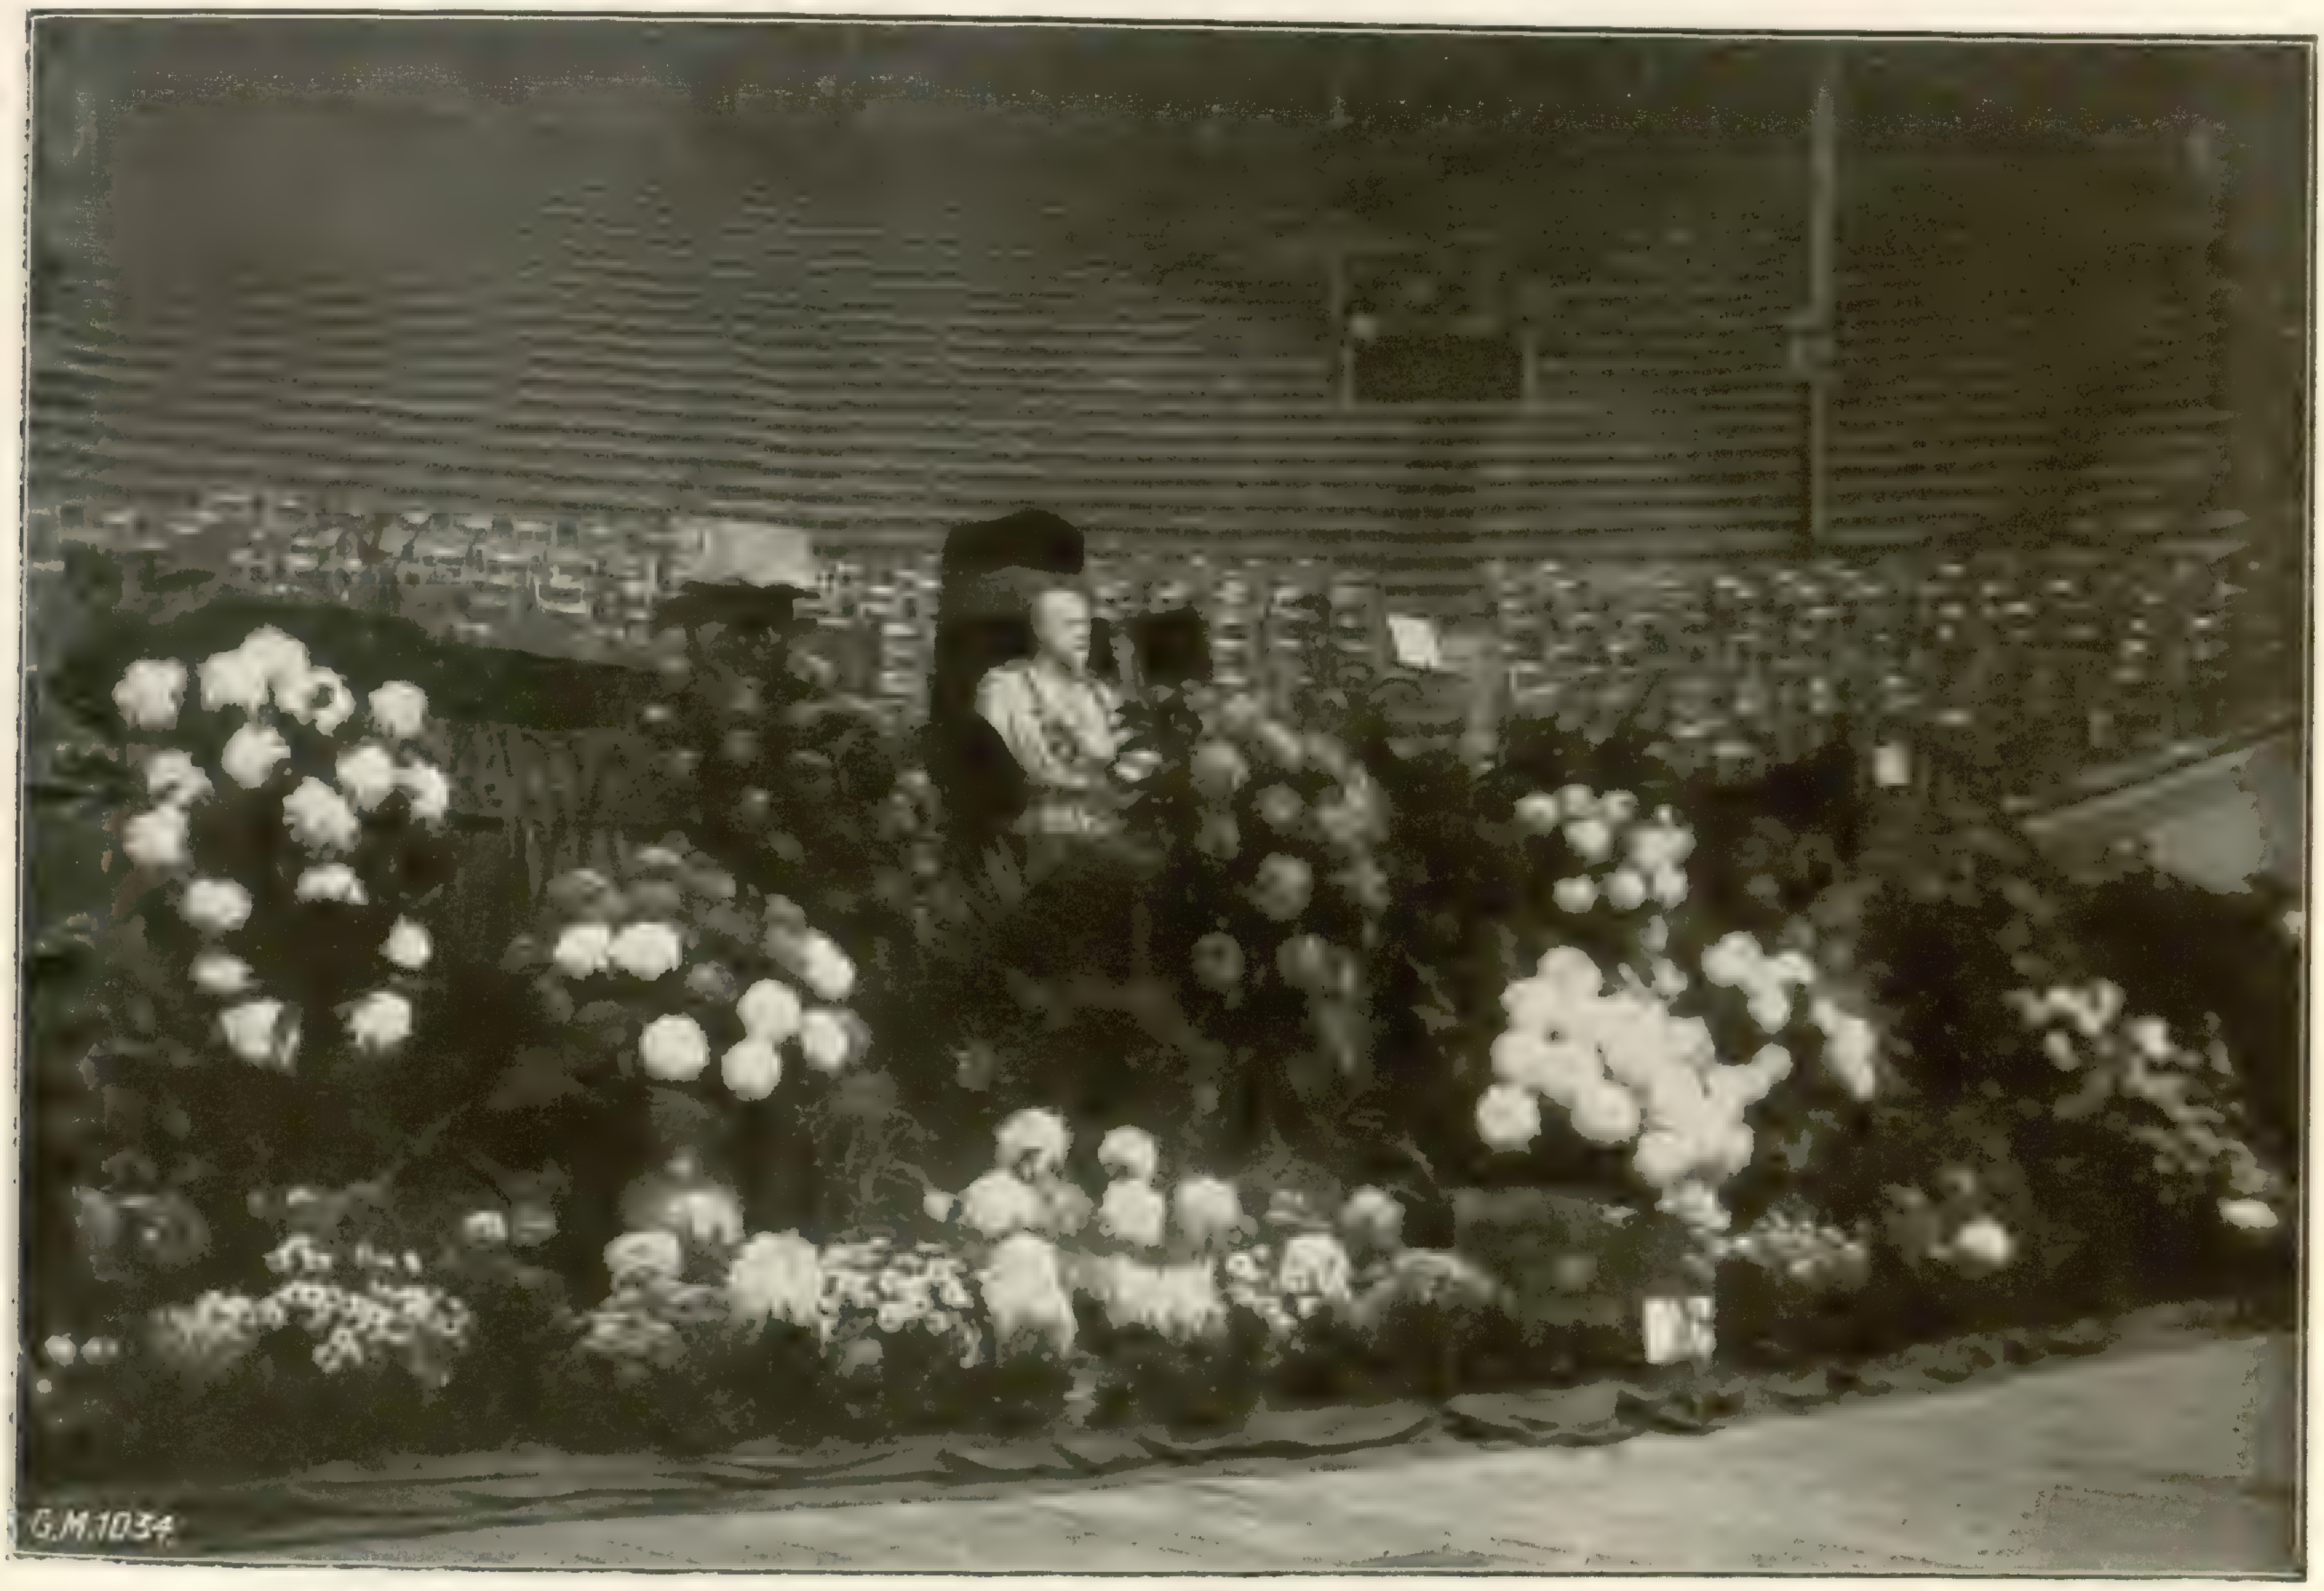
RED AND WHITE CURRANT CUTTINGS may be prepared and inserted in nursery beds as soon as the leaves have fallen. Select sufficient clean healthy shoots of the varieties found most suitable, and of this season's growth, from twelve to fifteen inches in length. Make a clean horizontal cut through the base of the cutting, immediately below a bud, cut out the bud at the point, reserve the next three, and rub out the remainder.

BLACK CURRANTS.—Cuttings of these may be treated in a similar manner if single stemmed bushes are required, but usually the cuttings are inserted without removing any of the buds, with the exception of the one at the point, thus encouraging the production of strong growths from the base, which are found very useful to replace the older branches as they become worn out. A border in a fairly open position should be chosen, and where the soil has been well manured for a previous crop. The cuttings may be inserted in rows one foot apart, eight inches between each cutting, and about six inches deep. Cut out with a spade a small trench six inches deep in which to place the cuttings; keep the latter in an upright position, and if the soil should be of a retentive nature a little sand sprinkled about the base of the cuttings will help the formation of roots. Make each cutting firm by treading.

GOOSEBERRY CUTTINGS may be prepared as advised for red and white currants; some of the buds are very small, and require close attention to remove them all from the lower portion of the cutting; remember that suckers on gooseberry bushes are most undesirable. One-year-old bushes which have made some healthy growth, and are found to be well rooted, should be removed from the nursery bed and planted in an open position two feet apart each way. The weaker plants are best left where they are for another season.

VARIETIES.—Cherry, La Versaillaise, Red Dutch, and Warner's Grape are useful varieties of red currants, while White Dutch Cut-leaved and Leviathan are both good white currants. Of the black varieties we find Boskoop Giant, Black Naples, and Lee's Prolific the most satisfactory. It is almost impossible to make a selection of gooseberries owing to the large number catalogued, but the twelve here enumerated comprise useful kinds for either kitchen or dessert purposes. Red: Whinham's Industry, Lancashire Lad, and Crown Bob; white: Whitesmith, Antagonist, and Careless; yellow: Mount Pleasant, Gunner, and Gipsy Queen; green: Overall, Keepsake, and Thumper.

RASPBERRIES.—The trenching, manuring, and preparation of the new quarter for these has been much delayed by a continuance of wet weather, and although it is not advisable to get on the ground while it is in such a saturated condition, still every opportunity should be taken when the soil is at all workable to have everything ready by the time the young canes are fit for planting. Stakes, posts, and wires, or iron hurdles, which are to be used for support, are best fixed before planting, that there may be no disturbance of the roots afterwards. In old quarters, after the old canes have been cut away, and sufficient of the new ones tied in to replace them, examine the rows for any vacancies which may have occurred during the past season, and make these good with plants that have been growing in the nursery bed for a year. As soon as the leaves have fallen gather them up, with any weeds that may be seen, and dust the whole of the surface with some freshly slaked lime, afterwards mulching the alleys with a good dressing of farmyard manure. The winter's rain will carry the manurial properties down to the roots.



MR. H. J. JONES'S LARGE GOLD MEDAL EXHIBIT OF CHRYSANTHEMUMS
At the National Chrysanthemum Society's Show, Crystal Palace, November 3, 4, and 5.

AMERICAN BLIGHT.—As the leaves fall from the apple trees, the presence of this pest is most easily discernible. The woolly covering under which the aphis protects itself is practically impervious to all kinds of spray fluids, but I have found that an ordinary paraffin emulsion, applied at this season of the year by a forcible garden engine, is one of the best remedies for keeping this destructive pest in check, and it should not be neglected wherever this pest is found.—Geo. Woodgate, Rolleston Hall Gardens.

THE ADVANCE OF FORESTRY

In his opening lecture before the class of forestry in the Aberdeen University, Mr. William Dawson, M.A., lecturer on the subject, said:

Within the last twelve months forestry matters have indeed made a great advance, and at last there is a likelihood of this long-neglected industry so developing as to occupy its proper position. The period of national indifference is past, and the true significance of forestry as a national question is becoming more generally understood. The forest appeals to all classes, and all sides of the question are being brought forward, but it must be understood that the production of timber is a business. An industrial nation is dependent on a sufficient supply of wood, for all industrial activity requires its use. We have all the elements necessary for successful timber production in our country, yet we have been content to buy from other producers and let our own resources remain undeveloped. Common sense tells us that is bad business. In Scotland we are faced with the startling fact that 65 per cent. of our land surface is neither town land, nor agricultural land, nor is it woodland. There is no doubt that several million acres of this is absolute forest land—that is, land which will realise its fullest use under trees. Thus we have at least one source of national wealth still waiting development.

Increased activity in forestry will lead to the development of many other industries. It is, indeed, such a fitting complement to agriculture that it would help to bring the ideal of small holdings nearer realisation. In Germany three-fourths of the forest workers follow some other occupation, many being small holders who look to the forest to supply them with work for regular periods of the year. Decades of neglect cannot be remedied at once, for from the nature of forestry there is every need of caution. We cannot, however, be accused of rashness in the matter, for while every civilised country has been advancing and developing, founding schools of forestry, and carrying out investigations and experiments, we have been more or less passive; but now there is a likelihood of active steps being taken to improve matters. In the Development Bill, at present under discussion, there is the clause: "Forestry, including the purchase and planting of land, the conducting of inquiries, experiments, and research for the purpose of promoting forestry and the teaching of methods of afforestation." These proposals are wise and considerate, and will go far to set matters right. Then, again, illustrative of the changed attitude of our legislators towards forestry, we find in the Finance Bill a substantial concession as to the payment of death duties on the value of forests. It is proposed that, on forests which are being managed on approved sylvicultural lines, the payment of the duties on the value of the woods may be deferred till the timber is mature and its value realised. This, too, is a great advance, and should help matters greatly. The way for greater developments is now paved. There are still many directions in which advance can be made. The industry can become a big one, and there is need for increased facilities for providing for education in work which is really highly specialised, demanding a wide range of knowledge. The present activity of forest owners ought to be encouraged, and they could be substantially helped by the provision of increased facilities for education.

BIRMINGHAM GREAT CHRYSANTHEMUM SHOW, BINGLEY HALL, TUESDAY, WEDNESDAY, and THURSDAY, Nov. 9th, 10th, and 11th. Secretary, ALFD. NOAKES, 148, Bristol Street, Birmingham.

BRADFORD CHRYSANTHEMUM EXHIBITION in ST. GEORGE'S HALL, on FRIDAY and SATURDAY, November 12th and 13th.
£27 for 24 Japanese (on Boards).
Prize Money for Open Competition again Increased.
Entries Close November 6th.
Schedules with entry form post free from H. SPENCER, Hon. Secretary, Horton Park, Bradford.

LOWER MARKET,
EXETER.

DEVON AND EXETER HORTICULTURAL SOCIETY'S
FLOWER, FRUIT, ETC., SHOW,
THURSDAY and FRIDAY,
November 11th and 12th.
SILVER CHALLENGE CUP, VALUE £30, FOR CUT BLOOMS. SPECIAL PRIZES for CIDER APPLES.
ENTRIES CLOSE 6th NOVEMBER, 1909.
Schedules, etc., from A. HAROLD WARD, Hon. Secretary, 9, Bedford Circus, Exeter.

SHEFFIELD CHRYSANTHEMUM SOCIETY'S GREAT ANNUAL SHOW.
CORN EXCHANGE, SHEFFIELD,
FRIDAY and SATURDAY, Nov. 12th and 13th.
UPWARDS OF £200 IN PRIZES.
Schedules and particulars free on application to Secretary.
C. COOK, City Road, Sheffield.

EXHIBITIONS AND MEETINGS.

United Horticultural Benefit and Provident Society.

The twenty-third annual dinner of this excellent institution was held at the Waldorf Hotel on Thursday, October 28, under the genial presidency of Mr. J. B. Slade, of Messrs. Protheroe and Morris. The attendance was scarcely so large as usual, and this was no doubt due largely to the cold, wet, and windy weather that prevailed throughout the afternoon and evening. It is, however, a matter of regret to find that nurserymen and seedsmen do not attend this function, and thus show their interest in and sympathy with the work of the society in the way they formerly did. Some who used to attend regularly have reached an age when evening meetings are not tempting, but there are others and younger men who might well come, especially as the society is not a charitable institution ever seeking for additions to its funds.

The dining-room was beautifully decorated by Mr. Bedford, of Gunnersbury House Gardens, with plants and flowers supplied by various friends, and the ample dessert was also largely supplied by members and friends.

After dinner, and the usual loyal toasts, the Chairman proposed "Continued Success to the United Horticultural Benefit and Provident Society," and in so doing pointed out the great value of the various benefit societies, as these inculcated thrift. Such societies had done a great deal of good to the community at large, but among them all, and he had studied the matter carefully, he could not find one so excellent in every respect as the one those present were nearly all members of. He thought the U.H.B.P. should appeal strongly to those who had the interests of the community at heart, and especially the interests of those engaged in horticultural pursuits. The great difficulty lay in securing young members, and he considered the lesson of early thriftiness needed to be taught in the present day. In the case of the U.H.B.P. it was found that many gardeners put off joining until it was too late, or joined other and less helpful societies. He pointed out how the Sick Fund, Benevolent Fund, and Convalescent Fund assisted sick and disabled members, and how, after all expenses were met each year, a balance was placed to the credit of each member, and grew into a considerable sum, with the added interest, in the course of years, and was available for use in old age, or went to the representative of the member in case of death.

Mr. Slade thought the society, considering its limited field of operations, had done well. It was worked with extreme economy, and thus ought to appeal to those in good circumstances who were interested in and derived pleasure and profit from horticulture. He found there were about fifty honorary members, but considered this number a very small one, and he promised to join independently of his firm. Finally, Mr. Slade urged all present to do their level best to make the society better known, to secure new honorary and benefit members, and so ensure the continued success of the society.

Mr. C. H. Curtis, chairman of committee, responded, and heartily thanked Mr. Slade for his presence, his interest, and his able speech. He pointed out that there were now about 1,300 members, and invested funds to the extent of about £35,000. He praised the keenness of the members of committee, and stated that up to date this year 60 new members had joined the society. The committee would be glad to enrol new honorary members, because they felt that nurserymen and seedsmen attached to the society in this way would naturally bring its benefits before their employees. Mr. Curtis quoted several cases (without mentioning names), in which the society had been able to very materially assist distressed members, apart from sick pay, thus proving the immense value of the benevolent fund.

Mr. J. Harrison Dick proposed "The Honorary and Life Members." He thanked those who had for so long assisted the society as honorary or life members, and pointed out that their donations almost amounted to one-half of the payments made by the Benevolent Fund. They did not seek charity, but felt that such names as those already on the list served to hall-mark the society as an excellent one, and give it added dignity. He hoped other nurserymen and seedsmen, especially the younger members of the various firms, would attach themselves to the society, become familiar with its working, and do their best to extend its usefulness among their workmen. Mr. T. A. Cox, of Messrs. Hurst and Son, briefly responded.

Mr. Riley Scott, who proposed "The Visitors," expressed the hope that those who were present as visitors would, after hearing the chairman's speech, become either honorary or benefit members. Mr. Scott made one of the hits of the evening by observing "we have an old age pension scheme of our own, it is not State aided, and we've got the money to pay with." Mr. A. Dawkins (Messrs. J. Veitch and Sons) responded in humorous vein, and told a number of witty stories, in each case making the moral of the story apply to the society.

"The Press" was very neatly proposed by Mr. E. F. Hawes, who showed that the influence of the Horticultural Press had always been on the side of the society, and had been the means of increasing its membership and usefulness. Mr. George Gordon, V.M.H. (Editor GARDENERS' MAGAZINE), responded briefly, and expressed the pleasure the members of the Press always felt in being able to help such a deserving institution. Mr. Harvey ("Garden" staff) also responded in a sympathetic manner.

Mr. Frogbrook proposed "The Chairman," and the toast was very heartily received, and accorded musical honours. In responding to the toast, the Chairman suggested that when the next annual report was sent to members, it should include a slip with space for name and address, and a strong appeal to each member to secure at least one new member next year. He expressed his great pleasure at having been invited to preside, the more so as this was the first time a member of his firm had ever been invited to preside over a similar function. He took a keen interest in horticultural matters, apart from business, especially in school gardens and allotments, and he promised to do all he possibly could to make the society better known among those with whom he came into contact. He also ventured to hope that in the years to come the committee might some day invite him to again preside, so greatly had he enjoyed the evening, and so delighted was he with the work of the society.

The Chairman then proposed hearty thanks to Mr. T. Winter for superintending the musical arrangements; to Mr. Winter's friends of the Waverley Glee Party for giving their services, and providing such an excellent musical programme; to those who had so kindly provided fruits, flowers, and plants; to Mr. Bedford for decorating the room; and concluded with "Good Health" to the secretary, Mr. W. Collins. Brief responses followed, and "Auld Lang Syne" brought a very pleasant evening to a close.

Hereford Fruit and Chrysanthemum Society.

OCTOBER 27 and 28.

This society held its annual show in the Shire Hall, Hereford, and apples and pears, which were surprisingly good considering the season, formed, as is usual at Hereford, the most important feature. Groups of plants, floral designs, grapes, vegetables, agricultural roots, and grain also contributed largely in making the show instructive and interesting. Chrysanthemums seldom take a prominent position at Hereford, and upon this occasion the exhibits of them were confined to vase classes.

FRUIT.

Collections of fruit, six kinds.—Only three exhibitors staged in this class, the best coming from Mr. Sykes, gardener to Colonel Henry, of Haffield, who had good Gros Maroc and Muscat of Alexandria grapes, splendid Doyenne du Comice pears, a fine Green Emerald melon, Late Admirable peaches, and good Cox's Orange Pippin apples; Mr. R. Currie, gardener to Rev. G. H. Devonport, was second. In the class for white grapes, three bunches, there were four competitors, and of these Mr. Currie and Mr. Sykes took the first and second prizes in the order named, each staging fair examples of Muscat of Alexandria. In a class for Gros Colmar, Mr. C. Liddle, gardener to Sir J. Cotterell, of Garnons, was a good first with grand perfectly finished bunches, followed by Mr. H. Parrott, gardener to A. W. Foster, Esq., Brockhampton Court, Ross; two other exhibits were staged. For any other black variety Mr. Nunn, gardener to Mrs. Woodhouse, scored with fairly good bunches of Alicante, Mr. J. Jones, gardener to Mrs. Hill, being a close second with the same variety; Mr. Sykes third with Gros Maroc.

The class for fifty dishes of apples, distinct, not more than twelve fruits or less than five to a dish, brought three collections, the chief of which was from Mr. Whiting of Credenhill, who showed a splendidly finished and otherwise excellent collection, in which the most popular varieties were represented. Amongst the best dishes were found Allington Pippin, Cox's Orange Pippin, King of the Pippins, Houblon, Charles Ross, Rival, Barnack Beauty, Lord Hindlip, Pickering's Seedling, King's Acre Pippin, Rosemary Russet, James Grieve, Swedish Reinette, Ribston Pippin, Mrs. Barron, King Edward VII., Newton Wonder, Washington, Warner's King, Gloria Mundi, Stirling Castle, Beauty of Kent, Queen Caroline, Tibbet's Pearmain, Blenheim Pippin, Chelmsford Wonder, Emperor Alexander, and Hambling's Seedling. Messrs. Pewtress Brothers, Tillington Nurseries, were second; Mr. J. Lee also staged a good collection, but was disqualified owing to his having accidentally mixed Mabbot's Pearmain with American Mother in one of his dishes; a special prize was deservedly awarded. In the class for thirty dishes Mr. J. Jones, gardener to Mrs. Hill, Moreton Court, staged a good collection, chiefly of culinary kinds, and was assigned the premier position. Mr. Taylor, gardener to J. Riley, Esq., Patley Court, was second.

In the class for eight dishes, dessert, there were nine exhibitors, Mr. R. Currie taking the lead with capital fruits of Ribston, Cox's, King, and Allington Pippins, Egremont Russet, American Mother, Wealthy, and Adam's Pearmain; Mr. Holder, gardener to A. G. Burney, Esq., The Weir, Hereford, second; and Mr. Sykes, third. For twelve dishes of culinary varieties Mr. Talbot, gardener to Sir G. Cornwall, Moccas Court, was first, and in the class for eight culinary and four dessert, open only to tenant farmers and amateurs, Mr. Bott, Brunton, secured the leading position. In a class for three varieties of apples of recent introduction Mr. J. Jones took leading honours with excellent dishes of Houblon, Charles Ross, and Rival; Mr. Whiting being a close second.

In competition for the prizes for a decorative group of fruit, fresh or preserved, arranged in a space of 50 square feet, only two lots were staged. Messrs. Pewtress Brothers were first with some fifty varieties of apples and pears, well arranged in boxes and baskets, relieved with small decorative plants; the King's Acre Nursery Company, who put up a splendid lot of bottled fruits, were second.

For a collection of pears, not less than twelve varieties, there were five entries, and Mr. Currie led with a fine set, including Doyenne du Comice, Beurre Bosc, Glou Morceau, Beurre Diel, Easter Beurre, Marie Louise, Le Lectier, and Beurre Superfin; Mr. H. Parrott, gardener to A. W. Foster, Esq., second. For eight varieties, dessert, the leading exhibitor was Mr. Poston, gardener to Rev. Prebendary Brierly, of Bridstow. His set were Emile d'Heyst, Madame Treyve, Beurre Alexander Lucas, Doyenne du Comice, Durondeau, Beurre Bachelier, Marie Louise, and Pitmaston Duchess; Mr. Sykes was placed second, and Mr. Williams third.

In the class for bottled fruits, twelve bottles, two excellent exhibits were staged, Miss Powell, Billingham Court, being first, and the Hon. Mrs. Wilmot, second, and in a similar class for jams or jellies Mrs. Blashill led, followed by Mrs. H. Betteridge, Stretton Court.

The best dish of pears in the show was Doyenne du Comice, from Mr. Currie; best dish of dessert apples, Cox's Orange Pippin, from Mr. Thoms; best dish of culinary apples, Peasgood's Nonsuch, from Mr. Nelme.

VEGETABLES.

For a collection of ten kinds of vegetables, for which Mr. J. Wilson, Commercial Street, Hereford, provided the prizes, there were seven entries, all good. The best collection was that from Mr. Holder, gardener to A. G. Burney, Esq., The Weir; Mr. Stainsbury was placed second, and Mr. Young third. For six kinds, for which Messrs. Sutton and Sons, Reading, offered prizes, Mr. Davies, gardener to W. C. King, Esq., was first, and Mr. Stainsbury second. Mr. Liddle was first for tomatoes, and Mr. Caddick second; ten lots were staged.

NON-COMPETITIVE EXHIBITS.

These contributed in a great measure to the attractions of the show. The King's Acre Nursery Company made the largest display. They staged upwards of 100 distinct varieties of apples in splendid condition, together with pears. This firm also staged floral devices and cut flowers arranged in vases in great beauty. Mr. Wilson, Commercial Street, Hereford, also staged a large stand of wreaths, bouquets, and other floral decorations in variety arranged with excellent taste.

Farnham Horticultural Society.

Under the auspices of this society a lantern lecture on "Vegetables, Old and New," was delivered at Farnham, Surrey, on Monday, October 25, by Mr. W. F. Giles, of Messrs. Sutton and Sons, Reading. The lecture attracted over 100 persons, and was a great success. At the close numerous questions were asked and answered, and on the motion of Mr. C. Moore, F.R.H.S., a vote of thanks was heartily accorded to Mr. Giles for his most able and interesting address.

Brighton.

Held, as usual, in the Dome and Corn Exchange, the Brighton Society's exhibition, on November 2 and 3, has to be written down as something of a failure as compared with previous efforts. Making all due allowance for the season, we find it difficult to account for the falling off in competition and quality. Directly the Corn Exchange was entered the fact that the show was a poor one was apparent. It will be a thousand pities if Brighton Chrysanthemum Show becomes comparable to an exhibition held in a small country town. Those who believe chrysanthemum shows are declining would find an excellent argument at Brighton. Flowers were of moderate quality as a whole, groups were poor, plants were fairly good, and fruits and vegetables were pretty well up to the standard of recent years.

CUT BLOOMS.

In the open class for three dozen Japanese blooms, in not less than twenty-four varieties, there were only two competitors, the silver cup offered by the president, J. Colman, Esq., being won by Mr. Chas. Hack, gardener to Mrs. L. C. Joad, Patching, Worthing, who had medium sized, bright examples of Master James, Mrs. Knox, Algernon Davis, Mrs. F. M. Vallis, Bessie Godfrey, Sir Frank Crisp, Norman Davis, Reginald Vallis, etc.; Mr. J. E. Hickson, gardener to the Rev. F. S. Sclater, Newick Park, Lewes, second. Messrs. J. Stredwick and Son, St. Leonards, led for twenty-five Japanese blooms, set up in five vases, and their best specimens were of Master James, Lady Letchworth, Exquisite, Mrs. G. Mileham, Mdme. Rivol, Lady Crisp, and Emperor; second prize fell to Mr. J. E. Hickson; only two competitors.

Mr. J. Harris, gardener to Colonel C. P. Henty, Avisford, Arundel, had the best twelve Japanese blooms, his set consisting of J. Lock, Splendour, W. Jinks, Mrs. N. Davis, Exquisite, Mrs. C. Penford, R. Vallis, Mrs. Knox, J. W. Molyneux, George Terry, W. Beadle, and Mrs. Marsham; Mr. Chas. Earl, gardener to O. E. Avigdor-Goldsmid, Esq., Somerhill, Tonbridge, second; and Mr. W. Humphery, gardener to F. W. Franks, Esq., Loampits, Tonbridge, third. There were seven entrants in this class.

Mr. J. Harris scored for six Japanese with Reg. Vallis, Mrs. Knox, Marquise Venosta, Mrs. N. Davis, W. Beadle, and Mrs. Marsham; Mr. Chas. Earl second; Mr. W. Humpherys third; and Mr. G. Best, gardener to H. S. Johnson, Esq., Seldenville, Worthing, fourth; eight entries. For six Japanese blooms, one variety, Mr. A. H. Geall, gardener to Miss Smith, Miramichi, Withdene, was a good first with finely-coloured Reginald Vallis; Mr. C. Hack second with Mrs. A. T. Miller; and Mr. E. Jones, gardener to H. Young, Esq., Withdean Grange, Brighton, third.

Apparently there was only one entry of twelve incurved blooms, distinct, and to this, from Mr. M. Tourle, gardener to E. Lake Walker, Esq., Horsted Place, Uckfield, a second prize was awarded, as the blooms were very rough. Mr. Harris scored for six blooms, and gained first prize with fair examples of Mr. Hygate, Embleme Poitevine, Mrs. B. Hankey, Clara Wells, Romance, and Godfrey's Eclipse; Mr. M. Tourle, second; and Mr. A. Emery, gardener to H. Oakey, Esq., Avoca, Eastbourne, third. Mr. Geall led for six incurved blooms, one variety, with Buttercup, not yet at their best; Mr. A. Sayers, gardener to S. Copestake, Esq., Adelaide Crescent, Hove, second, with Embleme Poitevine; and Mr. M. Tourle third.

Mr. T. Brackley, led for six Japanese blooms in one vase, and had a fine Mrs. A. T. Miller in his set; Mr. A. Emery second, and Mr. J. C. Reeves, gardener to Captain H. Acton Blake, Pucks Croft, Rusper, third. Mr. Emery led for a dozen Japanese blooms, in two vases, and was followed in order by Mr. J. C. Reeves, and Mr. C. Marshall, gardener to D. F. S. Smith, Esq., Parklands, Burgess Hill. These last two classes were for single-handed gardeners.

Mr. C. Earl was a capital first for nine Japanese blooms in one vase, showing grand flowers of popular varieties; Mr. E. Jones second, and Mr. T. Rush, Hassocks, third; six entries. For three vases of Japanese blooms, Mr. A. Bish, gardener to Miss E. FitzHugh, North Acres, Streat, led with Bessie Godfrey, Reginald Vallis, and a white variety unnamed; Mr. T. Rush second, and Mr. E. Putland, gardener to G. A. Hammond, Esq., Cambrian House, Burgess Hill, third.

Pompon varieties were not particularly well shown, but Mr. W. G. Pelley, Adavale, Chesswood Road, Worthing, led for three vases, and was followed in order by Mr. G. H. Bennett, gardener to P. H. Bayer, Esq., Hatch Beauchamp, Withdean, and Mr. G. Norman, gardener to A. Morris, Esq., The Garden House, Upper Drive, Hove. Three vases of singles proved a much better class, and here Mr. T. Brackley, gardener to Mrs. Brigden, Oaklands, Hassocks, was an easy first with large, finely developed, and well-arranged blooms of Edith Pagram, Bronze Pagram, and White Pagram; Mr. G. Best second, and Mr. G. Funnell, Mount Zion Place, Brighton, third.

In the amateurs' division there were some good blooms, notably those shown by Mr. C. Fox, Eridge Road, Tunbridge Wells, and Mr. Alfred Jeal, Montreal Road, Brighton. Mr. Fox showed remarkably well, winning firsts in the vase class, and for a dozen Japanese, and securing the amateurs' trophy, which he now holds, having won it three years in succession. He had a fine stand of blooms, and good examples of Mrs. G. Milcham, Bessie Godfrey, Mrs. Penford, and Mrs. Norman Davis.

GROUPS AND PLANTS.

There were only two groups of chrysanthemums and foliage plants, and neither of these was up to the high standard of former displays. Each group was conical, arranged within a circle 8ft. 6in. in diameter. Mr. G. Chandler, gardener to S. Witting, Esq., Hollingbury Copse, Brighton, was placed first, and Mr. G. H. Bennett second. For a table of plants and flowers, the only exhibit was from Messrs. G. Miles and Son, Victoria Nursery, Dyke Road, Brighton, who had a pretty arrangement of white, bronze, crimson, and yellow flowers, associated with ferns and crotons—first prize.

Mr. W. Hill, gardener to G. W. Ryder, Esq., Broad Hill, Keymer, secured first prize for a collection of orchids, and he put up a very bright display of well-grown Calanthe Veitchi, together with Cypripedium Spicerianum, and Odontoglossum grande.

In the amateurs' class for a group of chrysanthemums Mr. G. Funnell was first with a creditable arrangement of rather small flowers; Mr. T. Wells, The Bugle Inn, St. Martin's Street, Brighton, second. For a mantelpiece and fireplace decoration of chrysanthemums Messrs. G. Miles and Son were a good first with a bright and tasteful arrangement of bronze, white, and yellow blooms, associated with ferns, crotons, and asparagus. Mrs. H. J. Brill, Southdown Avenue, Preston Park, was second, and Miss Mabel Howell, Tower Lodge, Queen's Road, Brighton, was first for a similar decoration in the ladies' class.

Mr. G. Lambert, Bognor Road, Chichester, was an excellent first for six bush chrysanthemums, winning with finely grown plants carrying good flowers; Godfrey's King, Kimberley, and Merstham Yellow were very good; Mr. A. Sayers second, and Mr. G. H. Bennett, third. Mr. G. H. Bennett led for six bush plants of single varieties; Mr. Edward Jones second, and Mr. G. Best, gardener to H. S. Johnson, Esq., Seldenville, Worthing, third.

Mr. E. Jones was awarded second place for a dozen solanums, and Mr. Chandler a second for six specimens. Mr. J. Hill led for a dozen Chinese primulas, and Mr. C. Moppett, gardener to A. Carey, Esq., Downside, Roedean, was second. Mr. C. Moppett secured chief place for six Begonia Gloire de Lorraine, and Mr. J. E. Hickson had the best dozen plants of this begonia, and Mr. Chandler was a good second.

Mrs. Rapley, Warblington, Havant, had the best table decoration, in gold and bronze flowers; Miss S. Cheesman, Islingword Road, second; and Mrs. Brackley, Hassocks, third, with golden-yellow flowers.

FRUITS AND VEGETABLES.

Mr. A. Kemp, gardener to C. R. Scrase Dickens, Esq., Coolhurst, Brighton, was placed first for three bunches of black grapes, Mrs. Pince's Muscat, but two of the bunches had many red berries; Mr. H. Cook, gardener to A. D. Macnell, Esq., Malling Deanery, Lewes, second; and Mr. S. Woolgar, Ivy Arches Nursery, Worthing, third. Mr. C. Earl had the best white grapes, and was followed in order by Mr. J. Muddell and Mr. A. Kemp.

Mr. Bennett had the best dish of dessert apples, Cox's Orange Pippin. Mr. E. Jones scored for four dishes of dessert apples, Mr. Parsons, Lewes, coming second, and Mr. A. Kemp, third. Mr. W. J. Finck, gardener to F. A. White, Esq., Oakleigh, East Grinsted, had the finest set of four dishes of dessert pears, winning with fine fruits of Fondante de Thirriot, Pitmaston Duchess, Beurre Diel, and Doyenne du Comice; Mr. J. E. Hickson, second, and Mr. E. Jones third. Mr. W. J. Finch, East Grinstead, had the best dish of stewing pears, General Todleben.

Mr. W. Cornish, gardener to W. R. Hammond, Esq., Grovelands, Burgess Hill, won first prize for nine kinds of vegetables, and had good carrots, beet, turnips, and parsnips; Mr. W. Monton, gardener to Mrs. Mashiter, The Grange, Hurstpierpoint, second; and Mr. J. C. Reeves, third; the prizes were offered in this class by Messrs. J. Cheal and Sons. Mr. G. Crove, Grantham Road, Brighton; Mr. R. Moore, New Road, Lewes; Mr. W. J. Finch, East Grinstead (onions); and Mr. M. Tourle were other leading prize winners in the vegetable classes. Potatoes were especially good, Mr. J. Harris scoring.

NON-COMPETITIVE.

Non-competitive displays included a collection of fruits and autumn foliage from Messrs. J. Cheal and Son, Crawley; new single and Japanese chrysanthemums from Messrs. W. Wells and Co., Merstham; alpines from Mr. J. Box, Lindfield; fruits and flowers from Mr. F. Woollard, Lewes Road, Brighton; violets in variety from Mr. W. Brown, Mayfield; a fine collection of apples, pears, and grapes set up by Mr. E. Neal, gardener to J. A. Nix, Esq., Tilgate, Crawley; a bold display of cyclamen, chrysanthemums, cypripediums, lily of the valley, rose wreaths, and orchid bouquets from Messrs. W. Miles and Co., Church Road, Hove; and a collection of apples, pears, and grapes from the same firm; charming odontoglossums, cypripediums, and cattleyas from Messrs. J. and A. A. McBean, Cooksbridge; a group of Cattleya labiata, Vanda cærulea, and odontoglossums from Mr. J. H. Hill, Vale Bridge Nurseries, Burgess Hill; a display of sundries by Messrs. Tilley Brothers, London Road; some very fine apples and pears from the Barnham Nurseries, Hassocks; and some well-grown onions set up by Mr. J. Hill, gardener to E. Moreau, Esq., Fairlie Place, Surrenden Road, Preston.

Oxfordshire Chysanthemum Society.

OCTOBER 28.

This society held its forty-seventh annual exhibition on the above date in the Town Hall, Oxford, and an excellent representative display was produced. The date was much too early for chrysanthemums, but the committee were compelled to accept the last Thursday in October or abandon their show, as no other hall in the city is capacious enough to accommodate the large display of fruit and vegetables usually staged in competition. To add to this inconvenience the season has been late in developing the blooms. To summarise, there were five groups of plants, about 300 specimen blooms, some 360 dishes of apples and pears (twelve apples and nine pears to a dish), and fully 120 dishes of vegetables in the competition.

PLANTS.

Bush chrysanthemums were limited to one second-prize set of six, the growers in the district not being able to have their plants in bloom; but there were some fairly good double and single primulas, and very fine examples of Gloire de Lorraine begonia, cut violets, table plants, and violets in pots; for the latter, Messrs. Gardner, Son, and Adams, Kidlington, received the premier award for six varieties, and also staged fifty pots, as an extra.

The groups in competition, arranged on 48 feet, were a good average for quality, Mr. J. Holton, gardener to Rev. the Provost of Worcester College, occupied the post of honour; the second prize going to Mr. S. Mold (a working cooper), whose arrangement was not so well finished. The arrangements of winter-flowering and fine-foliage plants were very showy, but would have been more effective on a low stage instead of the floor; Mr. D. Curtis, Iffley Road Nursery, Oxford, had the first prize, and in his group was a most beautiful example of nephrolepis; and in the second set, arranged by Mr. W. Brown, gardener to Earl of Abingdon, Wytham Abbey, were attractive specimens of a large-leaved alocasia, and some neat examples of Cattleya labiata, C. Bowringiana, Odontoglossum crispum, and O. grande; the winter-flowering begonias, bouvardias, etc., were freely used with small chrysanthemums and fine-foliage plants. The largest group was "non-competitive," covered 160 feet super., and was arranged by Mr. J. S. Chidlow, gardener to Mrs. Herbert Monell, Headington Hill Hall. It had a remarkably fine spreading Kentia Belmoreana at the back, its elegant leaves spreading over a line of chrysanthemums, each plant having three massive spherical blooms; others were used as dot plants encircled with highly-coloured crotons, acalpyhas, the interspaces filled with neat palms and ferns, and various flowering plants.

CUT FLOWERS.

The cut flowers were, as was expected, but a small number compared with past seasons. Mr. J. M. Bush, gardener to F. J. Myers, Esq., Charlton Lodge, Banbury, was strong with Japanese, and obtained the premier for twenty-four varieties, and also the silver challenge bowl and £2 for nine triplets. His flowers were generally of full size and fresh. Mr. J. L. Burgess, Maisey Hampton, Gloucester, second. In the cup class Mr. Bush's nine triplets were remarkably fine specimens; Mr. W. Brown was second, with Mr. D. J. MacFarlayne, gardener to Harvey du Cros, Esq., Howbery Park, Wallingford, third. In the class for twelve incurved, Mr. G. Phillips, gardener to Vernon J. Watney, Esq., Cornbury Park, Charlbury, put up a very nice stand; while for six incurved of one variety, Mr. Burgess was first with Embleme Poitevine; and Mr. E. Lazenby, gardener to W. H. Fox, Esq., Bradwell Grove, Burford, second with Mrs. J. P. Bryce; and Mr. Phillips third for a grand six of Buttercup. For six blooms of a Japanese white, Mr. S. Brown, Aynho Park Gardens, Banbury, Mr. MacFarlayne and Mr. Burgess took the cards with Mrs. A. T. Miller. For six yellow, Messrs. Bush, MacFarlayne, and Lazenby divided the honours with Lady Talbot first and third, and Bessie Godfrey second. For six, not white or yellow, the cards fell to Messrs. S. Brown, E. Lazenby, and J. L. Burgess, for Sappho, President Viger, and Reginald Vallis. Mr. Burgess was the only exhibitor of a dozen triplet pompons and six bunches of singles, both sections he grows well.

Table decorations were elegant, and baskets of chrysanthemums were attractive. Mr. W. T. Mattock, Barton End Nursery, Headington, was first for cut blooms of violets, and for violets in pots Mr. T. Sirman, Stanton Harcourt, was first.

FRUIT AND VEGETABLES.

A very high quality was manifest in the fruit classes, proving to demonstration that the soil and climate of Oxon can and does produce good fruit and vegetables. Twenty-three classes were set apart for fruit, and among other exhibitors Mr. H. Smart, The Market, Oxford, obtained premier honours for a set of dessert on 24 feet, twelve dishes of apples and six dishes of pears; he also made a display of fruit consisting of forty-eight dishes in variety. Mr. S. Brown led with Muscat of Alexandria and Alicante in the grape classes, staging splendidly finished clusters; Mr. W. Brown was first for a set of nine dishes of apples; Mr. John Potter, gardener to Rev. C. de Lubat, Wytham Rectory, led for six dishes of dessert and culinary apples; Mr. C. Bodimeade, gardener to Sir W. Markby, Headington Hill, presented the best dish of Blenheim Pippin; Mr. Lazenby led for three dishes of pears; and Mr. A. Whitehead, gardener to Dr. Neil, The Warneford, Oxford, had the first prize three dishes of apples, one dish of dessert pears, and one dish judged by weight. Amateur growers staged a large quantity of fruit. Mr. W. F. Cross, 263, Iffley Road, Oxford, scoring firsts for triple dishes of apples and pears; the largest apples in the show were Peasgood's Nonsuch, and the pears Pitmaston Duchess, both staged by Mr. Whitehead. The Kidlington growers did well. Vegetables are always a great feature at Oxford; the cards for nine dishes falling to Mr. R. Wadham, gardener to Mrs. Bradshaw, The Grange, Steeple Aston; Mr. J. Holton; and Mr. A. E. Kirtland, Bletchington.

NON-COMPETITIVE.

In addition to the large groups, and the show of violets, the other non-competitive exhibits included a large display of roses artistically arranged by Mr. John Mattock, New Headington Rose Farms; a choice display of carnations by Mr. John Johnson, The Nurseries, Garsington; fifty dishes of apples and pears from Messrs. R. Tucker and Sons, Brookside Nurseries, Headington Hill; and displays of floral devices by Messrs. West and Sons, The Market, Oxford; and Messrs. Field and Jacob, Headington and The Market. To the last-named firm a gold medal award was made. Messrs. West and Sons, who secured a silver-gilt medal, had a large bell of early-flowering chrysanthemums, and an areoplane of white chrysanthemums. The other exhibitors of extras each received gold medal awards.

The weather was so cold, damp, and dull as to seriously affect the attendance. This was the forty-second show managed by Mr. W. Greenaway, the secretary.

Cambridge Horticultural Society.

NOVEMBER 3 and 4.

This long-established and admirably-managed society held its autumn show on Wednesday and Thursday last, and the plants, cut flowers, fruit, table decorations, and vegetables exhibited in the seventy odd classes filled the Corn Exchange to its utmost capacity, and produced a display remarkable alike for its interest and attractiveness. At the Cambridge shows liberal encouragement is given to fruits and vegetables, and as these are invariably contributed in large quantities and in excellent condition, visitors have an opportunity of seeing the useful products of the garden as well as those grown for ornament at their best. Indeed, in few districts are fruits and vegetables so well grown as in that of which Cambridge is the centre. It may also be said that the details of the exhibition are carried out with quite exceptional success by Mr. Arthur Matthew, the honorary secretary, and Mr. F. E. Fordham, the assistant secretary.

CUT BLOOMS OF CHRYSANTHEMUMS.

Sixteen classes were provided for cut blooms of chrysanthemums, and the most important of these was that for thirty-six Japanese varieties. In this class there was a spirited contest, and the first place was occupied by Mr. George Barker, gardener to Miss M. W. Gibson, who had blooms remarkable for their large size, freshness, and finish. The varieties especially well represented in the collection included Valerie Greenham, Lady Talbot, George Mileham,

Modern Glasshouses

Contractors to H. M. Board of Works; H. M. Admiralty; H. M. War Office, etc., etc. Awarded Gold Medal of the Society of Architects, and Six Medals of the Royal Horticultural Society.

MODERN GLASSHOUSES, embodying the latest improvements in design and construction, and made from the best material by the most competent workmanship, are illustrated and described in our Catalogue, which may be had on application. As specialists for 50 years in Glasshouse construction, our Glasshouses are unrivalled for durability and give lasting satisfaction.

Plans and Estimates for all kinds of Glasshouses and Heating sent free on receipt of particulars.

Formality (a beautiful white variety), Mr. J. D'Arcy, Mrs. Barkley, Magnificent, Mdme. G. Rivol, Louis Remy, Mrs. A. T. Miller, Mrs. K. Thorne, Rose Pockett, and Reginald Vallis. Mr. R. Smith, gardener to G. R. C. Foster, Esq., who was second, had a collection consisting of blooms evincing cultural skill of a high order.

In the class for twenty-four incurved, there had to be not less than eighteen varieties, and not more than two blooms of any one variety. The award of the first prize was made in favour of Mr. G. Barker, who had a collection in which the blooms of W. E. Wright, Clara Wells, W. Biddle, Mrs. J. Wynn, Romance, Lady Isabel, Louise Giles, Mrs. J. C. Boyce, and Exquisite were especially well represented.

The open class for six vases of Japanese, distinct varieties, three blooms of one variety in each vase, was well filled, and the splendid array of finely-developed blooms proved immensely attractive. Mr. G. Barker was successful in occupying the first place with blooms of exceptional quality, and Mr. R. Smith was a good second with blooms of a high order of merit. The varieties in the first prize set included Mdme. G. Rivol, Beatrice May, F. W. Lever, and Lady Talbot. The exhibitors in the classes for six vases of incurved varieties were free from any restriction with regard to distinctness of varieties or the number of the blooms in a vase. The premier award was made in favour of Mr. T. Todd, gardener to W. A. Briscoe, Esq., who staged one of the finest sets of incurved blooms in vases that has yet been placed on the exhibition table. The whole of the blooms were perfect, and the six vases were regarded as one of the finest exhibits in the classes for cut blooms. Mrs. G. Barker, who was second, staged neat, well-finished blooms.

The most important of the classes in the members' division was that for twenty-four blooms of Japanese, and, as became its importance, there was a brisk contest for the first place, the blooms being on the whole of splendid quality. The premier position was worthily occupied by Mr. T. Todd, who had blooms remarkable for their freshness and finish. Mr. H. Edwards was second, and also showed well. In the classes for twelve, six, and three blooms of Japanese and incurved, the principal prizes were awarded to Mr. Hall, gardener to J. J. Briscoe, Esq., Mr. R. Smith, Mr. H. Edwards, and Mr. E. Dyson, gardener to W. P. Neal, Esq. In this division there were four vase classes, two for six vases, and the same number for three vases. There was a strong competition for the prizes for six vases of decorative chrysanthemums, and Mr. Hurrell, Harlston, was first with a highly effective set, the blooms being of superb quality. Messrs. E. H. Warren and Son followed for second place with large and attractive vases. Mr. Armand Lelliott was third with effective arrangements. Interesting and attractive also were the contributions to the class for three vases of single varieties, and the premier position was occupied by Mr. R. Smith, whose blooms were of high quality and tastefully arranged. Mr. W. Dobbs was a capital second with a pleasing set, in which Mary Richardson was splendidly represented.

GROUPS.

The competition in the class for groups of chrysanthemums arranged for effect was stronger than has been the case at Cambridge for many years, and the seven or eight groups formed a magnificent feature. Mr. A. Dyson was successful in occupying the post of honour with a bold arrangement remarkable for the high quality of the blooms and the taste evinced in their disposition. Mr. J. Wright, gardener to Arthur Matthew, Esq., was a close second with a group of much merit, and Mr. H. Edwards was a good third.

In the several classes for specimen chrysanthemums, which were considerably above the average, the most successful exhibitors were Mr. G. Willers, Mr. J. Hutchinson, Mr. J. Wright, and Mr. E. Dyson.

FRUIT.

Apples, pears, and grapes were largely shown, and the quality was high throughout. The chief class provided for the first-named fruits was that for twelve dishes, six cooking and six dessert. Here Mr. Armand Lelliott was a capital first with an excellent collection, comprising especially fine examples of Allington Pippin, Blenheim Pippin, Cox's Orange Pippin, Cox's Pomona, Worcester Pearmain, and New Hawthornden.

In the class for six dishes of apples, comprising dessert and cooking in equal numbers, the awards were made to Alderman R. Stephenson, who had especially fine examples of King of the Pippins, Bramley's Seedling, and Warner's King. Mr. Armand Lelliott was a close second. The best three dishes of dessert apples were those staged by Mr. T. Todd; and Mr. A. Lelliott and Mr. J. H. Ridgewell were second and third, the fruit being good throughout. In the corresponding class for cooking apples the awards were made in favour of Mr. T. Todd, Messrs. E. Warren and Son, and Mr. R. Smith.

The two basket classes for apples were of much interest, and in the competition for the prizes for a basket containing 20lb. of cooking apples, one variety, Mr. J. Dyer, gardener to C. F. Townley, Esq., was first with Peasgood's Nonsuch, and Alderman Stephenson and Mr. U. Neaves were second and third. In the corresponding class for dessert apples, the premier position was occupied by Alderman R. Stephenson with Cox's Orange in splendid condition. Excellent baskets were also contributed by Mr. Lelliott and Mr. U. Neaves, who were second and third, both staging Cox's Orange Pippin.

In competition for the prizes for six dishes of pears, Mr. T. Todd was first with finely finished examples of Pitmaston Duchess, Marie Louise, Doyenne du Comice, and Beurre Superfin. Mr. T. W. Birkinshaw and Mr. W. Dobbs, who were second and third respectively, also staged meritorious collections. The best three dishes of pears were those from Messrs. E. H. Warren and Son, Mr. F. Ginn, and Mr. H. Neave.

For two bunches of Muscat of Alexandria grapes the successful competitors were Mr. T. W. Birkinshaw, who had large, finely-finished clusters, Mr. A. Pepper, and Mr. Kirkpatrick. In the class for two bunches of any other white variety the premier award was made in favour of Mr. T. W. Birkinshaw, who staged Foster's Seedling. The successful competitors for the prizes for Alicante were Mr. J. Kirkland, Mr. R. Smith, and Mr. Kirkpatrick, all of whom had excellent clusters. For any other black grape Mr. T. W. Birkinshaw was first with Lady Downes, and Mr. J. Kirkland was second.

VEGETABLES.

Vegetables were plentiful and of high quality, and formed an instructive feature by no means wanting in attractiveness. There were three classes for vegetables, and in that for nine kinds, in which the prizes were provided by the society, Mr. A. Pepper obtained the premier position, and Mr. F. J. Cook, gardener to the Hon. Mrs. Thornton, and Mr. J. Kirkland were second and third.

The prizes offered by Messrs. Sutton and Sons for a collection of six kinds were keenly contested, and in the result the awards were made in favour of Mr. A. Pepper, Mr. J. Kirkland, and Mr. F. Cook.

Messrs. Webb and Sons' class for six kinds was a strong one, and the successful competitors were Mr. A. Pepper, gardener to A. Hurrell, Esq., Mr. T. W. Birkinshaw, and Mr. J. Kirkpatrick, gardener to P. L. Hudson, Esq., in the order of their names.

Potatoes were, as usual, admirably represented, and in the great class for twelve dishes, distinct varieties, Mr. J. H. Ridgewell was successful in occupying the post of honour with splendidly-grown tubers. Conspicuous in the collection was a fine dish of Cambridge Kidney, a new early variety of much value. For six dishes Mr. Todd was the winner of the first prize, and for three dishes Mr. Pepper obtained premier honours.

ANSWERS TO CORRESPONDENTS.

CAPACITY OF CIRCULAR TANK.—F. C., Barming: The circular tank 8ft. in diameter and 9ft. deep will hold 2,819 gallons of water when quite full.

APPLE FARMING.—F. C., York: You should endeavour to obtain employment in one of the many establishments where apple culture is carried on extensively and on purely commercial lines. With your present experience, and the experience you would gain during a year's work in a fruit farm, you should be in a fair way to start business yourself with a prospect of success, provided the land is well selected, and you have some capital. Messrs. T. Rivers and Son, Sawbridgeworth, are large growers, as well as nurserymen; Mr. Hammond, Pilgrim's Hatch, Brentwood; Mr. Basham, Bassaleg, Newport, Mon.; Mr. C. Lee-Campbell, Glewston Court, Ross; and Mr. Woods, Crockenhill, Kent, are some who might help you, and these are only a few that occur to us as we write.

MICHAELMAS DAISIES.—E. K., Keighley: The varieties Beauty of Colwall (double), Wm. Marshall, Finchley White, May Crum, St. Egwin, and Climax are all excellent. The first-named is especially useful, and the last, Climax, has particularly large and bright. To those you already have you may well add Edwin Beckett, Diana, and Cordifolius elegans, all very graceful varieties.

LAWN GRASS SEEDS.—O. S., Yorks: Maintaining the following proportions (the figures represent lbs.), a good mixture for fine lawn grass on good medium soil would be: Cynosurus cristatus, 5; Festuca ovina tenuifolia, 4; F. duriuscula, 3; F. rubra, 5; Lolium perenne Suttoni, 15; Poa pratensis, 6; and P. nemoralis sempervirens, 5. If clovers are not objected to, add Trifolium repens perenne, 6; and T. minus, 3. Where the lawn will be subjected to very hard wear, such as tennis or croquet, add a larger amount of Festuca rubra, and reduce the other kinds in proportion.

LIVER OF SULPHUR.—M. J., Warwick: It is most probable that the mixture failed to be effective because the liver of sulphur (sulphide of potassium) had lost its value owing to exposure. Exposure in this case does not mean leaving the sulphur fully exposed to the air, but enclosing it in a receptacle that is by no means air-tight. It is bad practice to store liver of sulphur in quantity, but when it is stored it should be put in air-tight glass-stoppered bottles.

COLD FRAME.—T. C.: We are not sure whether we rightly interpret your letter, but if you want to know how to provide a hard base for the frame, whereon to stand plants in pots, there is no difficulty. Set the frame on a course of bricks set firmly in the soil; then take out two or three inches of soil inside the frame and put in its place a three-inch layer of small cinders, making these quite firm, and surfacing them with a little finer material. Dust the cinders with soot before putting the plants in position.

PUBLIC PARKS AND GARDENS.—G. B., Exeter: The only list of public parks and gardens, their area and superintendents, that can be considered complete is the one published in the "Gardening Year Book," published at the GARDENERS' MAGAZINE Office, 148 and 149, Aldersgate Street, E.C., post free 1s. 2d. The new edition for 1910 is now in course of preparation.

R.H.S. VEGETABLE SHOW IN 1910.—M. B., Basingstoke: There is, at the time of writing, a rumour abroad that the Royal Horticultural Society proposes to hold a big exhibition of vegetables in the autumn of 1910, but we have no official information on the matter either confirming or refuting the rumour—indeed, we have not asked for confirmation or refutation of the rumour. It seems scarcely likely that the R.H.S. will hold such an exhibition, in view of the fact that the Royal Horticultural Hall has been granted to the National Vegetable Society for a similar purpose in September, 1910. We

do not forget, however, that unlikely things do happen. If you feel very much troubled about the matter, why not write to the Secretary, Royal Horticultural Society?

BRITISH GARDENERS' ASSOCIATION.—J. S., Chester-le-Street: Several new branches of the British Gardeners' Association have been formed of late, but we cannot tell you which branch is nearest to you. You can, however, obtain full particulars of membership and local branches from the secretary, Mr. John Weathers, Talbot Villa, Isleworth, Middlesex. We have no knowledge of a previous communication from you. When did you send it?

FAIRY RINGS ON LAWNS.—W. H. P., Winscombe: In our issue of January 8, 1908, we published an interesting article dealing with the vexed question of subduing fairy rings on lawns. Many experiments were conducted for the purpose of discovering what would effectually kill the mycelium of the fungus without permanently injuring the grass itself. It apears to have been abundantly proved that 8lb. of sulphate of iron dissolved in 30 gallons of water, and applied to an area of sixty square yards of lawn, is effectual, provided a similar application is made three or four times at intervals of one week. Mowing should take place two days before each application, and the lawn should be watered the evening previous to the application, and it is a good plan to water lightly directly after the application to wash the solution down to the mycelium. Three applications will probably suffice in most cases, but whatever the number, it is essential that a week after the last application a good dressing of freshly slaked quick-lime in powdered form be given to the treated area at the rate of one ton per acre. This dressing is necessary to neutralise the excess of iron sulphate in the soil.

POTATO EXPERIMENTS.—C. T., Wisbech: So far as we can gather, it is to the Oxfordshire experiments you refer. The manurial experiments did not yield very definite results, but a great deal of interest centred in the results obtained from similar quantities of seed potatoes from various sources, each stock being given the same amount of space. The yield was as follows: Duke of York, Scotch, 248lb.; Berkshire, 127lb.; Oxon, 144lb.; Lincoln, 153lb. Epicure, Scotch seed, 147¾lb.; Irish, 143¼lb.; Oxon, 137½lb.; Lincoln, 146½lb. Duchess of Cornwall, Scotch seed, 167lb.; Irish, 271lb.; Oxon, 250lb.; Lincoln, 272lb. As you will see for yourself, these figures are somewhat inconclusive.

NAMES OF FRUITS.

Correspondents not answered this week will please consult succeeding issues.

E. S., Sipson.—Warminster Pearmain.

A. L., Guildford.—1, Emperor Alexander; 2, Blenheim Pippin; 3, not recognised.

M. G. E., Ipswich.—1, Allen's Everlasting; 2, Catillac; 3, Beurre Dièl; 4, Beurre Rance.

B. W. B., Lincoln.—The specimens were so small and scabby that it was impossible to identify them.

F. B. A., Frensham.—1, Golden Noble; 2, Adam's Pearmain; 3, Lane's Prince Albert; 4, Bramley's Seedling.

J. W., Shanklin.—1, Souv. du Congres; 2, Beurre Bosc; 3, Beurre Dièl; 4, Beurre Superfin; 5, Waltham Abbey Seedling.

NAMES OF PLANTS.

G. S., Neath.—Aristolochia elegans.

R. P. G., Ware.—1, Primula obconica; 2, Cratægus orientalis; 3, Cypripedium Spicerianum.

T. C. H., Cambridge.—1, Costus igneus; 2, Cissus discolor; 3, Nepenthes Mastersiana; 4, Oncidium varicosum Rogersi.

E. L. F., Horsham.—1, Abies Douglasi; 2, Cimicifuga simplex; 3, a garden variety of Aster Nova-Belgi; 4, Physalis Alkekengi; 5, Adiantum Williamsi.

J. C. D., Chester.—1, Begonia Gloire de Sceaux; 2, flowers very faded, but appears to be Begonia John Heal; 3, Jasminum nudiflorum; 4, Sedum Sieboldi.

A. C., Torquay.—Hope to name the conifers for you next week.

M. S., Newport.—1, We cannot undertake to name florists' flowers; 2, very poor specimen, appears to be a form of Saponaria officinalis.

W. H. S., Chipping Sodbury.—The damp moss in the air-tight tin generated so much heat that the flowers were black and practically hopeless when we opened them. No. 3 is Pellionia Daveaueana; 4, we will try and name for you next week.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

Fruit Ranching in British Columbia

By J. T. BEALBY, B.A.

Large Crown 8vo, Cloth, with 32 Page Illustrations from photographs.

PRICE 3s. 6d. NET

(Post Free, 3s. 10d.)

Within recent years it has been known, in a vague way, that fruit-ranching in Canada is an exceedingly pleasant and profitable occupation. Definite tidings, however, have been lacking. This knowledge—especially as regards British Columbia—is now available in the volume by Mr. Bealby, who has worked and prospered in the Colony for a sufficient period of years to enable him to speak with fulness and authority. There are practical chapters on climate, soil, markets, prices, varieties of fruit and packing, and the volume is one that will be invaluable to the emigrant as well as of much interest to the general reader.

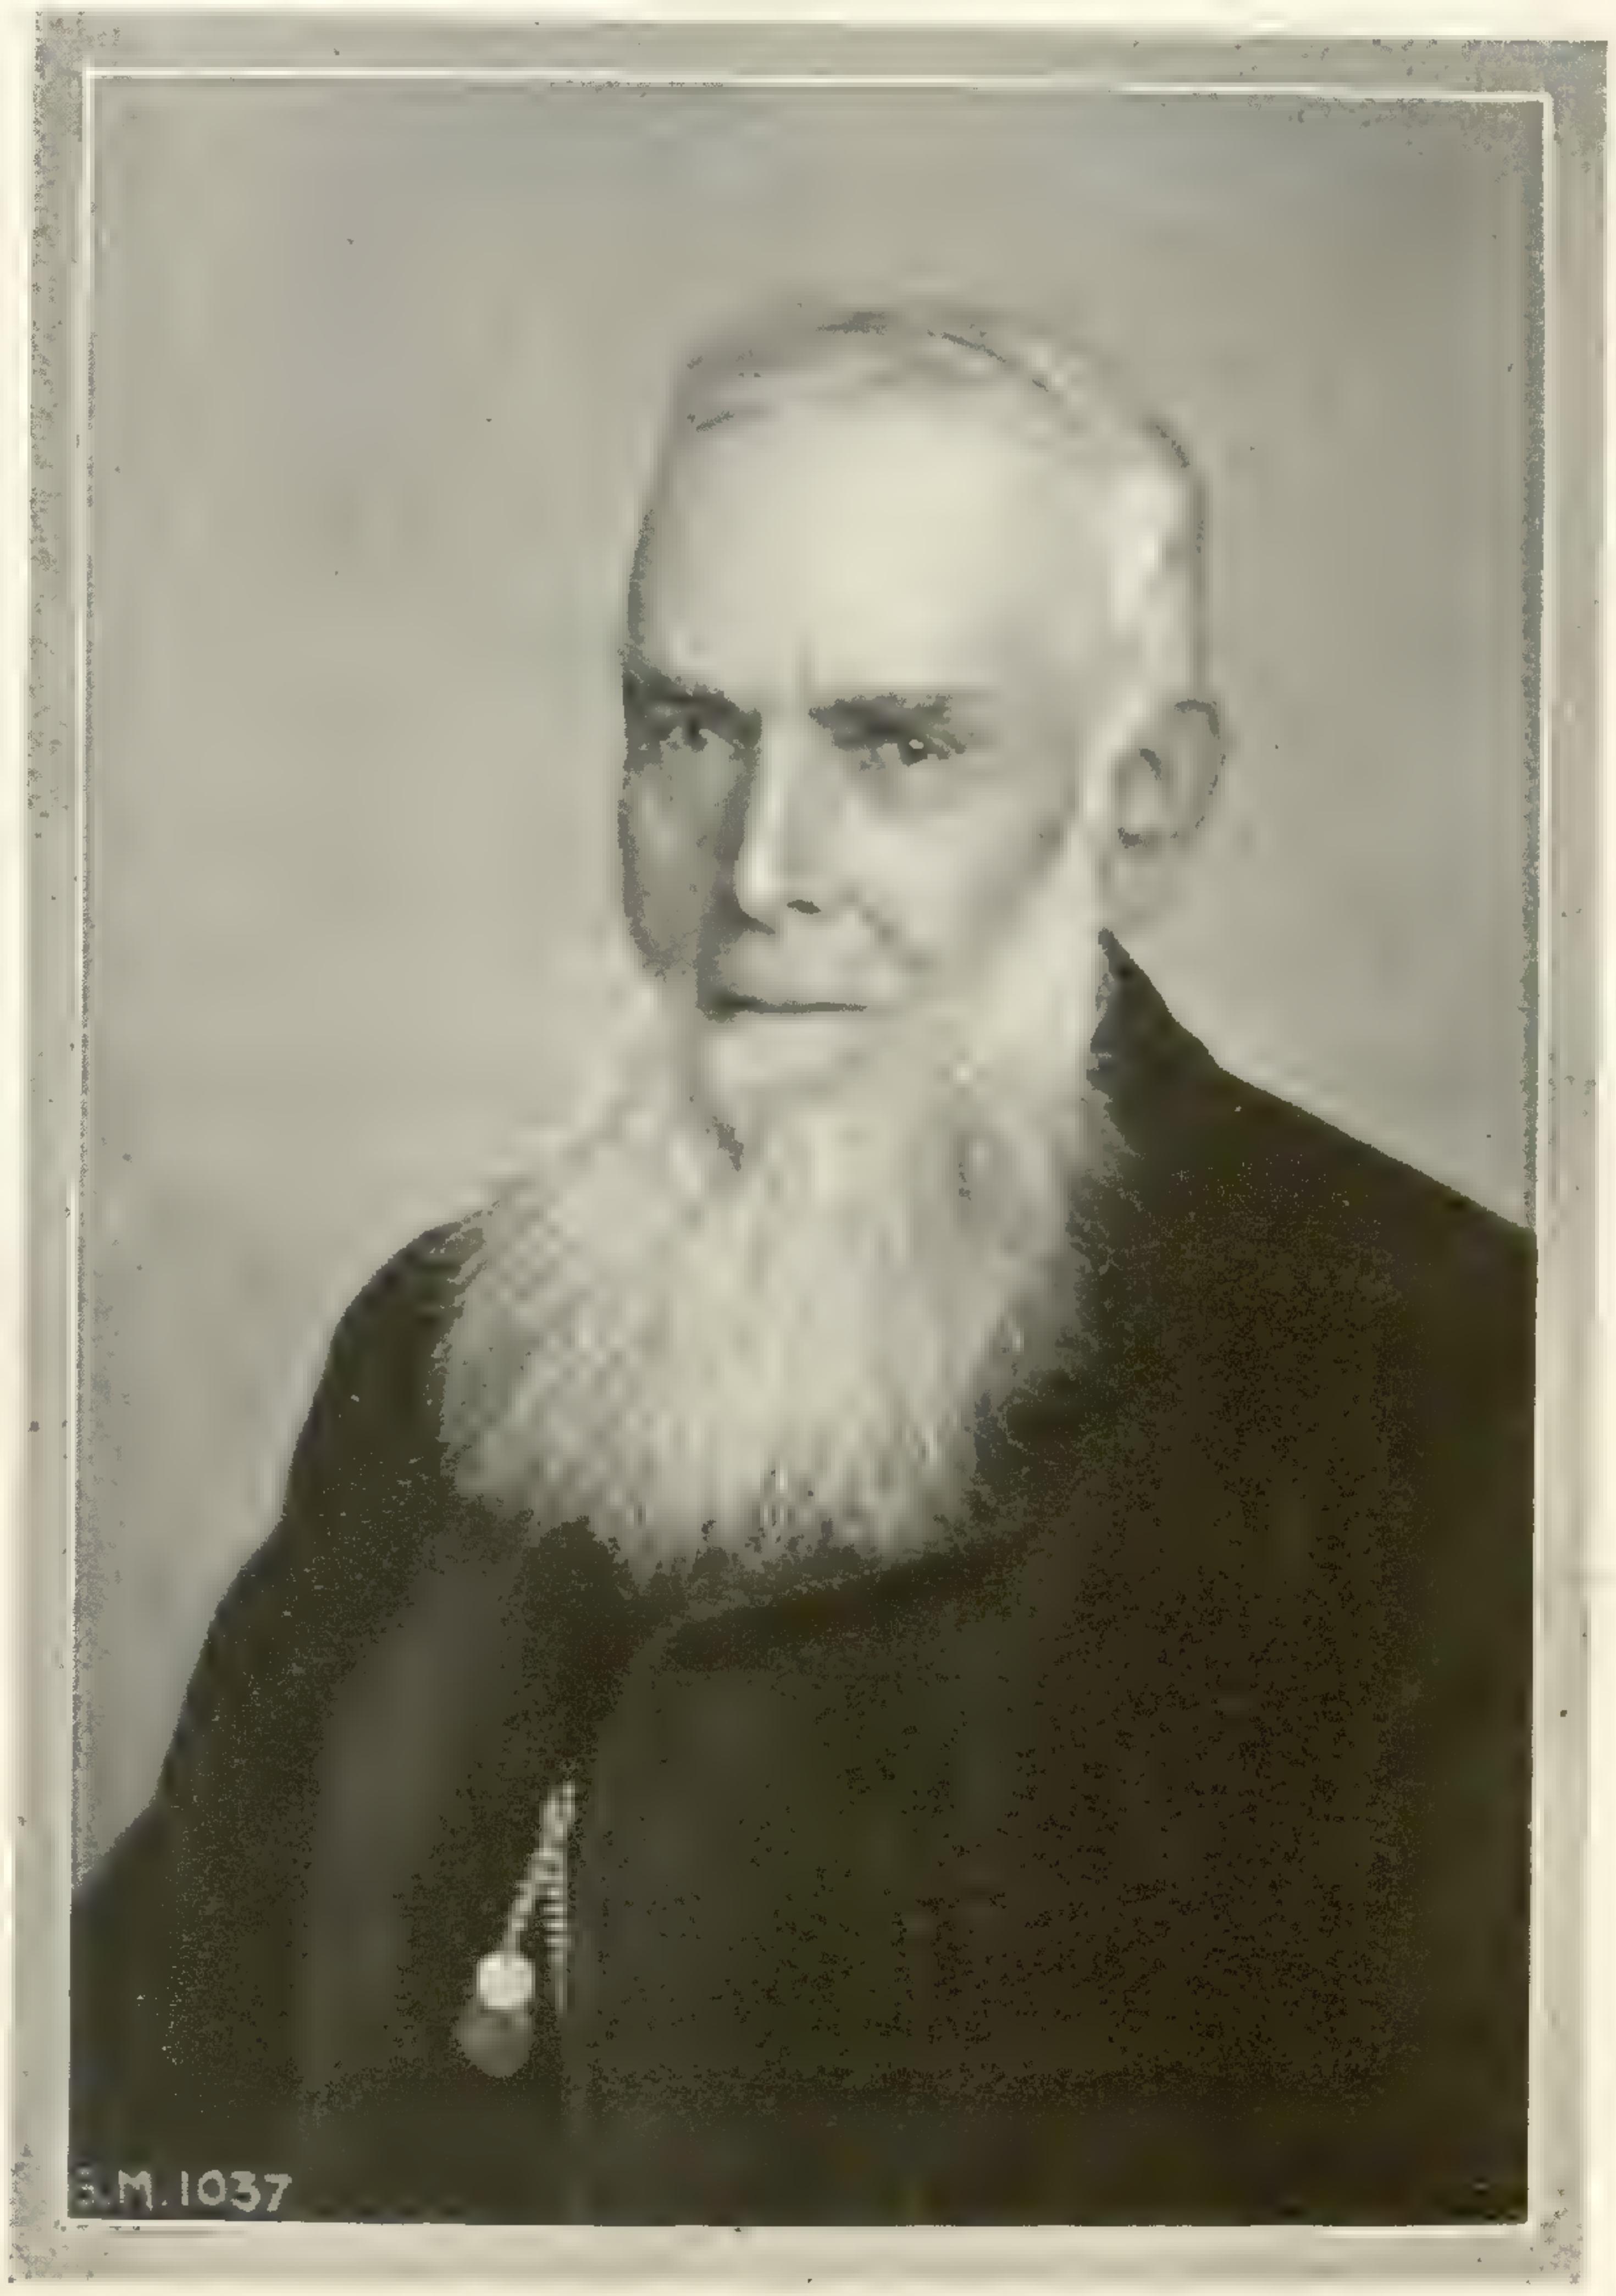
THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Insect Tolls.

To a very large degree the tolls which insects levy upon the flowers for the services which they render as fertilising intermediaries are, from the human point of view, fairly justifiable; thus, for instance, no gardener begrudges that levied by the bees, who collect the honey, which is designed to attract them, and devote a considerable amount of the pollen itself to the manufacture of bee-bread for their progeny. In this case, the maximum service is rendered with a minimum of harm to the plants, since the pollen supply is ample for both bee food and floral fertilisation. It is, however, far otherwise with moths and butterflies, which in their perfect state are satisfied with sipping the nectar and incidentally conveying pollen from flower to flower; but in their larval condition of the caterpillar represents, perhaps, the most destructive agency to vegetation, in some cases defoliating it to such an extent as to practically destroy it. Thus the ravages of the Gipsy moth, accidentally introduced into the United States, can only be held in check sufficiently to save vast forestal areas of established trees by the expenditure of millions of dollars and the labours of an army of men. This case is a typical one of animal life—for though we do not class insects with animals popularly, they certainly belong to the animal kingdom as distinct from the vegetable one—suddenly finding itself transferred to an environment free from checks which control it in its natural habitat. Under normal conditions of environment and evolution Nature always establishes a balance, instituting some sort of check to excessive multiplication by multiplying the foes of the particular organism in equal ratio, or by evolving some protective element in the plants liable to be attacked. In a new locality, which normally the attacking organism would never reach, not only are its natural foes absent, but the food plants available are unprotected, and hence, instead of levying a mere toll for service rendered, the ever-increasing hordes proceed to bring about a natural balance again by utterly destroying their source of food supply, and thus eventually leading to their own eradication for lack of support. This operation would, however, in all probability be interrupted by the evolution of an appetite for them in the native birds and insects, or the development of some disease induced by the change of environment. The gardener, however, knows, to his frequent discomfiture, that an enormous amount of damage is done by insects to which the term "toll," as meaning a charge for service rendered, is altogether inapplicable. A vast number of pests appear to be designed entirely on malevolently destructive lines. Thus the weevil tribe, with their subterranean grubs destroying the root system, and their superterranean beetles devouring foliage and fruits, contribute at no stage in their career to the perpetuation of the plants upon which they prey. The wireworms, the slug and snail family, the leaf-miners, gall insects, the multitudinous hordes of the aphis tribe, and a host of other pests to the gardener and agriculturist all belong to the category of unprofitable spongers upon the vegetative bounty of Nature, giving nothing in return but disciplinary exercise in the virtue of patience to the flower lover who has to contend with them. "Cui bono" is the inevitable query in this connection, but this admits of more than one reply. In the first place, the world was not made for man alone, but for a vast number of other forms of organic life, each of which has its own battle to fight, and undoubtedly, if we only knew it, its own particular function to perform in the great scheme of Nature. Taking for a moment the pernicious weevil's point of view, assuming it has one, what sort of a pest is man himself, a gigantic forky organism, which, after decimating the weevils, grubs, and beetles in his vinery for having taken a nibble here and a nibble there, coolly monopolises the fruit by entire bunches, and for no conceivable reason, mutilates the plant as well to a terrible degree when pruning time comes round. Another reply to the "Cui bono" argument is that, as we have seen, it is essential that Nature should institute checks upon that abundant multiplication for which she so liberally provides, and it is certain that no gardener can get away from the fact that all his foes do their level best in that direction, especially with his "pet" plants.



MR. R. SMITH.

Mr. Robert Smith, a gardener born, has by sheer perseverance, sound practice, and ability, won for himself a position of esteem in a wide circle of horticultural friends. Born at Bramfield, in the county of Hertford, he early showed his passion for gardening. Passing from the village rector's garden, Mr. Smith entered, as improver, in the service of Baron Dimsdale, of Essendon, who then had an establishment famed for its New Holland plants and its collection of trees and shrubs. From Essendon Mr. Smith passed to the vegetable and fruit garden of Winnington Hall, Northwich. His horticultural life has been fairly evenly distributed between the counties of Lincoln and Hertford, with the exception of breaks Kent. In the latter county, at Dartford, when he practised in Oxfordshire and he met with the elder Philip Ladds, and narrowly missed being absorbed into the market gardening section of horticulture. For a long time Mr. Smith was gardener at Carlton Lodge, near Louth, Lincolnshire, when geometric summer bedding was at its height, and he there achieved much fame in this line. He has entered enthusiastically into all the branches of gardening he has touched, and at one time was much given to the raising of new plants. A zonal pelargonium of merit saw the light at Dartford, and was grown for market by Mr. Ladds; in Oxfordshire a bedding centaurea was raised, and subsequently sold to the late Mr. Wimsett, of Chelsea. He also grows several apples of his own raising. It is his old love for fruit that has latterly brought him to the fore. Both at his late charge—Presdales, Ware, Herts, and his present one as gardener for E. E. Pearson, Esq., Brickendonbury, Hertford, he has been very successful. The silver cup offered by the Hertford Horticultural Society for hardy fruit and open to the county, has fallen to him four times in eight years. This is the more noteworthy in that two years ago Mr. Smith was seriously ill for a long time. In the notable Guild Hall fruit exhibition of 1890 Mr. Smith had the honour of being the exhibitor of one of the dishes of pears (Emile d'Heyst) selected for presentation to her late Majesty Queen Victoria. A medal presented by the Hertford Society further attests his prowess; he also possesses one of the GARDENERS' MAGAZINE medals, awarded in 1892 for cultural excellence in fruit. One feature of Mr. Smith's gardening must be noted, and that is his capacity for hard work. Most of his charges have been unmade or neglected gardens, which have been modelled or remodelled under his guidance. His late charge at Ware is a notable example, and his present one shows many new features of quite recent addition.

Royal Botanic Society's Gardens.—In view of the present position of the Royal Botanic Society, the following letter, which has recently been made public, was written by the Rev. W. Wilks, secretary of the Royal Horticultural Society, on the 15th ult., to the president, H.S.H. the Duke of Teck, G.C.V.O.: "The president and council of this society desire me to address your Serene Highness, as president of the Royal Botanic Society, in regard to the present position of that society. They have been given to understand by reports and other statements appearing in the public Press, as well as by letters and other private communcations, that there is serious danger of the gardens in Regent's Park reverting to the Department of Woods and Forests owing to financial difficulties. Should this be so, and should the Royal Botanic Society cease to occupy these gardens, the president and council of this society consider that it would be a real misfortune, not only to the Fellows, but especially to the very important interests of British horticulture, and to the people in London. Under these seemingly urgent circumstances the council of the Royal Horticultural Society desire me to say that, should the Royal Botanic Society wish it, they are prepared to appoint a committee of their body to meet a committee of the council of the Royal Botanic Society to consider and discuss any proposals which may be made, with an earnest desire to help in securing, if possible, the preservation of the Regent's Park gardens for horticultural uses."

Mr. Wilks' Letter to H.S.H. the Duke of Teck has not, according to a letter from Mr. Harry J. Veitch, V.M.H., which appeared in the "Times" of Wednesday last, yet been submitted to the council and Fellows of the Royal Botanic Society. Mr. Veitch writes: "It has become a matter of general knowledge that owing to a variety of circumstances the position of the Royal Botanic Society has become so precarious as gravely to threaten its continued existence. As a Fellow of the Royal Botanic and Royal Horticultural Societies of many years' standing, and writing with the knowledge and consent of the president and council of the Royal Horticultural Society (of which council I have the honour to be a member), I have been surprised to learn that a letter sent by the latter society to H.S.H. the Duke of Teck, president of the Royal Botanic Society, has not been communicated to the council and Fellows of the Botanic, though I believe H.S.H. the Duke intended it should be. The president and council of the Royal Horticultural Society feel that should the Regent's Park gardens come to an end it would be little short of a calamity both to the great gardening interests of the kingdom, and to the pleasure and enjoyment of the inhabitants of the Metropolis and its visitors. I am authorised to say that the president and council of the Royal Horticultural Society are most anxious, if possible, to come to such an arrangement with the Royal Botanic, as may ensure the continuance of the Regent's Park gardens for the future."

Sale of Orchids at Manchester.—On the 3rd inst. Messrs. Protheroe and Morris offered for sale, at the Manchester Coal Exchange, duplicates of choice orchids from the collection of Mr. H. J. Bromilow, at Raun Lee. Good prices were realised, and for one lot, comprising plants of Cypripedium Charlesworthi Bromlowiana, the sum of 140 guineas was paid. Other lots realised from 140 guineas to 10 guineas.

International Horticultural Exhibition at Florence.—The City of Florence and the Royal Tuscan Society of Horticulture have arranged to hold an International Exhibition of Horticulture in the year 1911, in celebration of the fiftieth anniversary of the proclamation of the kingdom of Italy. This exhibition will be held on dates yet to be fixed in the month of May, and the programme includes 432 classes, arranged in nine groups, and in these prizes in medals or cash are offered. The first group includes plants that are new or of recent introduction, orchids in collections, the first class for these flowers being for 100 distinct species or varieties; anthuriums and their allies; water lilies and other aquatics. In the second group the classes are set apart for collections of forced fruits and fruit trees. The third group comprises vegetables and strawberry plants in fruit of recent introduction. Seeds and bulbs have a place in the fourth group, and in the fifth group are the classes for cut flowers of various kinds, including dried and artificial. Group seven is devoted to glass houses, manures, insecticides, heating apparatus, fountains, rustic work, pictures of flowers and fruit, photographs of plants, flowers, and fruit in monochrome and in their natural colours, and photographs of gardens, parks, and forests. In the eighth group there are fifteen, and these are devoted to horticultural literature, plans of gardens, wall pictures illustrating plant structure, the life history of plant parasites, and in the ninth group are the classes for models of refrigerators, and of apparatus used in drying and preserving fruits and vegetables. Entries in some classes must be sent to the Executive Committee not later than December 31, 1910, and in others not later than March 31, 1911. Those who contemplate taking part in this exhibition can obtain the programme on application to the Comitato Escecutivo, R Società Toscano di Orticultura, via Bolognnese 9, Florence, Italy.

Glasgow and West of Scotland Horticultural Society.—We are pleased to learn that this society, which is now in its ninety-ninth year, continues in a most flourishing condition. In moving the adoption of the report and balance-sheet, submitted by Mr. Hugh Mackie, the secretary, Mr. T. Dagg, who presided, said the year had been one of great prosperity. The attendance at the annual show in September constituted a record, and the attendance at the meeting was considerably above the average. Further evidence of the interest that was taken in the society and its work was afforded by the keen competition there was for obtaining places on the committee.

Autocrat Pea.—In our issue of the 6th inst. we gave an illustration of this fine late pea, but by a slip of the pen in writing the inscription we described it as The Gladstone, which, as so well known, has curved pods. We hasten to correct the slip, and trust our readers will make due note of the correction.

Exhibition of Colonial Fruits and Vegetables. — H.R.H. the Princess Louise, Duchess of Argyll, has consented to open the Royal Horticultural Society's exhibition of Colonial-grown fruits and vegetables at 12.30 p.m. on December 1, at their hall in Vincent Square, Westminster, and her Royal Highness will be accompanied by his Grace, the Duke of Argyll, K.T., G.C.M.G., G.C.V.O. An excellent exhibition is being arranged, and the various Colonies are endeavouring to be represented according to their respective climatic abilities at this time of year. The hardy fruits of Canada and British Columbia, already so renowned, will, it is anticipated, be displayed in all their well-known excellence and beauty: the West Indian Islands—with their sub-tropical fruits, so suggestive of warmth and luxury of climate, will display their bounty; and New Zealand, Victoria, and South Africa are to show their resources. Free cinematograph displays at frequent intervals will be given, with lectures, and on December 1, at 3 p.m., Mr. Robert Newstead, A.L.S., F.E.S., of the Liverpool School of Tropical Medicine, will deliver a lecture on the West Indian insect pests.

Professor Percival has resigned the directorship of the Department of Agriculture and Horticulture at the University College, Reading, but has been appointed to the post of professor of agricultural botany. Mr. Ronald V. O. Hart-Synnot, B.Sc., has been appointed director of the Department of Agriculture and Horticulture in place of Professor Percival; and Mr. Frederick G. Drew is the lecturer and practical instructor in horticulture in succession to Mr. Charles Foster, who, as our readers have been informed, was, some time since, appointed director of the Times Experimental Station, Sutton Green, Guildford.

Bath and West of England Society will hold its annual show in 1911 at Cardiff, and the Marquis of Bute has placed the Sophia Gardens Field at the disposal of the local committee for the purposes of the exhibition.

ROYAL HORTICULTURAL SOCIETY.

There was a fine display of excellent produce at the Royal Horticultural Hall on November 9, but the hall was not so crowded as usual, and visitors (owing, perhaps, to the counter-attraction of the Lord Mayor's Show) were less numerous than usual.

FLORAL COMMITTEE.

Right across the end of the hall Messrs. J. Hill and Son, Barrowfield Nursery, Lower Edmonton, arranged what was probably the most magnificent exhibit of ferns ever put up at Westminster. It was a huge exhibit of finely-grown plants, many of them being specimens from 4ft. to 6ft. through, all tastefully arranged. Big dicksonias and cyatheas were set up over the other things, and were very graceful. Beneath these were fine examples of Asplenium caudatum, Davallia Mooreana, Polypodium irioides, P. giganteum, P. Knightæ, and P. Meyeriana, Davallia solida, D. fijiensis elegans, Nephrolepis elegantissima, N. Amerpohli, N. todeaoides, N. exaltata superba, Davallia tenuifolia Veitchi, D. polyantha, Gymnogramma grandiceps superba, Cheilanthes elegans, Adiantum peruvianum, A. Hendersoni, A. O'Brieni, A. digitatum, Asplenium nidus, Pellea robusta, and many other good things, and all pictures of health and elegance.

A magnificent group of splendid crotons, all beautifully coloured, staged by Messrs. Jas. Veitch and Sons, Chelsea, was a fine attraction on this occasion. The arrangement of the group was excellent, the brilliant coouring and elegant leafage combining to produce a startling effect, and once again prove the value of crotons for decorative purposes. The leading varieties were Warreni, Queen Victoria, the broad-leaved B. Comte, Golden Bracelet, Thomsoni, Golden Ring, Lucy, Disraeli, Prince of Wales, Williamsi, Reidi, Leonard Bause, and the bright Duchess of Portland. Altogether this fine collection included about forty of the very best varieties, and was therefore of educational value. Besides this display, the Messrs. Veitch filled the whole of one table with superbly grown chrysanthemums in pots, dwarf, freely-flowered examples in 48's, with foliage down to the pots. There were twenty-six single and about one dozen decorative varieties represented, each by a batch of a dozen or more lovely little bushes of immense decorative value. Among the decoratives the plants of White Cap, J. Shrimpton, Caprice du Printemps, Kathleen Thompson, and Soleil d'Octobre were splendid, many plants of Kathleen Thompson and Caprice du Printemps carrying twenty blooms of good size. Among the singles we were specially attracted by the yellow Lady Coleridge, the old pink Lady Smith, the deeper Metta, the blush Lillie Godfrey, the yellow Exmouth Yellow, the deep rose Alice Crate, and the elegant white Snowstorm—but all were charming. The same firm showed a new pure white single zonal pelargonium named Fairy Queen.

Messrs. Stuart Low and Co., Enfield, submitted a group of perpetual carnation flowers. Mr. D. Wilkinson, gardener to Sir D. Gooch, Bart., Chelmsford, brought up a fine lot of cut blooms of useful single chrysanthemums; the flowers were all disbudded, of large size, and on long stems, and the leading varieties were Doreen, Bronze Pagram, Mary Richardson, Roupell Beauty, Edith Pagram, J. H. Greswold Williams, Elsie Neville, Hilda Lawrence, and Altrincham Yellow. Mr. W. Graysmark, gardener to R. Barclay, Esq., Bury Hill, Dorking, also brought forward a collection of single chrysanthemums, and Messrs. H. Cannell and Sons, Swanley, staged a collection of these attractive and popular flowers, setting up large triangular bunches of Red Star, Honeysuckle, Gaiety, Mars, Mrs. G. Bates, The Lion, and other good things.

Mr. Bradford, gardener to E. H. Brown, Esq., Highwood, Roehampton, set up a large and very pretty group, effectively arranged, consisting of palms, crotons, dracænas, ferns, phryniums, abutilons, chrysanthemums, Begonia Gloire de Lorraine, celosias, browallias, Primula obconica, and cyclamens. Mr. G. Gilbert, Queen's Road, Hastings, showed Etoile Rouge, a free-flowering red decorative chrysanthemum. Mr. L. R. Russell, Richmond, set up berried aucubas, ivies, etc. Messrs. Wells and Co., Merstham, showed their new Phosphorescens, Freda Bedford, and other good chrysanthemums.

Messrs. Felton and Sons, Hanover Square, W., showed two large orange trees, one being well laden with fruits. These were seedlings, twelve years old, and a cultural commendation was awarded. Mr. Martin Silsbury, Shanklin, staged White Queen, Frances Joliffe, Hon. Mrs. Lopes, and other fine new Japanese chrysanthemums. Messrs. J. Peed and Sons brought up several good single chrysanthemums, Miss Dorothy Cottrell, rose and yellow, and Alfred Aylett, crimson scarlet, being the best. Mr. W. H. Page, Tangley Nurseries, Hampton, exhibited a batch of flowering plants of the new pink perpetual carnation named May Day, which appears to be a fine grower; Mr. Page also set up large vases of Mrs. T. W. Lawson, Enchantress, Rose Pink Enchantress, Britannia, Mikado, and other good varieties. Messrs. Wm. Cutbush and Sons, Highgate, had such carnations as Marmion, Helen Gould, White Perfection, The President, Enchantress, Victory, Winsor, etc. The same firm contributed a bank of pernettyas, skimmias, Michaelmas daisies, liliums, etc.

BEGONIA THE GEM.

A new and distinct winter-flowering variety, raised by Messrs. J. Veitch and Sons, Lim., who exhibited it at the R.H.S. Meeting on Tuesday last, when it received an Award of Merit. The flowers are rich scarlet.

Mr. J. Dickson, gardener to Adelaide, Duchess of Bedford, Chenies, Rickmansworth, showed some finely grown plants of a bright salmon and red, yellow shaded gesnera, a variety somewhat between G. exoniensis and G. splendens. The winter-flowering begonias shown by Mr. Ballantine, gardener to Baron Schroder, The Dell, Egham, were superb plants, and the kinds shown were B. Gloire de Lorraine, Mrs. Leopold de Rothschild, Elatior, Mrs. Heal, Julius, Ensign, etc. All these were aglow with blooms, well grown and very attractive.

Nephrolepises were delightfully shown by Messrs. H. B. May and Sons, The Nurseries, Edmonton, and the charming display of these elegant ferns included the new and very beautifully divided and frilled N. exaltata Marshalli; this is a sport from N. Amerpohli, and is the most graceful, shapely, and elegant of the many fine varieties; N. Whitmani, N. Amerpohli, N. Duffi, N. rufescens Mayi, and others were all shown well, and made up a most interesting exhibit. A small group of the Malmaison carnation Princess of Wales was put up in one of the corners of the hall, with ferns and foliage plants, by Mr. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge.

ORCHID COMMITTEE.

Very bright was the display of orchids made by Messrs. Charlesworth and Co., Haywards Heath, who had such showy subjects as Epidendrum vitellinum majus, Lælio-cattleya Luminosa, Cattleya Venus, Brassia Lawrenceana longissima, Cattleya Phrygia, Odontioda Ellwoodi, Cattleya Lord Rothschild, Sophro-cattleya Eros, and Cypripedium insigne Sanderæ, C. triumphans, C. Lord Ossulston, and the pretty Stenoglottis longifolia. Mr. Edward V. Low, Vale Bridge, Haywards Heath, brought up a number of white-flowered orchids, notable among these being Oncidium ornithorhynchum album, Cattleya labiata alba Laura, C. l. Ulysses, C. l. Reedleyensis, C. l. Ameriana, Dendrobium Phalænopsis album, and D. P. Phyllis Moore.

Messrs. Cypher and Sons, Cheltenham, put up a very pretty group of cypripediums that contained good plants and flowers of C. Niobe superba, C. Arthurianum pulchellum, C. insigne Sanderæ, C. Maude, C. Tityus superba, C. Leeanum aureum giganteum, C. insigne Harefield Hall, C. i. Laura Kimball, C. Fairrieanum, C. Actæus, and C. Minos Youngi.

Messrs. Stuart Low and Co., Enfield, contributed a group of orchids that included the graceful Ionopsis paniculata, Oncidium varicosum Rogersi, Cattleya Bowringiana, C. Armstrongæ, C. labiata in variety, C. aurea, and several botanical curiosities.

Mr. Mertens, Ghent, again brought over some fine odontoglossums, and Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, showed Cypripedium Dante magnificum, C. Rossetti magnificum, and Lælio-cattleya Corunna Westonbirt var. (A.M.). Mr. Hopkins, gardener to F. Wellesley, Esq., Westfield, Woking, brought up Cypripedium Elatior pulchella, C. Thalia Mrs. F. Wellesley, C. The Emperor, and C. Fulshawensis giganteum. Mr. P. Walker, Heatherfield, Putney, and Mr. Collier, gardener to Sir J. Colman, Bart., Gatton Park, Reigate, each showed a few orchids.

Cypripediums were nicely shown by Mr. W. C. Price, gardener to E. Rogerson, Esq., West Didsbury, Manchester, and these included C. insigne punctatum, C. Sir Redvers Buller, C. Leeanum Corona, C. Gaston Bulteel, C. Thalia giganteum, C. Actæus giganteum, C. Niobe, and C. triumphans, etc.

FRUIT AND VEGETABLE COMMITTEE.

Onions made a fine show as set up by Messrs. Sutton and Sons, Reading, who had fine bulbs of Sutton's Globe, Perfection, A1, Reading, Ailsa Craig, Magnum Bonum, Tripoli, and Bedfordshire Champion. Mr. W. A. Voss, Fairlight Glen, Rayleigh, put up excellent fruits of such apples as Duke of Devonshire, Scarlet Pearmain, Garrett Pippin, Court Pendu Plat, The Queen, and other apples, and a few pears.

Messrs. J. Veitch and Sons contributed two dozen dishes of splendid pears (French-grown, we understood), the leading varieties being Beurre Six, Mdme. Dupuis, Beurre de Naghan, Belle les Abres, Chas. Ernest, Notaire Lepin, Beurre Bachelier, Beurre Diel, Beurre Cadelein, Triomphe de Jodoigne, and Le Lectier. The Chelsea firm also contributed a collection of their special varieties of vegetables, in which parsnips, leeks, onions, Brussels sprouts, and endive were conspicuously good.

Mr. Divers, gardener to the Duke of Rutland, Belvoir Castle, Grantham, exhibited over forty dishes of pears, some of the best being Le Lectier, Beurre Diel, Beurre Clairgeau, St. Luke, Catillac, Doyenne du Comice, Chas. Ernest, Duchesse d'Angoulême, Pitmaston Duchess, and Beurre de Jonghe.

COMPETITIONS.

The only exhibitor of six dishes of potatoes was Mr. Gentle, gardener to Mrs. Denison, Little Gaddesdon, Berkhamsted, who was awarded first prize for splendid samples of King Edward, Goldfinder, Snowball, Royalty, Longkeeper, and Queen of the Veldt. Messrs. Jas. Carter and Co., High Holborn, scored for eighteen dishes of potatoes with fine specimens of Advancer, Goldfinder, Early Favourite, Royalty, Nonsuch, Snowball, May Queen, etc. Mr. Gibson, gardener to the Duke of Bedford, Welbeck Abbey, Notts, was awarded first prize for a dozen dishes of potatoes, distinct; the tubers were of beautiful shape, and quite free from blemish, but in some cases, notably Windsor Castle and Epicure, they were hardly characteristic; Mr. R. Staward, Panshanger Gardens, Herts, second. Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, was first for six dishes of onions with fine bulbs of Ailsa Craig, Globe, A1, Reading, etc.; Mr. E. Hatch, gardener to A. B. Goldschmidt, Esq., Cavenham Park, Mildenhall, second.

AWARDS.

First-Class Certificate. — To Nephrolepis exaltata Marshalli, from Messrs. H. B. May and Sons, Edmonton.

Award of Merit.—To Begonia The Gem, from Messrs. J. Veitch and Sons, Chelsea.

To Chrysanthemum Lingwood's Pride, from Messrs. J. Peed and Sons, West Norwood.

To Lælio-cattleya Baroness Schroder var. Mdme. Henriette, from Comte de Hemptinne, Belgium.

To Lælio-cattleya Corunna Westonbirt var., from Lieut.-Colonel Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

MEDALS.

Gold.—To Messrs. J. Hill and Son, Edmonton, for ferns.

Silver-Gilt Flora.—To Messrs. H. B. May and Sons, Edmonton, for ferns; to Messrs. Jas. Veitch and Sons, Chelsea, for crotons and chrysanthemums.

Silver-Gilt Knightian.—To Messrs. Sutton and Sons, Reading, for onions; to the Duke of Rutland (gardener, Mr. W. H. Divers), Belvoir Castle, Grantham, for pears.

Silver-Gilt Banksian.—E. Brown, Esq. (gardener, Mr. Bradford), Highwood, Roehampton, for group of plants; to Baron Schroder (gardener, Mr. Ballantine), The Dell, Egham, for winter-flowering begonias.

Hogg Medal.—To Messrs. J. Veitch and Sons, Chelsea, for pears.

Silver Flora.—To Mr. W. H. Page, Tangley Nurseries, Hampton, for carnations; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to the Duke of Marlborough, Blenheim, for Vanda cærulea.

Silver Banksian.—To Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Mr. E. V. Low, Haywards Heath, for orchids; to E. Rogerson, Esq. (gardener, Mr. Price), West Didsbury, for orchids; to Messrs. W. Cutbush and Son, Highgate, for carnations and hardy flowers; to Lord Hillingdon (gardener, Mr. A. Allan), Hillingdon Court, Uxbridge, for carnations; to Mr. W. A. Voss, Rayleigh, for fruits.

Silver Knightian.—To Messrs. Jas. Veitch and Sons, Chelsea, for vegetables.

Bronze Flora.—To Messrs. H. Cannell and Sons, Swanley, for chrysanthemums; to Sir D. Gooch (gardener, Mr. D. Wilkinson), Chelmsford, for single chrysanthemums; to the Duchess of Bedford (gardener, Mr. Dickson), Chenies, Rickmansworth, for gesneras.

Bouvardias. — These are beautiful and distinct subjects for flowering indoors during the winter months, as both white and coloured forms impart a bright effect to the conservatory when in flower, while as cut flowers they are in general request for button-holes and table decorations. At this season they require a light airy position in a warm pit where the atmosphere is lightly charged with moisture, and an occasional watering with dilute liquid manure will encourage the plants in the production of their flowers. Vapourising is the safest and most effective method in suppressing insects among these plants at this season.—Thomas Smith.

Roses for Town Gardens.—In the paper on "Roses for Town Gardens," by Mr. A. C. Hill, gardener to Sir R. Poynter, Bart., Kensington, W., read at the monthly meeting of the London Branch of the British Gardeners' Association, the following varieties were recommended as the most suitable for town gardens: H.P.'s, Ben Cant, Beauty of Waltham, Countess of Oxford, Duke of Teck, Duke of Edinburgh, Duke of Wellington, Ulrich Brunner, Fisher Holmes, General Jacqueminot, Prince Camille de Rohan, Frau Karl Druschki, Mrs. Sharman Crawford, Mrs. Geo. Dickson, and Ideal. H.T.'s, Caroline Testout, Killarney, Grace Darling, Mrs. J. W. Grant, Joseph Hill, Gloire Lyonnaise, Liberty, Marquis of Salisbury, Mildred Grant. Wichuraianas, Alberic Barbier, René Andre, Dorothy Perkins, Lady Gay. Polyanthas, Crimson Rambler, Philadelphia, Queen Alexandra, Longworth Rambler, Blush Rambler, Psyche.

NATIONAL VEGETABLE SOCIETY.

The second lecture of the winter session of the Kingston Gardeners' Society was delivered by Mr. A. Dean, V.M.H., and his subject was "The National Vegetable Society: Its Aims and Objects."

Referring to the existence of numerous special societies of a horticultural character, the lecturer said that they were exclusively devoted to the cultivation and exhibition of flowers, such as roses, carnations, sweet peas, dahlias, and others. These were all very well, from their promoters' point of view, but they did nothing to stimulate or popularise such very important food products as fruits and vegetables. Even the Royal Horticultural Society, with its 10,000 Fellows and large income, was so greatly concerned with horticulture as a whole, and covered so much ground, that it could not devote special attention to any one subject. Yet in its case both fruits and vegetables occupied a far less prominent position than did trees, shrubs, and flowers.

Now, whilst leaving to fruit growers to organise their own special society, vegetable growers, and others specially interested in their culture, whether as garden products for home use, or for commercial purposes, had formed the National Vegetable Society, of which the Duke of Portland is the president. There were a large number of vice-presidents, and an executive of twenty-four persons, all well-known in gardening circles. One special object of the society was to promote from time to time trials of different classes of vegetables, to ascertain which were the most profitable and suitable methods of culture, as well as the best varieties to recommend for general culture. To that end already three trials of autumn-sown cabbages and onions were in progress, one at Twickenham, one at the "Times" Experimental Farm, Sutton Green, Guildford, and one on stiff Essex land at Romford. Each trial was being conducted on exactly similar lines, with the same varieties, and in both cases these were all the best in commerce. Full reports of these trials will be published in due course.

Then a great effort is being made to hold at Westminster next September a large representative exhibition of vegetables, and numerous good offers of prizes have been made. The value of good home-grown vegetables as food was strongly emphasised. All the strongest of animals were vegetable consumers, and their bone and muscle was quite identical with that of man. But instead of cultivating the millions of acres of land at home, and in so doing furnishing good employment to millions of men in producing a great vegetable food supply, we preferred to depend on the uncertain and costly importations of meat and corn from elsewhere, supplies that at some critical moment may fail us. How much better to be able to consume good healthy, non-gouty foods grown at home, and obtained at trifling cost, than to purchase and consume vegetables grown elsewhere, and served up second-hand in the form of questionable animal food.

The subject was not one of vegetarianism or of politics, but it was one of successfully utilising vast areas of home land now lying almost waste or useless, and employing millions otherwise unemployed to cultivate the land, and produce from it an ample supply of good, wholesome food for all the nation's inhabitants. It was really a matter of common-sense or of no sense.

Special emphasis was laid on the unfortunate way in which, as a rule, good vegetables are presented for sale to consumers. Even were there great improvements in that direction seen, the consumption of vegetables might be speedily doubled. We were slow to learn, and generally too proud or too obstinate to be taught, but if we would adopt the methods of packing and marketing shown by foreigners or colonists, how much better would ours be.

A cordial vote of thanks was given after many questions had been replied to.

NATIVE PLANTS IN THE ROCK GARDEN.

With the rapid extension of rock gardening it has become imperative that the gardener and garden lover should know something concerning those plants which are especially adapted for furnishing the rock garden. Certainly one can find ample room for study among the plants that are suitable on the rockery. One is not limited in choice of species and varieties, neither is there any need to duplicate the kinds that are represented in someone else's garden.

The great charm of rock gardening lies in its enthralling interest, and happy indeed is he who can break away from conventional ideas, and choose and group his plants in his own "unfettered" way. If there is anything which will detract from the charm of the rock garden it is the repetition of a few well-known subjects, which, attractive though they may be, yet by constant association become, as it were, commonplace, and lose much of the interest that really belongs to them.

Happy is the collector who can devote himself to rarities, and embellish the ledges, chinks, and nooks with delightful uncommon plants from the mountain ranges of the world. All are not thus fortunate in being able to devote the time and money to the acquirement of such a collection. And, in a way, it is well, for the rarity of many alpines in cultivation enhances their interest and value.

Thus, to the reader who is desirous of making a rock garden of interest, which shall differ greatly from the majority, I would suggest the formation of a collection of British plants that are suitable for the purpose. And really there is a wealth of material to choose from. One could without difficulty form a very pretty collection at a small cost, which would impart to the rockery both interest and beauty. Violas like V. lutea, and the rare odorata varieties might all find a place. Dianthus, such as D. cæsius (the Cheddar pink) and its varieties, also D. deltoidea, and its varieties may be noted.

Saxifrages furnish many species, notably Saxifraga umbrosa, S. oppositifolia, S. hypnoides, S. geum, S. aizoides, S. cæspitosa, may be mentioned among them. Sedums also are somewhat numerous. S. rhodiola, S. album, S. anglicum, S. acre, S. dasyphyllum, S. sexangulare, S. rupestre, and others are worthy of inclusion.

But the wealth is so great that it is useless to attempt enumeration. One can briefly refer to such gems as the native linarias, the tiny Hutchinsia alpina and H. petræa, Dryas octopetala, Sisyrinchium anceps, Linum perenne, Epimedium alpinum in variety, Claytonia perfoliata and C. perfoliata alba, veronicas like V. repens, V. spicata, V. alpinus, etc., the charming thymes, vincas in variety, the silvery Antennaria dioica, cerastiums, including C. alpinum, primulas such as P. farinosa, P. scotica, the delightful native campanulas and phyteumas; lychnis such as L. alpina, L. viscaria, L. vespertina, and their varieties; Glaux maritima, gentians in variety, and the best of the geraniums and erodiums. Other exquisite natives are found among the potentillas, erysimums, arenarias, armerias, thalictrums, corydalis, statices, asperulas, ajugas, lithospermums, geums, alyssums, and arabis. Then there is the spur-valerian, Centranthus ruber, of which there are red and white forms. These handsome plants will have been noticed by many of my readers growing on chalk cliffs on the sea coast and elsewhere, more particularly in the South of England, where they produce a beautiful effect. They grow freely, and bloom profusely when planted on the rockery with ordinary soil for the roots to run in. One of the best proofs of this is the illustration given herewith of Centranthus ruber growing in a Hertfordshire garden.

Bulbous plants, such as Tulipa sylvestris, Fritillaria meleagris, Galanthus nivalis, narcissi in various forms, crocus, and others come readily to mind. Anemones like A. pulsatilla, A. nemerosa alba plena, A. ranunculoides, and A. apennina, cyclamen of the europæus section, and Convallaria majalis (the lily of the valley), and other cool-loving subjects are deserving of notice. When you add to the foregoing fragarias, Frankenia lævis, drabas in variety, erigerons, pyrolas, the daphnes, Astrantia major, and a host of other subjects, the reader will realise that the British rock garden need not be scantily supplied.

For the cool and half-shady portions of the rock garden one could select some of the choice varieties of the British ferns. There are so many exquisite forms to be found among the polystichums, polypodiums, scolopendriums, lastreas, etc., etc., that one need not doubt the propriety of grouping them in the cooler situations. With them one can associate such flowering plants as hellebores, anemones, etc., which will add to the interest and beauty of the garden.

Where comparatively large open spaces are available, groupings of the British heaths, in their many varieties, could be resorted to. Ericas are certainly pleasing, and a small collection, arranged on the peaty slope, with here and there a grouping of slow-growing shrubs, breaking up amongst them, to take off any appearance of flatness, will add to the attractions of the rock garden.

Lastly, but not by any means least, are the hardy orchids, and the cypripediums, orchis, ophrys, habenarias, call for distinct notice. With few exceptions the British hardy orchids may be successfully cultivated in the rock garden, and the selection of planting sites, the acquisition of representative species and rare varieties, and the subsequent interest attaching to them, will provide the garden lover with a pleasing task and an instructive hobby. Taken as a whole, the British flora, so rich in genera, species, and varie-

CENTRANTHUS RUBER AND OTHER NATIVE PLANTS IN THE BRICKENDEN GRANGE GARDENS.

ties, is deserving of the close attention of those whose hobby is their garden.

With a representative collection one may include a few plants, that may be either terribly invasive or wonderfully reproductive, but these can usually be kept in check by occasional lifting and prevention of seed formation, or, if time is an all-important item, such forms could be eliminated altogether. P. S. Hayward.

PEAR DOYENNE DU COMICE AS A BUSH TREE.

A common law in connection with pears seems to be that the more choice the variety the greater the need for high-class or wall culture. There may be some degree of truth in this as regards some of our better stocks, but certainly it does not apply to all, at any rate, in localities where pears are successfully grown in the open air. In the northern counties, and in districts where circumstances give occasion for special protection, the choicer kinds of pears may, and do, need either wall or glass protection in order to secure satisfactory results.

It needs no stretch of imagination to place pear Doyenne du Comice at the head of the large number of varieties in our garden, orchard house, or field, and yet what variety among them has such an adaptive disposition? The present season has been one apparently which has suited the pear much more perfectly than it has the apple, which is somewhat contrary to the commonly accepted views of the observant pomologist. It has often been said, and perhaps as often proved, that the pear revels in a summer with a record of solar maximums, and for these reasons one turns instinctively to the large importations of Continental and Colonial fruit in their season. The French Williams, and Duchesse d'Angoulême, are instances of such faith, their large size and good qualities taking a distinct lead over our own stocks of the same kinds. The last-named, indeed, has by no means a reputation for superior quality in British soil, yet the French fruit finds a ready sale in a market already very well supplied with other pears.

I can well remember the time when great hesitancy was found in choosing Doyenne du Comice as a bush or pyramid for the garden. It was regarded as fit only for the sheltering wall. It is true such provision may give samples more or less superior in appearance and size, but there is no gainsaying the fact that when flavour is the test the bush or pyramid in the open garden can calmly lay down a challenge where climatic or local circumstances favour open-air culture. It is true that from a wall, it may be, of east, west, or south aspect, there is a greater refinement of skin than is procurable from the open bush tree, and we cannot deny that skin perfections are very attractive; but take the outer skin off, and it will be found, to use a common expression, that beauty is but skin deep. Under the two systems of culture there is a marked difference in exterior tones. This recalls an incident in which a distinguished baronet who professed some knowledge of pear names declared that our "Brown Beurres" were the best he had ever tasted. An attempt to enlighten was not at first successful, for the medium size and russetty skin were such true counterparts of the real Brown Beurre that only actual flavour comparisons between them carried conviction. Evidently, wall-grown fruits were those to which he had grown accustomed.

These influences are not more developed in Doyenne du Comice than in other pears commonly grown in our gardens. The old favourite Marie Louise can just as easily deceive the untrained eye. At an exhibition last year a young gardener staging a very good collection of pears had doubts about the correctness of his names, and a specimen of Marie Louise was needed for verification. This was obtained instantly, yet the point arose, "But they are not like yours," which was true as regards skin colour only. The one had the pale, smooth golden tone, the other the characteristic russet of the open air tree, and so one might continue instances.

I have seen trees of Doyenne du Comice bearing heavy crops in several gardens this season, indeed, in one case it was much the best among the many sorts in point of fertility, and if there were any sense of hesitancy previously, it has been definitely overcome by the uniform aspect of the current season's crop. There may not be the same individual size of fruit obtained from bush trees as from a wall-trained example, but in the case of a healthy tree not much fault can be found in this respect. The size of fruit may be governed somewhat by the age and extent of tree and its crop, and also by the encouragement that is given in feeding of the roots.

It is often felt that the warmth derived from the wall itself is reflected in the produce of the tree, both in the matter of size, colour, and smoothness of the skin. The variety under notice has shown less tendency to fall prematurely from the trees than many pears this season, and it is well to remember that by the aid of muslin bags or even a tie on the stem this permits of their being left on the tree till later, and thus extends the season and service of the best pear of the garden.

W. Strugnell.

STONE FRUITS.

Stone fruits are in demand in almost all gardens, but in some certain kinds are in more demand than others. Apples and pears, if healthy trees, and the season is at all favourable, may be relied on to produce satisfactory crops, but with such conditions the same cannot be said of stone fruits. Soil plays an important part in the production of stone fruits, and with plums more so than any other kind—at least, that is my experience. A heavy, loamy soil is less suited for plums than for any other kind, and this is probably due to an absence of lime, but even with a liberal addition of lime, plums require much restriction of the roots, especially when grown as wall trees, and necessarily limited in branch space. When plums have to be grown in such land the roots of wall trees must be strictly confined, and it is then not so difficult a matter to provide the necessary soil conditions to ensure success, if the trees are properly managed in other respects.

To check strong growth and to induce fruitfulness, many growers have recourse to lifting and replanting, or other forms of root pruning, which, for a time, certainly checks the strong growths, and also tends to the formation of some fruit spurs. Replanting under such conditions requires to be done frequently, it also means the probable loss of a crop the first season afterwards. A firm border may be maintained, say, three feet in width from the foot of the wall, but the roots of plums will soon reach the cultivated border in front, even if it is intensively cultivated.

All such extra labour may be avoided if a different procedure is adopted at the time of planting. The best means I have found to ensure success with stone fruits is to take out a hole three feet long and about two wide and put in a wall of bricks placed on their sides, the undisturbed soil will keep them in position on the one side and soil put into the hole when planting will answer the same purpose on the other side. The bottom of the hole should be bricked over, and, if necessary, some drainage be placed over these bricks. Bricks commonly known as "thirds" will answer for the purpose. If in the course of time it is necessary to give the trees more rooting space, it is a simple matter to dig out more soil lengthways, on each side, and place the bricks a little further away. When planting the trees add a liberal quantity of lime to the soil, or, if this is difficult to obtain, apply basic slag liberally.

When planting the trees within these bricked enclosures, leave the top of the soil inside about an inch or more below the top of the bricks. When trees are so planted, whether on north, south, east, or west walls, the intervening spaces between these enclosures can be cropped without any injury to the roots of the trees, and there is always something that can be grown in such places.

The same treatment will apply to cherries, and to those trees of this fruit which may be grown as pyramids or bushes in enclosures where protection from birds is necessary. I have found basic slag one of the best manures for cherries in the production of fruiting spurs and also of a crop, and as sweet cherries come in at a useful time, and form an agreeable dish for dessert, space ought always to be found for growing a few trees.

Apricots are usually in request, either for preserving or for dessert, and they are (excepting in a few localities) the most difficult of stone fruits to successfully cultivate. Where this difficulty arises, the brick enclosures should be made for the reception of young trees, or for trees not too old for transplanting, but to apricots I would give less rooting space than other stone fruits.

Peaches and nectarines, the most delicious of stone fruits, are greatly benefited by being grown in the way described, if only for the prevention of peach blister. Many may not agree with me on this point, but to overcome the attacks of peach blister we must go to the root of the evil or the chief cause of it, viz., soft, gross, badly ripened wood. When we can secure hard, well-ripened wood, about nine inches in length, which is more likely to be obtained by leaving plenty of space between the branches and restricting the root-run, we shall be well on the road to success in combating the attacks of the fungus causing peach blister.

Some varieties of peaches and nectarines are more susceptible to the attacks of this fungus than others, as I have proved by growing such varieties by the side of those which have proved immune from attack, and I have also proved by the procedure here recommended that, where properly carried out and the trees carefully attended to in other respects, injury by peach blister may be prevented. It has been said that lifting and replanting will check strong growth and bring about the desired results, but I have invariably found that peaches so treated are, the first spring after replanting, more liable to suffer from peach blister than established trees. If, therefore, trees are planted as recommended, there is no after check to root action, the curtailment of rooting-space remedying this, and also saving the labour of root pruning and lifting. Planting as advised also brings the roots of the trees under the control of the cultivator.

Horsham. T. H. Slade.

THE GARDEN BEAUTIFUL AND ECONOMICAL.

A Kelway Garden is, in every sense of the word, a garden beautiful.

The charm of each individual kind—the artistic colour effects of the whole scheme—the wonderful profusion of flowers, from spring to autumn—make a combination that gives continual delight.

Moreover, a Kelway Garden is THE garden economical.

The initial cost is moderate, and there is no greenhouse culture—no bedding out—in fact, practically no expense for years.

NOW IS THE TIME TO PLANT.

For full particulars see our new booklet, "Gardens of Delight," or our "Manual of Horticulture," sent post free for 6d. and 1s. 6d. respectively (allowed on subsequent orders).

Owing to our perfect system of packing, our Hardy Perennial plants can be sent to practically any distance (even to the Colonies), and arrive in splendid condition, arranged ready for planting.

AMONG THE ROSES IN NOVEMBER.

There is a great contrast between some previous seasons and the present in the matter of lifting roses. More than once we have had to water the ground, and on many occasions extra care was needed because the ground was dry and hard.

No time should be lost in transplanting where one is fortunate enough to possess ground not too saturated. I would even endeavour to plant with the aid of planks or boards to tread upon rather than miss getting the plants in while the ground is still fairly warm. Of course, one must upon no account plant in mud, but where planting can possibly be done, the prevailing rains are all in favour of the soil settling firmly about the roots before real winter weather arrives. The condition of the soil in each case should be taken into consideration, and no hard and fast rule can be followed.

Owing to the humid and mild autumn the majority of roses are in leaf still, and I would like to draw especial attention to the benefit of removing most of the leaves immediately the plants are lifted. It is surprising how great a strain is put upon the plants to supply enough moisture to aid the ripening of leaves after the roots have been disturbed, and much shrivelling of wood and distress is avoided by removing the bulk of the foliage at once. Of course, in the case of permanent plants this removal is not necessary.

Some growers make a special hobby of cultivating their roses from the earliest stages; more particularly in the case of a few standards. Personally, I think it better for the amateur to obtain plants from some well-known nurseryman. Not only is there great annoyance from losses, but two years' delay before a respectable plant is secured. In addition to this there is the unsightly and straggly appearance unavoidable in the first stages of growing standards. Still, if it is your hobby, buy the briars as soon as possible before they have laid about in the frost. Half the secret in rooting hedge briars lies in procuring and planting them before they have had their roots frosted, and while the soil is still warm. Do not give manure to unrooted briars; they root better without, and any additional food can be supplied later. Wind waving should be avoided in some way, as support is necessary when briars are first planted.

In many cases wind has swayed the tall shoots of pillar and climbing roses more than usual this autumn, and therefore some care is needed to prevent injurious chafing of growths, which is oftentimes the direct forerunner of canker.

Pot roses need to be housed now; or, at any rate, put into pits. Excessive wet at the roots clogs and sours the compost, and the plants can readily be brought on in batches from the cold frame or pit as desired, never forgetting that steady treatment from the first is better than hasty forcing. But it is early yet for these except in the case of market growers, and I only mention them because experience has proved to me that they are best under cover at this date.

Too much attention cannot be given to preparing soil for roses; nor can one move it over too deep or often. By this I do not mean that sour or gravelly subsoil should be brought to the surface, and the roses be put in it, but that opportunity should be taken to drain the soil if necessary, and thoroughly work and enrich it. Although roses thoroughly enjoy a rich soil they do not like a big dose of manure all at once. After a good compost has been provided I would prefer to help the plants as they grow. It is obvious that if we add a lot of manure now, much of this will be lost long before the roots are active enough to use it, and that is why I think a good mulching in early spring is particularly beneficial.

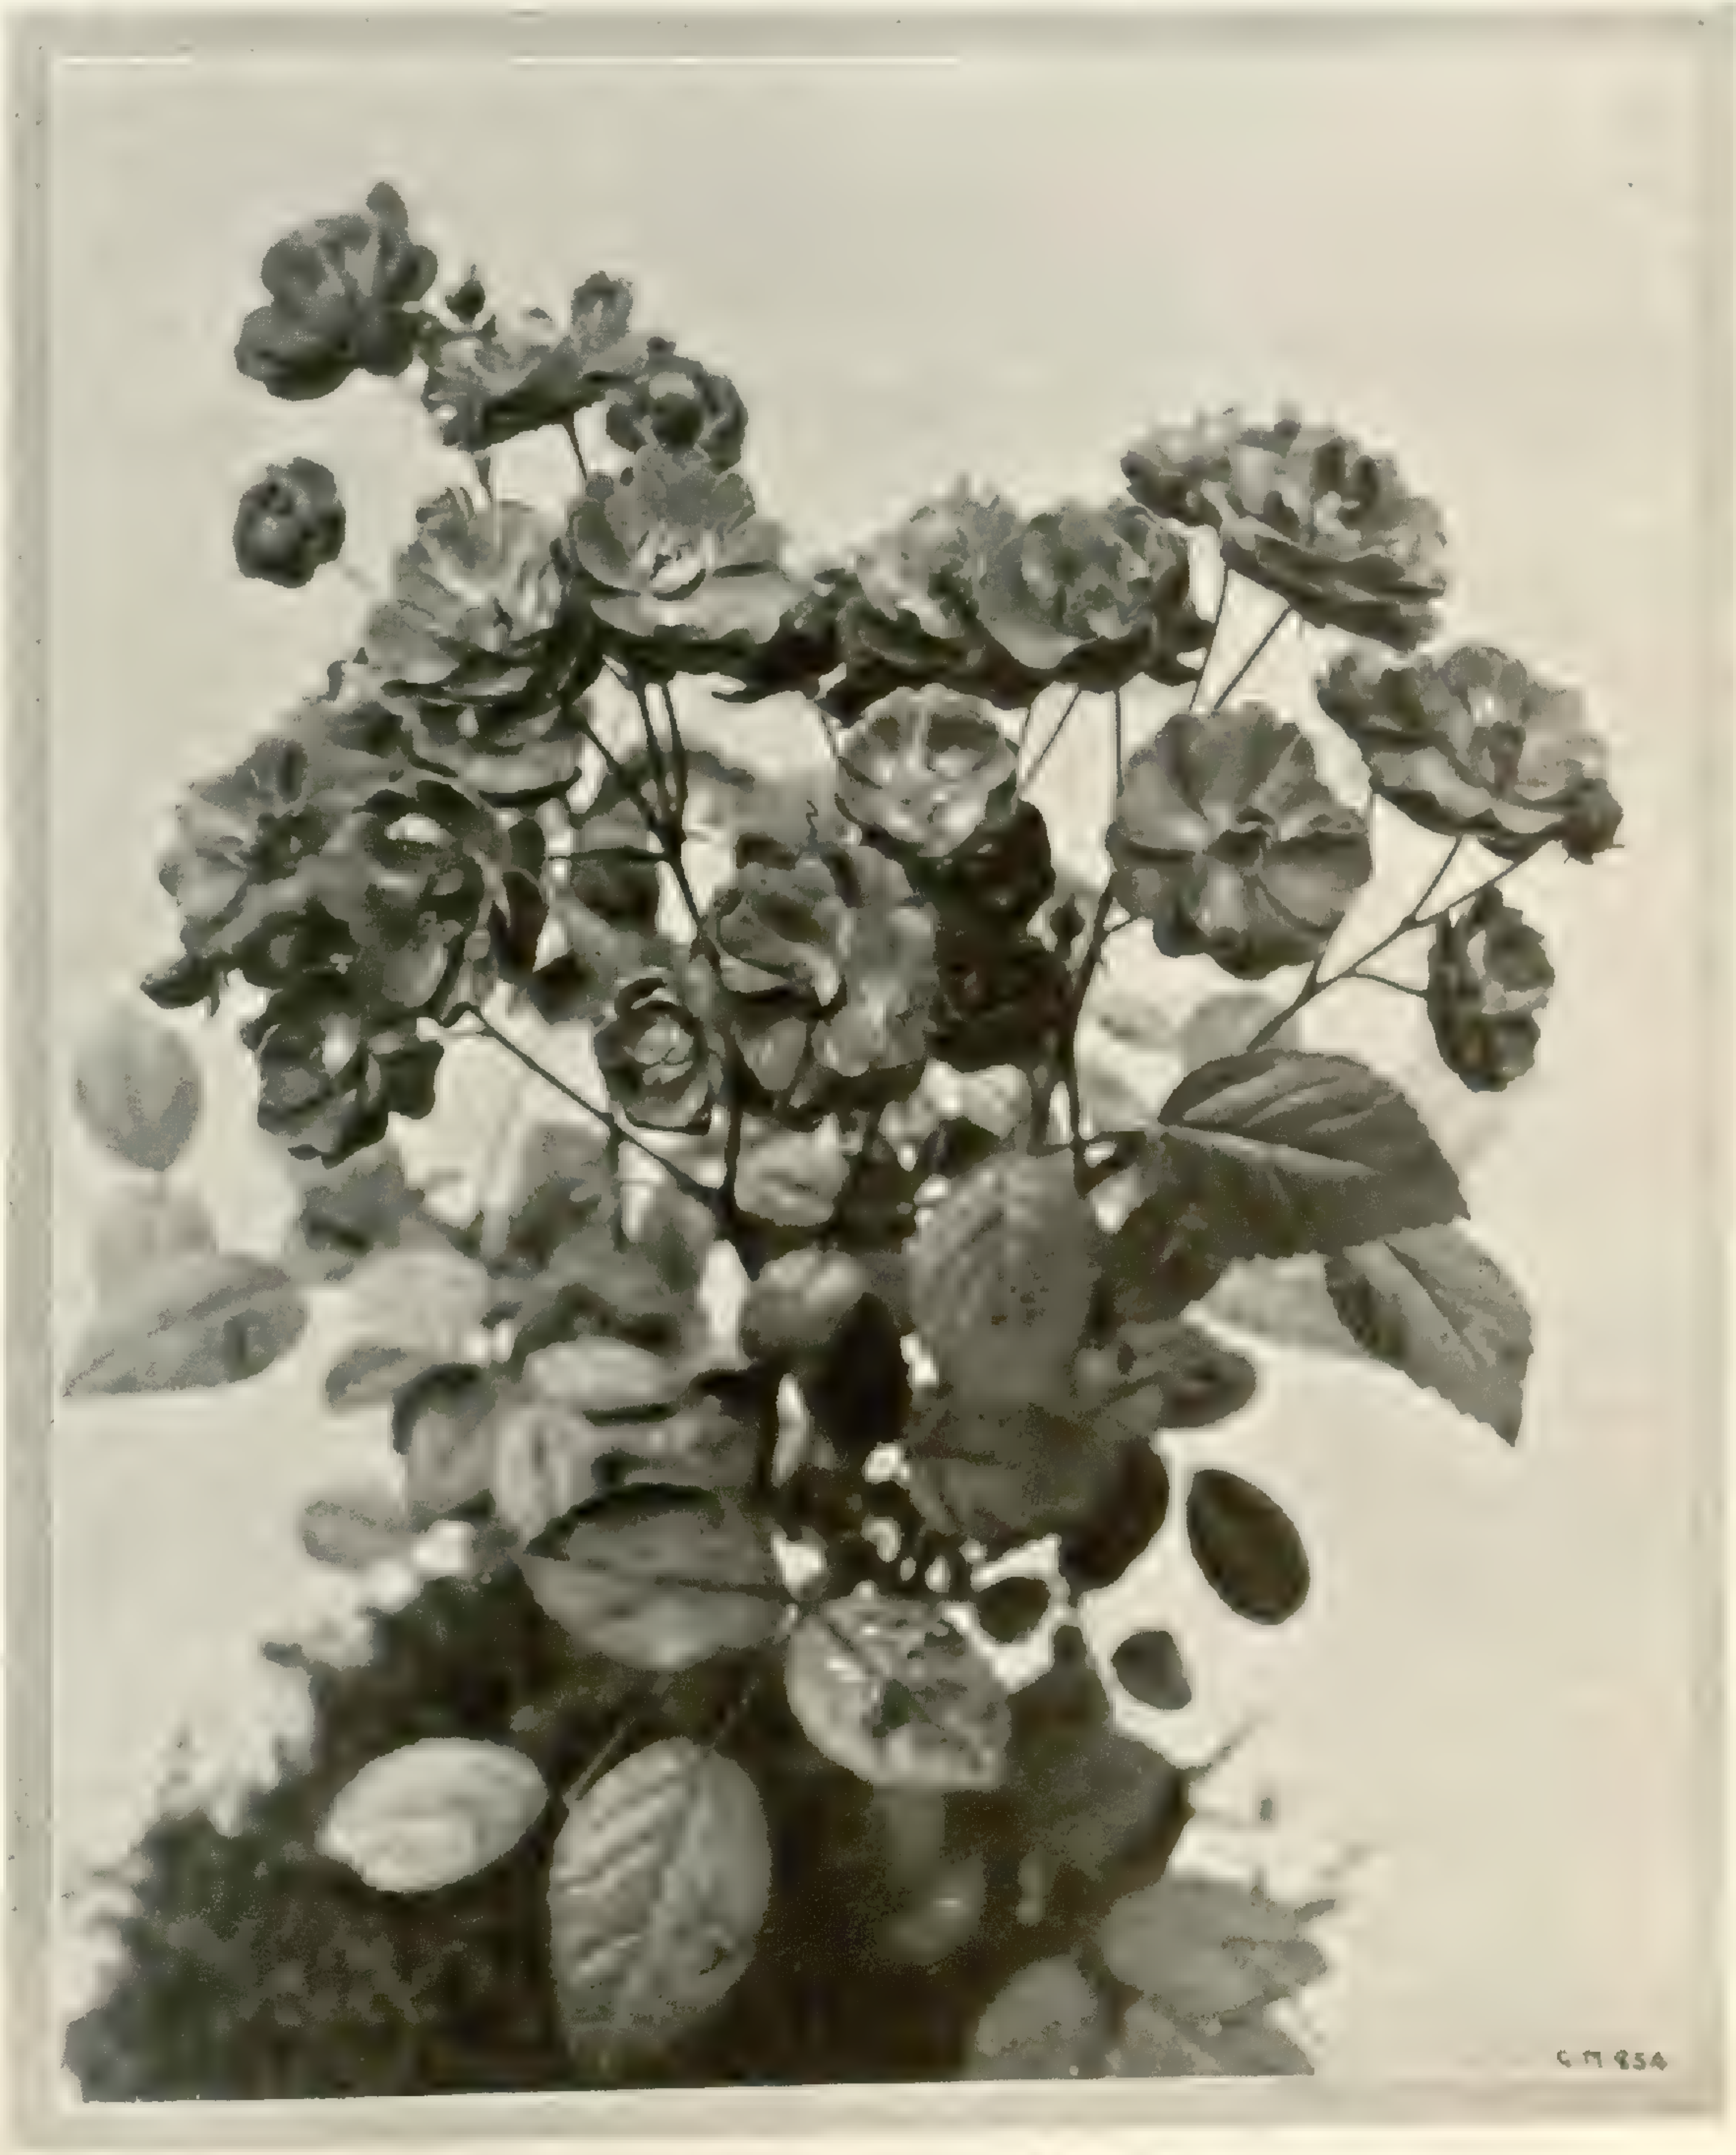
Nor is time wasted in spreading out the roots more carefully than I have seen it done in many instances. Endeavour to place them in a natural position. It hurts me to see the roots lumped in as if a farm hand was dibbling in cabbage plants. If we bore in mind how firm atmospheric and wind pressure soon makes the ground we would plant more firmly than is generally the case. Frost will often lift newly-planted roses considerably, and it is a good plan to examine the beds and tread around the plants after frosts or dry, windy weather.

As to which are the best roses to grow, we have such a selection now that one has only to choose a colour or colours, and they can be supplied in any form and suitable for almost any situation. It is no longer necessary to possess what is sometimes described as a rose soil, although, of course, a strong, stiff, and naturally rich loam is best. Good roses can be grown in any district or situation if due attention is given to the selection of varieties. I would advise those who do not know exactly which variety they want to state the colour, mention the situation they wish the plant to occupy, give a little idea of locality and soil, and then trust to some well-known rose grower to supply.

A. Piper.

NEW POLYANTHA ROSE JESSIE.

Those who saw this delightful little rose at the Temple Show held in May last, will hardly need a reminder of its usefulness and beauty. Others, however, who have not yet seen the variety, will gather from the illustration herewith some idea of its habit and appearance. It is a dwarf, neat-growing rose, producing its very double flowers in large clusters, and with great freedom. The colour is vivid crimson, almost a scarlet shade, consequently a bed or group of this rose is very effective at flowering time. Now that roses are being so abundantly grown in beds and rose gardens the use of dwarf polyantha varieties becomes a necessity for grouping among or around large growers or standard plants. This newcomer, named Jessie, is well worthy of consideration by planters, and it has been already hall-marked by the Royal Horticultural Society, this body granting it an Award of Merit on May 25, when it was shown by Messrs. H. Merryweather and Sons, Lim. Southwell, Notts, the introducers.



POLYANTHA ROSE JESSIE.

A beautiful free-blooming dwarf variety with flowers of a brilliant crimson hue. Introduced by Messrs. H. Merryweather and Sons, Lim.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price 1s. 6d. net, by post 1s. 9d.; cloth, 2s.; by post 2s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

PROLIFERATION.

One of the most familiar foliage plants for room or conservatory decoration is Asplenium bulbiferum, a pretty twice-divided evergreen exotic fern, the fronds of which are profusely proliferous, that is, produce a number of young plants which, under congenial conditions, bear a second generation while still attached to the parent plant. On examination it is found that these youngsters first make their appearance as tiny pimples upon the surface of the sub-divisions, and not, as with buds proper, as excrescences in the axils at the base of the stalks, and it is this feature which distinguishes them as bulbils proper.

In trees, as we know, there is a dormant bud at the base of each leaf where the leaf stalk springs from the twig, and it is by the development of these buds into twigs in their turn, and the expansion of the twig into a branchlet, and the branchlet into a branch that in time the great mass of a tree is constructed. These, however, may be considered as constituting buds proper, and there are very few flowering plants indeed which produce bulbils normally on their foliage, although it has been found that, in some cases, as in the begonias, gloxinias, and achimenes, they will form on the cut edges of wounded leaves, a faculty of great service to the propagator. Some bulbous plants, such as the hyacinth, also form bulbils abundantly on the artificially hollowed out bases of the bulbs (as was recently shown in these pages), though these might be more fitly termed bulblets, since they do not produce leaves as bulbils do, until subsequently planted, first forming a miniature bulb with only an embryo root system.

The root systems, however, of trees and other plants, are capable of producing what must be considered as proliferous bulbils, since, although there are no leaves or leaf axils proper, they produce young plants when they approach the surface by developing superficial buds. In many plants this capacity is developed on more definite lines in the form of subterranean runners or stolons, which, however, in many cases, must be regarded rather as plunging branches so to speak than proliferous roots, since, as a rule, the stolon or runner itself, only develops roots proper at the points where the buds develop into plants, precisely on the same lines as the super-terrestrial runners of the strawberry. In Anemone japonica there is an abundant provision of buds on the fleshy root branches in continuous rows like an incrustation, so that any accidental severance of the roots aids instead of hinders the propagation of the plants.

In ferns proliferation takes several forms. In the broad-fronded platyceriums or Stag's Head Ferns, the root tips when they reach the surface of the mass of humus on which they generally grow, form buds which develop into plants. The struthiopteris or Ostrich Feather Fern, produces burrowing stolons by means of which strong plants arise at a considerable distance from the parent. A large number of ferns have latent buds at the bases of their fronds which in some cases assert themselves so as to form cespitose or bunchy specimens, while in others they only do so when the main centre of growth is checked. Some, as we have seen in the case of Asplenium bulbiferum, produce bulbils on their fronds, others, as in many of the abnormal polystichums, bear proliferous buds on their frond stalks or even profusely along the main and secondary midribs of the fronds and their sub-divisions. In several distinct forms of plumose or extra feathery athyriums or Lady Ferns, the rare phenomenon of dorsal bulbils, or bulbils on the frond backs, in association with the spore heaps, exist, a phenomenon which is a specific character in the exotic Lastrea prolifera.

A pretty form of our native Maidenhair, Adiantum capillus veneris var. imbricatum, bears marginal bulbils where the spore heaps should be. The Hartstongue Fern is not normally proliferous at all, but a number of varieties produce bulbils erratically on the stalks; several do so on the surfaces of the fronds like Asplenium bulbiferum, and all forms possess a curious capacity of producing bulbils on the frond bases if these be severed from the caudex and kept close. Nature, in fact, has been most generous in providing means of resuscitation, or rather regeneration, of her plant creations in case of damage or partial destruction, by endowing the cells individually with the power of deviating from their normal course of development or objects and assuming reproductive powers. This, of course, is an immense advantage for the propagator who grasps this fact fully and finds ways to profit by it. Rare and comparatively or quite barren plants or infertile hybrids can be multiplied in this way, and we have a very strong impression that the very fact that normal sexual reproduction is repressed implies greater reproductive vigour in other directions. The converse case certainly holds good, for plants which propagate themselves freely and abundantly by other than seminal means are often sparse seed or spore producers.

Chas. T. Druery, V.M.H., F.L.S.

VIOLA CORNUTA PURPUREA.
A very distinct form, producing a profusion of rich purple-blue flowers; as exhibited by Messrs. Gunn and Sons.

VIOLA CORNUTA PURPUREA.

It is now very many years ago since the late Mr. John Wills so well known for his skill as a floral decorator—secured a good deal of fame for himself, and did horticulture a real service, by reintroducing Viola cornuta into gardens, and demonstrating its value as a bedding, border, or edging plant. Mr. Wills was at that time gardener to the Egerton family at Oulton Park, Cheshire. In more recent years the greatly improved race of violas, or tufted pansies, has overshadowed Viola cornuta for general garden decoration, though it and its varieties have been favourites with lovers of rock gardens.

Quite lately, however, a very fine variety of the good old species has been brought prominently before the public by Messrs. Gunn and Sons, of Olton, near Birmingham. This is V. cornuta purpurea. It would be difficult to conceive a plant that flowers more freely than this, for its brilliant deep purple-blue flowers, borne erect on wiry stems, are produced so freely that scarcely can the foliage be seen. Mr. Gunn points out that where old plants are pulled to pieces in late spring, and replanted, and another set similarly treated in the autumn, it is very rarely indeed that flowers are absent. This is worth remembering, because where floral decorations of a blue colour are necessary this viola is most valuable, and it may be pressed into service to take the place of violets in wreaths and other floral designs. As a bedding and edging plant this beautiful hardy viola has a fine feature, and one may expect to find it used largely for spring and summer displays in parks and gardens. There is no question as to the hardiness of Viola cornuta or its varieties.

THE ROWANS OR MOUNTAIN ASHES.

The accompanying illustration of Pyrus aucuparia var. dulcis directs attention to the free-fruiting qualities of the Mountain Ash and its varieties, though unfortunately, a photograph fails to do justice to the fruits, for the bright crimson, scarlet, or yellow colouring cannot be reproduced.

The Mountain Ash, Pyrus aucuparia itself, is one of our most ornamental fruiting trees, and is popular in many parts of the country, whilst it is frequently met with in a wild state. In wooded districts or in pleasure grounds it is no uncommon thing to find Mountain Ashes in all stages of development from tiny seedlings to mature specimens that have originated from seeds distributed by birds; for when ripe the fruits are greedily eaten by many of the feathered tribe, particularly blackbirds and thrushes. It shares with the birch and Scotch pine the distinction of being a good subject for reclaiming waste ground, for it grows well wherever it can find root-hold, and one is surprised at times to find it flourishing in places where little or no soil appears to exist. A seed has perhaps been dropped in the fissure of a rock; this has germinated, and the roots of the tiny seedling have gradually forced their way through tiny cracks until they have found sufficient food material to build up a goodly-sized bush.

PYRUS AUCUPARIA DULCIS.
A handsome form with brilliant crimson fruits as exhibited by Messrs. Paul and Son.

From this, it must not be imagined, however, that the tree prefers poor living, for it is just like other subjects, and, although it can get along comfortably in poor, sandy ground, it assumes its finest proportions in soil of good quality. It never grows into a large tree, and its maximum height appears to be about 40 feet, whilst trunks $1\frac{1}{2}$ft. in diameter are not common. The timber is not put on the market in sufficient quantities for it to have any special commercial value, though doubtless, if it could be obtained in regular quantities it would be saleable at a fair price, for it is hard, fine-grained, and takes a good polish. As an undergrowth it has some economic value, for coppiced stools throw up clean, straight growths which form good stakes, whilst they can be used in a split state for hurdle making. In the woodland groups or single trees are effective, whilst for small gardens they are to be commended.

In the case of a tree that is so widely grown it is not surprising to find that some variation has occurred either in habit or fruit, and advantage has been taken of these variations to give a number of the most distinct, descriptive names. The following varieties may all be obtained from the leading firms of nurserymen who make a speciality of trees and shrubs:

P. a. asplenifolia is distinguished from the type by the leaflets of the pinnate leaves being divided into fine segments. The fruits are very similar to those of the type. P. a. Backhousei has a stiffer and more upright habit than the type with very bright coloured fruit. P. a. discolor differs principally by its fruits, which are double the size of those of ordinary kinds and orange-scarlet in colour.

P. a. dulcis, of which an illustration is given, bears crimson-scarlet fruits in very large trusses, the individual berries being as large as those of the last-named. P. a. fastigiata is easily detected by its habit being similar to that of a Lombardy poplar. P. a. fructu-luteo is an extremely desirable plant, for it bears rich yellow berries in place of the ordinary scarlet sort. P. a. moravia is conspicuous by exceptionally large heads of fruit. P. a. pendula differs from other varieties by having pendulous branches. P. a. saturæfolia has larger leaves than the type and yellow fruits. P. americana, the "American Mountain Ash," is very similar to the common one, but is of stiffer habit with larger heads of smaller fruits.
W. D.

THE GARDEN IN NOVEMBER

Some of us like Nature best in her less soft and gentle seasons, having perhaps a tendency "to love the lovely that are not beloved," but when Nature is narrowed down to the garden, and that in November, there are not many who can really feel that the season has many pleasures peculiar to itself. Some will doubtless agree with the poet when he says:

> "My very heart faints and my whole soul grieves
> At the moist rich smell of the rotting leaves,
> And the breath
> Of the fading edges of box beneath,
> And the year's last rose."

But as the true Nature-lover can get his sense of the beautiful fully satisfied even in November, so a thorough-going gardener and not the suburban dweller, who, with so many of his neighbours, has recently taken up gardening, will find November a real delight in the garden. It has been said that the highest joy of gardening is in making improvements, even though, to the callous observer, they are only alterations, and November is the month par excellence to indulge this delight. I have often said that I enjoy gardening more in November than at any other time of the year—a nice dry November when you can ruthlessly clear everything away without waiting for anything to finish flowering or to be cut off by the frost, and can transplant anything with impunity, while the soil, nicely moistened to a good depth after the autumn rains, works easily and well, so that whatever we do something looks the better for it.

Our mental attitude towards the garden is one of hope, and that, to a greater degree perhaps than at any other season, for everything we do, apart from mere clearing away of leaves and rubbish, is a preparation for the future, and there are no failures or disappointments of any sort at present. A writer in "The Times" once said that a test of the extent to which a man was permeated by the true spirit of gardening was to ask him in which month in the year he would most reluctantly be away from his garden, for if he gave any month but November he might be considered wanting. The writer in question went on to say that November and March were the two most important months of the gardener's year, but I am prepared to contend that November stands by itself, for whereas the work in March, though indispensable, is mostly of a routine character —mainly sowing seeds and planting the vegetable garden—November is the season for making the plans and laying the foundation for next year's display.

Now is the time to do that two-spit digging, which will give us sweet peas ten feet high and two-pounder onions; to take up, renovate, and replant the mixed borders and beds; and, above all, to plant roses, shrubs (other than evergreens) and fruit trees, so that next season will scarcely show they have been moved. For all this the conscientious workman and the shirker can show pretty nearly equal results during the winter; but when spring comes, and after that the summer, what a difference in the results!

November has been called an untidy month, but it is the month of all months when we really make everything neat and tidy for the winter. It has been called a month of sadness, gloom, and hopelessness; but it is the reverse of all this, for everything is preparing for the spring, and the growing tips of the snowdrops, crocuses, narcissi, and others are in many cases only a fraction of an inch below the surface of the soil. July is the dead season for all these things, but very soon now we shall see that

"The buried bulb doth know
The signals of the year,
And hails far summer with his lifted spear."

In its more genial moods, too, bird life, especially in the person of the thrush, becomes more vocal after the comparative silence of the summer and early autumn, and it is the forerunner of the spring songs that we may hear in real earnest in open weather a month or six weeks later.

In conclusion, though the busy man sees all too little of his garden, it is a season when he may contemplate it with satisfaction and equanimity. This applies especially to the latter part of the month, when, unless he has been unfortunate, all the more pressing work is done, and that before the bad weather of the winter has set in. There is nothing to worry about now, everything is in winter quarters, or in such a state or position that the normal winter is not likely to do it any harm. Before the winter is over he will begin to worry about the early-flowering fruit trees on the walls, a worry from which he will not be quite free till May is nearly out, and after that it is not long before more things begin to need the watering-pot than he has time to satisfy, and this continues till August or the beginning of September, when he will be on the constant watch for the ravages of birds on his special apples and pears, ravages which are not always prevented by what he considers secure netting.

None of these conditions obtains in November, and only one whose delight is in Nature as we find her in the garden, can appreciate the feelings of the amateur who works about his garden in the semi-darkness of a November Saturday afternoon, and is able to recognise with satisfaction the work that has been accomplished during the week, either by himself alone or with the help of others—work which perhaps he had been setting his mind upon for months past, while at the same time he can feel—a rare thing for a gardener—that he can rest a bit soon now even when it is daylight. The whole forms the reverse of an exhilarating prospect to the Philistine, but we may say, mutatis mutandis with Robert Browning:

"The rest may reason and welcome; 'tis we musicians know."

Alger Petts.

THREE GOOD PEACHES.

The three different varieties of peaches to which I would briefly refer are very distinct, and should be included where a number of trees are grown under glass.

Exquisite.

I have grown this variety as a bush under glass, and I would remind inexperienced cultivators that rather more skill is needed to bring its fruits to perfection than in the case of Hales' Early. From the time that the fruits are the size of Barcelona nuts to full maturity, they must be exposed to the sun's rays. When not so exposed the flesh near the stone does not ripen as perfectly as the part near the skin; at least, this has been my experience, and, furthermore, I have found that the fruits require a longer period in which to ripen than many varieties. The fruits are large, the flesh vinous, and very sweet. The apricot-yellow ground suffused with deep crimson makes the fruits very attractive in appearance.

Lady Palmerston.

This is another excellent variety that ripens about ten days earlier than Exquisite; both, however, being in season, with moderate forcing, from the middle to the end of September, and during the early part of October in a cool structure.

Lady Palmerston is a very distinct variety, golden fleshed, and of high quality. I grew one tree on a wall at the end of a long range of cool peach and nectarine houses; the tree had a west aspect, all the others a south one. The shoots made annually were not very strong ones, but they were always studded with ripe buds, and never failed to give a full crop. In this instance, the aspect being a west one, I was able to gather splendid fruits in November nearly every year for ten years, and the colour and quality of each specimen were most satisfactory. The tree in question was exposed to cold draughts, but I never saw the least bit of mildew on the leaves or fruits.

Lord Palmerston.

This is a very large variety, maturing about three weeks earlier than the two already referred to. The flesh is firm, juicy, and very agreeable, but not quite so rich as that of the variety Lady Palmerston. Exposure to a south or south south-west aspect is essential in order to bring out the full flavour in the fruits.

B.

MEADOW LAND IN 1909.

The meteorological records of the Rothamsted Experimental Agricultural Station, Hertfordshire, show that the year 1909 started with a deficiency of rainfall amounting to 284 tons of water per acre. January and February of 1909 recorded a further deficiency of $2\frac{3}{4}$ inches of rain, equal to $276\frac{1}{2}$ tons of water per acre. March altered the condition of things, and probably saved the hay crop from being a complete failure, by yielding $3\frac{3}{4}$ inches of rain, including nine falls of snow, which was $1\frac{1}{8}$ inch in excess of the average for that month. This large and welcome rainfall was followed by April and May each recording a deficiency of rain amounting to $194\frac{1}{2}$ tons of water per acre. June gave an exceedingly large rainfall, measuring slightly over 4 inches, being $170\frac{5}{8}$ tons of water in excess of the average for June extending over the past 57 years at Rothamsted.

Taking the first five months of the year, January to May, together, the rainfall was 179 tons of water per acre deficient, which, added to the 284 tons deficient with which the year started, made a total deficiency of 463 tons of water per acre.

But the heavy rainfall of June considerably reduced this enormous deficiency, and certainly assisted the mixed herbage of grass-lands to quickly respond to the grateful showers.

The bright sunshine was in excess of the average in January, February, April, and May, but less than the normal record in March and June. The mean temperature was slightly above the average in January and April, but deficient in February, March, May, and June.

The first six months of the year 1909, therefore, which embraces all the growing period of the first crop of hay, revealed in this district a deficiency of rain, a much lower than average temperature, but $80\frac{1}{2}$ hours excess of bright sunshine.

Under these climatic conditions the experimental hay crop at Rothamsted was in each of the twenty-four plots, under different manurial treatment, below the average yield, and, in some cases, very considerably below the normal yield.

The greatest deficiency was shown on those plots which received no potash in the manurial mixture. The application of ground burnt lime applied at the rate of 2,000lb. per acre two years ago to certain portions of these permanent grass plots has effected a great improvement both in the yield and the character of the herbage.

The yield has in some cases been increased by the lime three-quarters of a ton of hay per acre, and of a much better stock feeding quality.

Selecting a few of the most characteristic of the Rothamsted experimental grass plots, which have received the same manurial treatment for the past 54 years, we find that the plot of land which has had no manure whatever for the whole of this long period, yielded but $6\frac{3}{4}$ cwt. per acre, being $9\frac{1}{4}$ cwts. of hay, less than the average; the addition of lime to one-half the area increased the yield by 4 cwt. per acre.

Superphosphate alone, at the rate of 3 cwt. per acre, produced $12\frac{1}{8}$ cwt. of hay per acre, being just about double the quantity of the unmanured plot. The addition of sulphate ammonia, 400lb. per acre, to the superphosphate, gave no increase over the plot receiving superphosphate alone; this fact was doubtless owing to the lack of potash, which ingredient in such an unfavourable season as the present appears to have considerable influence on the total yield of hay, as well as upon its cattle-feeding value.

The soil of this plot, which has received for so many years superphosphate and ammonia, but without potash, has become distinctly acid, so that the vegetation, which consists mainly of shallow-rooting grasses growing in tufts—namely, sheep's fescue, sweet vernal, common bent smooth-stalked meadow grass, and Yorkshire fog; these grasses have generally a rusty and unhealthy appearance, and there is an entire absence of clovers in the herbage. The addition of ground lime to one-half of this plot resulted in an increased bulk of hay of $11\frac{1}{2}$ cwt. per acre.

The plot receiving a complete mineral manure, of which the chief ingredients are 3 cwt. of superphosphate and 5 cwt. of sulphate potash gave $24\frac{3}{8}$ cwt. of hay, being 5 cwt. per acre less than average. On this plot an application of lime to one-half increased the yield of hay by half a ton per acre. On an adjoining plot where the potash was omitted, the weight of hay fell to $15\frac{1}{4}$ cwt. per acre, and on this plot with its soil-exhaustion of potash, the application of lime had no effect.

Superphosphate, sulphate of potash, and 400lb. sulphate of ammonia, produced $29\frac{1}{2}$ cwt. of hay, being $14\frac{5}{8}$ cwt. per acre less than the usual average. On the adjoining plot, where potash was omitted, the yield of hay was reduced to 17 cwt. per acre only, being nearly a ton of hay per acre less than the average record for this plot.

Superphosphate, potash, and 550lb. nitrate of soda per acre, yielded $48\frac{3}{8}$ cwt. of hay, which is very nearly the average produce for this plot. The same amount of superphosphate and potash with one-half the quantity of nitrate soda, namely, 275lb. per acre, gave $31\frac{5}{8}$ cwt. of hay, being $7\frac{5}{8}$ cwt. below average.

These experiments prove that on this class of grass land nitrate of soda is a much better manure than sulphate of ammonia, more especially in a season suffering from a deficiency of rain. The probable reason for this fact is that nitrate of soda dissolves more rapidly in the soil than does sulphate of ammonia, and thus descends more deeply into the subsoil whither the plant-roots follow it, for where the food is there go the plant roots to feed upon it, thus a larger soil area and a greater supply of soil moisture become available to the growing crop.

J. J. Willis.

Harpenden.

APPLE CHRISTMAS PEARMAIN.

This apple, introduced, I think, in 1905 by Messrs. G. Bunyard and Co., Lim., Maidstone, should, when better known, become popular amongst fruit growers. It grows to a capital dessert size, looks well on the exhibition table, and, from a market point of view, it is of a good taking colour. It is said that the variety crops heavily, and forms good standards, but I should like to hear a little more on these points, as well as observations on its behaviour generally in both heavy and light soils. Perhaps the raiser, or some other grower, will enlighten us on these matters. We know only too well all dessert apples are not Cox's Orange Pippins, as regards flavour, but there are other important qualities which must be considered, especially by those who grow fruit on a large scale, and as the time for planting is at hand any observations respecting this particular variety would be very useful.

H. Markham.

Wrotham Park Gardens.

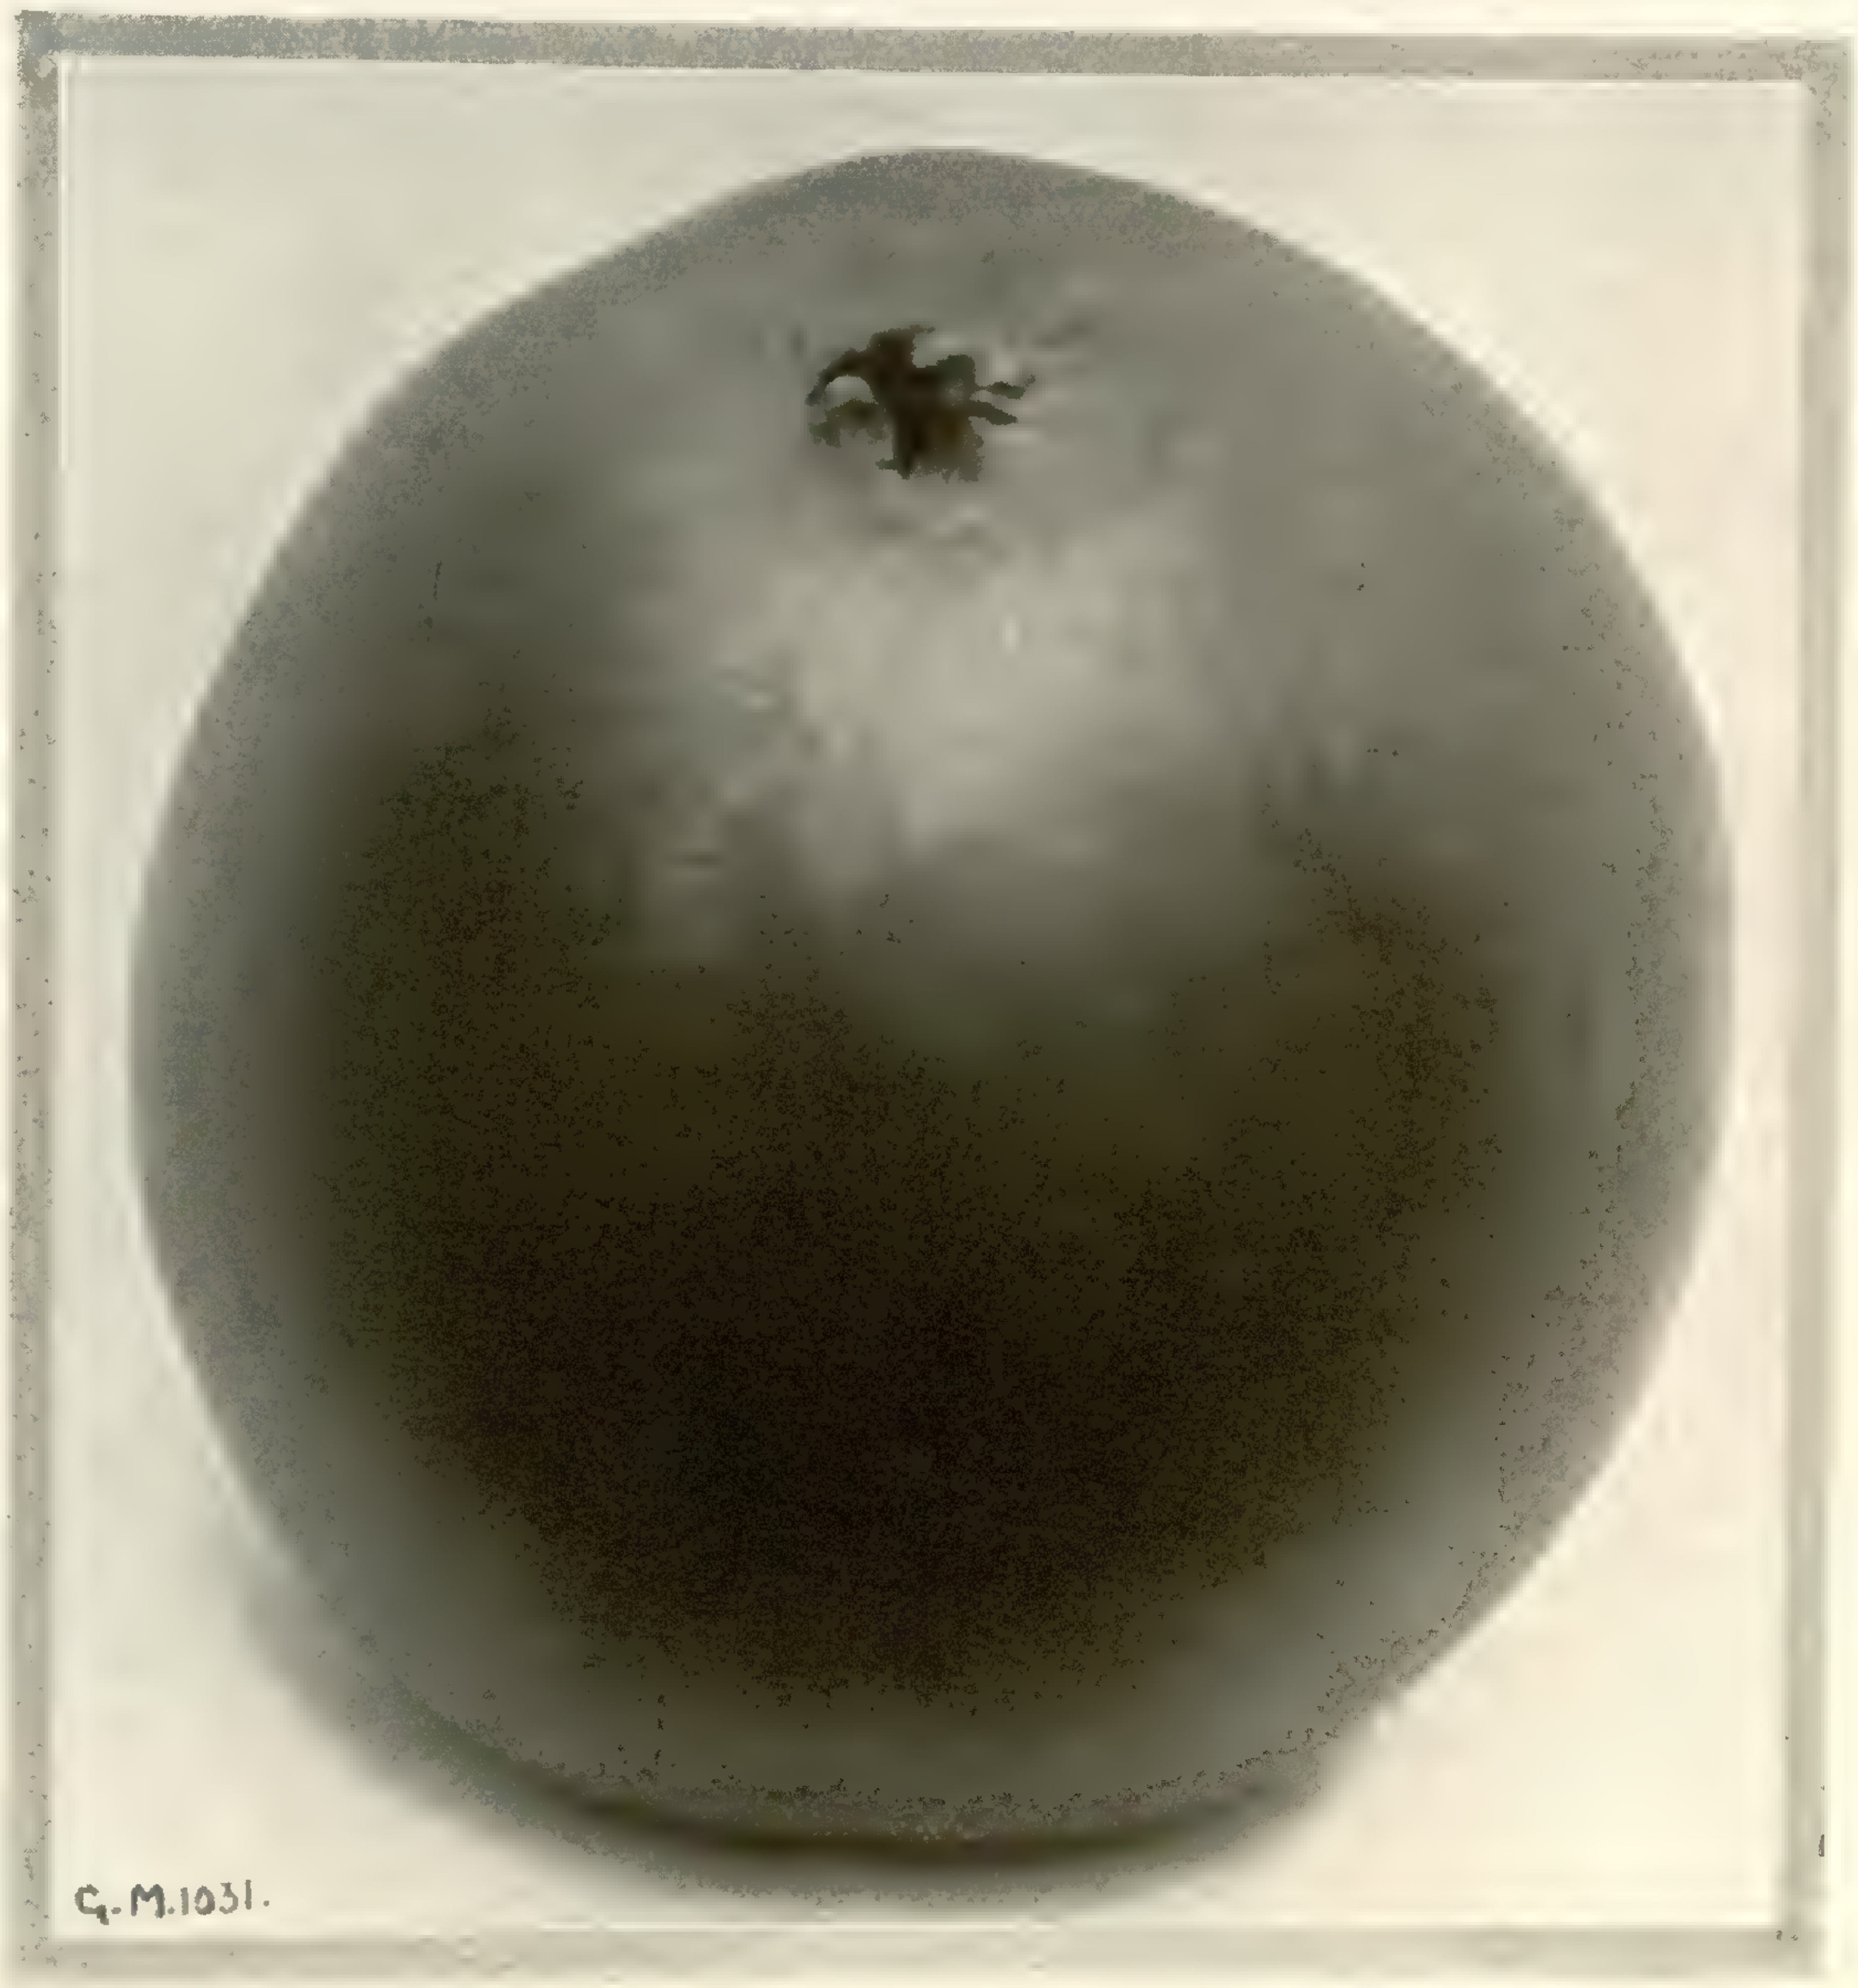
PLANTING FRUIT TREES IN POOR SOIL.

In some districts there are several different kinds of soil within a limited area. In one case I know of there is a strip of beautiful deep yellow loam about half a mile wide and many miles long, and for a considerable distance on each side of this narrow strip the soil is comparatively poor, consisting of peat in some parts, and gravel, peat, and sand in others. In the whole of the district in question gardeners strive to grow fruit trees, but those possessing the good soil are not handicapped to the same extent as others who are obliged to plant their trees in the poor soil. But this fact does not deter gardeners; they have succeeded in cultivating splendid specimens in the poorer ground, although both apple and pear trees thrive best in a deep, friable loam, preferably in that which is inclined to be of a clayey nature. In regard to pears, I know of instances where magnificent crops are now growing on trees planted in a gravelly, sandy, peaty medium.

Thousands of fruit trees will very soon be planted in both old and new gardens in different parts of the country, and in many kinds of soil. In all cases, I strongly advise intending planters to thoroughly prepare the ground before putting in the trees. One must regard the trees as permanent when once they are planted, and we expect them to improve every year. I will here state a case where failure resulted. A new orchard was being formed, and the soil was shallow, resting on a mixture of sand and gravel; it was poor and hard when dry. The orchard was intended to be an important one; but the initial mistake of not trenching proved to be a costly one. Holes were made—they were not large enough—and the trees roughly planted in them and left unstaked. Result: scarcely any growth was made during the three years following the planting; the trees lived, but were sorry looking objects. I have just inspected them after a period of fifteen years, and their appearance now is that of trees of five years' growth. There is scarcely a straight-stemmed specimen amongst them owing to neglect in staking. There are other fruit trees growing in similar soil not far from them, but they were treated well by a person who knew how to manage fruit trees, and they are splendid fruitful specimens. Much might have been done by surface dressings, etc., to improve the condition of the badly planted trees, but no attempt was made in this direction. I give this case as a warning to inexperienced cultivators.

I know of another instance where much success followed a novel method of planting apple and pear trees. There was a thin crust of soil on a gravel bed, mixed freely with sand. Holes in the gravel and sand were made after removing the crust of soil. Then the soil was used for covering the roots, and the stones and sand put back in the form of a mulch. The trees were well cared for, and top-dressings of better soil were put on as opportunity afforded. The stony surface was moist even in the hottest weather, and many fibrous roots were made annually. Branch growth was moderate, it matured well, and yielded fair average crops of average quality fruit. As many gardeners are now, no doubt, obliged to plant fruit trees in indifferent, or apparently unsuitable ground, or not have any trees at all, I give these examples as both a warning and an encouragement.

G. B.



APPLE CHRISTMAS PEARMAIN.

A remarkably handsome dessert variety of high quality. Introduced by Messrs. G. Bunyard and Co., Lim.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

WINTER FLOWERING CYPRIPEDIUMS.—Owing no doubt to the unfavourable climatic conditions of the past summer and autumn, the winter blooming cypripediums are some weeks later here and in this district than usual. One almost feared a short time since that they were not going to flower; but satisfactory results are apparent in the earlier flowering kinds, and there is no reason to anticipate otherwise with the later varieties. It is many years ago that I first referred in this column to the usefulness of these orchids for decorative purposes where there was a demand for plants and flowers during the duller months of the year. From recent observations it is evident they have become general favourites not only with orchid specialists, but also in gardens generally. I cannot pass the matter by without still further pointing out the advantage these cypripediums offer to those whose gardens are in the neighbourhood of large towns and in smoky manufacturing districts. Take, for example, some of the districts which surround Manchester. Here we find the conditions so detrimental to plant life that scarcely a blade of grass will grow outside. To attempt to grow any of the various stove or greenhouse plants is by no means encouraging. Yet we find in these districts the winter-flowering cypripediums are cultivated more extensively than in any other part of the country, and the success of their cultivation is displayed at the fortnightly meetings of the Manchester Orchid Society during the winter months. This, I think, should be sufficient to show that they can be successfully cultivated and satisfactorily flowered under conditions unfavourable to plant life. The cultivation is so simple, and their requirements are now so well understood by most amateurs, that they merit more general attention. The durability of the flowers when cut is remarkable, and, if permitted to remain on the plants, they last a long time in perfection. I would point out the desirability of cutting the flowers as soon as possible after they have become fully open. Nothing taxes these cypripediums so much as over flowering. If the flowers are removed and stood in bottles of water in the house in which the plants are grown, they will last for several weeks in perfection, so that there is no reason whatever to put the plants to a great strain.

SEEDLING PLANTS of the winter flowering cypripediums make, perhaps, more growth at the present season than at any other period of the year. Many of them will also be actively rooting. Such should be examined for repotting purposes, especially so where they are reaching the flowering stage. It is often difficult to decide what to do for the best when there is a possibility of their flowering, but unless a plant is actually showing flower, I do not consider it is desirable to neglect an increase of root room, when the roots are running freely, for, if carefully done, very little check is caused, and more satisfactory results are produced in the health of the plants, and also better quality in the flowers when they are produced. Where they become root-bound so much more frequent watering is necessary, which, in my opinion, is not desirable during the winter months.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

NEPENTHES.—Further shading will not be necessary this season, but a close, moist atmosphere at all times, even during the winter months, must be maintained. Daily syringing and regular watering, with a night temperature of about 65 degrees, and a slight rise during the day, should be maintained; and the plants will then make healthy growth. Cut-down plants will form pitchers which will fully develop in the spring.

DRACÆNAS.—At this season, to retain the beauty and value of dracænas, the leaves must not be allowed to drop from comparatively young plants; a light position near to the glass in a temperature of 60 degrees, and very careful watering are most essential. Careless watering during the short, dark, dull days is generally the cause of disfigurement. Sometimes damage is done to the young leaves of highly-coloured kinds by an over-free use of the syringe.

BEGONIA PRESIDENT CARNOT AND B. CORALLINA.—When, at this season, these begonias are grown in a temperature of about 60 degrees, they are very effective, and continue flowering for a very considerable time. Feed them freely if well rooted. Ample root room is necessary to produce the best results. When trained overhead on the rafters the huge clusters of bright flowers are most effective, and as the plants are fairly free from pests, they should be given such a position. Two parts loam, one part peat, one of coarse sand, and some burnt clay and wood ashes make up a very suitable mixture.

TUBEROSES.—These make fine companions to the above winter-flowering plants, and to secure a succession of bloom, bulbs should be potted up at intervals of a few weeks, using four-inch or six-inch pots, with one bulb in the former, and three in the latter. Remove all side growths, and use a light, rich, firm soil. When the pots are filled with roots, plunge them in a bed with a temperature of 60 degrees. Give little or no water until growth is well advanced. Tuberoses may be had in flower the greater part of the year, and when used in moderation their perfume is delicious.

EUPHORBIA JACQUINIÆFLORA.—If it is considered desirable to have some of these in flower, a slight rise in the temperature may be given; but this must not be overdone, because much fire-heat has a tendency to weaken the flowers. Careful watering is at all times essential.—W. Fyfe, Lockinge Gardens.

FRUITS UNDER GLASS.

RIPE GRAPES will require great care this damp season, and when it can be conveniently done the vines should be relieved of some of the bunches, especially when heavily cropped. If cut and the end of the laterals placed in bottles of soft water, and placed in a dry room, they will keep fresh for a very considerable time. When the borders are outside they should have received a covering to carry off the heavy rains. The grapes must be looked over regularly to cut away any berries that may be spotted or damping, and the interior of the house kept as sweet as possible by means of gentle heat, and a little air admitted at the apex ventilators; and if the borders have become too wet, a layering of clean straw will be a good means of absorbing a portion of the moisture.

TOMATOES.—Those plants now fruiting must have a warm, dry, and airy temperature of about 55 to 60 degrees. Pinch out laterals as soon as they are seen, so that the force shall be directed to the fruits. Give water only when needed, remembering that the tomato requires a comparatively high temperature and dry atmosphere. At the same time it must be borne in mind that the roots must not be allowed to become dust dry. Gather the fruits as soon as ready, and lay on fine wood wool till required for use.

CUCUMBERS.—The plants for supplies in winter are just commencing to fruit, and when they are in full bearing cut the old plants that produced the autumn crop to make room for other occupants. Keep the growths neatly tied in, and stop at the joint immediately above a fruit, and allow only one fruit to each joint. All others should be promptly cut off, and it is advisable not to allow more to grow than are required for use. Top dress as often as the roots are seen to be coming through the soil. Good loam and mushroom bed manure, and a little soot and bonemeal make a suitable top-dressing for winter cucumbers. Syringe the underside of the foliage every day in order to keep it clean, and damp around pipes and paths several times daily in order to keep a nice moist atmosphere.

ORCHARD HOUSE TREES.—Whether these are in pots or planted out, they should receive attention now, and those trees which are planted out, and have made too much growth should be lifted, and given fresh soil; good loam and lime rubble, are the principal materials for enriching the border, and for use in pots. It is best to apply manure when the trees are growing.

CHERRY HOUSE.—This should be thoroughly cleansed. The border should be lightly pricked over and be taken away, and some fresh soil and lime rubble spread over the border. When this has been done the trees will be in readiness for starting, or the house may be used for any light plants, bulbs, etc., for a few weeks.—W. A. Cook, Leonardslee Gardens, Horsham.

THE KITCHEN GARDEN.

FRENCH BEANS.—Those sown as advised in early autumn, if subjected to proper treatment, will be commencing to yield a supply of beans which will continue for some time. Although a heavy return cannot be expected from seed sown now, where convenience will permit it will pay to make a sowing, if only to give a few dishes and afford variety in the vegetable supply. Pots not larger than seven inches in diameter should be used, and these should have ample drainage, and be filled with light sandy soil. Anything of a heavy nature will result in failure; and care in watering the young plants is essential. Give them the lightest position in the forcing house to build up strength as growth is made.

LETTUCE.—A pan or two of seed of an approved variety of cabbage lettuce, such as All the Year Round, or Golden Ball, may be sown. The young plants should be grown along slowly in a light, cool position, such as on a shelf in a greenhouse or carnation house. Strong stocky plants suitable for pricking out over mild hotbeds towards the end of December and beginning of January ought to result from this sowing.

BROCCOLI.—To assist the plants to stand the winter frosts, the heads should be turned over to face northwards, and the stems earthed up with soil. It is just below the leaves that is mostly damaged by frost, and therefore requires protection. This will serve to reduce the loss that is often experienced during exceptionally severe weather when the crop is fully exposed. In districts in which vegetation suffers much from frost, a quantity of bracken fern is valuable to throw lightly over the plants when required.

DRAINING.—The present time of the year is the most suitable to drain the kitchen garden, as many of the quarters are clear of crops, and the condition of the soil shows clearly if charged with too much moisture. Where this is the case, the soil is too cold for vegetation to give its maximum returns, and should be drained at once that next season's crops may benefit from it. The nature of the soil must be taken in consideration when carrying it out. If strong and adhesive, the drains will require to be placed closer together and more shallow than on lighter land.

GENERAL REMARKS.—With such a moist, sunless season as we have experienced, reports are coming to hand that potatoes are keeping indifferently, and therefore frequent and careful examination will be necessary. Endive and lettuce placed in frames will require the removel of decayed parts, and free ventilation on every favourable occasion. Stir the surface soil amongst crops wintering in frames as often as possible, such as cauliflowers, etc.; also run the Dutch hoe through the sowings of young onions, spinach, and crops that are growing on south borders.—Charles Flack, Cholmondely Castle Gardens.

EXHIBITIONS AND MEETINGS.

◆

Liverpool Horticultural Association.

The thirtieth autumn exhibition was held in St. George's Hall on November 3 and 4, under most unfavourable weather conditions; indeed, so bad was the light during the judging that matches were brought into request to test the colouring of the grapes. The entries were much below the normal, especially in chrysanthemums and miscellaneous plants, and this detracted from the usual brilliant display generally seen at these exhibitions. The cause of this failure may be attributed to the early date of the show and the late season experienced.

CUT BLOOMS.

These were fairly good in quantity and surpassed expectations. In the chief class, for thirty-six blooms, eighteen incurved and eighteen Japanese, six lots were staged. Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., Allerton, last year's winner, was again successful, thus securing the handsome challenge vase presented by Sir W. H. Tate, Bart. The flowers were heavy throughout, especially fine were (incurved) Buttercup, Mrs. J. Hygate, Lady Isabel, Miss F. Ashworth, Boccasse, and Romance; (Japanese), Mrs. A. J. Miller, Chry. Montigny (possibly the finest bloom in the show), J. Locke, Mrs. W. Knox, Algernon Davies, Sir Frank Crisp, Lady Talbot, etc.; Mr. G. Goves, gardener to Sir Gilbert Greenall, Bart., was second; and Mr. G. Hunt, gardener to Pantia Ralli, Esq., Ashstead, third; and Mr. J. Stoney, gardener to Lieut.-Colonel J. B. Gaskell, J.P., fourth. For eighteen incurved, not less than twelve varieties, Mr. G. Hunt led the way, and for twelve blooms Mr. J. Clarke, gardener to Thos. Clarke, Esq., scored.

The best eighteen Japanese, not less than twelve varieties, came from Mr. G. Goves, and the best twelve from Mr. J. Copple, gardener to T. Biddulph, Esq. For six Japanese, distinct, to be shown in two vases, Mr. J. MacFarlane led, and for six vases of single flowers, arranged for effect, Mr. E. Wharton was to the fore, his white Edith Pagram being noteworthy. The most tastefully arranged table of flowers was by Mr. J. Williams, gardener to C. J. Procter, Esq.

PLANTS.

Chrysanthemums in pots showed the effects of the late season, some of them being staged with only a few open flowers. For four large-flowered trained specimens, Mr. T. Hitchman, gardener to A. Earle, Esq., was first with good, but unfinished plants. For one large-flowered example, the same exhibitor was to the fore.

Mr. R. T. Bushell, gardener to L. Noblett, Esq., took the lead for three plants of single varieties, and he also had the best pompons. In other plant classes, Mr. E. Wharton, gardener to John Findlay, Esq.; Mr. P. Caunce, gardener to G. Nicholson, Esq.; and Mr. T. Hitchman won prizes. For a group arranged for effect Mr. T. Atkin, gardener to J. W. Wright, Esq., held the place of honour with fresh flowers, well arranged.

For six begonia Gloire de Lorraine Mr. T. Hitchman won with excellent plants. For four stove or greenhouse ferns, Mr. W. H. Roberts, gardener to T. Dixon-Nuttall, Esq., led with fair specimens. Mr. R. J. Taylor, gardener to R. L. Overton, Esq., won with small, but choice varieties, in the class for three orchids, and for one orchid the same exhibitor was to the front, with a fine plant of Cattleya Mantini 4ft. in diameter, carrying twenty-seven spikes and 124 flowers; this plant received a well-deserved certificate of merit. For one cypripedium, Mr. W. Wilson won with C. Spicerianum, carrying several twin-flowered spikes. Mr. G. Osborne, gardener to Dr. Duffus, led for three palms or cycads, and also for a like number in eight-inch pots. Mr. H. McFall had the best primulas; Mr. R. T. Bushell the best cyclamen; Mr. E. Wharton the best mignonettes; Mr. F. Atkin the finest table plants; Mr. J. George the best poinsettias; Mr. T. Hitchman the winning sets of Roman hyacinths and salvias; and Mr. D. McKelvie the best lily of the valley.

FRUIT.

This section, as usual, contained many fine exhibits, and for six dishes, distinct, Mr. E. F. Hazelton, gardener to the Right Hon. Earl of Derby, led with well-finished Muscat of Alexandria and Black Alicante grapes, richly-coloured Cox's Orange Pippin, and Peasgood's Nonsuch apples; and White Seedling melon; Mr. J. Skitt, gardener to A. H. Bright, Esq., second; and Mr. T. Elsworthy, gardener to W. L. Gladstone, Esq., third. For two bunches of Alicante grapes, Mr. W. Wilson was first with well-coloured bunches, and for "any other black," Mr. R. Anderson, gardener to Mrs. Kendall, scored.

The best two bunches of Muscat-flavoured grapes were from Mr. J. Stoney, who had large-berried bunches; for "any other white," Mr. W. Wilson led, and for four bunches of grapes Mr. E. F. Hazelton won with Alicantes and Muscat of Alexandria. In the class for six dishes dessert pears, Mr. Hazelton won with heavy specimens; Mr. G. Gilmour, gardener to Thos. Kendall, Esq., led for four dishes; Mr. E. Hazelton for four dishes grown outside, and Mr. J. Taylor, gardener to F. Bibby, Esq., for one dessert variety, with Doyenne du Comice. Mr. Hazelton had the best dish of stewing pears.

For four dishes of dessert apples Mr. Hazelton won with richly-coloured fruits; for four dishes of culinary varieties, Mr. T. Howard led, and in the remaining five classes Mr. J. Lee, the noted amateur, was well ahead, his Cox's Orange Pippin and Peasgood's Nonsuch being very fine.

NON-COMPETITIVE.

As usual, this section was strong, and added much to the attractiveness of the exhibition. A gold medal was awarded to Mr. J. Lee, for seventy-four dishes of fruit, a very fine display; gold medal to Messrs. Mansell and Hatcher, for a choice display of orchids and for Lilium sulphureum; a silver medal went to the Liverpool Orchid Company for orchids; to Messrs. Dicksons for a collection of apples and carnations; to Messrs. Clibrans, for chrysanthemums and pelargoniums; to Mr. H. Middlehurst, for liliums and spiræas; to Messrs. Thos. Davies and Co. for ferns and spiræas; to Mr. W. Rowlands, for carnations and cyclamen; to Messrs. R. P. Ker and Sons, for palms, cyclamen, etc.

Bedford.

There was a very bright show in the Corn Exchange, Bedford, on November 4, and, though there was a falling off in some of the amateur classes for flowers, there were about sixty more entries than usual. In the leading cut flower classes, especially in the vases, there were some very fine Japanese blooms; singles were good, but incurved poor. The fruit classes brought out an excellent competition, but it was in the classes for vegetables that the competition was keen both as regards numbers and closeness of quality. The vegetables were excellent all through, and in the classes set apart for cottagers, the vegetables and fruits were of a high standard of excellence. Messrs. Laxton Brothers put up an excellent exhibit of hardy fruits grown at their Bedford Nurseries.

GROUPS AND PLANTS.

The premier award in the group class fell to Mr. Tysoe, gardener to the Misses Fitzpatrick, The Lodge, Clapham Road, Bedford, for a well-arranged display of good blooms, in which the colours were well blended, and white flowers were very few; Mr. A. H. Pike, gardener to W. H. Allen, Esq., J.P., Bromham House, Bromham, was second, but his margin of single varieties was very weak. In the single-handed gardeners' class, Mr. P. Welcher, gardener to J. W. Wright, Esq., Burnaby Road, was the only exhibitor, and he was awarded first prize for a really first-rate display, finished off at the pot level with ivy sprays. Plants were not good, although Mr. Burkinshaw's six table plants must be omitted from this observation; he was first in that class. He was awarded a second prize for Begonia Gloire de Lorraine, six plants.

FLOWERS.

From four competitors, Mr. Taylor, gardener to R. W. Allan, Esq., Blunham Grange, Blunham, secured the premier award for one dozen Japanese blooms, winning with F. S. Vallis, Master David, Eric Crossley, W. Beadle, Bessie Godfrey, and Edith Jameson; Mr. Tysoe was second, and very little behind the first set; Mr. E. Jones, Bower Street, Bedford, third. In the amateurs' class for a dozen Japanese blooms, Mr. P. Wilsher led, followed by Mr. E. Jones. First place for a dozen incurved blooms was won by Mr. W. Wilsher, who had fairly good specimens of Buttercup, Lady Isabel, and Embleme Poitevine; Mr. E. Jones a good second, and Mr. P. Wilsher third.

Mr. T. Tildesley, Goldington, was a capital first for a dozen Japanese in the cottagers' division, and with his stand he won the prize for the "best bloom" in his division, and also the N.C.S. certificate; Mr. H. Parrot second, and Mr. Pateman third.

Several of the vase classes were good. In the one for five Japanese blooms, distinct, with any foliage, Mr. E. Jones was a capital first with fine examples of Mrs. Knox, Reg. Vallis, and Lady Talbot; Mr. F. Taylor second, and Mr. H. Tysoe third. For five blooms of any one Japanese variety, Mr. F. Taylor scored with Bessie Godfrey in fine form; Mr. E. Jones second with Lady Talbot not quite fully out; and Mr. Tysoe third with spreading but thin flowers of F. S. Vallis. For a vase of five blooms of any one white Japanese variety, Mr. F. Taylor scored with Mrs. A. T. Miller in fine condition, and one of these flowers was the "best bloom" in the premier divisions; Mr. E. Jones second with the same variety; and Mr. P. Wilsher third with Mrs. J. C. Neville.

Mr. S. Shutler, gardener to J. Rushbrooke, Esq., St. George's, Ampthill, scored for three vases of three blooms each of Japanese varieties, his varieties being Mrs. R. H. Pearson, Mrs. A. T. Miller, and Mrs. Knox; Mr. Tysoe second, and Mr. F. Taylor third.

Some capital vases of singles were shown, and in the class for five vases, Mr. W. Wilsher led the way with Mary Anderson, Mrs. H. Redden, Mary Richardson, etc.; Mr. R. Day, gardener to T. E. Hurst Hodgson, Esq., St. Mary's Abbey, Bedford, second; and Mr. E. Jones third. Mr. Jones was first, and Mr. E. H. Pateman Eastwood, Pembroke Street, Bedford, second for three vases of single varieties.

Table decorations were fairly good; Mrs. Ruff, Sharnbrooke, gained first prize, with Mrs. A. H. Pike, Bromham, second, and Miss Stanton, Clapham, third. Mrs. Ruff was a capital first for a basket of chrysanthemums with a delightful display of Mary Richardson; Mrs. G. Myers second, and Mrs. A. H. Pike, third.

FRUITS AND VEGETABLES.

Mr. W. Wilsher led for two bunches of black grapes with large, loose bunches of Alicante; Mr. R. Day second, and Mr. T. W. Burkinshaw, gardener to Sir C. E. Hamilton, Bart., Hatley Park, Sandy, third with Lady Downes. Mr. Burkinshaw had the best Muscats, and Mr. W. Wilsher was second, with Mr. P. Wilsher third.

First place for four dishes of culinary apples fell to Mr. Tysoe, who had Blenheim Pippin, Peasgood's Nonsuch, Warner's King, and Beefing; Major Carpenter, Biddenham Close, second; and Mr. J. Bates, St. Mary's, third. Mr. Burkinshaw scored for dessert apples with Blenheim Pippin, Allington Pippin, Cox's Orange Pippin, and King of the Pippins; Mr. Tysoe second, and Mr. Day third. Mr. Tysoe led for pears with Pitmaston Duchess, Beurre Diel, Doyenne du Comice; Mr. R. Day second, and Mr. Burkinshaw third. Mr. Taylor had the best dish of culinary apples with Warner's King and Mr. Day had the best single dish of pears—Grosse Calebasse.

Vegetables were a splendid feature, and occupied a large amount of space. For nine kinds Mr. Tysoe scored with Michaelmas cauliflowers, Ailsa Craig onions, Perfection carrots, Standard Bearer celery, Windsor Castle potatoes, etc.; Mr. S. Shutler a close second; Mr. W. Gaiger, gardener to A. T. Tatham, Esq., Elstree, Herts, third; and Mr. Gentle, gardener to Mrs. Denison, Little Gaddesdon, fourth. There was little to choose between the sets, though some were better put up than others. For six kinds of vegetables Mr. F. Taylor scored; Mr. R. Day was second, and Mr. A. H. Pike third. In the class for six kinds, provided by Messrs. Sutton and Sons, Mr. Shutler was to the front, and he had grand onions and leeks; Mr. H. Tysoe second, and Mr. W. Gaiger third. In the class provided by the Messrs. Laxton Brothers, Mr. Tysoe led with splendid produce, onions being again fine; Mr. R. Day second.

Mr. J. B. Robinson, Great Barford; Mr. Mason, gardener to H. G. Hipwell, Esq., Shakespeare Road; and Mr. R. Burgin, Bower Street; also won prizes in classes for collections of vegetables, while in single dish classes Mr. Tysoe led for celery; Mr. Day for sprouts; Mr. Tysoe for leeks and for onions (fine); Mr. Gentle for potatoes; Mr. Gaiger for parsnips; Mr. Tysoe for carrots; Mr. Gentle for turnips; Mr. Gaiger for beet; and Mr. Day for cauliflowers.

National Amateur Gardeners' Association.

On Tuesday, the 2nd inst., at this society's meeting at Winchester House, Old Broad Street, Mr. T. W. Sanders, F.L.S., in the chair, Mr. Charles T. Druery, V.M.H., F.L.S., gave an interesting lecture on "Our Wonderful World." Opening with an apology for the necessarily superficial way in which so vast a subject could be dealt with in a single short lecture, he stated that his object was rather to induce increased attention to the innumerable marvels underlying all the familiar things around us, and whose very familiarity was apt to lead, not indeed to contempt, but an entire ignoring of their truly wonderful nature. He divided his subject into four heads, viz., the Air, the Earth, the Ocean, and the most interesting one of all, the Life which existed in each. The air he described as practically forming a vast and profound ocean, at the bottom of which we lived under an immense pressure, which we did not feel because it was counterbalanced by an equal pressure from within. He described its composition, gaseous and aqueous, and how it resembled the watery ocean in its currents and whirlpools, though these latter were on a vastly greater scale.

Next he dwelt upon the accepted history of the evolution of a solid habitable world from a nebulous celestial mist, and the stages through which it must have passed ere it became as we now know it, alluding to the variety of the rocks which compose its crust, and the history which these rocks unfold to the geologist and associated scientists. The oceans, all of which were practically one, were next touched upon, and the manner was described in which the great circulatory system was maintained, the tropical water sweeping north and south as vapour and returning by way of glaciers and rivers to the sea to form a slow returning bottom current, cold as ice, to their tropical source.

The final theme of the life existing in all three realms, and how it was evolved from simple beginnings into the innumerable forms with which we are more or less familiar, was concluded by an allusion to perhaps the most wonderful feature of all, viz., that the only link between the sun, the immediate source of all vitality and this world of ours, was chlorophyll, the tiny green granules pervading all foliage, and which alone were capable of utilising the sunbeam and transforming, by virtue of its energy, the inorganic salts of the earth and the carbonic acid of the air into all the foods and essentials of humanity and the animal world generally.

A hearty vote of thanks was accorded the lecturer.

Bournemouth.

The annual chrysanthemum show was held on November 2 and 3, in ideal autumn weather, in the Winter Gardens Pavilion, an excellent building for the purpose. The exhibition was a great success in every way. Groups of miscellaneous plants were new features this year, and there were also the old arrangements of chrysanthemums in pots. Table decorations were a lovely feature, the hand bouquets, sprays, and floral designs generally, also made a beautiful display. Hardy fruit was extensively shown both by private growers and nurserymen, and grapes were shown in greater numbers and of higher quality than in any previous year at this show.

Cut blooms on boards showed a falling off in numbers, but the average quality was good. Mr. Thomas Stevenson, gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone, was the first prizewinner in the class for thirty-six cut blooms, not more than two of any variety; his varieties were as follows: F. S. Vallis (two), Henry Perkins, Lady Talbot (two), Valerie Greenham, Mrs. Charles Penford, Sir Frank Crisp (two), Mrs. Norman Davis, Marquis of Northampton, Reginald Vallis (two), Master James (two), F. W. Lever, Mrs. W. Knox, Mrs. A. T. Miller (two), Algernon Davis, G. J. Bruzard, Mdme. de la Crouce (two), James Lock (two), Chas. H. Totty, Walter Jinks, Miss N. K. Thorne, Duchess of Sutherland (two), J. H. Silsbury, Mrs. Stoop, Mrs. Norman Davis, Leslie Morrison, and Mdme. G. Rivol; Mr. Usher, gardener to Sir Randolph Baker, Bart., Blandford, was a close second, and his best blooms were Rose Pockett, Mrs. A. T. Miller, Lady Talbot, President Viger, W. Beale, Splendour, Mr. Laxton, and Dr. Watson.

For twelve cut blooms, Japanese, Mr. Lloyd, gardener to Major Wyndham Pain, Christchurch, scored; Dr. Brodie, Bournemouth, being second. Dr. Brodie was also first for twelve Japanese in not less than six varieties; Mr. Barge, gardener to Rev. C. H. Burrows, being a close second. In the class for nine vases of Japanese blooms with long stems, three blooms of each, in nine distinct varieties, Mr. Slark, gardener to G. J. Fenwick, Esq., Bournemouth, was successful, winning the silver challenge cup presented by Alderman Beale.

Instead of providing for a group of chrysanthemums and foliage plants, as formerly, the committee this year included other plants, making it a miscellaneous group. Messrs. G. Watts and Sons, Bournemouth, were the successful exhibitors; Mr. Welch, also of Bournemouth, being second. Mr. Tompkins, gardener to the Dowager Lady Miller, scored in the chrysanthemum group class, also winning the challenge trophy presented by the Mayor of Bournemouth, with a very fine arrangement. This exhibitor also secured the silver challenge cup presented by Mrs. Telfer for two vases of Japanese chrysanthemums, nine blooms (one variety), in each case. Mr. Sprackling, gardener to Dr. Lys, scored for three bush plants in the open division, and in another class Mr. Slark won, followed by Mr. C. Barrett, gardener to E. Howard May, Esq., the specimens all being very fine.

Mr. W. Shave, gardener to the Dowager Lady de Tabley; Mr. Wills, Southampton; and Mr. Jeffreys and Miss Taylor were prominent exhibitors in the classes for baskets of flowers and foliage, bouquets, sprays, and table decorations.

FRUITS AND VEGETABLES.

Fruits were shown in very fine condition, and extensively. For three bunches of grapes, distinct varieties, open to all England, Mr. Pope, gardener to L. G. Pike, Esq., Wareham, Dorset, scored, followed closely by Mr. Geo. Garner for second honours with better finished bunches. Mr. C. Curtis, Blandford, was successful also in the open class for two bunches of black grapes, and Mr. G. Garner again won second prize, Mr. C. Barrett being third. Mr. Pope was first in the open class for two bunches of white grapes, staging Muscat of Alexandria in superb condition. He was also first in the local class for two bunches of grapes.

Mr. Beesley, gardener to the Right Hon. Earl Nelson, was premier exhibitor with four dishes of kitchen apples (forty dishes staged), and Mr. C. S. Wady was equally successful in the class for dessert apples (forty dishes staged here also).

Vegetables were a prominent feature of the show, and Mr. Usher was first for a grand collection of six distinct kinds.

NON-COMPETITIVE.

Mr. A. S. Usher staged a very imposing collection of vegetables, not for competition, for which he was awarded a gold medal. The chairman of the committee was awarded a silver medal for a beautiful collection of orchids, prominent amongst them being Cypripedium insigne Harefield Hall variety, Cattleya Harrisoni and sophronitis, Cattleya Harrisoni, Lælia Elva, and some lovely oncidiums that have flowered during the past seven years. Mr. R. Chamberlain, the vice-chairman, was awarded a gold medal for floral designs, and Messrs. Cypher and Sons, Cheltenham, a similar award for orchids. Messrs. Cooling and Sons, Bath, sent apples and pears (silver medal); Messrs. D. Stewart and Sons, Wimborne, had a gold medal for a grand collection of apples and pears. Messrs. Cutbush and Sons, Highgate, obtained a silver medal for carnations, and Messrs. Toogood and Sons, Southampton, a silver medal for vegetables. Messrs. Ingram, Thurston, Prichard, and Haskins all had excellent exhibits.

Aberdeen Natural History Society,

Professor Davidson, Aberdeen University, was the lecturer at the last meeting of this society, his subject being "The Poetry of Plant Names." There was an exceedingly large attendance, the botany classroom of the University being crowded. Mr. Reay presided and introduced Professor Davidson.

The professor, who met with a very cordial reception, started with a reference to the great amount of light that is thrown upon words by the mode of handling them, that deals with their growth in meaning, and traces their history, and to the remarkable achievements in this sphere that the new Oxford Dictionary, carrying out the principles first enunciated by Archbishop Trench, has made. The lecturer proceeded to limit his subject to the realm of common plant names, and to bring out the poetry and romance that many of them embody. His examples were: Speedwell, Our Lady's Bedstraw—a plant which figures prominently in Poussin's painting as the bedding of the manger at Bethlehem; Mouse-ear, Scorpion Grass, Paddock Pipes, and Paddock Stools, Hollyhock, Devil's Bit Scabious—the abrupt termination of the root giving rise to this name among the common folk, who imagined that Satan was angry with the plant on account of its beneficial medicinal properties; Solomon's Seal, Foxglove, Eyebright, Daisy, Pansy, Rowan, Horse-chestnut, Willow, and Royal Fern (Osmunda regalis), the only "flowering" fern found in Britain. All those examples, and many others, the lecturer pointed out, went to prove that plant names had wonderful stories of the past to tell.

History and archæology, folk-lore, and social customs, poetry and religion, fable, myth, and superstition—all were here; and medicine also had a distinct interest in the study, if it would see itself faithfully presented, not perhaps as a primitive science, but as a primitive art. Further still, plants bearing certain names had been, the professor pointed out, the subjects of poetic handling from the very earliest times. Chaucer and Spenser, and Shakespeare and Wordsworth, revelled in the poetry of flowers. Burns and Hogg and the Scottish ballad writers sang sweetest when inspired by some field weed or untended plant of Nature. It would be difficult to find anything finer in the English language than what had been written by the poets on the

Daisy. Celandine and Eglantine, and Primrose and Pansy, had each been the theme of brightest poetic effusions. Examples of these were given at various points as the lecturer proceeded, and the appropriateness of the study of plant names by members of the society was emphasised, because of the bearings of the subject on natural history and on antiquarianism, and because the subject was instinct with human interest, and replete with literary significance.

In replying to a vote of thanks, most heartily awarded, Professor Davidson specially referred to the great interest which had been taken in the lecture by such a large audience.

Newport (Mon.) Chrysanthemum Society.

NOVEMBER 4.

On the above date this society held its twenty-first annual show in the Gymnasium, Newport, when chrysanthemums were well shown. Cut blooms of Japanese varieties, both in the classes for stands and vases, and also single-flowered varieties in the classes devoted to them, were throughout of a high order of merit. The class for table decorations, open only to ladies, was well filled with pleasing displays. Fruit was not largely shown, but in the few classes provided very creditable exhibits were found.

PLANTS.

In the class for a group of chrysanthemums, to fill fifty square feet, there was only one exhibitor, but he had an excellent arrangement. This was composed of Japanese and single-flowered varieties, pleasingly mingled with crotons, cocos, and other palms, eulalias, etc., edged with variegated panicum and adiantum. The exhibitor was Mr. W. C. Pearce, gardener to H. Oakley, Esq. For a group occupying forty square feet, open only to amateurs and gentlemen's gardeners, Mr. R. Long, gardener to W. F. Dawson, Esq., Llantarnum Court, was the leading exhibitor with a nicely-arranged collection. Mr. Denman, gardener to Mrs. C. H. Bailey, was placed second. Mr. Denman was first for a group of miscellaneous plants arranged in a space of forty square feet, with a bright and tasteful arrangement, composed chiefly of flowering decorative plants. Mr. W. C. Pearce, who was second, employed chiefly ornamental-leaved plants in his arrangement. For three dwarf trained chrysanthemums, Mr. Denman was placed first with medium-sized, well-grown, and flowered examples. For three bush plants, singles excluded, Mr. Harris, gardener to G. F. Colborne, Esq., was first, and for three bush plants of single-flowered varieties, Mr. Duff, gardener to Mrs. Williams, Bryngias, took the lead. For four plants, single-flowered varieties, open only to under gardeners, Mr. W. Meades, under gardener to F. W. Dalson, Esq., was first with a good set.

CUT BLOOMS.

Mr. Duff was the only exhibitor of twenty-four Japanese, in not less than eighteen varieties, and was deservedly awarded the first prize, his blooms being of large size, fresh, and well-finished. In a similar class for twelve blooms, Mr. Duff again had no rival, and took the first prize with excellent examples.

In competition for the prizes for twelve Japanese, Mr. Long was first with excellent blooms of well-known varieties. In a similar class for amateurs, Mr. W. H. Hollingdale led with splendid blooms, including a fine example of the Hon. Mrs. Lopes (which secured the N.C.S. silver medal for the best bloom in the amateur class); the second prize was taken by Mr. J. Matthews, of Heatherwood. For six blooms, Mr. Matthews won with capital examples, and Mr. Hollingdale was a close second. For eight vases Japanese, three blooms in each, Mr. Drake, Cardiff, was placed first amongst four competitors with grand sets. This exhibit secured for Mr. Drake the society's challenge trophy, valued at thirty guineas, and £5 in cash. Mr. Bible, gardener to H.S.H. Prince Hatzfeldt, Draycott Park, was a good second, and amongst other varieties staged a grand vase of Hon. Mrs. Lopes, one bloom of which won the N.C.S. certificate for the best bloom in the show; Mr. Duff was third. In the amateurs' class for four vases, three blooms of each variety, Mr. Hollingdale again led, and Mr. Matthews was second. For four vases single varieties Mr. R. Fry was placed first, and for six vases, single varieties, Mr. E. George, gardener to E. Steer, Esq., was first; Mr. J. George, gardener to H. Freeman, Esq., being second; and Mr. Long third.

DECORATIVE CLASSES.

The most tastefully arranged table was exhibited by Mrs. McGinn, and Mrs. Percy Phillips secured the second prize. The best vase of spidery chrysanthemums was staged by Mr. Price, and the best hand bouquet of chrysanthemums by Mrs. Long. Mr. Holbrook had the best shower bouquet.

FRUIT.

Mr. Bible was first, and Mr. Duff second in a class for black grapes, each staging good bunches of Lady Downes. For white grapes Mr. Long scored with fair samples of Muscat of Alexandria. For two dishes of apples Mr. Bible was first with fine dishes of King of the Pippins and Newton Wonder; Mr. R. Hobbs second. For four dishes, Mr. Duff led with good samples; Mr. Long second. Mr. Long was first for two dishes of pears; Mr. Hobbs second. Dr. Brooke, Gratta, and C. D. Phillips, Esq., were each awarded certificates of merit for choice collections of orchids, staged not for competition.

Portsmouth.

The twenty-third annual autumn show was held in the Town Hall on November 3, 4, and 5, and, for the season, was up to the average, although entries were not quite so numerous as in the past. Cut blooms are liberally provided for in the schedule, six classes being open and twelve confined to the radius of Portsea Island.

The most important class was for thirty-six Japanese blooms in not less than eighteen varieties, and not more than two of one variety. The leading prize was a silver cup valued £20, a gold medal, and £5—quite a tempting offer. Only two competed, and the leading award was made in favour of Mr. E. Garratt, gardener to Lord Ashburton, The Grange, Alresford, for a good set of blooms, the following being the most noteworthy: The Hon. Mrs. Lopes, Mrs. W. Knox, Miss H. Rowley, Edith Smith, Mrs. N. Davis, Marquis of Northampton, Rose Pockett, R. Vallis, Lady Talbot, F. S. Vallis, J. Stoney, Splendour, Henry Perkins, Bessie Godfrey, W. Beadle, G. Mileham 1908, Mrs. A. T. Miller, President Viger, and Mrs. Marsham; Mr. W. G. Adams, The Strand, Southsea, was second with smaller specimens, J. W. Molyneux, Mrs. A. T. Miller, Hon. Mrs. Lopes, and Lady Talbot were the best.

Three competed for twenty-four Japanese, in not less than sixteen varieties, and Mr. W. E. Gill, St. Mark's, Florence Road, Southsea, was first with heavy, even-sized blooms of Lady Talbot, Bessie Godfrey, Reg. Vallis, Splendour, Marquise V. Venosta, Mdme. G. Rivol, F. S. Vallis, and Algernon Davis; Mr. P. J. Palmer, gardener to L. J. Roig, Esq., Holly Band, Emsworth, second.

Pompons were, as they always are here, well shown. For twelve sprays, three blooms on each, in not less than eight varieties, there were three entrants. Mr. J. Nance, 98, Hampshire Street, Portsmouth, was first with W. Sabey, Black Douglas, Perle des Beautes, Maid of Kent, Harry Hicks, Faber, and W. Westlake; Mr. H. Snook, 5, Fitzroy Street, Fratton, second. Single-flowered varieties were well displayed, and greatly admired; Mr. C. Johnston, 38, Walmer Road, Portsmouth, had the best set of twelve sprays, showing Roupell Beauty, Mrs. R. H. Parkinson, Edith, White and Bronze Pagram, and Jessie Curtis as the most prominent; Mr. Snook again followed.

Mr. W. E. Gill had the best group of chrysanthemums arranged on a space of 60 square feet, and he secured the silver cup offered with £5 as the leading prize, with a distinctly good exhibit; the Asylum Committee, Portsmouth, were second.

In the local classes there was good competition, and highly creditable blooms were staged. For twenty-four flowers, twelve Japanese and twelve incurved, Mr. J. Love, 2, Bertie Cottage, Park Road, Cowes, Isle of Wight, was first among three with medium sized, nicely staged blooms of Buttercup, Hanwell Glory, Romance, Clara Wells, Mrs. J. Wynn, and Embleme Poitevine (incurved), and Mdme. P. Radaelli, Lady Talbot, Hon. Mrs. Lopes, F. S. Vallis, and Mrs. A. T. Miller as the best in the Japanese section; Mr. C. White, Garden Terrace, Southsea, came next. Mr. Gill had the best twelve Japanese, distinct, and Mr. J. Love a similar award for the best dozen incurved specimens.

In the classes for ladies only, for the most tastefully arranged floral decoration for a dinner-table, there were four entrants, Mrs. W. Sturt, Stanstead Gardens, Emsworth, securing the leading position with an effective display; Mrs. Rapley, Warblington, Havant, second. Miss G. D. Burden, 17, Margate Road, Southsea, won the premier award for a basket of chrysanthemums with an extremely attractive display; Mrs. Rapley second.

Vegetables were well shown by Mr. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, who won the society's first prize for nine dishes, also the premiers given by Messrs. Sutton and Messrs. Webb for six dishes, staging high-class exhibits in all classes. Mr. Ellwood also won first place for six dishes of apples and two bunches of black grapes.

Bristol.

The Bristol Chrysanthemum Society held its forty-sixth annual show on November 3 and 4 in the Drill Hall, Bristol. As there were several other shows held in the district upon the same dates, chrysanthemums were not in quantity, or quality, staged so well at Bristol as we have usually found them. Specimen stove and greenhouse plants, ferns, decorative plants, and orchids, were well shown, while apples, pears, and grapes made a fine display. Trade exhibits, as usual, occupied considerable space, and were generally of high-class in quality.

GROUPS.

For a group of plants, fifty square feet, Mr. F. A. Burt, gardener to Mrs. Stucky Wood, took the lead with a well-arranged lot of dwarf chrysanthemums, carrying large, well-coloured blooms, with an edging of maidenhair fern; Mr. Hunter, gardener to J. Buckland, Esq., was placed second; and Mr. Price, gardener to I. M. Dunlop, Esq., third. Only one group was staged in a class for chrysanthemums and ornamental plants arranged on an area of 50 square feet, this was from Mr. Bannister, gardener to Mrs. St. Vincent Ames, Stoke Bishop, who had a beautiful arrangement of large-flowered chrysanthemums, tastefully relieved by the single-flowered Miss Mary Richardson, and palms, crotons, eulalias, and ferns.

CUT BLOOMS.

For twenty-four Japanese, in not less than eighteen varieties, Mr. Pope, gardener to C. Bailey, Esq., led with fairly large, well-coloured blooms, and some of his best were Mrs. W. Beadle, Splendour, President Loubet, Mrs. A. T. Miller, Madame P. Radaelli, Norman Davis, R. Vallis, and Leslie Morrison; the second place was taken by Mr. G. Sutton, gardener to W. A. Todd, Esq.; and third by Mr. Coote, gardener to D. E. Taylor, Esq. In a class for twelve blooms two fairly good lots were staged, the leader being Mr. Baker, gardener to Dr. I. Cropper; Mrs. Norman Davis, Norman Davis, Edith Smith, Reg. Vallis, Bessie Godfrey, Mrs. A. H. Lee, Mrs. F. G. Coster, and Mrs. A. T. Miller were his best blooms; Mr. H. Woodward, gardener to E. Watts, Esq., second. In the class for a dozen blooms, open only to amateurs and gentlemen's gardeners, Mr. Woodward took the lead, closely followed by Mr. Sutton. Mr. Baker was the only exhibitor of twelve incurved, and he staged good blooms.

In a class for six vases of single varieties, five sprays of each, Mr. F. Little, gardener to Lord Justine Farwell, was first; Mr. Benfield, gardener to F. Tagart, Esq., coming second; and Mr. Wilkinson, gardener to G. A. Gibbs, Esq., Flaxbourton, third. This made a pretty class. In the class for six blooms of any one Japanese variety, two exhibitors staged splendid blooms of Mrs. T. A. Miller, viz., Mr. J. T. Curtis, gardener to Sir W. H. Davies, and Mr. H. Woodward, who took first and second prizes in the order named. For six blooms of any white variety, Mr. Benfield was first, and Mr. H. Woodward second, Mrs. A. T. Miller being again the variety staged. For one bloom of any variety, Mr. Baker was placed first with a fine bloom of A. T. Miller.

PLANTS.

Orchids made a splendid show, and for a group 6ft. by 4ft., Mr. Gostling, gardener to A. G. Groves, Esq., took chief honours, with lælias, cattleyas, odontoglossums, and cypripediums; Mr. Spowage, gardener to Colonel H. Cary Batten, followed. Mr. Curtis won the first prize for three plants, staging Oncidium varicosum Rogersi, a fine variety of Cattleya labiata, and a good form of Cypripedium insigne; Mr. Woodward took the second place. Mr. Mitchell and Mr. Woodward took first and second prizes in the order named for two plants; and Mr. Curtis and Mr. Viner first and second for one plant. For three plants of choice varieties of Cypripedium insigne, Mr. Spowage and Mr. Gostling took the honours, and for one plant of Cypripedium insigne, Mr. Curtis was placed first, and Mr. Jay second.

Ferns were shown as large specimens, Mr. Benfield and Mr. Bannister taking the lead here and in several other plant classes.

FRUITS AND VEGETABLES.

In the class for a collection of six dishes of fruit, not less than four kinds, there were four exhibitors, Mr. Wilkinson, gardener to G. A. Gibbs, Esq., Tynesfield, coming first with Lady Downes and Muscat of Alexandria grapes, Jubilee melon, Fearn's Pippin apples, and Marie Louise and Doyenne du Comice pears; Mr. Baker second, and Mr. Thoday, gardener to L. P. Nott, Esq., third. For six dishes of pears, Mr. Bannister was placed first amongst five exhibitors with excellent examples of Charles Ernest, Princess, Doyenne du Comice, Beurre Diel, Beurre Anjou, and Fondante de Thirriott.

Dessert apples, six dishes, formed a strong class (eleven competitors) in which Mr. G. Pow, with splendid dishes of Cox's Orange Pippin, Allington Pippin, King of the Pippins, Baumann's Red Reinette, Rival, and Paroquet took the first prize; Mr. J. H. Virgo second; Mr. H. Pow third. Mr. A. Currey took the lead for four dishes with a fine set. For six dishes of culinary apples, Mr. G. Pow was again first in a strong class, staging large, clean dishes of Newton Wonder, Bismarck, Bramley's Seedling, Stirling Castle, Peasgood's Nonsuch, and Gascoigne's Seedling; Mr. H. Pow was a good second, and Mr. Currey third. Mr. Wilkinson was first for a single dish.

Mr. Wilkinson deservedly secured the special prize offered for the best exhibit of fruit with his collection of six dishes. This exhibitor was also a conspicuous winner in classes for grapes.

Vegetables, for collections of which Messrs. Garaway and Co., Messrs. Carter and Co., and Messrs. Sutton and Sons all gave prizes, were staged in large quantity, and in first-rate condition.

NON-COMPETITIVE.

The non-competing exhibits were a great help in making the show a success. Orchids in rare variety were staged by Messrs. Cypher and Sons, of Cheltenham; a large and good collection of apples by Messrs. Garaway and Co., Clifton, Bristol; conifers, floral designs, and decorative plants by Messrs. Parker and Sons, Clifton; carnations by Messrs. Young, Cheltenham; chrysanthemums and carnations by Mr. Ellis, Weston-super-Mare; vegetables, palms, etc., by Messrs. Brooks and Kitley, Bristol; collection of apples from British Columbia; and chrysanthemums from Messrs. Wells and Co., Merstham. Medals were awarded to these exhibitors.

Cardiff.

NOVEMBER 3 and 4.

In the Park Hall, the twenty-third autumn show was held, and, as a whole, was the best yet seen there. Much encouragement is given at Cardiff to chrysanthemums, no fewer than fifteen challenge cups, bowls, etc., are offered, beside a large amount in cash. Surely such encouragement in the nature of prizes should have an effect upon exhibitors, and it has induced them to bring of their best. Cut blooms were fine, and so were groups of chrysanthemums.

CUT BLOOMS.

There were ten open classes, and all but two of these were devoted to cut blooms. The leading class was for eight vases of Japanese blooms, distinct, three of each, for which the George Williams Challenge Cup and £4 in cash was offered as the premier award; four competed, the best coming from Mr. W. G. Drake, Cathays Terrace, Cardiff, an exceedingly fine display, the blooms not excessively large, but fresh and richly coloured; the varieties were Mrs. A. T. Miller, J. H. Silsbury, Mdme. P. Radaelli, F. S. Vallis (fine), Lady Talbot (extra good), President Viger (large), Bessie Godfrey, and Reginald Vallis (extra deep and richly coloured); Mr. F. Bible, gardener to Prince Hatzfeldt, Draycott Park, Chippenham, was a good second, having a magnificent trio of the Hon. Mrs. Lopes, one of which was awarded the prize for the best bloom in the show; Mr. G. H. Brown, gardener to E. Treharne, Esq., Cœdarhydylyn Park, third, with small blooms. In the class for twenty-four blooms, incurved, the Mrs. Courtis Challenge Cup and £3 in cash was awarded to Mr. Drake, who was the only competitor. The award was well deserved, for he staged a really fine set. For twelve Japanese, distinct, five competed, and Messrs. G. Williams and Son, Manor Road Nurseries, Cardiff, were first with an even set of well-staged fresh blooms; Mr. Bible was a good second, and Mr. H. A. Joy, Cardiff, third.

In the amateurs' section for six vases, three blooms of each, Mr. A. F. Hill staged grand specimens of the Hon. Mrs. Lopes, Lady Talbot, F. S. Vallis, P. Viger, and Mrs. G. Mileham, and won the coveted trophy, the "Vivian" cup. Single-flowered varieties were, as they always are here, well shown. Mr. T. Bindon, gardener to Dr. Wallace, Cardiff, was first with extremely fine blooms of G. W. Forbes, Edith Pagram, Altrincham Yellow, Felix, Metta, and Bronze Pagram. The best arranged vase of single-flowered varieties was one from Mr. G. J. T. Grinter, Cardiff. For twelve incurved, not more than three of any one variety, Mr. G. Tucker, Cathays, Cardiff, won with exceedingly fine blooms. For six, any kind, Mr. F. Maident, 4, Bradford Street, Cardiff, won the premier position, no fewer than seven competing. For six Japanese, Mr. T. J. Dugmore, 30, Pembroke Terrace, Penarth, was first with blooms in splendid condition, eight staging.

PLANTS.

For a group of chrysanthemums and foliage plants, Lord Ninian Stuart gave a challenge cup, which was competed for by Messrs. G. Williams and Son and Mr. W. Treseder, Cardiff, the prizes going in the order here given. The premier group contained many handsome blooms, and, for the small space occupied, was distinctly good.

Very fine, too, were the groups of chrysanthemums arranged by cottagers in a space of 20 square feet. There were five entrants. Mr. W. Hatherdale, Cardiff, a working mason by occupation, won the first prize with dwarf plants well clothed with deep green leaves, and carrying good blooms.

In the division for amateurs and gentlemen's gardeners, there were fourteen classes for cut blooms. The "Courtis" challenge cup was offered for twenty-four Japanese, but there were two entries only, Mr. A. F. Hill, 10, Oakfield Street, Cardiff, an enthusiastic amateur, was first; Mr. H. E. Allen, Penarth, was a good second. For twelve Japanese, Mr. F. E. Atkins, Cardiff, was first with high quality blooms of the leading varieties, Mr. H. Edwards, Cardiff, a close second. Mr. F. Bible was awarded the first prize for twelve incurved with large, rather rough examples of popular varieties. Mr. Drake secured the premier award for six Japanese, white, with handsome blooms of Mrs. Norman Davis and Mrs. A. T. Miller; Mr. Bible second. The last-named won the leading place for twelve incurved, and a like number of Japanese, distinct.

Fruit was a capital display. Especially fine were the apples and pears.

Gold medals were awarded to Messrs. J. Cypher and Son, Cheltenham, for orchids, and to J. J. Neale, Esq., Lynwood, Penarth, for orchids, well grown and arranged; and to Mr. Basham, Fair Oak Nurseries, Bassalleg, Newport, for a fine exhibit of apples and pears. Messrs. W. Clibran and Son, Altrincham, Cheshire, had also a gold medal for vegetables in much variety and of high quality.

Reading Gardeners' Association.

An unusually large number of members assembled for the fortnightly meeting in the Abbey Hall on Monday, October 25, the vice-president, Mr. Leonard Sutton, occupying the chair. Mr. Sutton drew attention to the approaching exhibition by the members, remarking that November 17 would be here very quickly, and urging intending exhibitors to inform the hon. secretary what space they would be likely to require.

Mr. Alderman Parfitt, president of the association, was, according to the programme, to have lectured this evening, but owing to his unavoidable absence from Reading, Mr. F. Townsend, head gardener to the vice-president, very kindly exchanged dates with Mr. Parfitt, and gave his paper, "Annuals and Perennials Grown as Annuals," on this occasion, instead of a fortnight later. Mr. Townsend opened his remarks by saying that he did not propose to touch on sweet peas, asters, or stocks, each of which might well form a subject in itself.

First dealing with annuals grown in pots, Mr. Townsend reminded his audience of the beautiful clarkias in pots, which no doubt many of them saw at the last Temple Show, and enumerated many other subjects that might be treated in an equally successful manner, schizanthus, godetia (double rose), stock-flowered larkspur, annual and perennial chrysanthemums, nicotiana, balsam, nemesia, Dimorphotheca aurantiaca, etc., the charm and novelty of which, when seen in pots, words could not express. Passing to half-hardy and hardy subjects raised under glass for summer bedding, the lecturer said he made no apology for the number of varieties he proposed to mention, the members had seen all, or nearly all, in the gardens when they visited Hillside in the summer, and could form their own conclusions as to their beauty. Some of the subjects touched on were Rehmannia angulata, carnations, dianthus, antirrhinums, pentstemons, salvias, lobelias, begonia (fibrous-rooted), petunia (large-flowered, dwarf, compact), nicotiana, cosmea, Arctotis grandis, statice, mimulus, verbena, Phlox Drummondi, salpiglossis, scabious, and zinnia.

Instructions as to sowing, the proper compost to be used, and advice as to subsequent treatment were fully given. From personal experience Mr. Townsend was able to recommend with confidence that for the raising of annuals a preponderance of leaf-soil may be, with advantage, used in the compost at the ratio of two parts leaf-soil to one of loam. The paper was brought to a conclusion with instructive remarks as to the treatment of annuals sown in the open where they are intended to flower, and having spoken for just over an hour, Mr. Townsend resumed his seat amidst applause.

An animated discussion followed, among those taking part were the vice-president, Messrs. Tunbridge, Loader, Alexander, Stanton, T. Judd, W. J. Townsend, G. Hinton, and Bailey.

Mr. Townsend illustrated his lecture with specimens of antirrhinums, pentstemons, salvias, etc., the fine flowers so late in the season being much admired.

Votes of thanks to the lecturer and the chairman concluded the evening.

Southampton Horticultural Society.

NOVEMBER 9 and 10.

In the Artillery Drill Hall, St. Mary's Road, the annual autumn show of this society was held, and proved a distinct success.

PLANTS.

For the prizes, six, distinct, each carrying not less than five blooms, suitable for conservatory decoration, there was but one competitor, and he was awarded second prize owing to the blooms on one plant being but partly developed, although the remainder were good. For six plants, consisting of white and yellow varieties, there was again but one entry. This from Mr. Dymott, Freemantle Nurseries, Southampton, who received the premier award for well-grown and freely flowered plants of F. S. Vallis and the Hon. Mrs. Acland, the latter carrying twenty-eight fully developed blooms. The contributions to the class for six single-flowered varieties, in pots not to exceed eight inches in diameter, made a good display. Mr. Dymott was first with freely flowered examples of Reine des Roses, Mrs. Hampson, Edith Pagram, Mary Richardson, and Elsie Neville; Mr. Chandler, 75, Shirley Road, Southampton, second. Four bush plants, distinct, were best shown by Mr. C. Dymott; E. Vere Freeman, Melanie Fabre and its sports were freely flowered.

The amateur growers had a class for a group of chrysanthemums wholly to themselves, but there were only two competitors, the first prize being awarded to Mr. R. Parnell, Derby Road, Southampton, for a fairly good exhibit.

CUT BLOOMS.

The prizes for twelve vases of Japanese varieties, distinct, three blooms in each, were well contested; there were three entries. Mr. F. Bible, gardener to Prince Hatzfeldt, Draycott Park, Chippenham, was distinctly first with handsome, fresh blooms of Hon. Mrs. Lopes, extra fine; to one of these was awarded the prize for premier Japanese in the show; J. H. Silsbury, J. H. Doyle, Mdme. G. Rivol, Lady Talbot, Splendour, Superb, Bessie Godfrey, Mdme. P. Radaelli, W. Jinks, Purity, and F. S. Vallis; Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, was a capital second with smaller blooms, of which those of Mrs. W. Knox, J. Peed, Leslie Morrison, and Mrs. L. Thorn were the most noteworthy; Mr. F. Chandler third. For two vases of white-flowered Japanese, three blooms of each, there were three competitors. Mr. T. Stevenson, gardener to E. Moccatta, Esq., Addlestone, won with splendid blooms of F. W. Lever and Mrs. N. Davis; Mr. Bible was second, staging Purity finely; Mr. Chandler third. In a class for any two varieties, three blooms of each, other than white, six competed, the best coming from Mr. Stevenson, F. S. Vallis and Master James being grandly displayed; Mr. Bible followed; Mr. Usher, gardener to Sir R. Baker, Ranston, Blandford, third.

FIRST PRIZE SIX VASES OF SINGLE CHRYSANTHEMUMS.
Shown by Mr. C. Dymott at the Southampton Horticultural Society's Exhibition.

FIRST PRIZE TWELVE VASES OF JAPANESE CHRYSANTHEMUMS.
Shown by Mr. F. Bible at the Southampton Horticultural Society's Exhibition.

Single-flowered varieties, in six distinct varieties, arranged in vases, displayed their popularity by the number of entries. At the head of the eight competitors was Mr. Dymott, who staged remarkably fine blooms of Mary Richardson, Crown Jewel, Roupell Beauty, Mary Anderson, Florence Robinson, and Bronze Pagram; Mr. Bible second; Mr. H. C. Dredge, gardener to J. C. Willis, Esq., Fleming, Chilworth, third.

There was a good competition in the class for twenty-four Japanese, in not less than sixteen varieties, arranged on the orthodox boards. The best collection was that from Mr. Stevenson, who staged heavy, richly-coloured blooms of F. S. Vallis, Leslie Morrison, H. Perkins, R. Vallis, Duchess of Sutherland, Mrs. N. Davis, Leigh Park Wonder, Lady Crisp, J. Lock, Mrs. C. H. Totty, Lady Talbot, Hon. Mrs. Lopes, C. H. Broomhead, Master James, Mdme. G. Rivol, Frank Payne, and the Marquis of Northampton; Mr. Mease was second with smaller blooms, but finely finished; Mr. Usher third with blooms not well arranged. The class for twelve Japanese, distinct, was a popular one, there being six competitors for the premier position, which was occupied by Mr. D. Edwards, gardener to W. Garton, Esq., Salisbury Court, with medium sized, well-coloured specimens; Mr. H. Pearce, gardener to Mrs. Trogett, Romsey, second. Incurved blooms were very fine. For eighteen, in not less than twelve varieties, four entered, the best coming from Mr. Mease, especially good being those of Daisy Southam, Mrs. J. Wynn, Buttercup, Romance, Clara Wells, and Mrs. P. Bryce; Mr. Chandler followed closely for second place; Mr. Bible third.

For twelve, incurved, there were three entrants, Mr. Edwards winning with large and rather rough blooms; second, Mr. Chandler.

The blooms from amateurs made a good display. There were three competitors in the class for twelve Japanese, the best coming from Lieut.-Colonel R. R. H. Moore, Netley Cliff, a deserving collection; Mr. F. Chandler second. The last-named won for twelve Japanese, not less than eight varieties, with a good set.

MISCELLANEOUS CLASSES.

Dinner table plants were a good display, Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, winning for a bright set. The most tastefully arranged table decoration of flowers, foliage, and grasses, orchids excluded, brought nine exhibitors. Mr. J. D. Cape, Ferndown, Wimborne, was an easy first with bronze chrysanthemums intermixed with bright autumnal foliage; second, Mr. R. H.

Jeffery, Nursling, with carnations and pink roses; third, Mr. Bealing, Bassett.

OPEN TO LADIES ONLY.

The most elegant stand of chrysanthemums arranged with autumn foliage, etc., was one from Mrs. Bealing, amongst six entrants of fair quality. And for a vase similarly treated, there were six competing. Mrs. Jeffery, Nursling, was first with a fair exhibit.

Baskets of autumn leaves, berries, etc., were a distinct feature, no fewer than nine taking part, much the best coming from Mrs. E. Ladhams, Shirley, Southampton, a choice collection of material tastefully arranged; second, Mrs. Marsh.

FRUIT.

For the prizes for three bunches of grapes, distinct varieties, there were five competitors. Mr. H. C. Dredge was an easy first with almost perfect examples of Mrs. Pince, Muscat of Alexandria, and Gros Maroc; second, Mr. W. Sanders, Andover.

In the class for two bunches of black grapes, nine competed, and Mr. Dredge was first with Mrs. Pince, good; and Mr. J. Hughes, gardener to A. P. Ralli, Esq., Twyford Lodge, second. In a similar class for white, Mr. D. Pope, gardener to L. G. Pike, Esq., King Baron, Wareham, was first among five with Muscat of Alexandria; second, Mr. Dredge. Apples were a distinct feature of the show. For four varieties dessert, twelve entered. Mr. Usher was first with really fine Ribston Pippin, Cox's Orange Pippin, Rival, and Wealthy; second, Mr. J. H. Cope. For the same number of kitchen varieties eleven staged, the best coming from Mr. T. Beesley, gardener to Earl Nelson, Trafalgar, Salisbury, with Hambling's Seedling, Peasgood's Nonsuch, and Blenheim Pippin; second, Mr. G. Barnes, gardener to T. C. Wilson, Esq., The Thickets, Bishop's Waltham.

VEGETABLES.

These were numerous and good. Messrs. Sutton and Sons provided the prizes in one class for six dishes. Mr. Ellwood was first among six entrants; second, Mr. Usher; third, Mr. Barnes. Mr. Ellwood was first also in Messrs. Toogood's class for six varieties, and Mr. H. Pearce was second.

Nottingham.

NOVEMBER 5 and 6.

In the Mechanics' Hall the annual show was held, and if not quite so good as in some former years, was a remarkable display for the season. Nowhere can such exhibits be seen as here from the artisan competitors. Certainly on this occasion the incurved blooms were superior to those seen at the National Chrysanthemum Society's show at the Crystal Palace. There is also a keenness shown by the exhibitors here that is much wanting at other shows. As many as fifteen entries was not an uncommon occurrence, and the hall was taxed to its utmost to afford space for the exhibits and display them properly. The society is managed by an efficient committee, ably led by the secretaries, Messrs. Skelhorn and Atkin.

CUT BLOOMS.

There were eight open classes, the principal one being that for twenty-four Japanese in not less than eighteen varieties. Mr. A. Chandler, gardener to A. James, Esq., Coton House, Rugby, was distinctly ahead with a set of heavy, well-coloured blooms, of which the following were noteworthy: Reginald Vallis (premier bloom), Marquise V. Venosta, Bessie Godfrey, Mrs. W. Knox, C. H. Totty, J. Lock, Mrs. A. T. Miller, G. Mileham 1908, Lady Talbot, Mrs. G. Mileham, Miss Hilda Rowley, F. S. Vallis, President Viger, Algernon Davis, and Valerie Greenham. Mr. W. G. Drake, Cathays Terrace, Cardiff, second, Master James, J. H. Silsbury, F. S. Vallis, and Reginald Vallis being distinctly meritorious in his stand. Mr. R. Nisbett, gardener to Sir W. Bass, third; five staged. For twelve incurved, distinct, three competed, the best set of blooms coming from Mr. Drake, who staged Godfrey's Eclipse, Nellie Threlfall, Doris Rayner, E. F. Evans, Mrs. Judson, Bocaccio, Ma Perfection, W. Beadle, Triomphe de Mont Brun, and C. H. Curtis. Mr. Chandler second.

The amateur and artisan classes included one for six incurved and six Japanese, distinct. In a strong competition Mr. W. D. Parkin, 65, Truman Street, Nottingham, was first with remarkable blooms of Clara Wells, Mrs. G. Denyer, Pantia Ralli, B. Hankey, Buttercup, and Romance for incurved, and the Japanese were Lady Talbot, Splendour, and F. S. Vallis, all of which were equally good.

In the class open to artisans only, for six Japanese and six incurved, in which the premier award was a challenge cup, the entries were numerous and the blooms of high quality. Mr. W. Cox, 11, Cromer Road, Nottingham, was first with splendidly-developed blooms of incurved, such varieties as Clara Wells, Mrs. J. Wynne, and Buttercup measured fully six inches in diameter. The Japanese, which were equally meritorious, included F. S. Vallis, Lady Talbot, and Reginald Vallis. In a class restricted to artisans growing not more than 200 plants, a challenge cup was offered as the premier award for six incurved and six Japanese. Here Mr. G. Wright was the most successful with wonderful blooms of Mrs. G. Denyer, Triomphe de Mont Brun, Buttercup, and John Wainwright.

In a class for six Japanese a challenge cup was offered, which Mr. W. Swann, 152, Blue Bell Hill, Nottingham, won with extra fine examples of popular varieties. For three Japanese, one variety, there were nine competitors. Mr. L. Burley won with handsome examples of Lady Talbot. For three incurved, one variety, nine staged, Mr. W. Swann won with remarkably fine specimens of Clara Wells, large in size, and finely finished. For twelve incurved, not less than eight varieties, four competed, and Mr. G. Wright obtained premier honours with grand blooms of Clara Wells, Buttercup, Mrs. G. Denyer, Triomphe de Mont Brun, W. Pascoe, and John Wainwright. For twelve Japanese in not less than eight varieties, Mr. W. D. Parkins, in a strong entry, was first with handsome examples. For a vase of seven blooms, arranged as for drawing-room decoration, Mr. W. J. Holmes was first among six entrants. Seven entered in the class for six Japanese, any one variety, Mr. W. D. Parkins was first with Reginald Vallie, remarkably fine; Mr. W. Swann second.

Single-flowered varieties were extremely fine; seven entered for three vases, and Mr. W. D. Parkins won easily with enormous blooms of Edith, Bronze, and White Pagram.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE.—Oct. 26.

Present: Mr. E. A. Bowles, M.A., F.E.S., F.L.S. (in the chair); Messrs. E. M. Holmes, A. W. Sutton, A. Worsley, G. Gordon, J. Fraser, J. T. Bennett-Poë, F. J. Chittenden (hon. sec.), and Rev. Aikman Paton, M.A. (visitor).

HYBRID SOLANUMS. — Rev. Aikman Paton, M.A., Soulseat, Castle Kennedy, N.B., showed a series of Solanums raised by himself to illustrate the result of crossing Solanum tuberosum (a wild form from Mexico) and the white flowered variety of S. Commersoni. He also showed plants and fruits of S. verrucosum, S. etuberosum, etc. The following is a description of the parents used and the resulting progeny:—

S. tuberosum (Mexico), wild. [The Mexican variety used has larger portions of the rhachis bare between the leaflets, fewer leaflets, and the terminal leaflet also tapering from the base, where the lamina is often adnate to the rhachis, fewer interspersed small leaflets than the Chilian variety.] — Stems, green to purplish, speckled or streaked with green, with wavy green-winged edges. Leaflets, oval, very short stalked, the lamina much raised between the venation, giving the leaves a crumpled appearance, glossy; edges, crenate. Calyx, hairy, with long tapering awl-like points, which turn back from the berry. Corolla, rotate-pentagonal; edges, arcuate. Colour, dark lilac [R.H.S. Colour Chart 202, 2 and 3]. Anthers, short, orange coloured. Style, slightly projecting beyond the stamens. Berries, somewhat rounded, pointed, heart-shaped, with sloping shoulders at stalk end, covered with white spots, especially at the lower half. Tubers, reddish.

S. Commersoni (Uruguay), white flowering.—Stems, pale green, violet at nodes, especially in axils; edges, slight, straight, green winged. Leaves, pale green, sparse. Leaflets, shortly stalked, widely separated on the rhachis, few or no interspersed leaflets, oval obtuse, flat, dull; edges, plain. Calyx, short, blunt, shouldered, with short claws. Corolla, star-shaped, deeply segmented, white (sometimes with a violet tinge on base of back of petals). Stamens, long, thin, lemon coloured (paler than those of S. tuberosum). Style, much exserted. Berries, larger than those of S. tuberosum, heart-shaped, dimpled at stalk end, with sulcus down the middle always visible at stalk end, and especially if seedless, few spots. Tubers, yellowish white, warty (lenticels).

Hybrids of above.—Stems, dark violet, rounded triangular; edges, winged, green, straight. Leaves, dark green. Leaflets, oval obtuse, flat, plain-edged, dull. Calyx, short, blunt, shouldered, with short claws (sometimes triangular tapering, with longer claws). Corolla, always lilac [No. 202, 4 and 3], rotate-pentagonal. Style, much exserted. Stamens, pale yellow, long. Berries, bluntly heart-shaped, full at top, covered with whitish spots on lower half. Tubers, white, with large lenticels, like S. Commersoni. In a brief comparison of the hybrids with their parents, the hybrids have the form of stem, the form and colour of foliage, the venation of the leaflets, and the habit and general appearance of S. Commersoni. The calyx is generally that of S. Commersoni. The flower in form and colour is that of S. tuberosum, the shade only different [No. 202, 4 and 3]. The berry is intermediate, shaped like that of S. Commersoni, but blunter and thicker, and spotted like that of S. tuberosum.

The cross above described is particularly interesting, in view of the fact that very rarely has Solanum Commersoni been got to produce fertile seed. Mr. A. W. Sutton has obtained some, but besides this no one appears to have done so, although the plant has been widely grown. The committee, on the motion of Mr. A. W. Sutton, unanimously recommended the award of a silver Knightian medal to Mr. Paton for his interesting exhibit.

POTATO TUBERS. — Mr. A. W. Sutton showed a series of tubers of various solanums as follows: 1, Solanum Commersoni (white-flowered form); 2 (seedling from No. 1), Solanum Commersoni (white-flowered), selfed 1906. These tubers showed a distinct break from those of the parent, the skin being of a different colour and the tubers of a different shape. 3, Solanum Commersoni, FitzHerbert's form; 4, Solanum Commersoni (violet-flowered form); 5 (seedling from No. 4), Solanum Commersoni (violet-flowered), selfed; 6, Solanum Ohrondi; 7, Solanum Maglia; 8, Solanum Maglia × commercial Potato; 9 (seedling from No. 8), Solanum Maglia hybrid × commercial Potato, selfed; 10, Solanum etuberosum.

VIRESCENCE IN CREPIS VIRENS.—Mr. E. M. Holmes showed a plant of Crepis virens in which the individual flowers had become stalked, and in place of a pappus a calyx had developed. The capitulum looked very like the inflorescence of an Umbelliferous plant.

SALIX LANATA.—Mr. Fraser briefly recounted how he had discovered this rare alpine willow, and showed specimens. The plant does not appear to thrive in many gardens, but there are fine specimens in the garden of the society at Wisley, and in the Botanic Gardens at Birmingham.

PRUNING AFTER PLANTING.—A communication dealing with the question of the wisdom of pruning immediately after planting trees was received from Mr. J. Lansdell. It will be printed in the society's "Journal."

DORSTENIA WALLERI.—Mr. Chittenden showed a plant of this interesting species from the society's garden, grown from a tuber received from Central Africa. The species was first described in "Gard. Chron.," August 12, 1893, p. 178, plants having been raised at Kew from seed received from Central Africa. Like other plants of the genus, the green inflorescence is flattened, and bears the flowers like an opened fig upon the flattened stem; the margin of the inflorescence is raised somewhat, and gives rise to four or five coarse long tapering filaments.

ACORNS REFUSED BY STOCK.—Mr. Bowles showed some acorns from three trees at Myddleton House, Waltham Cross, which neither cattle nor sheep would eat. Mr. Holmes took them for further examination.

ABNORMAL BULB FORMATION IN NERINE.—Mr. A. Worsley showed a curious bulb of nerine which had developed at the apex of a flattened process somewhat similar to that seen in the bulbs of vallota. The occurrence of a bulb in the position assumed by this is unique in Mr. Worsley's experience of nerines, and he considered it probable that it was owing to the diseased condition of the basal part of the bulb.

National Vegetable Society.

A commitee meeting of this society was held at the Royal Horticultural Society's Hall on the 9th inst., Mr. A. Dean, V.M.H., being in the chair, and the following members present: Messrs. W. Poupart, E. Beckett, V.M.H., J. Gibson, C. Foster, J. Harrison Dick, T. Harvey, G. Wythes, V.M.H. (treasurer), and E. G. Quick (secretary). The minutes of the previous meeting were read and signed. A letter was read, stating that the council of the Royal Horticultural Society could not grant the use of the hall for a two days' exhibition, as it would not be available on the dates provisionally fixed at the previous meeting. The Chairman reported that, owing to the R.H.S. having also determined to hold a vegetable show in September, the National Vegetable Society had approached the council as to the two exhibitions being held conjointly, but it was stated that the space at command would not be sufficient. It was then decided to hold a show in 1910, as at first suggested on September 28. Messrs. Beckett, Gibson, and Foster supported this resolution, and it was unanimously carried. Promises of liberal prizes were received from Messrs. Dobbie and Co., Rothesay, Messrs. Barr and Sons, King Street, W.C., Messrs. Cheal and Sons, Crawley, and Messrs. Wood and Sons, Wood Green. Letters were read from Messrs. Clibrans, Altrincham, and other large firms promising assistance and liberal prizes. The Treasurer reported several new subscribers. and several gentlemen were nominated for membership. It was proposed to issue the schedule early in the new year.

Aberdeen Horticultural Society.

The annual meeting of this society was held in the Music Hall Buildings, Aberdeen, on Saturday evening, 30th ult. Mr. J. G. Burnett, of Powis, chairman of directors, occupied the chair, and there was a good attendance. The annual report showed that, from a horticultural point of view, the exhibition held in August was an exceedingly good one, but the financial result was not satisfactory, owing to the complete breakdown of the weather on the last day of the show—for the second year in succession. The income for the year amounted to £390 5s. 11d., and the expenditure to £456 4s. 9d., showing a deficit for the season of £65 18s. 10d., the debit balance to be carried forward to next year being £34 2s. 9d. The membership, unfortunately, continued to show a slight decrease, and the directors appealed to their fellow-members to endeavour to get their friends to join the society. The report ended with a vote of thanks to the Town Council for granting the use of the park, and to Sir David Stewart, LL.D., for his courtesy in opening the show.

The report was agreed to.

A short but animated discussion followed on the question of the date of next year's show, the contention being that the show was held too early. It was pointed out that Edinburgh and Dundee held their shows about the beginning of September, and their displays were much better than that of Aberdeen. The matter was left in the hands of the directors.

On the motion of the chairman, the hon. president, hon. vice-presidents, and hon. directors were all re-elected. For the office of chairman for the ensuing year, Mr. J. G. Burnett was re-elected. Councillor Milne was re-elected vice-chairman; Messrs. Reid and Wyllie were re-appointed auditors, and Mr. J. B. Rennett was reappointed secretary and treasurer. A large committee was then appointed representing the various interests of the society—professional gardeners, market gardeners, nurserymen, and florists, amateurs, and working-men.

The usual votes of thanks closed a pleasant meeting.

Chrysanthemum Mary Richardson. — The popularity of the single chrysanthemum for winter decoration stimulates the production of new varieties, many of which, however, are in no way superior to existing forms. A striking exception is found in the variety Mary Richardson, and, though not new in the strictest sense, it is as yet unrepresented in many collections: the flowers are a most distinct shade of reddish-salmon, of medium size, and are borne upon erect stems of an average height of three feet. The plant is a free-grower, and flowers during the early part of November. It is a beautiful flower for decorating, as the blooms attain a great brilliancy under artificial lighting.—Thomas Smith.

CLAY'S FERTILIZER
FOR
CHRYSANTHEMUMS.

The Large Gold Medal given by **Messrs. CLAY & SON, Stratford,** for the Best Non-competitive Exhibit at the **NATIONAL CHRYSANTHEMUM SHOW,** Crystal Palace, November 3, 4, 5, was won by **Messrs. H. J. JONES' NURSERIES, Ltd.,** Ryecroft, Hither Green, Lewisham, the well-known Specialists, who produce their excellent blooms by the aid of **CLAY'S FERTILIZER.**

CLAY'S ✕ LONDON ✕ FERTILIZER
TRADE MARK

Sold everywhere in **6d.** and **1s.** Tins; and Sealed Bags:—7 lbs., **2s. 6d.**; 14 lbs., **4s. 6d.**; 28 lbs., **7s. 6d.**; 56 lbs., **12s. 6d.**; 112 lbs., **20s.** Or direct from the Works, Carriage Paid in the United Kingdom for Cash with Order (except **6d.** tins).

CLAY & SON, STRATFORD, LONDON, E.

NOTES OF OBSERVATION.

Cupressus funebris. — Commonly known as the Funeral Cypress, this is an excellent subject for summer bedding, and, when grown in pots, it forms neat specimens that can be turned to excellent account for decorative purposes indoors during winter. The plant forms a faultless pyramid of slender, wiry branches, which are gracefully pendulous, while the scale-like leaves are of a pleasing grey-green colour. It endures the most trying conditions indoors, and will stand for several months in dimly-lighted rooms, or in draughty corridors without apparent injury. This species is readily raised from seeds or cuttings, and when grown on rapidly in a warm house it makes handsome specimens in a very short time. Good fibrous loam and firm potting, in conjunction with copious supplies of diluted liquid manure during summer are the main features in its culture.—Thomas Smith, Walmsgate Gardens.

Coleus thyrsoideus.—This useful winter flowering plant will now be showing flower spikes. The pots are now well filled with roots, therefore, to retain the foliage and enlarge and brighten the flowers, frequent applications of liquid manure and soot water should be given. Through the dull winter months few plants show to such advantage when well grown, their bright blue spikes always claiming admiration. The plants best suited for our own requirements run from three to five feet in height, with one, two, and not more than three stems. When in flower in conjunction with Begonia Gloire de Lorraine, Euphorbia jacquiniæflora and Poinsettia pulcherrima, etc., are very decorative.—W. Fyfe.

Codiæums (**Crotons**).—Among tender exotics few plants rank with crotons in exhibiting greater variety of colouring in their leaves, and, although less popular in some respects than they were a few years back, yet the demand for these is more or less present in every establishment, their lightness, grace, and beauty of colour giving point to every decorative arrangement in which they are employed. Encouraged by humid conditions during the growing season, and exposed to the sunlight in order to develop the colouring of the leaves, at this season it becomes necessary to inure them to a lower temperature and drier atmosphere in order that they may stand the change from the plant stove to the mansion or exhibition table without injury. Sudden changes of temperature should, as far as possible, be avoided with crotons, and they must never be left in positions exposed to draughts, while their period of usefulness is prolonged to the utmost if those employed indoors are frequently changed. Specimens that become leggy early in the season are still useful for furnishing leaves for bouquets or other cut flower arrangements, it being only necessary to retain the leads for propagating purposes. —Thomas Smith.

HOW TO ENJOY A MELON.

I extract the following recipe freely translated from "La Tribune des Sociétés Horticoles." Brussels: "Take a Cavaillon melon (shun the Cantaloupe), cut it circularly round the stalk with an enamelled knife and remove the seed with a silver spoon, not disturbing the pulp. This done, put alternate layers of refined sugar (two spoonfuls) and alpine strawberries until it is full, and then pour in a bottle of irreproachable Bordeaux to fill up the spaces between berries and sugar. Then replace the severed part to serve as a stopper, and let it stand in a cool cellar for 24 hours. Empty then the contents into a dish, and the solemn hour will have arrived. As for the melon itself, present it to some lukewarm friend at the right season." For the combination this might be worth trying by the fruiticultural gourmet, or the members of the fruit committee, by way of a change from unsophisticated material. C. T. D.

OCTOBER IN THE NORTH.

During October, writes our Aberdeen correspondent, we seem to have been more fortunate in the North than most other places as regards the weather. We had a good deal of sun on some twelve or thirteen days; sometimes, as on the 31st, from morning until night. Temperature, however, has been keen and cold during the closing days of the month, with frost in the mornings, sometimes exceedingly hard, especially on the 27th. The rainfall was about three inches, a little below the average of the last 40 years for October. On a long average, October is the month in which we have most rain. The wettest was that of 1895, in which we had nearly seven inches; the driest that of 1899, when we had only one inch. Although it has been below the average this year, yet the number of days on which some rain fell is large, being at least sixteen. In England and the South of Scotland the rain has been excessive—far worse than we have experienced. In the Stranraer district of Wigtownshire there have been only five days, it is said, which were suitable for field work. Unfortunately we have recently had a succession of bad harvests, for of the last eight at least six have been rather late and tedious, and in only one (that of 1905) was there really fine harvesting weather, while the harvests of 1903 and 1907 were about the worst anyone now living can remember. As these things often follow in groups, the chances are there will be some fine harvests by and by, at any rate, it is to be hoped so. The weather in the North in October is often either very good or very bad. A fine sunny day in October in these northern regions is one of the most pleasant in the whole year, the air is so cool, clear, and bracing, and with what Northerners call a "stang" in it, but a gloomy, squally day of rain in that month is just the reverse. In the month just closed we have had samples of both.

NEW PLANTS, ETC.

CHRYSANTHEMUMS.

Mrs. Colles.—A large-flowered, single variety of great beauty and distinction, and apparently a very free-flowering one. The shapely flowers are of that charming shade of colour known so well among ladies as crushed strawberry. F.C.C., N.C.S., November 3. Mr. H. Redden, Manor House Gardens, West Wickham.

George Hemming. — A deep Japanese variety with drooping and curling florets. The colour is bright rosy-claret, with silvery reverse. A fine addition in the matter of good colour and refinement. F.C.C., N.C.S., November 3. Mr. G. Mileham, Emlyn House Gardens, Leatherhead.

J. H. Greswold Williams.—This is a large-flowered single variety of bright yellow colour. It produces its showy blooms in good sprays. F.C.C., N.C.S., November 3. Mr. H. Tribe, Bradenbury House Gardens, Worcester.

Francis Joliffe.—A distinct, long-petalled Japanese variety, a very deep bloom; straw-yellow, shaded with rose along the margins of the broader florets, and rather deeper yellow in the centre of the flower. F.C.C., N.C.S., November 3. Mr. Martin Silsbury, Shanklin, Isle of Wight.

Mrs. R. Luxford.—This promises to become a very useful Japanese market variety, as it has very solid flowers of good form and of a decided deep chestnut-red colour. F.C.C., N.C.S., November 3. Messrs. W. Wells and Co., Merstham.

Phosphorescens.—A free-flowering decorative or market variety of reflexed Japanese form, and one that makes a first-rate bush plant. Colour, bronzy terra-cotta. F.C.C., N.C.S., November 3. Messrs. W. Wells and Co., Merstham.

TRADE NOTES.

Much taste and judgment is at the present time shown in the preparation of trade catalogues associated with gardening, and as the result, many of these publications are so admirably prepared, both as regards utility and attractiveness, as to fully merit the warmest praise. For a long period, the "Manual" issued by Messrs. Kelway and Son has occupied a foremost position among trade catalogues of the highest class, and the issue for 1909-10 which is now before us is so great an advance upon its predecessors as to deserve the heartiest commendation. The publication forms a handsome quarto of about 350 pages, and descriptive lists of plants, flowers, fruits, seeds, and bulbs, and is remarkable for the large amount of information it contains, and is of interest as indicating the immense resources of the firm. It need hardly be said that delphiniums, gaillardias, pæonies, pyrethrums, and gladioli occupy a prominent position in the "Manual," for it is well known that the firm has taken a leading part in the creation of the many beautiful varieties of these flowers that are now in cultivation. But it must be said that the descriptive lists of the finest of the varieties are accompanied by large numbers of finely executed illustrations, in black and white and in colours. Other sections of the "Manual" are also freely illustrated, the illustrations being such as to afford valuable aid in making selections.

Messrs. Foster and Pearson's "Catalogue of Horticultural Buildings" is issued in an enlarged form, and is so attractive, comprehensive, and useful as to merit some fuller reference than can be given it under the heading of "Catalogues Received." A great and instructive feature of the catalogue is formed by the admirable illustrations of the structures that have been erected by the firm in gardens in various parts of the United Kingdom. These range from the ornate conservatory to the plain forcing house, and are of special interest for the elegance that characterises the whole of the designs. Not less interesting is the section devoted to the famous Robin Hood and other boilers manufactured by the firm. Copies of the catalogue may be obtained from Messrs. Foster and Pearson, Beeston, Notts.

From Messrs. J. K. King and Sons, of Coggeshall, we have received fruits of a new tomato that they intend distributing in the forthcoming seed season. The variety originated as the result of a cross effected between Lord Roberts and Beauty of Wilts, and the fruits are so handsome in shape and high in quality as to justify the anticipation that it will in due course become popular both in private and market gardens. The fruits are more or less spherical, quite smooth, of a brilliant scarlet colour, and have a firm flesh and fine flavour. They should appeal to the cook, for the fruits before us are about four ounces each, which is undoubtedly the most suitable size for the table. We are informed by the firm that the variety is very productive, many of the stems in the house in which it is seeding having from twenty-four to thirty fruits, each of the size of those sent us. We have no intimation of the name the variety is to bear.

Lectures at Aberdeen. — At the recent meeting of the Aberdeen Horticultural Society it was announced that a course of lectures on "The Elementary Chemistry of the Garden" was to be given by Mr. James Hendrick, B.Sc., of Aberdeen University, commencing on Thursday, November 25, and that the course on forestry would be given by Mr. William Dawson, B.Sc., commencing on November 10.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

VARIETIES OF RHUS COTINUS.—F. S., Jersey: Comparatively few people know that there are two distinct varieties of the Wig Tree or Burning Bush. These two are pendula, with weeping branches, and atropurpurea, that has purplish leaves, growths, and flower stems.

ROSES FOR TOWNS.—A. G. D., Wood Green: The National Rose Society recommends the following ten roses as the best varieties for towns and suburbs: Blanc double de Coubert, Caroline Testout, Gloire de Dijon, La Tosca, Longworth Rambler, Mdme. Abel Chatenay, Mdme. Isaac Periere, Mrs. J. Laing, Mrs. Paul, and Ulrich Brunner. To these we would like to add such strong growers as Ben Cant, Frau Karl Druschki, Conrad Ferdinand Meyer, G. Nabonnand, and the bright and fragrant Gruss an Teplitz.

THE BOG ASPHODEL.—S. L., Huntingdon: There are many prettier things for the bog garden than the common Bog Asphodel (Narthecium ossifragum), but if you have plenty of room for it a good colony will prove attractive. As a single plant, or in tiny groups, it is of little value. Wet peaty soil suits this native plant finely. The golden yellow flowers are produced in July and August. The plant may be readily increased by division of the root stocks.

PROTECTING STANDARD ROSES. — F. E. A., Derby: In districts where it is necessary to protect standard roses during the winter, the material employed is usually bracken or straw, this being placed loosely around and among the branches. We feel sure that a great deal of damage is often done to standard roses during the very early frosts, especially after a mild, damp autumn, because the growths are then very sappy, and suffer badly, though the damage may not be apparent for some time. When there has been a bright and fairly dry autumn to ripen up the wood, the danger is not so great. A few days ago we saw a quantity of standard roses being protected with the old flowering heads of Michaelmas daisies, etc., and were told that the clearing of the herbaceous border provided ample material for protecting the roses.

ORACHE.—T. P. L., Baldock: The Orache is closely allied to the garden spinach, and is sometimes called Mountain Spinach. It is a native of Tartary, a hardy annual, and occasionally used as a substitute for spinach. We do not recommend it, however, because the garden spinach is as easy to grow, and, we think, of better flavour. Seeds should be sown an inch deep, in drills 2ft. apart, in March. Rich soil and plenty of moisture are necessary to secure good results. Pinch out flowering stems as they appear, and make new sowings every six weeks from March to September.

STORING DAHLIAS.—M. E. H., Tadcaster: Cut down the blackened growths as far as the stout, woody portion of the main stem, and then lift the roots. Fasten the label securely to each plant, and set the roots on their sides in the sunshine, or in a frost-proof shed, to dry. When dry put them in an outhouse or cellar that is frost-proof, cover the roots with fine ashes. Some straw or bracken may be thrown over the ashes in the event of very severe weather.

BASIC SLAG.—M. E., Cambridge: You are quite right, basic slag is a capital manure to use on moor, peaty, and fen lands. It contains a large proportion of lime, and also a good percentage of phosphoric acid and oxide of iron. Basic slag should not be used in conjunction with sulphate of ammonia.

A PERFECT SOIL.—D. P., Bristol: Most of us have our own pet ideas of what constitutes a perfect soil, and those ideas vary greatly. The amount of labour and material at command count for a great deal; if these be plentiful then a deep, heavy soil, inclining to clay, can be brought into a highly fertile condition in a few years, and even a thin soil over chalk or gravel can be materially improved. This is hardly the point, however. Dr. Griffiths has laid it down that "a perfect soil for general cultivation would contain approximately: 60 per cent. of sand; 25 per cent. of clay, and 7 per cent. each of calcium (lime) carbonate and humus. This soil would contain enough sand to make it warm, retentive of moisture, and sufficiently open to admit air into its interstices; enough clay to render it sufficiently moist, without being wet and cold, and capable of holding manures; enough carbonate of lime to aid in the decomposition of organic matter, and to provide the necessary lime for plant growth; and, finally, a sufficiency of humus to assist in providing plant food, and the production of carbon dioxide in the soil." Dr Griffith also points out that the water-holding power of soils is as follows: Clay soil, 40 per cent.; loam 51 per cent.; heavy clay, 61 per cent.; and fine carbonate of lime, 85 per cent.

NAMES OF FRUITS.

When sending fruits for naming will our readers be good enough to send good specimens, as without these it is not possible to accurately determine the varieties. Pack firmly, using light tin or wood boxes, and send not more than six varieties at once. Label each specimen and enclose letter with the fruit, whether a separate notification is sent or not. Address the packages to the Editor, GARDENERS' MAGAZINE, as advised in the notice at the head of "Answers to Correspondents."

M. C. F., Lasswade.—1, Bramley's Seedling; 2, Catillac; 3, Mère de Ménage; 4, Court Pendu Plat; 5, Beurre Clairgeau.

T. W., Merton.—1, Waltham Abbey Seedling; 2, Alfriston; 3, Beurre Bosc; 4, Beurre d'Aremberg.

F. F., Chelverton.—1, Doyenne Boussoch; 2, Nouvelle Fulvie; 3, Cockle Pippin; 4, Dutch Mignonne; 5, Chelmsford Wonder.

L. D. V., Sherborne.—1, Peasgood's Nonsuch; 2, Dumelow's Seedling; 3, Smart's Prince Arthur; 4, D'Arcy Spice; 5, Blenheim Pippin.

J. S., Leamington Spa.—We have received no specimens from you; please let us know whether they were sent to the Aldersgate Street or the Kew address.

G. B., Dublin.—The specimens are not good ones, and therefore difficult to identify; they are being dealt with. Names of first lot were published in our issue of October 30.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

C. C. A., Harpenden.—1, Poinsettia pulcherrima albida; 2, Cattleya Bowringiana.

T. S., Hull.—1, Leonotus Leonurus; 2, Cypripedium Spicerianum; 3, Gymnogramma calomelanos; 4, G. peruviana.

W. H., Shanklin.—1, Drimys Winteri; 2, Photinia japonica—the Loquat; 3, Fuchsia procumbens.

P. S. J., Tewkesbury.—1, Primula frondosa; 2, Calceolaria Burbidgei; 3, Callicarpa purpurea; 4, Bouvardia Humboldti corymbiflora.

I. B. D., Molton.—1, Dendrobium formosum giganteum; 2, Cypripedium insigne; 3, Cattleya labiata; 4, C. Bowringiana; 5, C. Mantini.

BOULTON & PAUL, LTD., Horticultural Builders, NORWICH.

GREENHOUSES FOR ALL CLASSES.

No. 49A.—Span, 1[illegible]ft. by 8ft. £10 10 0
No. 47A.—Lean-to, 10ft. by 7ft. £8 10 0

FORTHCOMING ENGAGEMENTS.

MONDAY, November 15.—National Chrysanthemum Society; Floral Committee at Essex Hall at 3 o'clock; Executive Committee at 7 o'clock.

Royal Institute, Lecture by Mr. Inigo Triggs, on "The Planning and Laying Out of Public Spaces," 8 p.m.

TUESDAY, November 16.—Winchester Chrysanthemum Show.

Redhill and Reigate Gardeners' Association, Lecture by Mr. George Gordon, V.M.H., on "Spring-flowering Bulbous Plants," with lantern slides, 7.30 p.m.

WEDNESDAY, November 17.—York Chrysanthemum Show; three days.

Chester Chrysanthemum Show; two days.

Buxton Chrysanthemum Show.

Royal Meteorological Society.

THURSDAY, November 18.—Edinburgh Chrysanthemum Show: three days.

Barnsley Chrysanthemum Show; two days.

Manchester Chrysanthemum Show; three days.

Norwich Chrysanthemum Show; two days.

Linnean Society Meeting.

FRIDAY, November 19.—Bolton Chrysanthemum Show; two days.

Leeds Chrysanthemum Show; two days.

TUESDAY, November 23.—Royal Horticultural Society; Committees meet at 12 o'clock; lecture at 3 p.m. on "Spices," by Mr. J. A. Alexander; Scientific Committee at 4 o'clock.

CATALOGUES RECEIVED.

J. CHEAL AND SONS, CRAWLEY, SUSSEX.—A handy, clearly-printed, well-arranged, and illustrated catalogue of ornamental trees and shrubs, fruit-trees, and roses. New fruits are a speciality.

DICKSONS, CHESTER.—To those concerned with reafforestation, and new plantations of either forest or ornamental trees, and covert plants, this catalogue will strongly appeal.

CHAS. WALL, SOUTH DOWN, BATH.—A neat descriptive list of carnations and picotees.

BEES, LIM., MILL STREET, LIVERPOOL.—In this catalogue of fruit trees, shrubs, and herbaceous plants the chief interest centres in the new plants, notably the new primulas, introduced by the firm from the mountains of Yunnan.

LAXTON BROTHERS, BEDFORD.—In their new catalogue of fruits the Brothers Laxton describe and illustrate several new varieties of their own raising; these include new plums, a new peach, and a new black and new red currant. The catalogue is devoted exclusively to fruits, and, of course strawberries are included.

R. H. BATH, LIM., WISBECH.—This is one of the early autumn sweet pea lists. The remarks on fixity, and the colour descriptions, are of special interest. Five new varieties are listed.

ANTHRACITE COAL for Greenhouses delivered any station in truck loads, 4 to 10 ton lots. Apply W. ALFRED PHILLIPS, Colliery Agent, CARDIFF.

Tarragon is in many establishments much used for flavouring salads and other things, and is in continuous demand. Where this is the case, roots should be lifted and put into ten or twelve-inch pots, and placed where they can have a little bottom heat. If they have attention to daily syringing the plants will soon commence to grow and form serviceable shoots for cutting.—C. F.

Send for Illustrated Catalogue, free. BOULTON and PAUL, Ltd., Manufacturers, Norwich.

THOMSON'S CELEBRATED MANURES.
For full advertisement see page 919.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

THE NEW

13th Edition.

ENCYCLOPAEDIA OF GARDENING.

By T. W. SANDERS, F.L.S.

A Page of the New Encyclopaedia of Gardening.

ENCYCLOPÆDIA OF GARDENING.

Clematis (Virgin's Bower).—Ord. Ranunculaceæ. Greenhouse and hardy climbers and herbaceous perennials. All very showy plants.

CULTURE OF HARDY CLIMBING SPECIES: Soil, rich, deep, well-drained loam containing plenty of old mortar and decayed manure. Position, sunny trellises, arches, old tree stumps, arbours, etc.; also in beds with shoots trained over surface. Plant in autumn or spring. Prune in Feb. Pruning: Montana, Florida, Patens, and Lanuginosa kinds only need to have weak shoots removed as they flower on the old wood. Coccinea kinds require weak growths and tips of strong ones removed. Viticella and Jackmanni groups require previous year's shoots to be cut back to six inches from their base. Feed healthy plants occasionally in summer with weak liquid manure. Top-dress those grown in beds with decayed manure in autumn.

CULTURE IN POTS: Compost, two parts loam, one part of equal proportions of leaf-mould, decayed manure, & sand. Plant in pots or tubs in June. Train shoots up roof of cold or cool greenhouse, or around wire trellis fixed in pots. Water freely March to Sept. Apply weak liquid manure occasionally in summer. Keep soil nearly dry in winter. Prune shoots to 3 or 4 in. from base early in the year.

CULTURE OF GREENHOUSE SPECIES: Compost as for above. Grow in pots or in well-drained bed, planting in spring. Water freely during the summer, moderately in winter. Prune away weak growths and shorten rampant ones a little in Feb. Train shoots near the roof. Temp., Sept. to March, 45° to 55°; March to Sept., 55° to 65°. Syringe freely daily in summer.

CULTURE OF HERBACEOUS SPECIES: Soil, ordinary rich. Position, sunny borders. Plant in autumn or spring. Top-dress annually with decayed manure in autumn. Prune shoots close to soil in autumn. Dwarf species best grown on sunny rockeries. Propagate by seeds sown in sandy soil in cold frame in spring in case of hardy kinds, or in heat in spring in case of greenhouse species. Greenhouse species also by cuttings inserted in sandy soil in temp. of 75° in spring; hardy climbers by grafting on roots of C. viticella or vitalba in heat in spring, also by layering shoots in summer; herbaceous kinds by division in autumn or cuttings of young shoots in frame in summer.

GREENHOUSE SPECIES: C. indivisa lobata, white, April, 15 to 20 ft., New Zealand.

HARDY CLIMBERS: C. coccinea, scarlet, July, Texas; flammula, white, July France; florida, white, summer, Japan; Jackmanii, purple, summer, hybrid; patens, white, summer, Japan; lanuginosa, blue, June, China; montana grandiflora, white, May, Nepaul; vitalba, white, July, Britain; viticella, blue, July, Spain. Lady Londesborough (mauve) and Miss Bateman (white) are examples of the patens group, and flower in May and June. Duchess of Edinburgh (white) and John Gould Veitch (lavender-blue) are typical forms of the Florida group flowering in summer; Henryi (cream) and Lady Nevill (lavender) of the lanuginosa section; Lady Bovil (blue) and Hendersoni (purple) of the viticella group; and Jackmanii (purple) of the Jackmanii section.

HERBACEOUS SPECIES: C. Fremonti, purple, summer, 1 ft. N. America; fusca, reddish, summer, 6 to 8 ft., shoots woody, N. Asia; heracleæfolia, purple, summer, 2 ft., China; heracleæfolia davidiana, lavender-blue, fragrant, Aug.; integrifolia, blue, Aug., 2 ft., S. Europe; ochroleuca, yellow and white, summer, 2 ft., N. America; recta, white, fragrant, Aug., 2 ft., S. Europe.

Cleome (Spider-flower).—Ord. Capparidaceæ. Stove & hardy annuals & perennials. First introduced 1817.

CULTURE OF STOVE SPECIES: Compost, equal parts loam, leaf-mould, & sand. Position, pots in sunny stove. Water moderately at all times. Temp., 65° to 75°. Propagate by seeds sown 1-16 in. deep in light soil in temp. 70° in March, transplanting seedlings into pots when 1 in. high.

A Book of 466 pages, which shows you at a glance How any Flower, Vegetable, Fruit, Plant, Tree, or Shrub can be Grown with ease and success.

3/6 net;

By Post, in box, 3/10.

"A valuable book of reference in a handy form, conveying in a nutshell all that the amateur gardener needs to know about plants and flowers of every description." —*THE QUEEN.*

General MacArthur	**Queen of Spain**

The Set of 12 Strong Plants, **22s. 6d.,** Carriage Paid.

12 CHOICE HYBRID TEAS, the ever-blooming and popular varieties, **12** for **8s. 6d.,** and **6** for **5s.** Large, healthy, strong bushes.

Caroline Testout, shell-pink	**Liberty,** scarlet
Lady Ashtown, pale rose	**Mrs. W. J. Grant,** rich pink
Dean Hole, salmon shade	**Bessie Brown,** creamy-white
Mme. Abel Chatenay, carmine-rose	**Countess of Gosford,** salmon-pink
Killarney, flesh, shaded white	**J. B. Clark,** scarlet and purple
Marquis Litta, rosy-carmine	**K. A. Victoria,** lemon

12 CHOICE HYBRID PERPETUALS, best for exhibition or general garden purposes. Carriage paid for **7s. 6d.** All splendid varieties.

A. K. Williams, carmine	**Victor Hugo,** crimson, shaded purple
Capt. Hayward, bright carmine-crimson	**Marie Baumann,** bright red
Dupuy Jamain, cherry-red	**Mrs. John Laing,** soft pink
Fisher Holmes, shaded crimson-scarlet	**Mrs. R. G. S. Crawford,** deep rose-pink
Frau Karl Druschki, purest white grown	**S. M. Rodocanachi,** silvery rose
Hugh Dickson, brilliant crimson	**Ulrich Brunner,** cerise

12 CHOICE TEAS for **10s. 6d.,** Carriage Paid.

Anna Olivier, flesh-coloured rose	**Mdme. Lambard,** bright rose
Lady Roberts, rich apricot	**Mr. Edward Mawley,** carmine and salmon
Catherine Mermet, rosy-flesh	**Souv. de Pierre Notting,** apricot-yellow
Mdme. Hoste, white, yellow centre	**Maman Cochet,** flesh and carmine-rose
Mdme. Jean Dupuy, rose and yellow	**White Maman Cochet,** white
Mdme. Jules Gravereaux, yellow and peach	**Muriel Graham,** cream

12 CHOICE CLIMBERS for **12s. 6d.**; or **1s. 6d.** each, Carriage Paid.

The above Collections are grand value, and cannot be surpassed. The plants are very strong and healthy, and should be ordered now for early planting.

WEST BERGHOLT, COLCHESTER.

CHRYSANTHEMUMS.

NEW CATALOGUE issued by

NORMAN DAVIS

Now Ready, Post Free.

The Choicest Varieties, as supplied to the leading exhibitors for the past 35 years. Also a Splendid Collection of Singles, Decorative Varieties, and the Best and Choicest Michaelmas Daisies.

CHRYSANTHEMUM NURSERIES,
FRAMFIELD, UCKFIELD,
SUSSEX.

TROPÆOLUM SPECIOSUM (with cultural directions) also well-rooted ground Ivy. 12 strong roots, each 1s. 3d., free. HARDY, Stranocum, Co. Antrim.

SPECIAL REDUCTIONS IN PRICE OF RHODODENDRONS, etc.

We hold the largest Stock of **RHODODENDRONS** in Great Britain, all extra fine, bushy stuff, grown 1,000 ft. above sea level; being recently transplanted are in a splendid condition for removal. Special reduction will be made to clear land of the following:—

RHODODENDRONS, which can be supplied by the hundreds of thousands, in sizes from 1 ft., 1½-2 ft., 2-2½ ft., 2½-3ft., and 3 to 4 ft, by the doz, 100, or 1,000 to suit purchasers **PONTICUMS, HYBRID SEEDLINGS, BLANDUM, CAUCASIAN PICTUM, CUNNS** (white and blush) **JACKSONII,** choice named varieties; extra fine, clean stuff.

AZALEA PONTICUM, 1 to 4 ft., extra fine.

CUPRESSUS, in all varieties, from 2 to 6 ft.

HOLLY COM., from 1, 2, 5, 6, 7, 8, and 9 ft. high; extra fine. **HOLLY HODGENSII, MADERIENSIS,** and **SHEPHERDII** in all sizes.

LAURELS in variety from 2, 3, 4, 5, 6 ft. high.

YEWS, ENG., from 1, 2, 3, 4, 6, 7, and 8 ft. high; extra fine stuff.

ORNAMENTAL TREES, FOREST TREES, PLANTS FOR HEDGES, GAME COVERTS, &c., in large quantities.

We extend a Courteous Invitation to inspect our Nurseries, 300 acres in extent.

NOTES OF THE WEEK.

Plant Fecundity.

As regards capacity for propagation by seeds or eggs, though the animal kingdom presents examples of wonderful fecundity, as we may see in some of the fish tribes, whose eggs run into hundreds of thousands per individual, there is no doubt that the plant world can, in innumerable instances, far and away surpass it. In this respect, it would appear that high development in both cases tends to reduce fertility. Among animals especially, the offspring of the mammals are comparatively few, their very organisation which gives them their name, precludes a greater number of progeny than the mother can herself nourish; when, however, we descend to the layers of eggs, the numbers increase, and may, as we have already stated, become enormous. Another point is that Nature undoubtedly favours numbers in direct ratio with the risks which the young must experience when first launched into active existence, a fact which is obvious enough when we consider that, despite the disparity of numbers of young produced, the number of adult individuals, speaking generally, may be regarded as equal year after year, so nicely is the balance maintained. In the plant world all are seed or spore bearers, the plant, whether of high or low degree, has no share in the protection of its young progeny. All it can do, and this it usually does, is, by means of its special contrivance for flight, attachment, or other means of wide dissemination, to get its seed away from its own particular area, and give it a chance at a distance. This being so, it follows that a large number is, as a rule, an essential for the continuance of the race, since the struggle for existence to which the seedling is inevitably exposed, renders equally inevitable the early destruction or perishing of an immense majority. Thus, even in, let us say, the oak, as a type of long-lived trees, which may exist for centuries, every season may witness the production of an immense crop of acorns, yet how few seedlings shall we find even in the soil which may have been all but covered with them at the fall, though every one, as we can easily convince ourselves, will sprout and grow if sown and protected. In point of fact, all which fall within the shade or upon the root realm of the mother tree are heavily handicapped by the practical monopoly of light and soil, and we thus see that the fecundity of the oak is largely neutralised by the fact that, as regards seed dissemination, it is a failure. The balance is, however, maintained by the stability and longevity of the parents. Ephemeral plants, such as annuals and biennials, make up for their short life by more abundant seed, accompanied often by clever scattering devices, and, there is little doubt, a greater capacity of germination than obtains in perennials generally. Many perennials which have a widespreading stoloniferous habit, and propagate themselves freely in that way, are either chary of producing seed at all, or their seed is very slow to germinate. It is, indeed, a rule in Nature that, giving free propagation in one direction, there is a check in another. Ferns, for instance, with travelling rootstocks, lend themselves much less freely to spore propagation, as a rule, than those with single crowns. In the case of ferns, their fecundity is incredible, a single plant of fair size yielding by actual computation over a thousand million spores as an annual crop, while in some of the huge tree ferns they must be reckoned by the billion, and this, despite the fact that there is practically no limit to their longevity. The marvel here is the greater since it has been abundantly proved that each spore is capable of producing not merely one but several ferns. Here the incipient fern represented by the preliminary scale-like growth which originates from the spore, and upon which the equivalent of flowers are produced, is very small, and is handicapped in a great variety of ways in the struggle for existence, so that here again the balance is maintained exactly in an unchanged environment. It is, however, among the still lower grades of vegetative life, viz., the fungi, that we arrive at the acme of fecundity; computation fails to estimate the crops of spores which may be produced by a colony of fungi originating from a single one. Here the spore produces an invading growth, the so-called mycelium, which penetrates the soil or the tissues of infected plants, and eventually forms colonies instead of single individuals, each member of which may disseminate countless spores in its turn to pervade, perhaps, the very air itself with potential germs, and it may be, cause serious injury to plant or animal life.

MR. THOMAS BEVAN,
Chairman of the National Chrysanthemum Society's General Committee.

Mr. Thomas Bevan, whose portrait we give in this issue, is, perhaps, best known to the general body of horticulturists for what he has done in connection with the National Chrysanthemum Society, but he has accomplished much useful work in other directions. After a considerable experience in gardens at home and on the Continent, Mr. Bevan was appointed to the post of superintendent of the St. Marylebone Cemetery, and here he has, by his free and tasteful use of ornamental plants, set an example that is worthy of imitation generally, and deserving of high praise. Notwithstanding the immense amount of detail incidental to his position that has to receive attention, Mr. Bevan has found time to do excellent work in the advancement of horticulture. For many years he has taken an active part in the management of the various horticultural societies in the north of London, and for a quarter of a century or so he has been closely associated with the management of the National Chrysanthemum Society. Long a member of committee, he was for about seven years chairman of the Floral Committee, and for a similar period he has filled the higher position of chairman of the Executive Committee. During his period of office Mr. Bevan has visited many of the principal horticultural exhibitions as a deputation from the National Chrysanthemum Society, with other members of the executive. Mr. Bevan fully appreciates the usefulness of gatherings of gardeners, both for technical and social purposes, and during the past twenty years he has seldom been absent from the more important horticultural meetings held in and around London.

Fruits of Foreign Growth were so sparingly contributed to the British markets during October as to show a very material decrease in values, as compared with the corresponding month of last year. This may be regarded as satisfactory, or otherwise, according to the view taken with regard to the presence of foreign fruits in the home markets. The imports of apples amounted to 513,253 cwt., of the value of £300,554, these figures showing a decrease in quantity of 69,610 cwt., and in value of £16,669. In the imports of apricots and peaches there was a decrease in quantity of 836 cwt., and in value of £1,524, the aggregate having been 170 cwt., of the value of £200. Banana imports aggregated 496,807 bunches, of the value of £145,135, these figures representing decreases, as compared with October, 1908, and increases on the imports of the corresponding month of 1907. There was the very large decrease of 167,456 cwt., on the imports of grapes, the aggregate having been only 173,460 cwt., of the value of £178,060, which is the smallest quantity of foreign grapes that have been received in British markets during October for many years past. Lemons, oranges, and almonds were imported in increased quantities; but the imports of miscellaneous nuts show a material falling off. Of pears the imports were 80,209 cwt., of the value of £58,375, or a material decrease both in quantity and value. Plums, on the other hand, show an increase of 17,433 cwt., of the value of £8,731, the aggregate imports having been 19,636 cwt., of the value of £10,085. Unenumerated fruits were also imported in increased quantities, the total imports having been 48,226 cwt., of the value of £33,543. The total value of the fruit imports for the month was £1,056,080, or a decrease of £166,240.

Royal Botanic Society.—With reference to the correspondence relating to the proposition made by the Royal Horticultural Society to this society, it will be of interest to mention that the following letter has been written to the secretary of the Royal Horticultural Society: "Dear Sir,—At the meeting of my council held last (Friday) evening I was directed to say that they have heard to-day from our president, his Serene Highness the Duke of Teck, and have sent a copy of your letter dated October 15 to his Highness. My council reciprocates the friendly sentiments expressed in that letter, and will be pleased to meet a committee of your body and to consider and discuss with them the question proposed. My council suggests that five on each side would be a convenient number, and that the meeting should take place at as early a date as practicable.—J. Bryant Sowerby, secretary of the Royal Botanic Society."

Roses and Rose Culture.—The members of the Croydon Gardeners' Association were fortunate in having an address on roses and their cultivation by Mr. E. J. Holland, at their last meeting, a fact which they appeared to fully appreciate. Mr. Holland, at the outset of his address, gave a brief sketch of the history of rose growing in this country; but, as the object he had in view was of a distinctly practical character, he did not devote much time to the historical aspect of his subject. Passing on to a consideration of cultural matters, Mr. Holland suggested that in selecting a site for the rose garden it should be borne in mind that while roses should have sufficient shelter to protect them from strong winds, the position should be open to sunlight and air. The importance of liberal manuring and trenching was insisted on, and November was suggested as the best month in which to plant roses. Careful handling of the roots and firm planting was advised, and, in the case of dwarf roses, it was recommended that they should be deep enough in the soil for the junction of the stock and scion to be below the surface. Proceeding to deal with the details of management, Mr. Holland advised that pruning should be commenced in March with the hardier kinds, and that this operation be completed by the end of the month. A rather severe system of pruning was advocated, but it was mentioned that the stronger growers should be cut back to within seven or eight inches of the base of the shoots. The thinning of the young growths at an early stage of their development, the use of liquid manure in June, the search for and destruction of insect pests, and other points received a full share of attention, and at the close of his lecture Mr. Holland received the heartiest of thanks.

Horticultural Club.—The next house dinner of the club will be held on Tuesday next, November 23, at 6 p.m., when Mr. Joseph Cheal will give a lecture entitled, "Canada of To-day, Horticulturally and Generally." As Mr. Cheal's observations of the Dominion extended from the Atlantic to the Pacific, the lecture, which will be freely illustrated by original lantern slides, should be not less interesting than those previously given by him at the Horticultural Club.

Primula obconica.—From Mr. J. Dickson, gardener to Adelaide Duchess of Bedford, Woodside, Chenes, Rickmansworth, we have received a box of flowers of numerous varieties of this useful primula. The flowers are large in size, of superb form, varied and effective in colour, and represent an excellent strain.

Vegetable Imports in October were about equally balanced as regards increases and decreases. In the imports of onions there was the substantial increase of 133,633 bushels, of the value of £8,041, the total having been 884,335 bushels, of the value of £105,251, which we suggest is a much larger quantity than we should have to obtain from abroad to meet the demand for these pungent bulbs in October. There was an increase also in the imports of tomatoes, which aggregated 77,634 cwt., of the value of £76,725. The imports of potatoes were 111,475 cwt., of the value of £18,243, these figures representing small decreases both in quantity and value. Unenumerated vegetables were imported to the value of £10,448, or a decrease of nearly £3,000.

Plants Injured by Frost.—At the meeting of the R.H.S. Scientific Committee, on the 9th inst., Mr. J. Fraser showed specimens to illustrate the damage done by frost acting under varying conditions, e.g., Bracken growing in the open (near London) became quite black, while under an oak tree it remained green. Solanum nigrum varied considerably in the extent to which individuals suffered, the pernicious weed, Galinsoga parvifolia, originally from Peru, now too common in market gardens in Surrey and Middlesex, was blackened by four degrees or five degrees of frost, while Chrysanthemum frutescens from the Canaries was uninjured. While Datura stramonium was killed, its fruits were uninjured, and it persists as a weed in this country partly on this account, but also because the seeds from any particular pod do not all germinate in the same season.

Plant Distribution.—A fact of peculiar interest in connection with plant distribution is, observes "Nature," presented by Dr. Engler in the discovery of an African plant referred to the family Triuridaceæ. The plants of this family are saprophytes of such a reduced nature that there is some doubt whether they are correctly classed with monocotyledons. Several species, under two genera, have been discovered in tropical America and tropical Asia; also a new species from the Seychelles Islands was described by Mr. Botting Hemsley in 1907. The latest species was collected in West Africa, in the Cameroons, so that the genus Sciaphila is now recorded from three continents. It is quite unlikely that the seeds of a plant which is a saprophytic inhabitant of virgin forest should be transported by water, and the problem of its existence in these distant isolated localities is exceedingly puzzling. An anatomical examination of the stem showed a reduced structure not inconsistent with a monocotyledonous position.

Magnolia Delavayi is, unfortunately, not quite hardy in the open, even at Kew, although it does well against a wall. It is an evergreen species, and has big creamy-white flowers, and is the subject of a double-page illustration in the November issue of the "Botanical Magazine." Other plants figured in the same issue are Pieris formosa, a fine evergreen flowering shrub, that does well in the West of England; Cotoneaster moupinensis floribunda, a hardy, scarlet-berried shrub; Cephalotaxus drupacea, a not very common yew-like conifer; and Kitchingia uniflora, a sedum-like plant, with inflated tubular red flowers borne singly at the ends of the growths.

Formation of Chlorophyll.—According to the researches of Mr. B. L. Issatchenko, a low temperature (24 deg. Fahr.) does not prevent the development of chlorophyll in plants, and it is formed as rapidly in a low temperature as a high one, the formation of chlorophyll depending wholly upon the intensity and duration of light.

Horticultural Congress at Brussels.—We would again draw our readers' attention to the International Horticultural Congress to be held at Brussels in 1910, in connection with the spring flower show. The Congress will occupy four days, i.e., from April 30 to May 3. The subscription to the Congress is five francs, and the office of the secretariat is 28, Rue St. Catherine, Brussels.

FUCHSIAS.

The recent article in The Gardeners' Magazine, page 787, on these beautiful flowering plants is exceedingly interesting to one like myself, for I have devoted a good deal of attention to the subject, and some varieties of my raising may now be regarded as popular ones.

I have tried to intercross several of the species with each other, or with some of the garden forms, and must confess that the failures have far outnumbered the successes. The fact that the berries reach their full size and ripen thoroughly must not be taken as always indicating that they will contain good seed, for many individuals are very disappointing in this respect. One particular variety from which I have been very anxious to obtain seed for years disappoints me annually, for each season there is a full crop of berries, but they never contain a single good seed. With regard to the best mode of extracting the perfect seeds from the pulp, I do not favour the plan advocated on page 787, but much prefer the system followed by Mr. George Fry, and detailed by him in a paper read at a meeting of the Royal Horticultural Society on August 9, 1892. It is to simply smash the ripe berry on the palm of the hand and pick out the perfect seeds on the point of a penknife. In practice it will be found an easy matter to select the good seeds, which are often limited to two or three in a pod, while occasionally there are a considerable number of them. A superior variety that can be depended upon for seeding purposes is of considerable value to the hybridist.

Concerning an erect-flowered fuchsia referred to in the above-mentioned article, I may point out there is one by no means new in which the flowers are nearly erect. It is, I believe, of Continental origin, and is still catalogued by Messrs. H. Cannell and Sons, of Swanley, under the name of Fuchsia erecta Novelty. This variety has white sepals and petals, and a deep rose corolla. From its habit it is certainly very distinct, but to my mind at least is far less pleasing than those whose flowers droop in the ordinary way.

A great favourite of mine is that exceedingly distinct, white-flowered variety Countess of Aberdeen, which was put into commerce about twenty years ago. The flowers of this are semi-erect, and though I know nothing of its early history, except that it was distributed by Messrs. Cocker, of Aberdeen, it would not surprise me to learn that Countess of Aberdeen originated either as a sport or a seedling from the above-mentioned F. erecta Novelty.

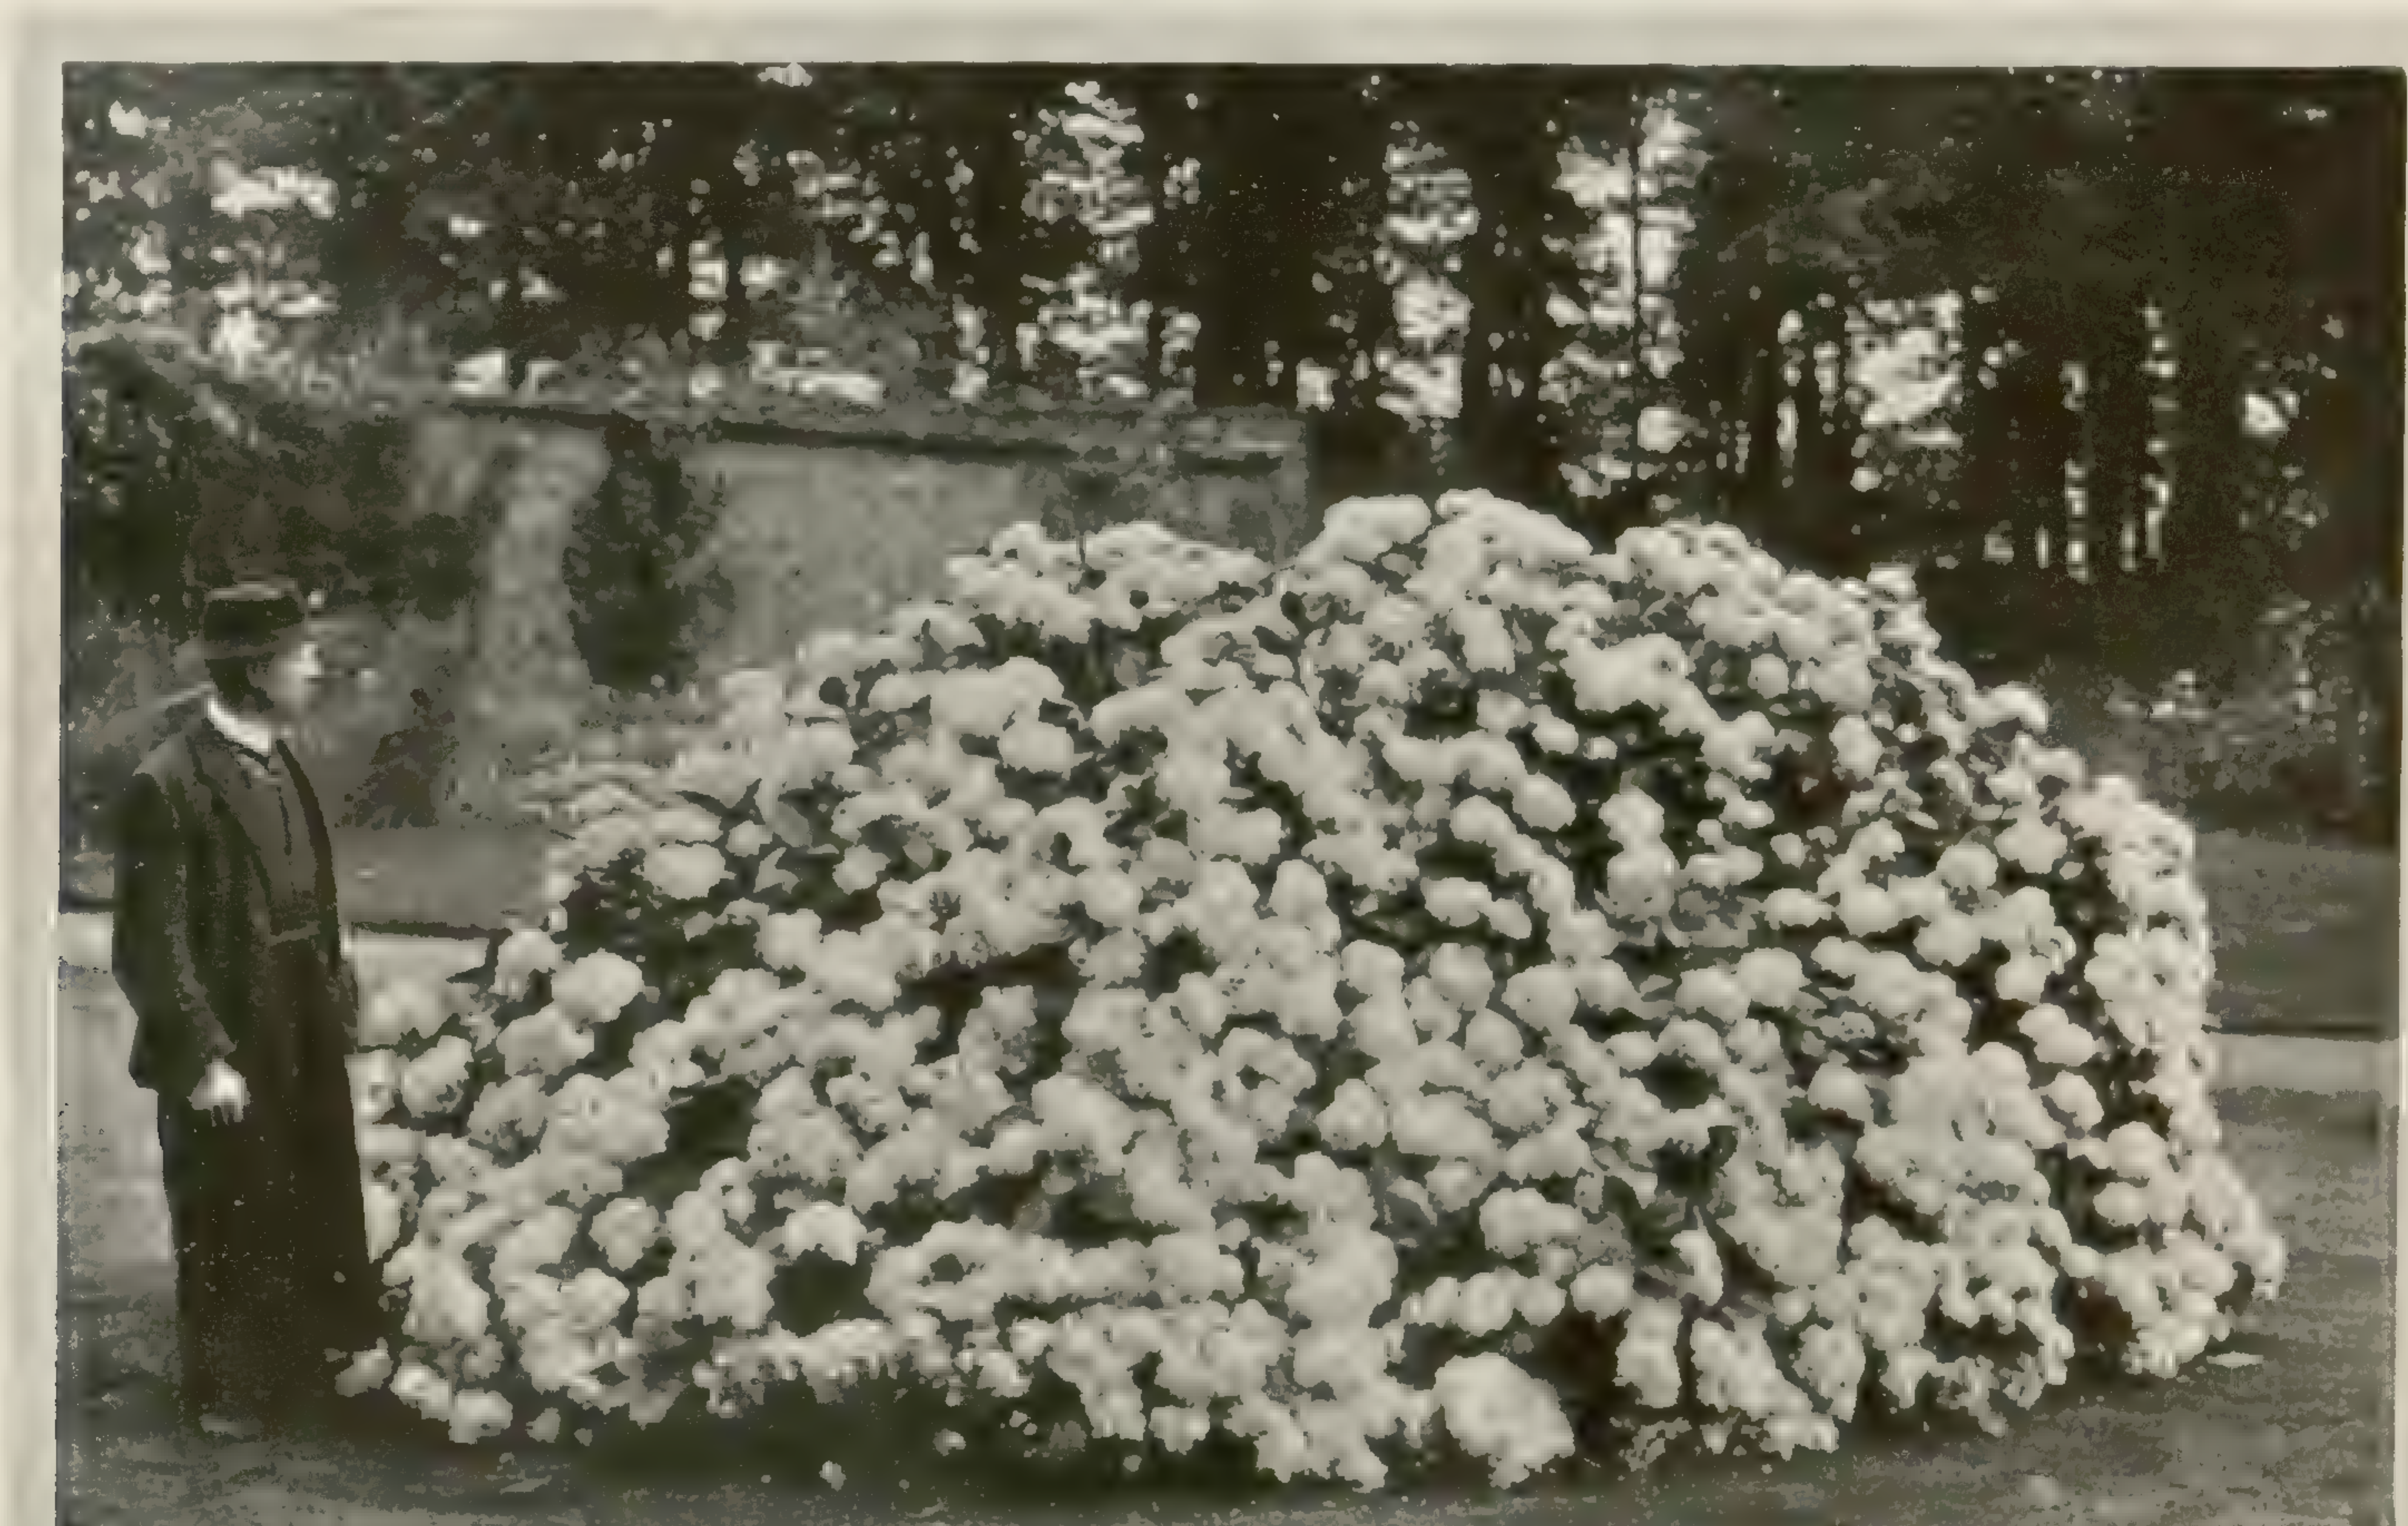
I have many times tried, but up to the present without success, to obtain good seed from Countess of Aberdeen, either fertilised with its own pollen, or with the pollen of other forms. By fertilising some flowers with pollen from a light-coloured variety I obtained some large berries, which eventually ripened, but not a single perfect seed could I find. The fruits of this variety even when ripe remain green, while most of the varieties change to a purple hue. As a rule, however, those forms in which the tube and sepals are white produce berries that are greenish or yellowish green when ripe.

There are two or three raisers in France, notably M. Lemoine of Nancy, who send out regularly a few new varieties, some of which are quite distinct in their colouring or other features from those in general cultivation. The most decided "break away" among fuchsias sent out within the last few years are the varieties raised in Germany. One of these—Coralle, was given an Award of Merit by the Royal Horticultural Society about two years ago. These German varieties are, I should say, hybrids between Fuchsia triphylla, F. fulgens, and F. corymbiflora. They formed quite a notable portion of Messrs. Cannell's exhibit at the last Temple Show. The best of them are—Clio, rosy red; Coralle, coral-red; Eros, deep pink; Gartenmeister Bonstedt, orange-red; Perle, silvery rose; Thalia, rosy coral; and Traudchen Bonstedt, pink tube and sepals, and orange corolla.

K.

A NOBLE HYDRANGEA.

In the western and southern counties there are, here and there, to be found some wonderful examples of that fine old flowering shrub, Hydrangea Hortensia. In some cases these develop a beautiful shade of blue in their flowers, and they are then even more striking than the pink and rosy forms. Many would give a good deal to be able to secure blue flowers on their hydrangeas, and doubtless many have tried various methods for securing a fulfilment of their wishes, mostly with unsatisfactory results. In some soils and positions the blue colouring comes naturally, but under different circumstances the same plant would lose its novel colouring in a short time. At Dyffryn, Neath, South Wales, the seat of J. E. Moore Gwyn, Esq., J.P., D.L., there is a fine specimen hydrangea on the spacious lawn, and it recently bore no fewer than 1,740 heads of bloom, all of a pleasing shade of blue, and this specimen we are able to illustrate in the present issue, by the kindness of Mr. H. T. Bradley, the able gardener at Dyffryn.



A NOBLE SPECIMEN OF HYDRANGEA

Growing in the Gardens at Dyffryn, Neath, South Wales, and bearing 1,740 heads of bloom.

Epiphyllums.—These are among the most novel of winter-flowering greenhouse plants, their curious form and brilliant colour always attracting attention, while their value in a mixed group of plants at this season is not easily over-estimated. Grown as standards, the flowers are most conspicuously displayed, the leaf-like stems assuming a pendulous habit and surrounding the main stem, and when the branches are terminated by the brightly-coloured flowers, they constitute the perfection of symmetry and grace, so that one can scarcely conceive a more effective or more generally useful subject for the winter months. The various forms of E. truncatum exhibit considerable variety of colouring, scarlet, orange, salmon, rose, and white appearing in varying combinations. Their cultural requirements are of the simplest character, so that amateurs whose glasshouse facilities are of a limited character will find them of inestimable value.—Thomas Smith.

CONIFER FRUITS.

It has seldom happened that a more abundant crop of cones has been produced by conifers than that which occurs during the present year. While most kinds have fruited well, various species of abies have borne a prodigious crop, and the trees have been effective for a long period.

When extolling the merits of various ornamental fruited trees, the conifers are usually left out, though they might well be included, for the cones of some are of decorative value, not only for a few weeks during autumn, but from the time they first make their appearance, while those sorts which do not bear cones have also their interesting points. When examining a full collection of conifers and studying the cones of each group separately, a great difference is found both in size and shape, and even in a genus a great deal of variation is noticeable.

In point of size, pride of place has to be given to the Chili Pine, Araucaria imbricata, amongst hardy conifers, for well developed examples of the cones of this are seven or eight inches long, and almost as far through, nearly round, curiously covered with stiff scale appendages, and borne upright on the branches. They take two years to mature, and, though male and female inflorescences are sometimes found on the same tree, it more frequently happens that trees are diœcious. Following close behind the araucaria comes the Californian Pinus Coulteri. This has remarkable woody cones, nine inches or so long, covered with stout, woody, claw-like spines, which terminate the scales. They are often six inches through at the base. A tree somewhat similar in appearance which has also large cones is P. Sabiniana. P. ponderosa and P. Jeffreyi have smaller cones, six or seven inches long and about three inches through at the base, they are not woody like the former, and the scales separate as the cones ripen. The Cluster Pine (Pinus Pinaster) is remarkable for the manner in which the cones are often borne in large clusters which surround the branches. The cones are light brown, five to six inches long and very handsome. They are very hard and sometimes hang on the trees for several years. This habit of bearing cones in clusters is not confined to the one species, for it is frequently noticed in Pinus Thunbergi, P. insignis, P. parviflora, and others. Upwards of sixty cones have been counted in a single cluster of P. Thunbergi.

In the case of P. insignis the cones are very conspicuous, being three to four inches or sometimes more in length, and three inches through, one side being always a great deal more fully developed than the other, causing the cone to have a lop-sided appearance. The Stone Pine, Pinus Pinea, is remarkable for its large solid cones with thick scales. The cones are about four to five inches long and three to four inches through. They are very hard and rarely open without being subjected to heat. P. tuberculata and P. muricata retain their cones for a very long period, and cones may be found on trees which were matured thirty or forty years ago, with cones of all ages, to those borne this year. The group of pines represented by P. strobus, the Weymouth Pine, contains some conspicuous trees. P. excelsa bears drooping cones six or seven inches long and two inches through, plentifully clothed with resin. P. ayacahuite has long cones nine or ten inches in length, and two and a-half to three inches through, whilst P. Lambertiana has still longer cones. These are a few of the most noticeable.

The abies or firs bear their cones upright on the branches. Many of them are of a lovely violet hue when quite young, and the colour is retained until well on towards the end of summer. The finest cones are borne by A. nobilis and A. magnifica. These are six to eight inches long and two to three inches through, and are very imposing when seen in quantity about the summit of a tree. As a contrast to these come the small purple cones of A. balsamea, which are frequently but two inches long. Abies religiosa, though of little value for general use, bears very pretty cones with hooked scales. The tree, however, is only met with in the warmer parts of the country. A. Webbiana produces very distinct cones, whilst those of A. bractyphylla, A. Pinsapo, A. grandis, A. pectinata, and A. Nordmanniana, are all handsome. The cones of A. bracteata are also very distinct.

The spruces or piceas can be distinguished from the abies or firs by their pendulous cones. Conspicuous amongst them are P. morinda and P. excelsa, both with cones five to six inches long, P. nigra with tiny cones scarcely an inch long, and P. Menziesii with cones about three inches long.

The Tsugas or Hemlock Spruces all have small cones, whilst the Douglas Fir, Pseudotsuga Douglasii, bears pendulous cones three to five inches long.

Something special might be expected from the Mammoth-tree of California (Sequoia gigantea), but the cones are comparatively insignificant in size, being but one and a-half and two and a-half inches long by about one and a-half inches in diameter, while its relative, S. sempervirens has somewhat smaller cones.

The Umbrella Pine (Sciadopitys verticillata) bears cylindrical cones three to four inches long and two and a-half inches in diameter, which take two years to mature. The various species of athrotaxis bear tiny cones and the small globular fruits of the junipers are hardly worth consideration. The cypresses have rounded cones, those of Cupressus Lawsoniana, C. pisifera, C. thyoides, and C. nootkatensis being small, while such sorts as C. sempervirens and C. macrocarpa have rounded cones one to one and a half inches in diameter. The thuyas differ from the cypresses by having longer cones, which are usually rather narrow compared with their length, while the cryptomerias have rounded cones. The fruit of the Maidenhair Tree (Ginkgo biloba) differs greatly from that of other conifers. It very much resembles a small plum and is yellow when ripe, and one-half to three-quarters of an inch in diameter. Some considerable difference is noticeable in the cones of the larches, the most conspicuous being the rare Larix Griffithii, which has cones three inches long, the scales of which are curiously hooked. During development the colour is bright violet.

The fruit of the yew is well known by reason of the bright red fleshy covering which surrounds the seed, the red colour giving place to yellow in some of the varieties. The cephalotaxus and torreyas produce nut-like seeds covered by green shells, the seeds being in some instances upward of an inch long. Though these do not exhaust the interesting trees and shrubs to be found in coniferæ, they are sufficient to direct the attention of those who have not paid them special attention hitherto.

Kew. W. Dallimore.

Roses may be grown to perfection by following the instructions given in Roses and their Cultivation, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

CHRISTMAS ROSES.

Well-grown clumps of Christmas roses are generally welcome at the festive season, in fact I have myself been specially charged to have them in flower for Christmas Day, and probably other cultivators have had to furnish a supply for the same date. In most gardens these hellebores are in demand, and good blooms when the chrysanthemums are past their best, make a change from the ordinary forced bulbs.

The hellebores are impatient of much forcing, and therefore to lift the clumps with the object of quickly getting them into flower is not altogether wise: I do not say such treatment would end in failure, but it weakens the plants, and soon causes the stock to deteriorate. Placing the plants in gentle heat to obtain blooms by a certain date is helpful, but the forcing must be gentle or the flowers will not open kindly.

The better way of persuading those plants to expand their flowers is to grow them in a good position where the protection of a light can be given in good time. This will advance the buds gently, and as these expand such protection not only keeps away the frost, but also preserves the purity of the blooms. Different growers have different ideas respecting the cultivation of Helleborus niger, especially as to the position or aspect in which the plants should be grown, and many have the notion that they require a shaded or half-shaded position. For lengthening the season of flowering they may be grown in two or three aspects. I have grown them facing east, south, and west, and in such positions, at the base of a wall or the front of forcing houses, they can easily be protected from the weather, and will flower in succession if well arranged.

To thoroughly ripen the crowns and give the plants a partial rest I prefer the south and west aspects, and in such positions, if the plants are undisturbed for several years, quantities of flowers can be gathered. In such places as here described the plants would require several waterings during the growing period.

The finest clumps of Christmas roses I have had the pleasure of seeing this season are in the gardens at Newells, Horsham, the residence of W. S. Graves, Esq. These are growing in a small border in front of a lean-to house, and facing due south. Mr. Haldane, the gardener, informed me they had been planted four years, and had received an annual dressing of manure and leaves, while during the summer an occasional watering has been given when required. These clumps have leaves of leathery texture, and exceedingly healthy appearance, while the crowns are bristling with an abundance of flower buds. Later in the autumn small sashes are placed over the plants for their protection, and a large harvest of flowers is gathered. These clumps of hellebores are a fine object lesson of what a position facing due south will do in developing good plants, and in supplying abundance of blooms.

T. H. Slade.

Pyramidal and Bush Fruit Trees are well adapted for planting in the borders of the vegetable garden, while the narrower borders may be utilised by planting espaliers or oblique cordons, the latter for preference, as these young trees come into use sooner than the espaliers. A greater number of varieties can also be grown on the same length of border, and should any vacancy occur, these can be more easily filled up by the cordons than espaliers.—G. Woodgate.

NEW PLANTS, ETC.

◆

NEPHROLEPIS EXALTATA MARSHALLI.

Notwithstanding the fact that very many beautiful varieties of Nephrolepis exaltata are now in commerce, it must be conceded that the newcomer, N. Marshalli, is the most beautiful of them all. Whether it becomes as popular for market as some of its predecessors remains to be seen; but it is certain of wide popularity in private gardens. N. Marshalli is a sport from N. exaltata Amerpohli, and its wide fronds are very finely divided and plumed, so that each frond looks like a graceful piece of the most exquisite moss. F.C.C., R.H.S., November 9. Messrs. H. B. May and Sons, Edmonton.

BEGONIA THE GEM.

This very beautiful winter-flowering hybrid should do much to further the popularity of the Veitchian begonias. It is of fine habit, as the illustration on p. 881 has shown, but the colour of the flowers, brilliant carmine, is so rich, that the effect is almost that of scarlet. The plants bloom very freely, and as the flowers are semi-double, they last a considerable time in good condition. B. Socotrana, and a semi-double, rose-coloured tuberous variety, were the parents of The Gem. A.M., R.H.S., November 9. Messrs. Jas. Veitch and Sons, Chelsea.

CHRYSANTHEMUM LINGWOOD'S PRIDE.

A very effective single chrysanthemum, of large size, and with soft pink florets surrounding a golden centre. The variety was raised by Mr. G. Rigden, Englefield Green. A.M., R.H.S., November 9. Messrs. J. Peed and Son, West Norwood.

LÆLIO-CATTLEYA CORUNNA WESTONBIRT VAR.

Beyond the fact that Lælio-cattleya Ingrami was the seed parent, the origin of L.-c. Corunna is unknown, but probably Cattleya Hardyana was the other parent. The flowers are of good size, with bright rose-purple sepals and petals, and a rich crimson-purple lip, veined with gold. A.M., R.H.S., November 9. Lieut.-Colonel Holford (grower Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

LÆLIO-CATTLEYA BARONESS SCHRODER, VAR. MDME. HENRIETTE.

This handsome hybrid between Lælia Jongheana and Cattleya labiata gives ample evidence that fine varieties of the parents were used in its production. The rosy-purple sepals and petals are veined and shaded with deeper purple, and the lip is yellow with a crimson purple apex. A.M., R.H.S., November 9. M. le Comte Joseph de Hemptinne, St. Denis Westrem, Ghent.

EXOSTEMMA SUBCORDATA.

This West Indian shrub is closely allied to the cinchonas, and is said to thrive under the treatment usually accorded ixoras. It grows about a yard high under cultivation, and produces a terminal corymbose inflorescence composed of white fragrant flowers. The flowers are tubular, with five recurving slender lobes, and prominent exserted stamens. Bot. Mag., t. 8,274.

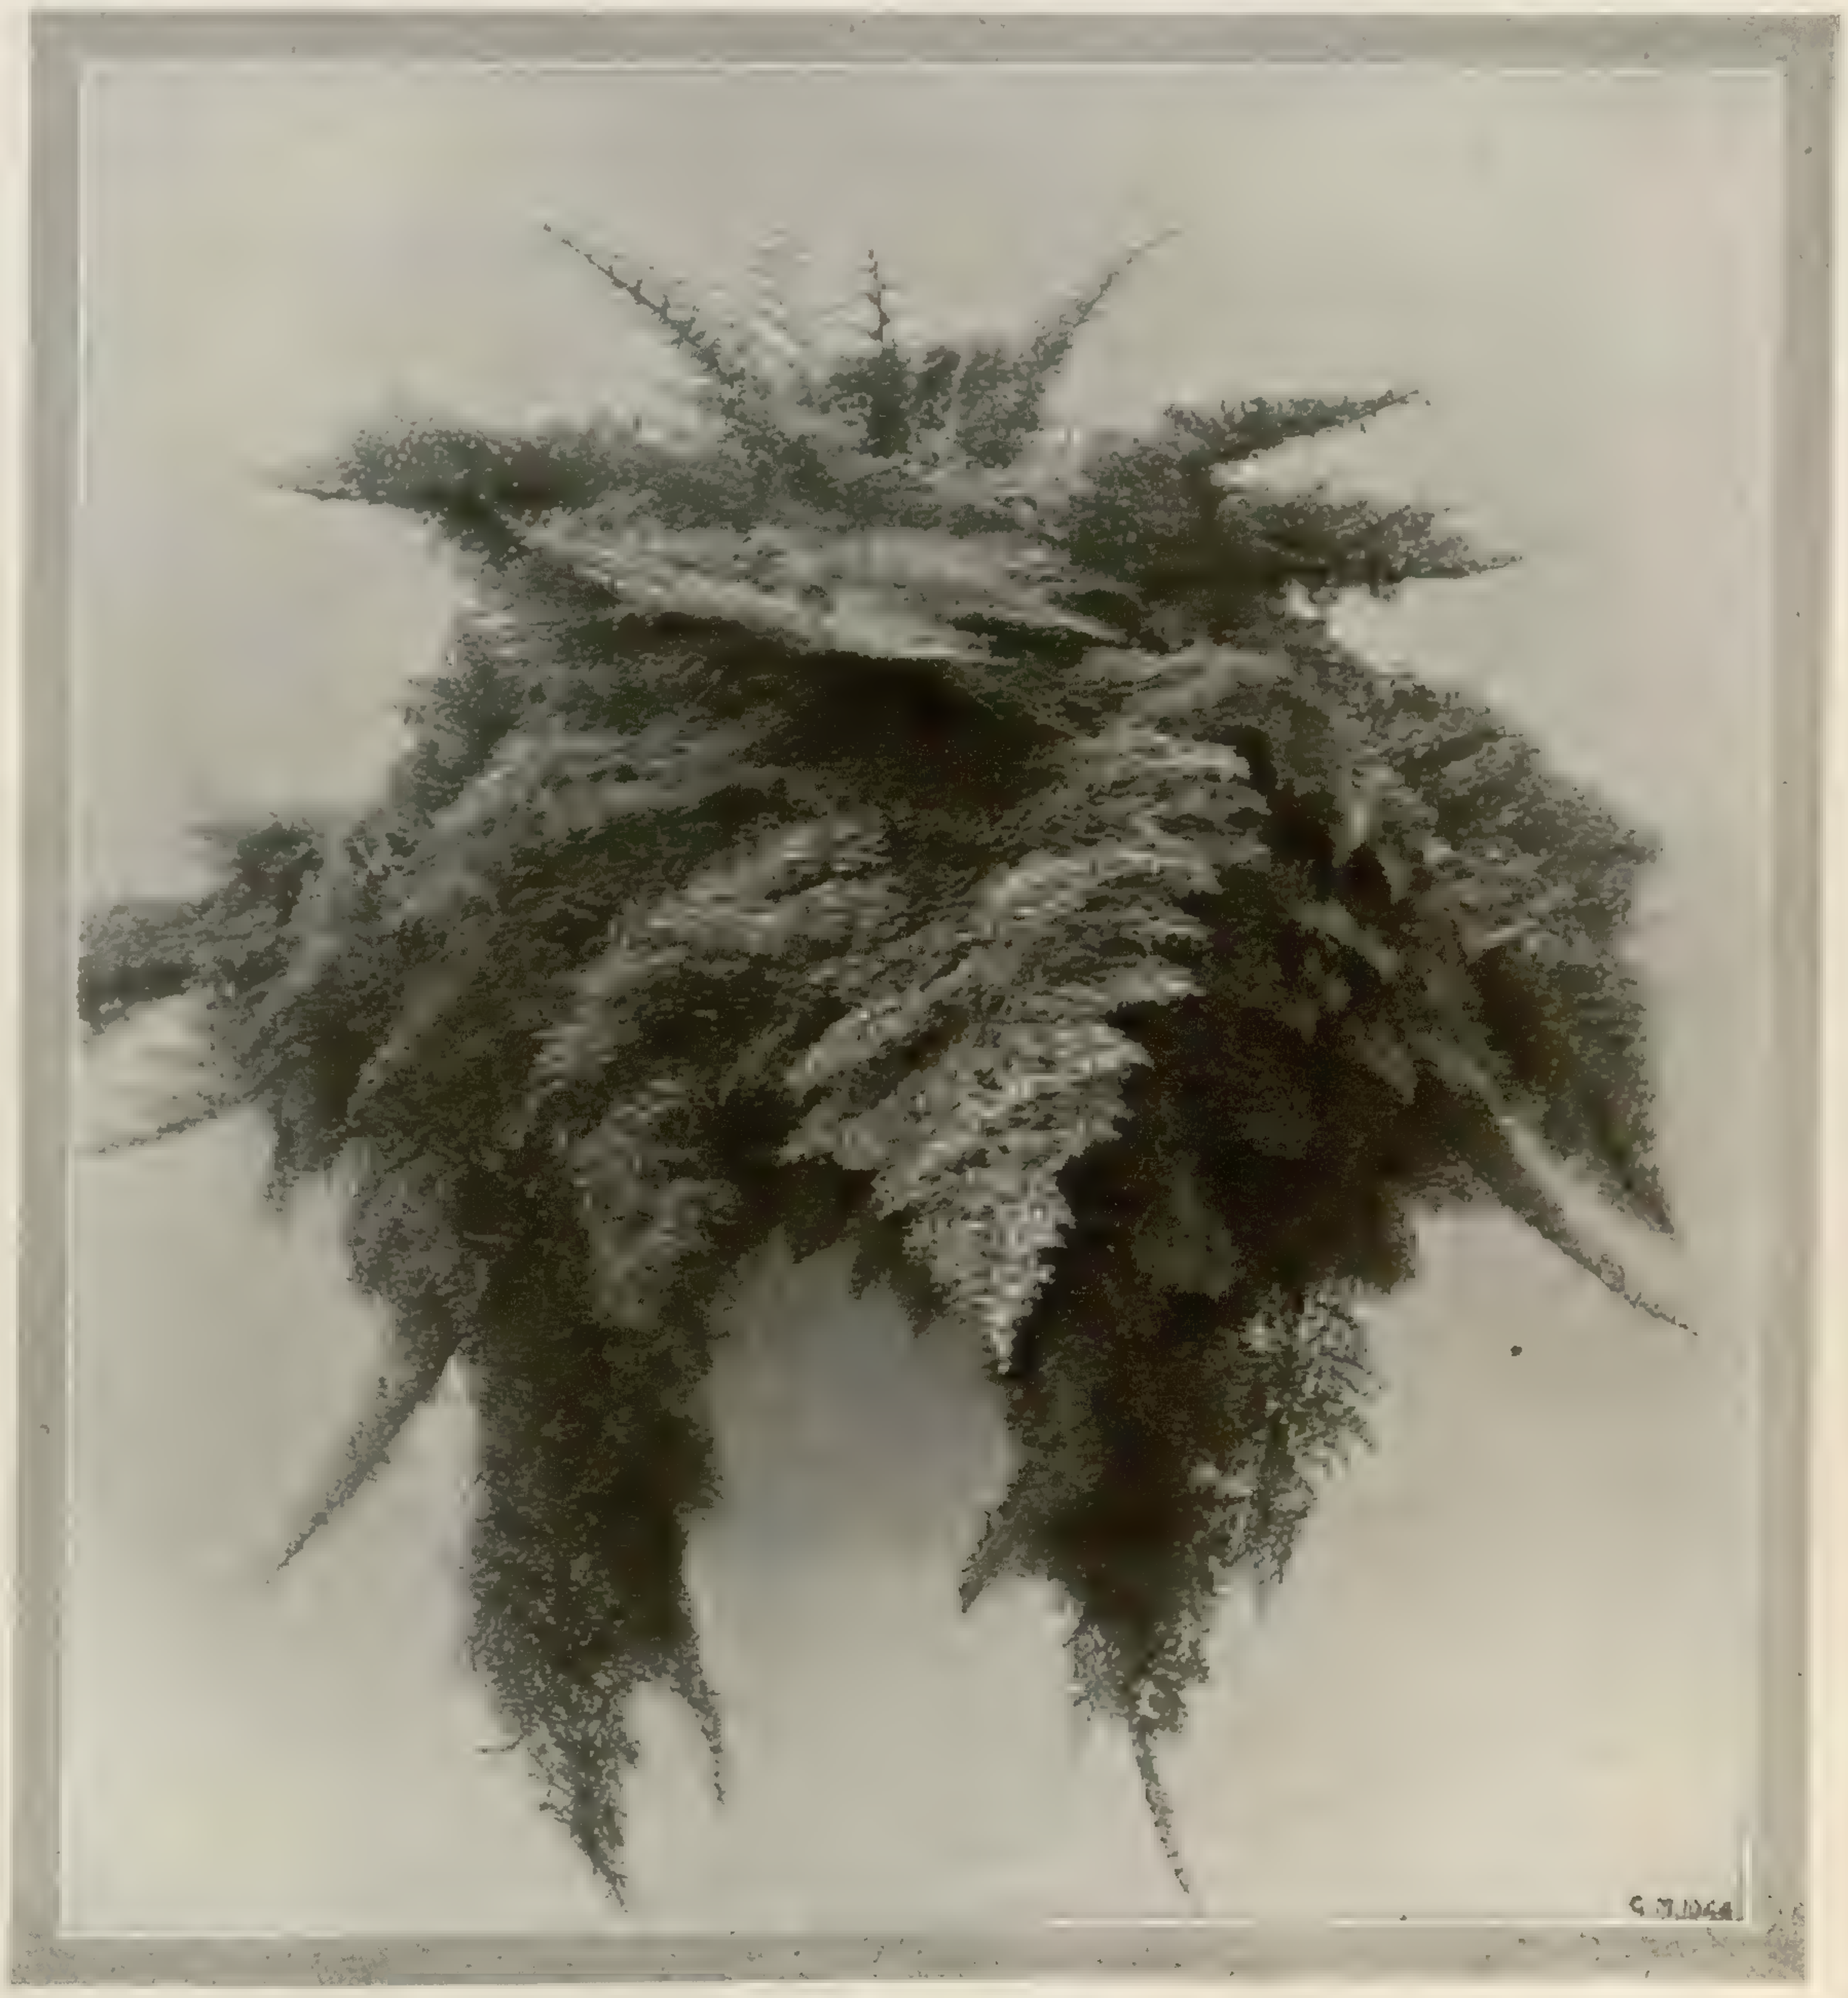
Peach, Nectarine, and Plum Trees are prone to throw up suckers from their roots, therefore when planting these see that every appearance of these young suckers is pruned off close to the roots. A little carefulness in this matter now will prevent a lot of trouble later on. Do not plant too deeply, especially on cold, wet land, but keep the roots well up to the surface, and mound the soil over them. The roots will be certain to penetrate quite deep enough. In all cases plant the trees and bushes in their new positions firmly, so that the roots may be brought into close contact with the soil at once.—G. Woodgate, Rolleston Hall Gardens.

WINTER CHERRIES.

Everyone knows these two forms of the Winter Cherry—P. Alkekengi, with its small and rounded, inflated calyces; and P. Franchetti, with its larger, ribbed, and pointed form, three to four inches long, both alike of a brilliant orange-scarlet when at their best. The latter is generally considered a great improvement upon the former, but I am conservative enough to regard the older form as more beautiful in the shape of its calyces and more graceful in the manner of its growth. They require a sunny border for the greatest production of well-coloured balloons, especially in an autumn which is not very sunny, but they will grow and thrive in the shade, especially the older form. Any ordinary soil suits them, but they do best in a soil which is light and warm. Though P. Franchetti is of much more vigorous growth than the other form, attaining a height in favourable circumstances of two to three feet, it does not spread underground so much as P. Alkekengi, which consequently should not be planted near choice fruit trees or shrubs, as it is little better than bindweed in a favourable soil in this respect.

The gathering of the stems, with their attached balloons, needs care if they are to look well afterwards, the slightest pressure being sufficient to make an indentation in the calyx, which cannot be removed. If they are left till late in the year, when the leaves have fallen, the calyces will become skeletonised, showing the berries, or cherries, as they are called, inside; and though in this state they are interesting, they are not so effective for indoor decoration as when the calyces retain their brilliancy of colouring. Some recommend cutting off the stems close to the ground as soon as a sufficient number of calyces are coloured, putting the cut ends in vessels of water, and standing them in a dark place till the leaves have fallen off. I think a better way is to cut them carefully, and hang them up in twos or threes head downwards till the stems are dry and stiff, when they will retain their rigidity, and may be arranged for the winter. A pretty combination may be made with this and the old-fashioned Honesty, and other arrangements will occur to everyone. They will last the whole winter, though they need a little careful dusting to keep them bright.

It is often said that the berries make a good preserve, but I cannot imagine any housewife sacrificing such a number of the scarlet lanterns as would be necessary to carry it out. These quaint plants are suggestive of China and Japan, from which countries they are said to have come, though the later form is a native of the Caucasus. P. C.



NEPHROLEPIS EXALTATA MARSHALLI.
A.M., R.H.S., November 9. Messrs. H. B. May and Sons.

Armeria Laucheana.—Of all the varieties of dwarf thrifts, or sea pinks, this is one of the brightest coloured, and, withal, one of the best in every way. It makes a close tuft of fresh green leaves, and gives on this quite a large number of dainty heads of bloom, which come as near crimson as we can find in the thrifts. It is only a few inches high, grows freely, and is multiplied by division. It will not come altogether true from seeds, even when grown apart from others. A. Laucheana makes splendid edgings, fine tufts for the rockery, or pretty plants for the front of the border. — S. Arnott.

SCABIOUS.

The annual or biennial varieties of this favourite old-fashioned flower, with its honeyed scent, belong to the species Scabiosa atropurpurea, a native of Southern Europe, and therefore as we might expect, they are not always hardy in cold, damp situations, though they will grow in any soil. They may be treated as annuals, for, if sown early in the spring, they flower in the latter part of the summer, but finer plants are obtained by treating them as biennials, when they should be sown in June or early in July, either on a reserve border and thinned out to six or eight inches apart, or in pans and dibbled out at a similar distance apart. The handsomest plants are obtained when they are allowed to bloom where they are sown, but they can very well be transplanted into their flowering positions not too late in the autumn. They will stand a fair amount of frost, but a wet winter is often more destructive to them than a frosty one. Plants which stand the winter will be in flower by the end of June, and if the dead blooms are regularly picked off they will continue in flower during July and August.

These varieties of scabious are very useful for cutting, as they can generally be obtained with good long stalks, and, though they have a tendency sometimes to droop, this may be reduced to a minimum by cutting them early in the morning and putting them in water at once, preferably warm water. For the purpose of cutting, a bed of them in the reserve or kitchen garden is very useful, and whether grown in this way or in the mixed beds and borders, the best effect is obtained by growing together those of fine colour only, seed of differently coloured varieties now being sold separately by all nurserymen. A better effect, too, for indoor decoration, is produced by the use of one colour, or, at most, two colours together.

Among the best varieties are those of rosy red shades, yellow, and white, those with shades of lilac and purple in their colouring not being so pleasing in effect. The old-fashioned deep crimson Pincushion flower, too, one has a sort of sentimental regard for, and it is decidedly pretty, and very sweet-scented. It is sometimes recommended to pot up the plants when small, say, in July or early in August, and grow them on in a cold frame, when they make good flowering plants in the greenhouse the latter part of the winter or early spring. Keepers of bees will find a bed of these scabious a great attraction.

A word or two must be said about the Caucasian scabious (S. caucasica), which is undoubtedly the handsomest of all the scabious family. It is a true perennial, but is difficult to establish on cold wet soils, where, even if slugs leave it alone, it seldom survives any but a very favourable winter. On light warm soils, on the other hand, it forms large clumps which produce great quantities of beautiful lilac-blue flowers right through the summer and into the autumn. It grows two to three feet in height, and the flowers are often three to four inches in diameter. There is also a white variety, which, though beautiful, is scarcely equal to the species, as there are so few flowers of its colour. It can be propagated by division where it does well, though it takes some little time to become established. Seedlings raised in a frame in the spring and planted out on a nursery bed of light, rich soil, will make nice flowering plants for the following year, and they can be put in their flowering positions in the autumn. If seed is sown in heat in February the resulting plants may be had in flower the same season. This is certainly one of the best flowers for cutting in August, a season when flowers for cutting are not too abundant. This and the primrose-coloured variety of S. atropurpurea make a very beautiful combination.

ALGER PETTS.

PLUM ENEMIES.

(Concluded from page 844.)

◆

The Brown Rot of Plums.

One would have thought that, with Botrytis cineria in the strawberries and apple and pear scab on those fruits, the fruit grower's trials from fungoid diseases would be for a time, at least, ended. Alas, another dread plague has appeared on the scene, aided by the weather conditions, which latter, to the ordinary individual, may appear much maligned, though in reality the damage resulting therefrom can hardly be overestimated.

The cold spell of June and July set the skin of the plums; then we had the heat of the first fortnight in August, followed by the rain of the last week in that month, and, as a result, the plums split in all directions. Into these cracks there entered a spore, or, it may be, spores of the Monilia fungus, which very quickly rotted the fruit, showing its presence outwardly by curious brownish tufts all over the outside, which, under a microscope, are seen to consist of dense masses of chains of spores, branching in all directions.

This fungus is common to most of our fruits, apples, pears, peaches, and apricots being all affected, though it takes somewhat different forms in various cases. In apples and pears the tufts of spores are produced on the surface of the fruit in curious irregular, concentric circles having a very striking appearance. If the affected plum forms one of a bunch of fruits touching each other, the mycelium of the fungus often passes from one to the other till the whole bunch is diseased.

As there are countless millions of spores on each diseased plum, it is apparent that with bad weather delaying the ripening of the crop, and continually splitting the plums, the situation becomes very serious indeed. Not only so, but the spores are able to live over the winter and commence infestation anew the following spring in a variety of ways.

If the plum is attacked in the growing stage when it is small, less than half grown, the tendency of the fungus after it has completely filled the fruit with its threads of mycelium, is to shrivel and mummify the fruit, which remains firmly fixed to the tree.

In this condition it remains over the winter, when, with the approach of spring the spores are released and distributed all over the tree. Some fall on the opening blossoms, there to germinate and kill the flowers, producing a brown, withered appearance as if the injury had been caused by frost, the mycelium afterwards passing down the stalk to twig and shoot, killing them.

All this is often seen in the spring in some varieties of plums and particularly in Morello cherries, where these withered shoots can often be seen dotted all over the trees. In the spring of 1907 this form of the disease was very bad on one variety of plums with us, but in 1908 it was not so bad, and in this year, 1909, the attack is less still, though nothing has been done to combat the disease.

The only remedy at all suggested or proposed to me, was to send a man with a ladder to cut off all these shrivelled tips. As these trees were something like twenty feet high and ten to fifteen feet through them, and there were something like five acres of them, coupled with the fact that I estimated a man might, perhaps, do twenty trees a day, I abandoned the attempt, failing the gratuitous assistance of a regiment of soldiers.

When the fruit attacked has attained anything like full size, the fungus, taking possession of it, seems to rot it, so that the fruit falls away from the stalk on to the ground. There it decays and the spores are released to remain in the ground over the winter to form another fruitful source of infection in the following spring and summer. Yet another possible manner in which infection is carried on is by means of spores which fall on the shoots and branches of the tree and pass the winter in the lichen and moss by which they are covered. There is, therefore, a terrible danger of this disease reproducing itself by the mummified fruits, by the hibernating mycelium in the shoots, by dormant spores in the ground, and by spores which pass the winter on the tree.

In the first place, all these shrivelled fruits must be removed, put in a pail, and burnt with as little disturbance as possible. Secondly, wherever it is possible, without costing too much, as in the case of wall trees and bush plums and cherries, the withered shoots should be removed, preferably while the leaves are on the trees and affected shoots can be more easily seen and burnt. Thirdly, the ground round trees, from which such fruits have fallen, should receive a good soaking of a solution of sulphate of iron, which may be prepared as recommended by the Board of Agriculture in their leaflet (86) on the subject, namely, to place 25 pounds of sulphate of iron in a barrel, pour one pint of sulphuric acid on it, and add 50 gallons of water by degrees. Fourthly, the trees should in winter receive a good spraying with a simple solution of copper sulphate at the rate of four pounds to 100 gallons of water, care being taken to thoroughly wet every portion of the twigs, boughs, and branches as well as the trunk of the tree.

There is no doubt that this disease, like most others, is very prevalent and also very virulent this year, and it therefore behoves all who have it at all badly to take active measures in order that the attack during next season may not be worse.

I have heard of one grower in Kent who has 10 per cent. of his plums affected; considering the millions of spores produced on each plum, the outlook for next year for this man, unless he does something to combat the disease, is most serious indeed. I sincerely trust that he will awake to the danger, and take some active steps before it is too late.

There is no doubt in my mind that the excessive damage produced this year is due to some extent to the fact that the skins of the plums have cracked, so giving entrance to the spores. In company with a friend, I examined many bunches of fruit, and in every instance a cracked plum proved to be the starting-point in the bunch of decay.

FRED W. HAMMOND.

Pilgrim's Hatch.

Horse Radish.—A quantity of strong, straight roots may be lifted from the bed, and laid in moist soil or ashes for future use. This will do away with the necessity of searching for it when the ground is unfit to work. The roots will keep quite well for a considerable time in a plump condition.—CHARLES FLACK.

HERBACEOUS SPIRÆAS FOR FORCING.

The plant known popularly as Spiræa japonica has for many years been largely grown for forcing purposes, and, in fact, it is still cultivated to a greater extent than any other. Fine clumps that will flower well may at this season be purchased at a very cheap rate, and few plants can be depended upon to give such an amount of blossom for such a moderate outlay. Still, S. japonica is not the only spiræa of this section that is available for forcing purposes, as several other forms have come prominently to the front within recent years. Most of these are of a larger and bolder habit of growth than the older kind, a feature, no doubt, derived from Spiræa astilboides, a species introduced from Japan by the late Mr. William Bull, of Chelsea, and distributed by him about twenty-five years ago. This is altogether a bolder plant than S. japonica, both the leaves and leaflets being larger and rougher in texture, while the young foliage is tinged with brown. The flower spikes are taller, and dispose themselves in a more informal manner, while the flowers are of a somewhat creamy tint.

Half-a-dozen years or so after the distribution of S. astilboides a variety of Continental origin was put into commerce under the name of S. astilboides floribunda. It was supposed to be an accidental hybrid between the two species above-named, and this was borne out by its general appearance. This spiræa has now been popular for many years, and still remains so. Of late, however, other varieties belonging to this large, bold growing section have been freely distributed, particularly S. astilboides longifolia and Lord Salisbury, both of which can now be purchased at a price not much exceeding that of S. japonica itself. For the decoration of the greenhouse or conservatory these varieties, from their taller and bolder habit of growth, are especially valuable.

Of marked difference from the last, inasmuch as it is of a dwarfer and more compact habit than Spiræa japonica, is S. compacta multiflora. It originated, I believe, as a sport, and was given an Award of Merit in 1891. For some years it was decidedly popular, but is not, I think, now grown to the same extent as it then was. A very old variety, with golden-veined leaves, has the inflorescence almost, if not quite, identical with S. compacta multiflora, and I should say that this last is a sport from the older variegated form.

The two pink-flowered varieties—Queen Alexandra and Peach Blossom—which attracted so much attention when first exhibited, have proved to be somewhat disappointing. When forced, the blossoms are in many cases of an undecided tint, and they are seen at their best when the plants are well exposed to light and sunshine, in conjunction with a free circulation of air. Last season many of these pink-flowered spiræas were often noted as unsold in Covent Garden Market, and I saw them frequently exposed for sale on the costermongers' barrows in the streets of London during the summer. When allowed to develop entirely out of doors the pink colour of the flowers is most pronounced.

Spiræa palmata, with flattened heads of deep rose-coloured blossoms, is very effective when grown in pots for decorative purposes, but it is not amenable to hard forcing. For the embellishment of the greenhouse during the months of May and June Spiræa palmata is as valuable as it is later on out of doors.

In common with many other subjects, most of the spiræas intended for forcing are sent to this country from Holland during the month of November. It is a decided advantage to obtain them as soon as possible after their arrival, for they are frequently, when unsold, kept in warehouses or similar spots, where the atmosphere is so dry that they soon deteriorate. These spiræa clumps very quickly commence to root, for which reason they should, as soon as possible, be placed in their flowering pots. For early forcing this is absolutely necessary, but for later flowering it is also an advantage, even if the pots are, when finished, stood out of doors. W. T.

MORE ABOUT DAMSONS.

I was much interested in Mr. George Garner's article on the culture of this fruit, and while I agree with him that there is no jam superior to that from damsons when properly made, I go a step further and contend that there are few better fruits for dessert in October than a fine fully ripe Cheshire damson. Like your correspondent, I know something of the conditions under which damsons are grown in Cheshire and the adjoining counties, and I lived for some years in a certain district of Staffordshire, where in an area of some square miles, the damson flourishes like the proverbial bay tree. In a general sense this is anything but a favourable district for fruit, as the situation is bleak and the soil a cold stiff clay. Apples canker badly, and pears need a lot of coaxing, but damsons simply revel in the local conditions. Every farm almost has its damson orchard attached, and in the district there are numerous small holdings, comprising a cottage—built originally on common land—with a few acres of ground attached, enough to keep a cow. Nearly all these holdings boast of a small damson orchard, which, in favourable seasons, help materially to pay the rent. As in the county referred to by your correspondent, the hedges dividing many of the fields are studded with damson trees, but I do not think the majority of them were ever planted by human hands. They simply sprang up as seedlings or suckers, rose above the hedge, and formed themselves into low standard trees. In these districts, which are especially adapted to damson growing, the trees are propagated locally, or propagate themselves, after the manner of the Pershore plum round Evesham, and the establishment of an orchard is not a costly matter. The trees do well on grass, they get as much manure as they want from the pigs and calves which run underneath, and protection in the early life of the trees consists of a primitive bunch of thorns round the stems. I am not going to say what the results would be if the ground before planting were trenched as your correspondent suggests, but cultural operations rarely enter into the consideration of the Midland damson grower, and I know of no crop which gives a better return with so little attention.

Spring frosts and biting easterly winds when the trees are in flower or the fruit is setting are the great troubles, and, owing to these agencies the calculations of a crop are often upset. It is very doubtful whether damson growers get as much financial benefit as they should from the fruit, particularly in seasons when crops are heavy. It is the custom of farmers and small holders to pick their fruit and take it to the nearest market, if they do not dispose of it to a travelling dealer. When there is a lot of fruit in, these local markets become glutted, dealers buy pretty well at their own prices, and in some cases the return to the grower is hardly sufficient to pay picking expenses. Years ago local weights and measures were variable quantities, and I once knew an old fellow who used to buy damsons in North Staffs at so much per strike, take them to Manchester, sell them for the same price or less, and make a profit, the explanation being, of course, that there were so many pounds more in the local than in the market strike. I am aware that to some extent methods of distribution have improved somewhat in recent years, perhaps to the benefit of the grower, but it is a doubtful point, I think, whether the middleman does not get the best picking out of the damson harvest.

There can be little doubt that certain fruits are adapted by Nature to certain localities, and this accounts for damsons flourishing as they do in the counties referred to. Mr. Garner asks for information as to the way damsons thrive in the southern counties. Well, I spent some years in Kent—the favoured home of fruit culture, but I never saw any damsons that could be compared to those of the Midlands. I knew a few places that could be described as damson districts, but the fruit is small and wanting in that fleshiness which is characteristic of the Cheshire and Staffordshire damson. In Kentish fruit plantations there are many trees of the Kent Cluster or Crittenden variety, which is a heavy cropper, and the fruit is borne in clusters, but there is a good deal of stone in the damsons, and the quality is not first rate.

Of late years I have had some experience of damsons in the West of England—the home of orchards and cider apples, but nowhere in the running with Cheshire, Staffordshire, and Salop, where damsons are concerned. By way of illustration I bought some native damsons a year ago for the purpose of jam making, but I was a little bit suspicious of them at the time, as the fruits were so small. However, the jam was made, and it is in the cupboard now, because no one will eat it on account of its peculiar woody flavour. Of course, there may be better damsons in the West, but if so, I have not been fortunate enough to get hold of them.

I cannot help thinking that lessons in commercial fruit culture might be taken from this illustration of the damson given by Mr. Garner, and supported in these remarks. There are people possessed of extravagant ideas regarding the possibilities of commercial fruit culture, who, through their doctrine of "plant fruit and grow rich," have induced others with money but not much practical knowledge to plant fruit in unsuitable soils and situations, with the results that they have lost money. I do not wish to suggest that fruit growing as a commercial venture does not posses possibilities, but in choosing situations let Nature be the teacher. The plant here, plant there, plant anywhere idea is absurd, and the correct thing is to let Nature indicate the districts where certain fruits will grow, as the damson does in the counties referred to, and then cultivate the fruit and market the produce on the best known principles. G. H. H.

Standard Fruit Trees should have the necessary support fixed into the ground before planting, and all such trees should be made secure to the supports immediately the work is finished, but all fastenings should be so adjusted that while they will prevent the tree from being blown about by the wind, they will still allow of a slight sinking of the tree with the natural subsidence of freshly broken up soil.—G. Woodgate.

NATURALISING BULBS.

Mr. Aggett's interesting article (p. 841) has induced me to offer a few further suggestions on the naturalisation of bulbs. He is quite right when he says that many species of bulbous plants look more artistic in the grass than when grown in borders or beds, and none are more striking in that respect than narcissus, especially where the soil suits them, but the grass should not be cut until their foliage has died down.

My method of planting differs somewhat from Mr. Aggett's. In the first place, some soil is sifted, old potting soil generally, and a little bonemeal mixed with it, as that will assist them soon after they commence to root. The bulbs are then thrown from a basket, and strewn over the ground that is to be planted as naturally as possible, with some thick patches running out thinner at the outsides, and a few stray ones here and there, a yard or two from the others. The thick patches are irregular, and there is no "cabbage bed" arrangement about it, or the effect will be entirely lost. As soon as the bulbs are thrown out men follow on with dibbers similar to those shown in Messrs. Barr's catalogue; a hole is then made about six inches deep, as close as possible to where the bulbs lie, another man or boy follows each dibber with a basket of the sifted soil, and puts a little in each hole; the bulb is then placed in position, and the hole filled up, each bulb having a covering of two or three inches. In this way I have planted as many as fifteen thousand in a day with eight men dibbing and the same number of planters, when the ground was in good condition, but when hard and dry the same men have planted no more than three thousand.

Several of the varieties need a little shade, and this can be arranged near trees by planting a little to the north side; but when under trees the main branches should be avoided, or any that are likely to bring down an excessive amount of rain. Narcissus pallidus præcox likes a slope to the north, and the flowers vary a great deal in colour from creamy-white to deep yellow. The double white variety does not thrive so well in the grass, as the flowers become smaller, and, after a year or two, many fail altogether. It requires deep cultivation and a moist situation.

For the past eight years I have planted from fifty to sixty thousand narcissus bulbs annually, and have found the above method to answer very well. Our groups vary from five hundred to fifteen thousand of a variety, and, as the park is very undulating, this adds very much to the beauty of the flowers as seen in the distance.

The following are the favourite varieties here out of over fifty kinds: Emperor, Golden Spur, Henry Irving, Queen of Spain, Maximus, M. J. Berkeley, Rugilobus, Empress, Grandis, Horsfieldi, Princeps, Mrs. Thompson, pallidus præcox, William Goldring, Autocrat, Cynosure, Queen Bess, Sir Watkin, Stella superba, Barri conspicuus, Leedsi, amabilis, Duchess of Brabant, Minnie Hume, Mrs. Langtry, poeticus, ornatum, poetarum, and Pheasant's Eye.

Aconites, chionodoxas, muscaris, Scilla sibirica, single snowdrops, and crocuses are all planted in the same way, but the pheasants soon destroy the crocuses. The first season we planted five thousand, but by the end of the following summer scarcely one was left; then seven thousand were planted, and put seven inches below the surface, and they, too, were eaten in about three years, except for a stray one here and there. In conclusion, I would advise anyone proposing to naturalise daffodils to secure good bulbs, as nothing is more discouraging than cheap bulbs, which are seldom true to name. W. Brooks.

Blackdown House Gardens,
Haslemere.

APPLE KING EDWARD VII.
A valuable late culinary variety, as exhibited by Mr. W. Crump, V.M.H.

APPLE KING EDWARD VII.

The fine culinary apple King Edward VII. was admirably represented at the second of the two October meetings of the Royal Horticultural Society, when prizes were offered for apples and other fruits introduced since 1892. Both in the class for single dishes and for collections of three dishes of culinary apples it was well shown, and attracted much attention, and in the single dish class the winners of the first and second prizes staged fruits of King Edward VII. The variety was raised at Worcester, from a cross between Blenheim Pippin and Golden Noble, and it has received an Award of Merit from the Royal Horticultural Society's Fruit Committee, and also similar distinction from the Birmingham Fruit and Chrysanthemum Society. The tree has a good constitution, and crops most freely in a young state. The fruit is very solid, of great density, being one of the heaviest apples known, and may be kept in sound condition until June. In the earlier stages the skin is green, changing to a bright golden-yellow, and the flesh is white, richly flavoured, and cooks splendidly. Mr. W. Crump, V.M.H., Madresfield Court, who exhibited the first-prize dish, from which the fruit herewith illustrated was selected, at the R.H.S. meeting, regards it as "quite one of the very best late-keeping culinary varieties."

NEW H.T. ROSE WALTER SPEED.

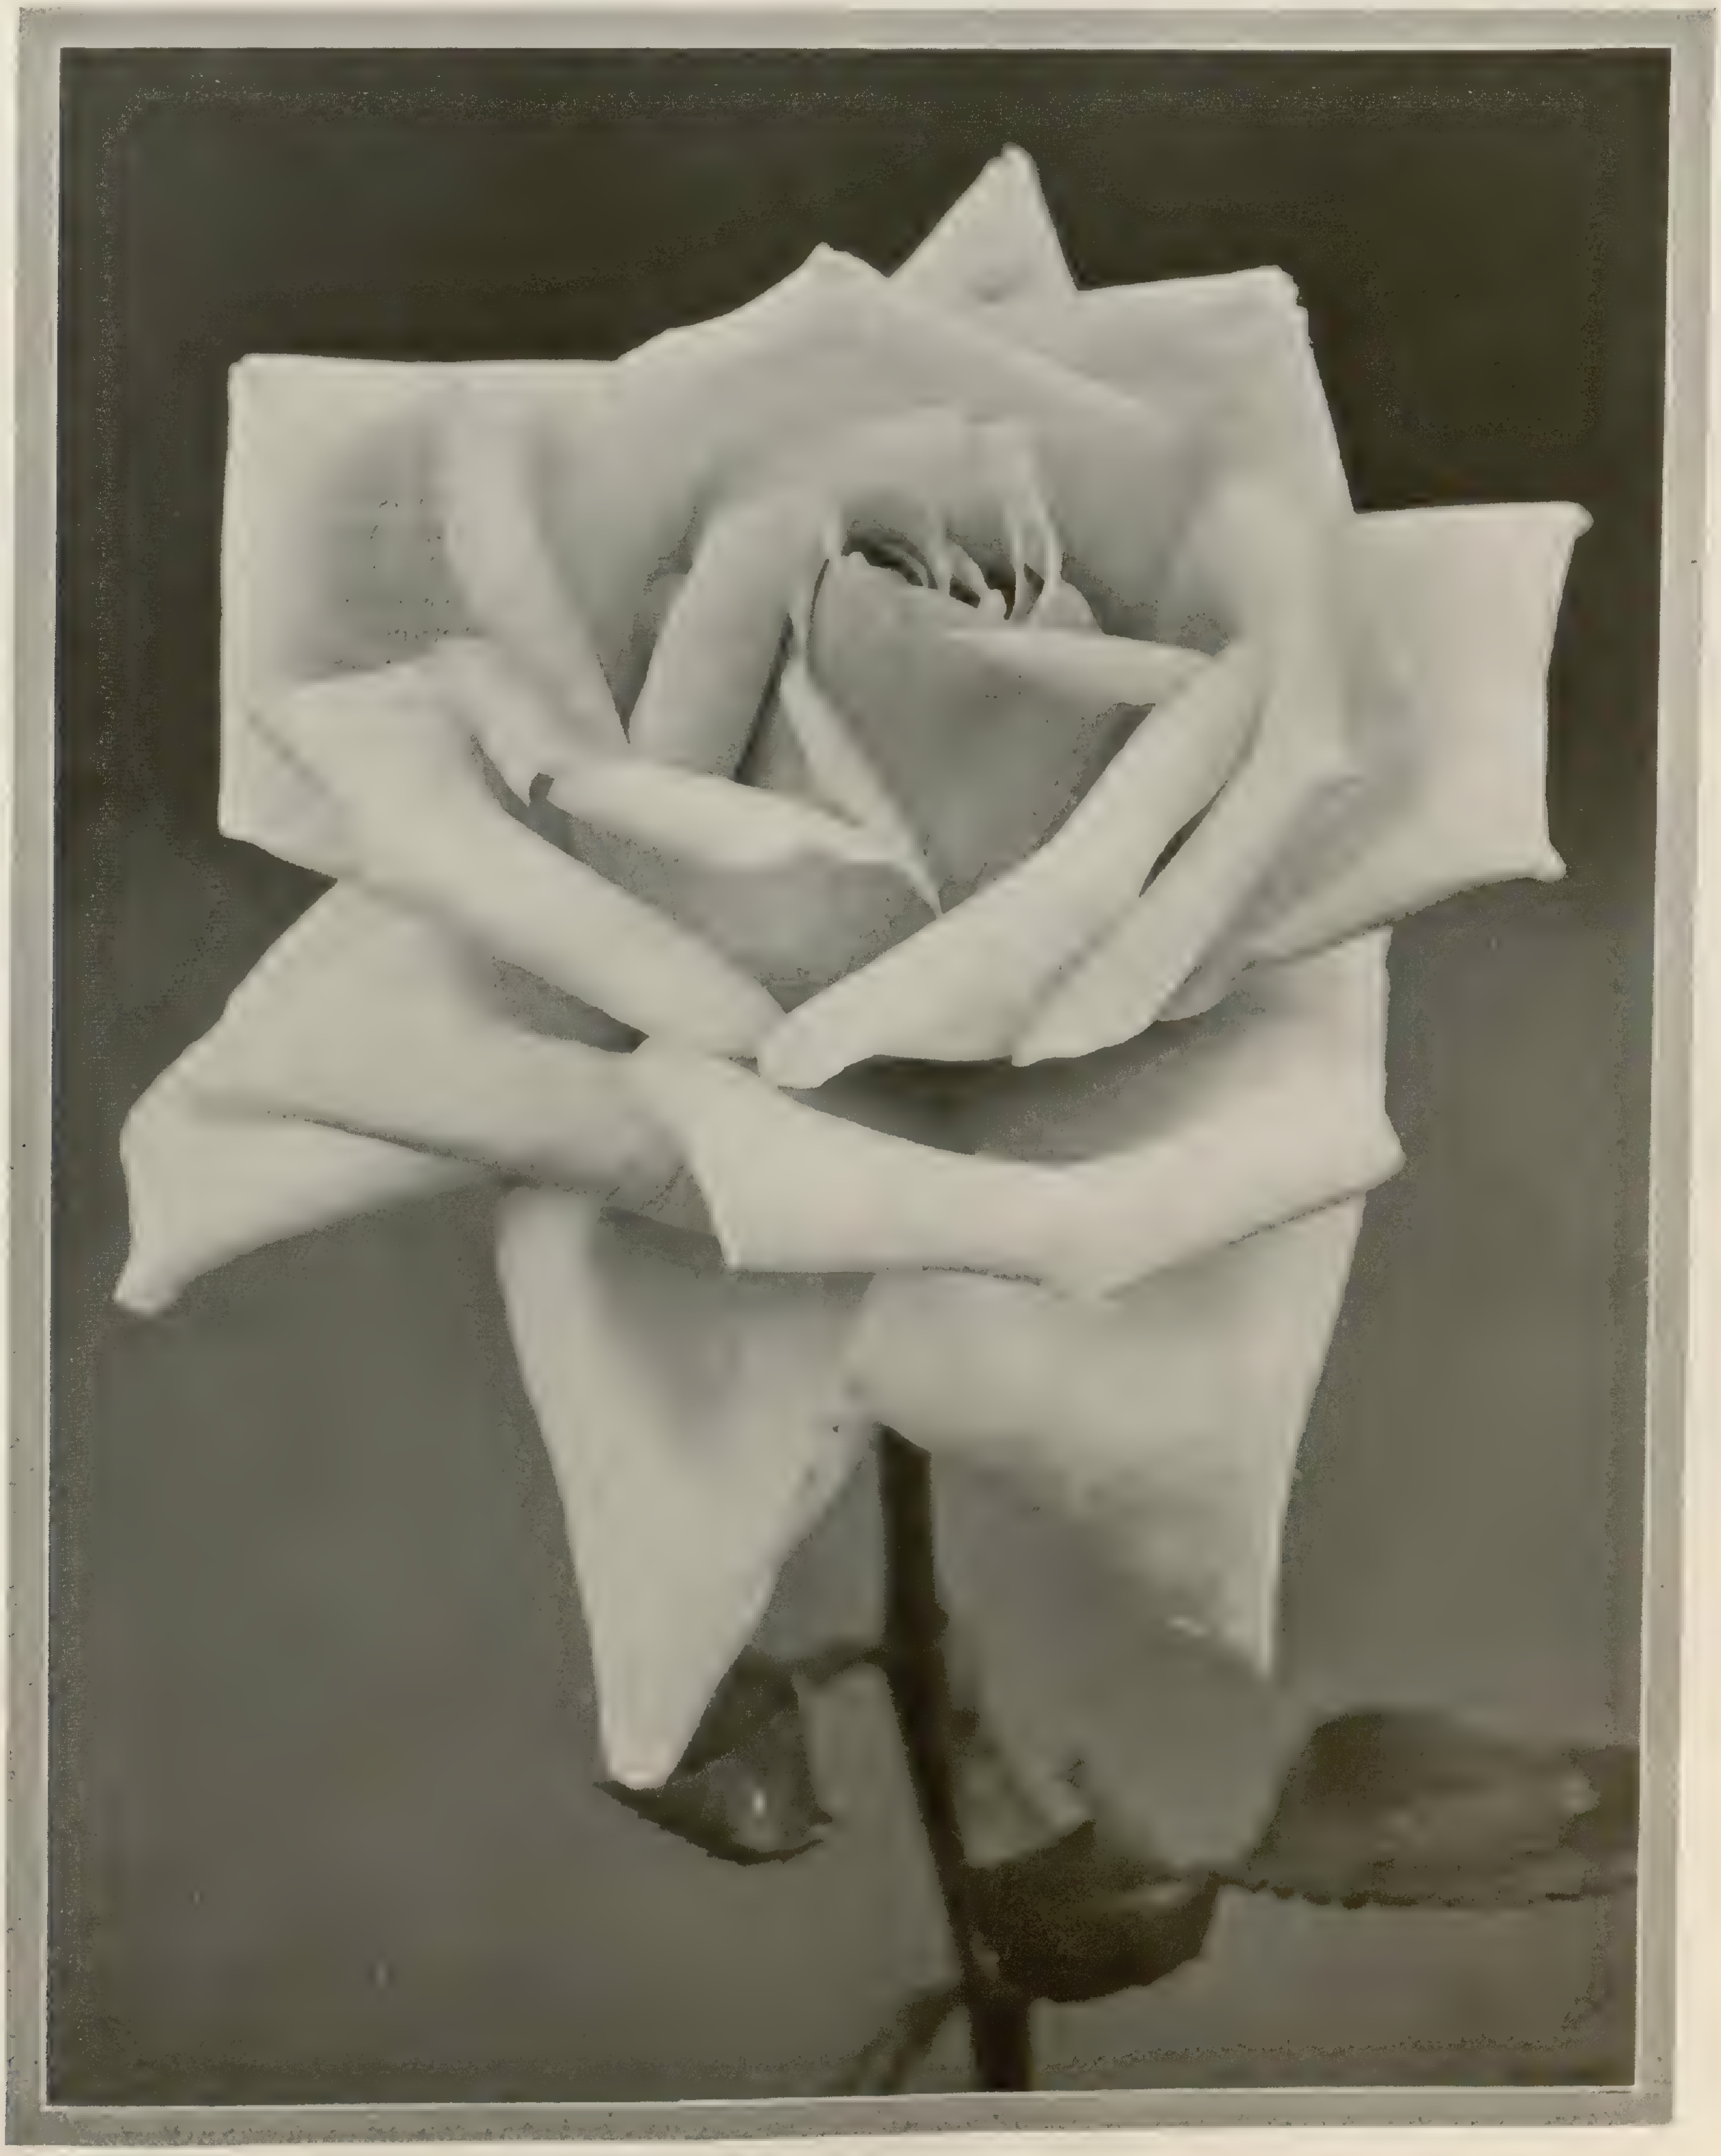
One of the most attractive of the many fine new roses exhibited by Messrs. Alex. Dickson and Sons, of Newtownards, at the Holland Park Show in July of the present year, was the beautiful hybrid tea we now figure, named Walter Speed. We had an opportunity of seeing it growing and flowering in Ireland last season, and were then much struck by its wonderful robustness, erect habit, and fine style of blooming. The flower stems are stiff and carry the blooms erect, and this is a point of considerable importance. The high centred, broad petalled flowers are very handsome in form, and of beautiful colour, the latter being creamy-white in the case of fully-opened blooms, shaded with pale yellow, and tinted with salmon in the centre, but just as the buds open the yellow shading is much deeper. Walter Speed is a continuous flowering rose, vigorous and hardy, and has so many good qualities that it is sure to become a great favourite. It gained an Award of Merit from the Royal Horticultural Society on July 6.

Lowne's Tulip.—In Tulipa Lownei we have one of the dwarf species of tulips which seem so well suited for the rockery. The flowers are crocus-like in their appearance, although rather starry, and are of a lovely series of tints, soft rose, based with yellow, and having the outer colouring of a beautiful olive-green. As it is only six inches high it can be grown on a small rockery, and is fine for the front of the border. It comes from Cilicia, and blooms with us about April. The bulbs should be planted about two inches deep.—S. Arnott.

GARDENS NEAR CHEPSTOW.

Mathern Palace was, in the old days, the abode of the Bishops of Landaff, but the Reformation dealt hardly with the see, and its lands and revenues were largely alienated or stolen, with the consequence that the palace gradually fell into decay, and, after a struggle to keep up appearances on £400 a year, the bishops ceased to reside in their diocese, and the palace was turned into a farm house. About fifteen years ago Mr. H. Avray Tipping bought the palace, and restored it with the most admirable taste, using the old grey stones in outbuildings, ruins, and walls in the work of repairing the dwelling, so that, at the present time, it presents a most picturesque and at the same time habitable appearance.

The gardens at Mathern Palace are interesting. Last year the pomegranate bore five fruits, the largest as big as a man's fist. This year, owing to the dull and rainy season, no fruit has set, but it was in fine flower in September. It is very unusual for the pomegranate to fruit in this country. Clianthus puniceus and Sollya heterophylla were rather badly cut last winter, which was severe, but had quite recovered and had made good growth. By the waterside is a long row of Astilbe Davidi, which must have presented a fine sight when in full flower, especially as no other plants bearing brightly-coloured blossoms are sufficiently near for their hues to clash with the tint of the astilbe's bloom. Large masses of Rodgersia podophylla were very decorative in their colouring, and a great plant of Polygonum sachalinense was in full flower. Campanula Raineri grows like a weed, and is to be seen in great masses among the rocks, where cyclamen flourish to perfection. A bush of Indigofera Gerardiana is 7ft. in height and 12ft. in diameter, and Clerodendron trichotomum is 12ft. in height, while Carpenteria californica is very healthy.



NEW H.T. ROSE WALTER SPEED.

A.M., R.H.S., July 6, Messrs. Alex. Dickson and Sons, Newtownards. Flowers white, yellow and salmon.

By the walls of the palace Veronica Hulkeana and Romneya Coulteri are flourishing, and Alströmeria pelegrina and its white variety, which are generally considered tender, appear quite at home. Diascea Barberæ, usually treated as an annual, is here a perennial. Tricyrtis hirta makes astonishing growth, being fully 3ft. 6in. in height, instead of the 2ft. it generally attains, and Zauschneria californica creates a brilliant effect in the late summer.

At Mounton, a mile or so distant, Mr. Tipping has a charming wild garden. The lower portion of the grounds is intersected by streamlets, while behind cliffs rise perpendicularly, their tops crowned by trees whose branches droop gracefully over the edge, and provide a picturesque background to the garden. Water-loving vegetation borders the streams. Enormous clumps of Saxifraga peltata exhibit their handsome foliage, and the bronzed leaves of Rodgersia podophylla are fine in colour, while in one spot the bank is covered by Rosa Wichuraiana. Many of the primulas flourish by the waterside, P. rosea having increased enormously by self-sown seedlings. The two plants first obtained have by now multiplied into several hundreds, which have formed large clumps around the stream-bed, and are in the most vigorous health.

In the stream the common mimulus, ranging in colour from yellow to red, spreads freely, and Ranunculus Lingua luxuriates. In one place, the steeply-sloping bank of the stream is covered with a large colony of Tiarella cordifolia. Above a rock the branches of Cotoneaster horizontalis, bright with scarlet berries, spread out above the water, creating an extremely pretty effect. Herbaceous phloxes are here seen in perfection, and Lilium speciosum makes marvellous growth, one of a group of the variety rubrum, measuring 8ft. in height last year, and bearing 48 flowers. These lilies are grown in soil mixed with peat-moss litter manure and apparently appreciate their treatment. Abutilon vitifolium succeeds admirably here, and has attained a height of 20ft., while it shows no signs of dying off as it so often does in the south-west. Coriaria terminalis is exceptionally fine, with its shoots, 4ft. in length, studded with amber-yellow berries, and there is a large colony of Kniphofia Northiæ.

At the base of the cliff Romneya Coulteri is doing well, and Euphorbia Wulfeni, in the same position, is very ornamental, as is Carpenteria californica when in flower. Hoheria populnea has blossomed for the last two years, and in September a few of its starry white blooms were still in evidence. The foliage of this tree is very peculiar, that at the base of the branches being very small, and not unlike that of Azara microphylla, while at the extremity of the branchlets the leaves are quite large, the two forms being absolutely dissimilar, and appearing to belong to different trees. Plagianthus Lyalli also flowers well here, and great bushes of Pyrus japonica were loaded with fruit. The rare Cotoneaster adpressa is a very attractive little shrub of prostrate growth. It is being propagated freely, and can be easily increased to any extent, since the branches root into the ground as they spread, and, if cut off, can be readily lifted with good roots and transplanted. It is intended eventually to cover portions of the higher levels with this cotoneaster.

Nandina domestica was very healthy and in flower, and there were large masses of Potentilla Hopwoodiana. Polygala Chamæbuxus purpurea was doing well, and Oxalis enneaphylla was evidently satisfied with its surroundings, a number of plants having been obtained from the one first procured. Saxifrages find a congenial home on a steeply sloping bank studded with rocks, the mossy and encrusted sections both exhibiting most robust health. Large masses of S. Burseriana, S. apiculata, S. sancta, and others formed mats of green between the stones, and were obviously happy. Of the yuccas Y. vomerense has flowered, as has Spiræa Aitchisoni, which has been discarded by Canon Ellacombe on account of its failure to bloom.

The handsome Asclepias tuberosa, whose brilliant, flat, orange-scarlet flower-heads have such a showy effect early in August, but which sometimes proves difficult to grow, was in the best of health, and there were fine breadths of Androsace sarmentosa. Spiræa gigantea, Astilbe Davidi, and Miscanthus zebrina were growing by the waterside, and there was a strong young plant of Davidia involucrata.

WYNDHAM FITZHERBERT.

A CHAT ABOUT ROSES.

Previous to the sharp nip of frost on the 29th of last month, we had a really good show of late blossoms; so much so that I venture to give a short list of varieties that have proved most reliable with us for late summer and autumnal flowering. Beautiful as roses are during early and mid-summer, the individual blossoms do not last so long or keep so fresh as those produced during cool autumn, and we can now have quite a feature of late sorts.

Most of the extra strong growers, including the Wichuraianas and their hybrids, produce a large mass of flowers early in June, and are then over for that season. But we have a few of these extra vigorous varieties that bloom much later, and one of the best among these is Delight, a bright carmine coloured form of Hiawatha, which was in flower until the frost previously mentioned. Flower of Fairfield, the perpetual Crimson Rambler, has also been very showy. Trier is creamy-white all through the summer and autumn. Ards Rover supplies a glowing crimson, with particularly handsome foliage. Perpetual Thalia does not grow so strong as those already mentioned, but it is exceptionally free, and produces large trusses of small white flowers up to the last. Another of the strong growers that should not be missed is the Wichuraiana type, which has been in flower all the autumn, and a few standards are showy at the time of writing, notwithstanding we had 8 degs. of frost. The pure white, star-like blooms of this rose are greatly intensified by its clear yellow stamens, while it is as nearly evergreen as any rose. Occasionally, too, we find William Allen Richardson a mass of highly coloured blossoms upon a sheltered wall late in the season, but it does not come so persistently with us as the others named. Conrad Ferdinand Meyer and its white form, Nova Zembla, are both good autumnal bloomers.

But we find our best late bloomers among the dwarf polyanthas, and very showy indeed some of these have been since early in July. Mrs. W. H. Cutbush, Phyllis, Mdme. N. Levavasseur and Maman Levavasseur, Gloire des Polyanthas, Miniature, White Pet (there is also a good climbing form of this), Schneewittchen, and Leonie Lamesch are among the best. Among the Chinas we should by no means pass over Queen Mab, Eugene Resal, Comtesse du Cayla, and Laurette Messimy.

Many grand late bloomers can be selected from the increasing class of hybrid teas, a few of the very best being Betty, Countess of Derby, Corallina, General MacArthur, Mdme. Antoine Mari, Richmond, Edu Meyer, Ecarlate, Madame Pol Varin-Bernier, Lady Battersea, Georges Nabonnand, Peace, Mrs. Peter Blair, Papa Gontier, Peggy, and Pharisaer.

There are a few varieties in the hybrid perpetual section that are extra free in the autumn, and, although I do not find Victor Hugo so constant as General MacArthur, Gruss an Teplitz, and Richmond for late blooming, it is indispensable because of its glowing maroon scarlet, and great lasting qualities. Mrs. R. G. Sharman Crawford and Killarney are two good silvery pinks, and Frau Karl Druschki is by far the best white. This grand rose will do anywhere, and is useful for almost all purposes.

In these rambling notes I have by no means exhausted the list of roses suitable for late blooming, but have noted a few of the best. If I were confined to half-a-dozen from these they would be Frau Karl Druschki, Mrs. W. H. Cutbush, General MacArthur, Ecarlate, Betty, and Madame Pol Varin-Bernier; the last is one of the sweetest scented roses grown, and produces numbers of well-formed buttonhole flowers up to the advent of sharp frosts. It is a deep yellow, with silvery edges as the bloom ages, and is also a good forcer.

In addition to naming some of the best late bloomers, it may be useful to note the average time of flowering among some of the varieties most suitable for pillars, pergolas, and arches, so as to secure the full benefits of contrast in colours. For instance, we find two good yellows in Electra and Aglaia in flower early in June; among the very first, in fact, and to plant them with Dorothy Perkins, Hiawatha, or Crimson Rambler that generally flower fully from four to six weeks later is to lose much of their effect.

In the following list I propose naming a few with their approximate dates of flowering, adding their predominating colour only: Flora (rosy-flesh), Amadis (purplish-crimson), Aglaia (canary-yellow), Electra (deep lemon, changing to white), Leuchtstern (bright rose, white eye), Polyantha simplex (white, bramble-like), Tea Rambler (copper and salmon-pink), Thalia (white), Trier (coppery-cream), Waltham Bride (pure white), Alberic Barbier (yellow, opening to silvery white), Gardenia (brightest yellow), Joseph Billiard (bright red), and Ruby Queen (deep carmine), all commence flowering about the second week in June.

The following list do not come in until from two to four weeks later, viz., Wichuraiana (white), South Orange Perfection (rosy blush), Adelaide Mouille (rosy-carmine), Delight (carmine), Dorothy Perkins and its white companion, Hiawatha (rich crimson), Lady Gay (a slightly improved Perkins), Crimson Rambler, Climbing Cecile Brunner (orange and apricot), and Blush Rambler. The last-named opens a little sooner than the preceding, but continues so long as to almost outlast the rest of this batch. Carmine Pillar and Bardou Job are exceptionally early, and afford grand reds to go with the earliest varieties.

There are not many climbers that bloom freely late in the season; a few of the best being Perpetual Thalia, Trier—both only semi-climbers—Gardenia, Francois Foucard, Ards Rover, Wichuraiana Delight, Paradise, Flower of Fairfield, and Alberic Barbiér. Although these notes rather resemble a catalogue, I trust they may help intending planters whom I advise to obtain the necessary plants as soon as possible.

Uckfield. A. PIPER.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

WARM DIVISIONS.—At this season of the year, and during the next few weeks, most of the plants in the warmer divisions will be in a dormant state, and the opportunity should be taken advantage of to thoroughly overhaul them for cleansing purposes. It is at this season that scale and other insect pests are most troublesome. It is by no means an easy matter to rid plants that have become attacked with scale, but by thoroughly cleansing the pseudo-bulbs and foliage now, they are the more easily kept in check during the winter season. One is frequently asked the best insecticide to use for cleansing purposes. There can be no doubt but that the safest method is to sponge the plants with clean soft water. Carelessness in the use of any insecticide, however safe it may be when used with proper discretion, cannot fail to have detrimental effects. I have seen so much of the unfavourable results of careless usage that I would not be prepared to permit any plant in my charge to be cleansed with insecticides unless in a position to mix it myself. In spraying the quantities are given, and where it is regularly used there is very little fear of the young men failing to follow out the written instructions for use, but when it comes to small quantities for sponging purposes more than ordinary care is required in properly diluting it to the required strength. Even the use of soft soap, or what was at one time considered a safe remedy, nicotine-soap, must be applied very sparingly indeed, or serious damage is done.

MILTONIA ROEZLI.—Most of the plants of the typical form and the variety M. R. alba, will now be developing their flower spikes, and where they can be induced to grow well, there are few orchids that give a better display during the winter months. They are, as a rule, considered to be difficult to cultivate, but where a situation suited to their requirements can be found, there are few orchids that make greater progress or repay better the consideration and admitted trouble in keeping them clean and free from thrips. With M. vexillaria, these insects are the greatest pests that have to be contended with. I recently visited a garden where there was no pretence to grow orchids, and in a hot moist corner of the plant stove, plunged in a bed of sphagnum moss, I found a batch of both varieties of the species growing luxuriantly, and was informed that they had been in cultivation under the same conditions for a number of years. There can be no doubt that a hot, humid atmosphere suits them at all seasons of the year. They are best grown in shallow pans drained to about two-thirds their depth with clean material. The potting compost should consist of about equal proportions of peat and chopped sphagnum moss. I have found considerable advantage derived in the cultivation of this and its allied species, M. phalænopsis, to have a trough made, and to place the pans containing the plants in it. Put ample drainage at the bottom, and fill in the remaining space with chopped living sphagnum moss to the rim of the pans.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CONSERVATORY.—During the dull, cold weather that we are likely to have for some two or three months the conservatory will need very careful attention. Remove all decaying foliage and flowers. Salvia splendens in particular is very apt to drop its blossoms, and these, if left about on the foliage of other plants, soon set up decay. Where groups of chrysanthemums have been arranged rather thickly mildew is very apt to make its appearance, and if it does, dusting with flowers of sulphur will check it. Care in watering is a very essential point at this time of the year, and if done properly will often prolong the flowering period of a plant, whereas if it is done in a haphazard manner, splashing or wetting the foliage in the process, no plants or blooms will keep well.

ZONAL PELARGONIUMS.—These are among the brightest and most useful of winter-flowering plants (after the chrysanthemums are over); they should be treated as well as possible. A light, airy house, with a night temperature of about 50 deg. (not lower) will suit them well, giving the plants as much room as possible. Watering must be very carefully done, keeping the plants just on "the dry side," and giving them weak liquid manure at each watering. Keep all dead flowers and foliage picked off regularly; ventilate freely during bright weather but shut down closely in the event of fog, this being the great enemy of zonal pelargoniums in winter.

BULBS.—Roman hyacinths if required for house or conservatory decoration should be neatly staked as they throw up their spikes, but if required only for cutting this will not be found necessary. If used in conjunction with Cypripedium insigne, they make a very pretty table decoration. Further batches may now be brought forward as well as some of the earlier varieties of tulips, and, if well rooted, also a few pots of Van Sion and Golden Spur narcissi, but these latter must not be subjected to much heat.

POINSETTIAS.—These are now spreading out their bracts, and somewhat drier and rather cooler quarters will suit them if they are to be kept for any length of time. When they are developed very little water will be required at the root—just sufficient to prevent their flagging.

EUPHORBIA JACQUINÆFLORA is somewhat later in flowering and should still be kept in a fairly warm temperature, not under 55 deg. at night. Keep them fairly dry overhead, but do not stint water at the root until the flower spikes are fairly well advanced, when less will be required.—Thomas Stevenson, Woburn Place Gardens.

THE FLOWER GARDEN.

AUTUMN COLOURS.—The present season has not been an ideal one by any means for the development of the high colouration of many of our trees and shrubs, but it should always be borne in mind when planting that at this season of the year many of the numerous varieties of deciduous subjects from which one can select are never more beautiful than when they commence ripening their foliage prior to its falling, or, it may be, carrying their heavy crops of highly coloured fruits. When these are associated with evergreens in such a way as to portray their beauty to the best advantage, autumn time can be made most interesting. Few trees or shrubs assume richer coloured foliage than the many forms of Japanese maples, and these ought to be planted more largely in the shrubberies in good open, sunny positions. Not being such rapid growers as many other shrubs, they do not so readily become too large for their position. Another highly coloured tree is Pyrus nigra, which is an excellent and distinct subject for grouping or growing as specimens. Many of the euonymus, cornus, spiræas, especially S. prunifolia fl. pl., Berberis Thunbergi, virescens, aquifolium (also good for massing and planting under trees), Amelanchier canadensis, or Snowy Mespilus, makes good specimens for planting in the open woodland, so also do the many varied species of the American thorns, now loaded with their large-sized scarlet fruits, and the various crabs. The cotoneasters, such as C. frigida, C. nummularia, C. Roylei, and C. Roylei pendula are all free fruiting varieties, whilst the Sea Buckthorn, Hippophœa rhamnoides, though a British shrub, is well worth planting, and, being diœcious, both sexes must be grown, when a free set of berries will be ensured.

GENERAL WORK.—With the persistent wet and mild weather which we have experienced of late the leaves are very much later in falling, but no doubt the few frosts we have just had will hasten their downfall. These should be kept brushed up and collected as quickly as possible, and wheeled away to some out of the way spot to decompose. Continue to roll the drives and walks, and many parts of the lawns will require a further mowing when dry enough, to make them presentable. No time should be lost now in procuring a sufficient quantity of protecting material for the more tender shrubs, and stored in some dry place ready to hand whenever wanted. Furze or gorse is excellent for this purpose, also bracken, and, when necessary, tender shrubs planted on walls should either be matted up for the winter or protected by slanting reed mats against them. This is an excellent method, as these can be easily removed when the weather is more genial. Smaller subjects are best protected by having a guard placed round them made of wire to enclose the material. Many of the more tender rock plants will need these, and at this season care should be taken to keep these clean by removing all leaves which have littered on them, or these will probably rot the more delicate subjects. Another excellent plan is to enclose the crowns of choicer plants by small circular pieces of perforated zinc, to protect them from the ravages of slugs and other enemies.—E. Beckett, Aldenham House Gardens.

HARDY FRUITS.

PLANTING.—The damp and very mild weather which we have been experiencing of late has kept the trees growing much later in the season than usual, with the result that many of them are still full of leaf, but no time should be lost in sending on the orders for any fresh trees that may be required, so that these may be despatched as early as possible after they are ready for removal. I always advocate autumn planting whenever it can be carried out, as the soil is then sufficiently warm to encourage new roots to push forth, and take possession of the soil. Some old potting soil will be found useful to spread among the roots if the staple soil should be of a stiff nature. In preparing the ground for new quarters of raspberries, loganberries, blackberries, currants, and gooseberries, plenty of good manure should be trenched into the ground, as it is not advisable to dig among these crops afterwards; but for apples, pears, plums, cherries, peaches, and nectarines, very little manure is necessary, unles the soil is in a poor condition, when a little well-decomposed manure may be used, but this will be found more beneficial to the trees if an equal proportion of good turfy loam is well incorporated with it. Examine well the roots of each tree previous to planting, and remove all broken and damaged pieces by a clean cut with a sharp knife.

FULL STANDARD TREES are best for planting in orchards where cattle will be allowed to graze, or where it is intended to crop with vegetables; but half-standards are most suitable for orchards which are kept specially for fruit, these being easily attended to in the matter of pruning, spraying, and thinning the fruit.

RED and WHITE CURRANTS, as well as gooseberries, are well adapted for growing as either double or treble cordons, as they take up very little space, produce excellent fruit, and are more easily protected from birds than when grown in the ordinary bush form.

WALL TREES.—Peaches, nectarines, plums, Morello cherries, and apricots are usually grown in fan-trained form, while pears, sweet cherries, and apples are more often seen growing as horizontal-trained, or as cordons.

POSITIONS.—Peaches, nectarines, and apricots should have a wall with a south aspect. Plums and sweet cherries, also apples and pears, will thrive well against walls having a south-west or west position, while against walls facing north and north-east Morello cherries and a few gooseberries will be found to fruit satisfactorily.—Geo. Woodgate, Rolleston Hall Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Sheffield.

There is ample room in the big Corn Exchange, Sheffield, for an extensive show, but on November 12 there was very little room to spare when the place was cleared for judging. The schedule differed considerably on this occasion from that of 1908, as the big plant group class and the arrangement of certain vase classes in front of mirrors were omitted. Whether the alteration is an improvement is an open question, but there is a good deal to be said for rearrangement and alteration, as visitors do not care to find so much apparent sameness in the shows year after year. The flowers were good at Sheffield, and one of the most pleasing features of the show is the keenness of the contest in all the local and amateur and cottagers' classes, and one loves to see the competition for two blooms each of such charming old incurved varieties as Mrs. Rundle, Mrs. Dixon, and Mr. G. Glenny, and on this occasion there were ten entries, chiefly from cottagers, many of whom are connected with the Sheffield steel trade.

SIX VASES OF INCURVED CHRYSANTHEMUMS,
For which Mr. Drake was awarded the first prize at Sheffield.

It should be added that the committee had draped the whole of the inner walls of this big building with soft deep green material, and festooned it along the top with heliotrope material—a capital idea.

CUT FLOWERS.

Vase classes are a leading feature of the cut bloom section at Sheffield, and the competition is invariably good and close. For four vases of Japanese blooms, three blooms of one variety in each vase, the leading award fell to Mr. E. J. Brooks, gardener to Lieut.-Colonel Beech, Brandon Hall, Coventry, who was the best out of five competitors with magnificent flowers—some of the best we have seen this year—of F. S. Vallis, Pres. Viger, John Peed, and Lady Talbot; Mr. G. Hall, gardener to the executors of the late Lady Ashburton, Melchet Court, Romsey, second with Lady Talbot, Edith Jamieson, J. H. Silsbury, and Annie Hamilton; Mr. W. Iggulden, Frome, third, and Mr. Drake, Cathays Terrace, Cardiff, fourth.

The leading prize for six vases, three blooms in each, of incurved varieties, is £6, and there are three other money prizes of £4 10s., £3, and £2 respectively. There were three competitors, and two of them showed remarkably well, and the first prize was well won by Mr. Drake, Cardiff, with splendid examples of Mrs. Judson, G. F. Evans, Triomphe de Montbrun, Embleme Poitevine, Bocaccio, and May Phillips; Mr. W. D. Parkin, Nottingham, second, with Mrs. B. Hankey, Clara Wells, Buttercup, W. Pascoe, Mrs. G. Denyer, and Triomphe de Montbrun. Mr. J. Harrison third. In a somewhat similar class, but for Japanese varieties, Mr. C. J. Brooks added to his laurels by winning with deep fresh flowers of F. S. Vallis, President Viger, Reg. Vallis, Madame G. Rivol, Madame P. Radaelli, and Lady Talbot; Mr. G. Drake second with big blooms of F. S. Vallis, Reg. Vallis, Madame P. Radaelli, Bessie Godfrey, Lady Talbot, and Valerie Greenham; Mr. W. Iggulden, Frome, third, and Mr. G. Hall, fourth.

Mr. Drake had also the best pair of vases of incurved varieties, showing C. H. Curtis and Mrs. G. Wynn in fine form; Mr. W. D. Parkin, Nottingham, second, and Mr. J. Harrison third. The best single vase of a white chrysanthemum was Lock's Hill, a white sport from Madame Paolo Radaelli, from Mr. W. Iggulden. Mr. Brooks scored for one vase of a yellow Japanese variety with noble flowers of F. S. Vallis; indeed each competitor showed this variety.

Mr. Drake beat Mr. Harrison for a dozen incurved blooms, on boards, and he had Miss M. Threlfall, Godfrey's Eclipse, Mrs. G. Wynn, Ialene, and Mrs. Judson, very good. Mr. Brooks came to the front again for a dozen Japanese blooms, distinct, on boards, scoring with F. S. Vallis, J. Peed, Lady Talbot, Reg. Vallis, Madame G. Rivol, Madame P. Radaelli, Mrs. N. Davis, C. H. Totty, Marquis V. Venosta, President Viger, and Splendour; Mr. Drake had to be content with second place, and Mr. G. Hall was third; five competitors.

In the district classes, limited to growers residing within a radius of twenty miles of Sheffield Parish Church, there were a number of excellent exhibits of cut flowers, chiefly staged in vases. Of four vases of Japanese blooms three flowers of one variety in each vase, there were seven entries, and here Mr. J. Harrison, Walkeley, was first with good examples of Mrs. Knox, Reg. Vallis, and G. Mileham; Mr. W. Fletcher, Stannington, second, and Mr. T. Colin Fletcher third. For two vases of three blooms each, Japanese varieties, the honours fell in order of merit to Mr. J. Marsden (for Reg. Vallis and Mr. A. T. Miller); Mr. William Fletcher, and Mr. J. Harrison.

Six bunches of single varieties made a brave and interesting show, as there were four good entries; Mr. D. Lewis, gardener to W. A. Milner, Esq., Totley Hall, led with fine bunches of Master E. L. Lewis, Seagull, Scarlet Gown, and Ajax; Mr. W. Hartley, Ward Green, Barnsley, second; and Mr. Spencer, gardener to Miss Roberts, Park Grange, third. Mr. Harrison led, and was followed by Mr. W. Fletcher for twelve incurved blooms, but the tables were turned in the class for six blooms, Mr. Fletcher showing very well here.

In the amateurs' and cottagers' division the names that appeared prominently in the cut bloom classes were Mr. Colin Fletcher, Stannington; Mr. W. Fletcher, Stannington; Mr. J. Bateman, Mr. W. C. Carnall, Mr. H. G. Betts, Mr. Lackard, Dixonfield; and Mr. W. Crawshaw (fine incurved).

GROUPS, ETC.

The class for a table group of chrysanthemums, with other plants and foliage, was not a very good one, inasmuch as the two leading displays set up were utterly unlike in style; that from Mr. Iggulden, was an exhibit of Japanese blooms, with a very few asparagus sprays among them, while the other, from Mr. C. Hyde, was a bold and decorative display of palms, crotons, and moderately good flowers. Prizes were awarded in the order named, but the most "decorative" display was Mr. Hyde's, and Mr. Iggulden's the best flowers; Mr. J. Harrison third.

Messrs. Seagrave and Co., Gleadless, secured the chief award for a table decoration, their flowers being carnations and Cypripedium insigne; Mrs. Blake, Mylnhurst, was second, with a very pretty design in carnations, cypripediums, and lily of the valley; Mr. J. C. Davis, Balathie Gardens, Stanley, third, with bougainvillea and lily of the valley.

In the plant classes Mr. W. C. Hyde gained first place for a specimen palm with a large spreading Phœnix; Mr. Agar, gardener to J. Roberts, Esq., Queen's Towers, had the best three ferns; Mr. J. Marsden, gardener to Mrs. Blake, Mylnhurst, led for Begonia Gloire de Lorraine, six plants; Mr. W. C. Hyde for six table plants—rather too big, but the best shown.

Mr. W. C. Hyde led in the local district class for a table group of chrysanthemums and foliage plants, and he showed some excellent material in a tasteful manner.

FRUITS AND VEGETABLES.

Some good collections of fruit were shown, and after a good deal of consideration the judges awarded first prize to Mr. A. Blakey, gardener to G. H. Shaw, Esq., Howden, East Yorks, for Gros Colmar and Muscat of Alexandria grapes, Pitmaston Duchess and Beurre Clairgeau pears, and Worcester Pearmain and Blenheim Pippin apples; Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, second, with an excellent set that would have been placed first by many judges; Mr. J. C. Davis, third; five competitors. Mr. J. Gibson was placed first for white grapes (Muscats), and also for black grapes (Alicante), and there were five competitors in the latter class.

Mr. James Gibson, Welbeck Gardens, scored an easy first for a collection of six kinds of vegetables with Prizewinner leeks, Dwarf Gem Brussels sprouts, Autumn Mammoth cauliflowers, Ailsa Craig onions, Ideal potatoes, and Superb Pink celery; Mr. Blakey, Howden, second; and Mr. W. C. Hyde third. The prizes in this class were presented by Messrs. Sutton and Sons, Reading.

NON-COMPETITIVE.

Messrs. Clibrans, Altrincham, were represented by an exhibit of Japanese, incurved, decorative, and single chrysanthemums, set up in association with palms, ferns, etc., the whole making an effective display. Messrs. Seagrave and Co., Lane End Nurseries, Gleadless, Sheffield, were large exhibitors of decorative and single chrysanthemums put up in tall stands, with baskets and small stands of singles in the foreground. In the centre of their exhibit they had a bank of the most popular varieties of perpetual-flowering carnations.

In the display of chrysanthemums submitted by Mr. H. Woolman, Shirley, near Birmingham, there were some excellent vases of incurved and decorative chrysanthemums, and a fine selection of the leading single varieties. Mr. Alfred Upstone, Rotherham, brought over a collection of clean vegetables, his parsnips and potatoes being the most attractive kinds. The Agent-General for British Columbia had a big and very attractive exhibit of Columbian apples, some of the fruits being selected and staged in dishes, but the majority were in the boxes, as packed, with the lid off; Jonathan, Rome Beauty, Grime's Golden, and King of Tompkins County were very fine. Messrs. Hiram Shaw and Son, Richmond Hill Nurseries, Sheffield, exhibited crotons, chrysanthemums, liliums, bamboos, etc., but the feature of their group was an arch of Gros Colmar grapes over a little bank of Cypripedium callosum.

Messrs. W. Artindale and Son, Sheffield, had a superb display of floral designs, and not only were the various items composing it made up in the very best style and taste, but the grouping of these delightful representations of floral art was exceptionally good. Roses, carnations, arum lilies, violets, and cattleyas were beautifully disposed in chaplets, harps, anchors, cushions, stars, hearts, and other devices.

Woolton, NOVEMBER 10.

The eleventh exhibition of chrysanthemums at Woolton will compare favourably with its predecessors, although in some classes a decided drop was noticeable.

In the class for single-flowered chrysanthemums, nine vases, with nine flowers, there was a remarkably fine display. The splendid challenge vase presented by A. H. Tate, Esq., has induced the growers in the district to put forth their most strenuous efforts, and as the result the exhibits were admitted to be the finest yet seen. R. W. Barr, Esq. (gardener, Mr. T. Keightley), secured the premier award, the flowers being of large size, of good form, substance, and bright in colour; as this section is rapidly coming into favour, we give the names in the collection — Mrs. W. Herbert, A. K. Askell, Eureka, Edith Edwards, Sir A. T. Simons, Metta, Mr. Walton, G. W. Forbes, and Edith Pagram; W. Tod, Esq. (gardener, Mr. G. Eaton), was second with a charming set; and A. S. Mather, Esq. (gardener, Mr. H. Howard), a good third; each exhibit, it should be added, was admirably staged. For three vases, S. S. Bacon, Esq. (gardener, Mr. J. Rothwell), was the chief prizewinner with good blooms. For twenty-four Japanese, Mr. G. Eaton took the lead with a strong set, his Lady Talbot, for which he received the N.C.S. Certificate, being exceptionally fine. In the class for eighteen Japanese, Sir W. H. Tate, Bart. (gardener, Mr. G. Haigh), staged excellent flowers; and for the twelve, Mr. Keightley had the best. In the competition for the prizes for eighteen incurved, T. Clarke, Esq. (gardener, Mr. J. Clarke), obtained premier honours with a set in which Souvenir de William Clibran proved the best bloom in the show. For twelve varieties, Mr. J. Clarke was the winner of the first prize.

Trained plants are usually a feature of this society's shows, but on this occasion they were hardly up to the average owing to the lateness of the season. For three distinct, trained or bush specimens, Arthur Earle, Esq. (gardener, Mr. T. Hitchman), had the leading examples in good form. For one incurved, W. Cunningham, Esq. (gardener, Mr. W. Wilson), had the best. For one pompon, Mr. T. Keightley, and for one anemone, Mr. Keightley was the most successful competitor; and for one single-flowered specimen Mr. Keightley was first.

Mr. G. Haigh obtained the leading award for a palm, with a noble specimen; and Mr. J. W. Hughes (gardener, Mr. J. McColl) was first for a specimen fern with Goniophlebium subauriculatum in a high state of development. For one cypripedium, Lieut.-Colonel J. B. Gaskell (gardener, Mr. J. Stoney) with C. Spicerianum. The best foliage plant was shown by Mr. G. Eaton; and in the class for one flowering plant, Mr. H. Howard was first with Eucharis amazonica. Mr. J. Stoney was first for two begonias, staging well-flowered specimens.

For two bunches of black grapes, Mr. W. Wilson won with Alicante; and for two bunches of white grapes he was first with well-coloured Muscat of Alexandria. Mr. T. Clarke won for a collection of dessert apples; and for a collection of culinary apples Colonel R. Ireland, Blackburn (gardener, Mr. A. A. Evans), obtained premier honours. Mr. A. A. Evans and Mr. J. McColl shared the honours for pears.

Birmingham Chrysanthemum Show.

NOVEMBER 9, 10, and 11.

The forty-ninth annual chrysanthemum, fruit, and vegetable show at Birmingham compared favourably with its predecessors, and although there was a decrease in a few of the classes, this was balanced by the introduction of other novel features, notably classes for Begonia de Lorraine and carnations, which served as a very pleasing change for the visitors. Contrary to expectations in some quarters, owing to the unfavourable character of the season, chrysanthemums were, on the whole, of average merit, and many of the cut blooms excelled those staged at any previous show. Fruit was well represented, but not so highly coloured amongst apples as on some previous occasions. As usual, the trade or non-competitive displays added much to the attractions of the exhibition.

SPECIMEN CHRYSANTHEMUM PLANTS.

These were unusually well staged by those highly successful local growers Mr. Oliver Brasier, gardener to Mrs. E. Martineau, and Mr. Alfred Cryer, gardener to J. A. Kenrick, Esq., of Edgbaston. In the class for six Japanese varieties Mr. Cryer led with well-developed specimens, and Mr. Brasier was a close second. In the remaining six classes the latter was successful in winning the premier prizes, while Mr. Cryer followed closely for the second place. The class for a group of chrysanthemums, arranged in a space 20ft. wide at back and 12ft. deep, was not a success, for, as was the case last year, there was only one exhibit, when Mr. A. Cryer was awarded the society's first prize of £10 and the William Butler Memorial Silver Cup, presented by W. Waters Butler, Esq., in memory of his father, a past president of the society. This is the second time Mr. Cryer has won the cup, and when he wins it again it will become his property. There was a good competition in the class for a group 14ft. by 10ft., and Mr. R. Bullock, gardener to T. W. Piggott, Esq., Moseley, led with a very good arrangement; Mr. G. Corbett, gardener to Hume S. Pinsett, Esq., Harborne, was a good second. For a group of decorative chrysanthemums, arranged as grown, the sole exhibitor was Mr. C. H. Herbert, The Nurseries, Acock's Green, who was justly awarded the premier prize for a fine arrangement of fresh flowers.

CUT BLOOMS.

The new class for winter-flowering carnations evoked much interest; the flowers were arranged on staging 20ft. long by 8ft. deep, in vases or stands. The first prize consisted of £12 12s. in cash, offered by the committee, and a silver challenge shield, to be held by the exhibitor during the ensuing year. The prizes induced two growers from the South to compete. These were Mr. C. F. Waters, Balcombe, Sussex, who was successful in obtaining the premier position; Mr. S. Mortimer, Farnham, Surrey, was a close second. There were but few exhibitors of hand bouquets. Messrs. Perkins and Sons, Coventry, were the only exhibitors of bridal bouquets. On the other hand, there were several competitors in the class for bouquets of chrysanthemums, and, on the whole, these were very creditable. Dinner table decorations, with chrysanthemums, were fewer than usual, but the leading examples evidenced considerable artistic ability. An attractive feature was formed by the cut blooms of chrysanthemums, in vases, which were fully up to the average, many of the blooms being perfect in size and quality, notably examples of F. S. Vallis, Lady Talbot, and Mrs. A. T. Miller. For six vases of Japanese, in eighteen varieties, one bloom of each, of three distinct varieties in each vase, Lieut.-Colonel Beech, Coventry, led with superb examples; second, Mr. W. Iggulden, Frome; and third, Hugh Andrews, Esq. (gardener, Mr. F. R. Tooley). For four vases, Colonel Beech was again first, Mr. Tooley was second, and Mr. W. Iggulden third. The best vase of a pink-coloured variety was Colonel Beech's Reginald Vallis; second, Mr. R. Peyton, Edgbaston, the same variety; third, Mr. Iggulden. For a crimson coloured variety Mr. John Tooley scored with Magnificent; second, Mr. Iggulden, with the same variety. The best vase of a white variety was shown by Mr. H. S. Foster, gardener to F. G. Muntz, Esq., Umberslade, who had superb blooms of Mrs. A. T. Miller; second, Mr. J. Deacon, gardener to the Right Hon. Joseph Chamberlain, with the same variety; third, Colonel Beech, with Mrs. Norman Davis. For a vase of a yellow variety Colonel Beech again scored with F. S. Vallis, a superb exhibit; second, J. H. Whitley, Esq., Berkswell Hall, Knowle (gardener, Mr. W. H. Westley); and third, Mr. Iggulden. Decorative varieties were also very well staged.

There was a fair number of competitors in the incurved section of chrysanthemums. For four vases of distinct varieties Mr. J. Deacon was first, with excellent examples. For a similar class, but with three blooms of one variety in each vase, Mr. J. Deacon was first; second, Mr. H. F. Keep, Edgbaston. For two vases, in two varieties, Mr. Deacon was placed first; second, Mr. O. Brasier; and third, Mr. Keep.

MISCELLANEOUS PLANTS AND FLOWERS.

The new class for twelve plants of Begonia Gloire de Lorraine was highly interesting. Mr. W. V. Wall, gardener to A. Hughes, Esq., Knowle, led with very good examples; second, Mr. A. Cryer; and third, Mr. J. Deacon.

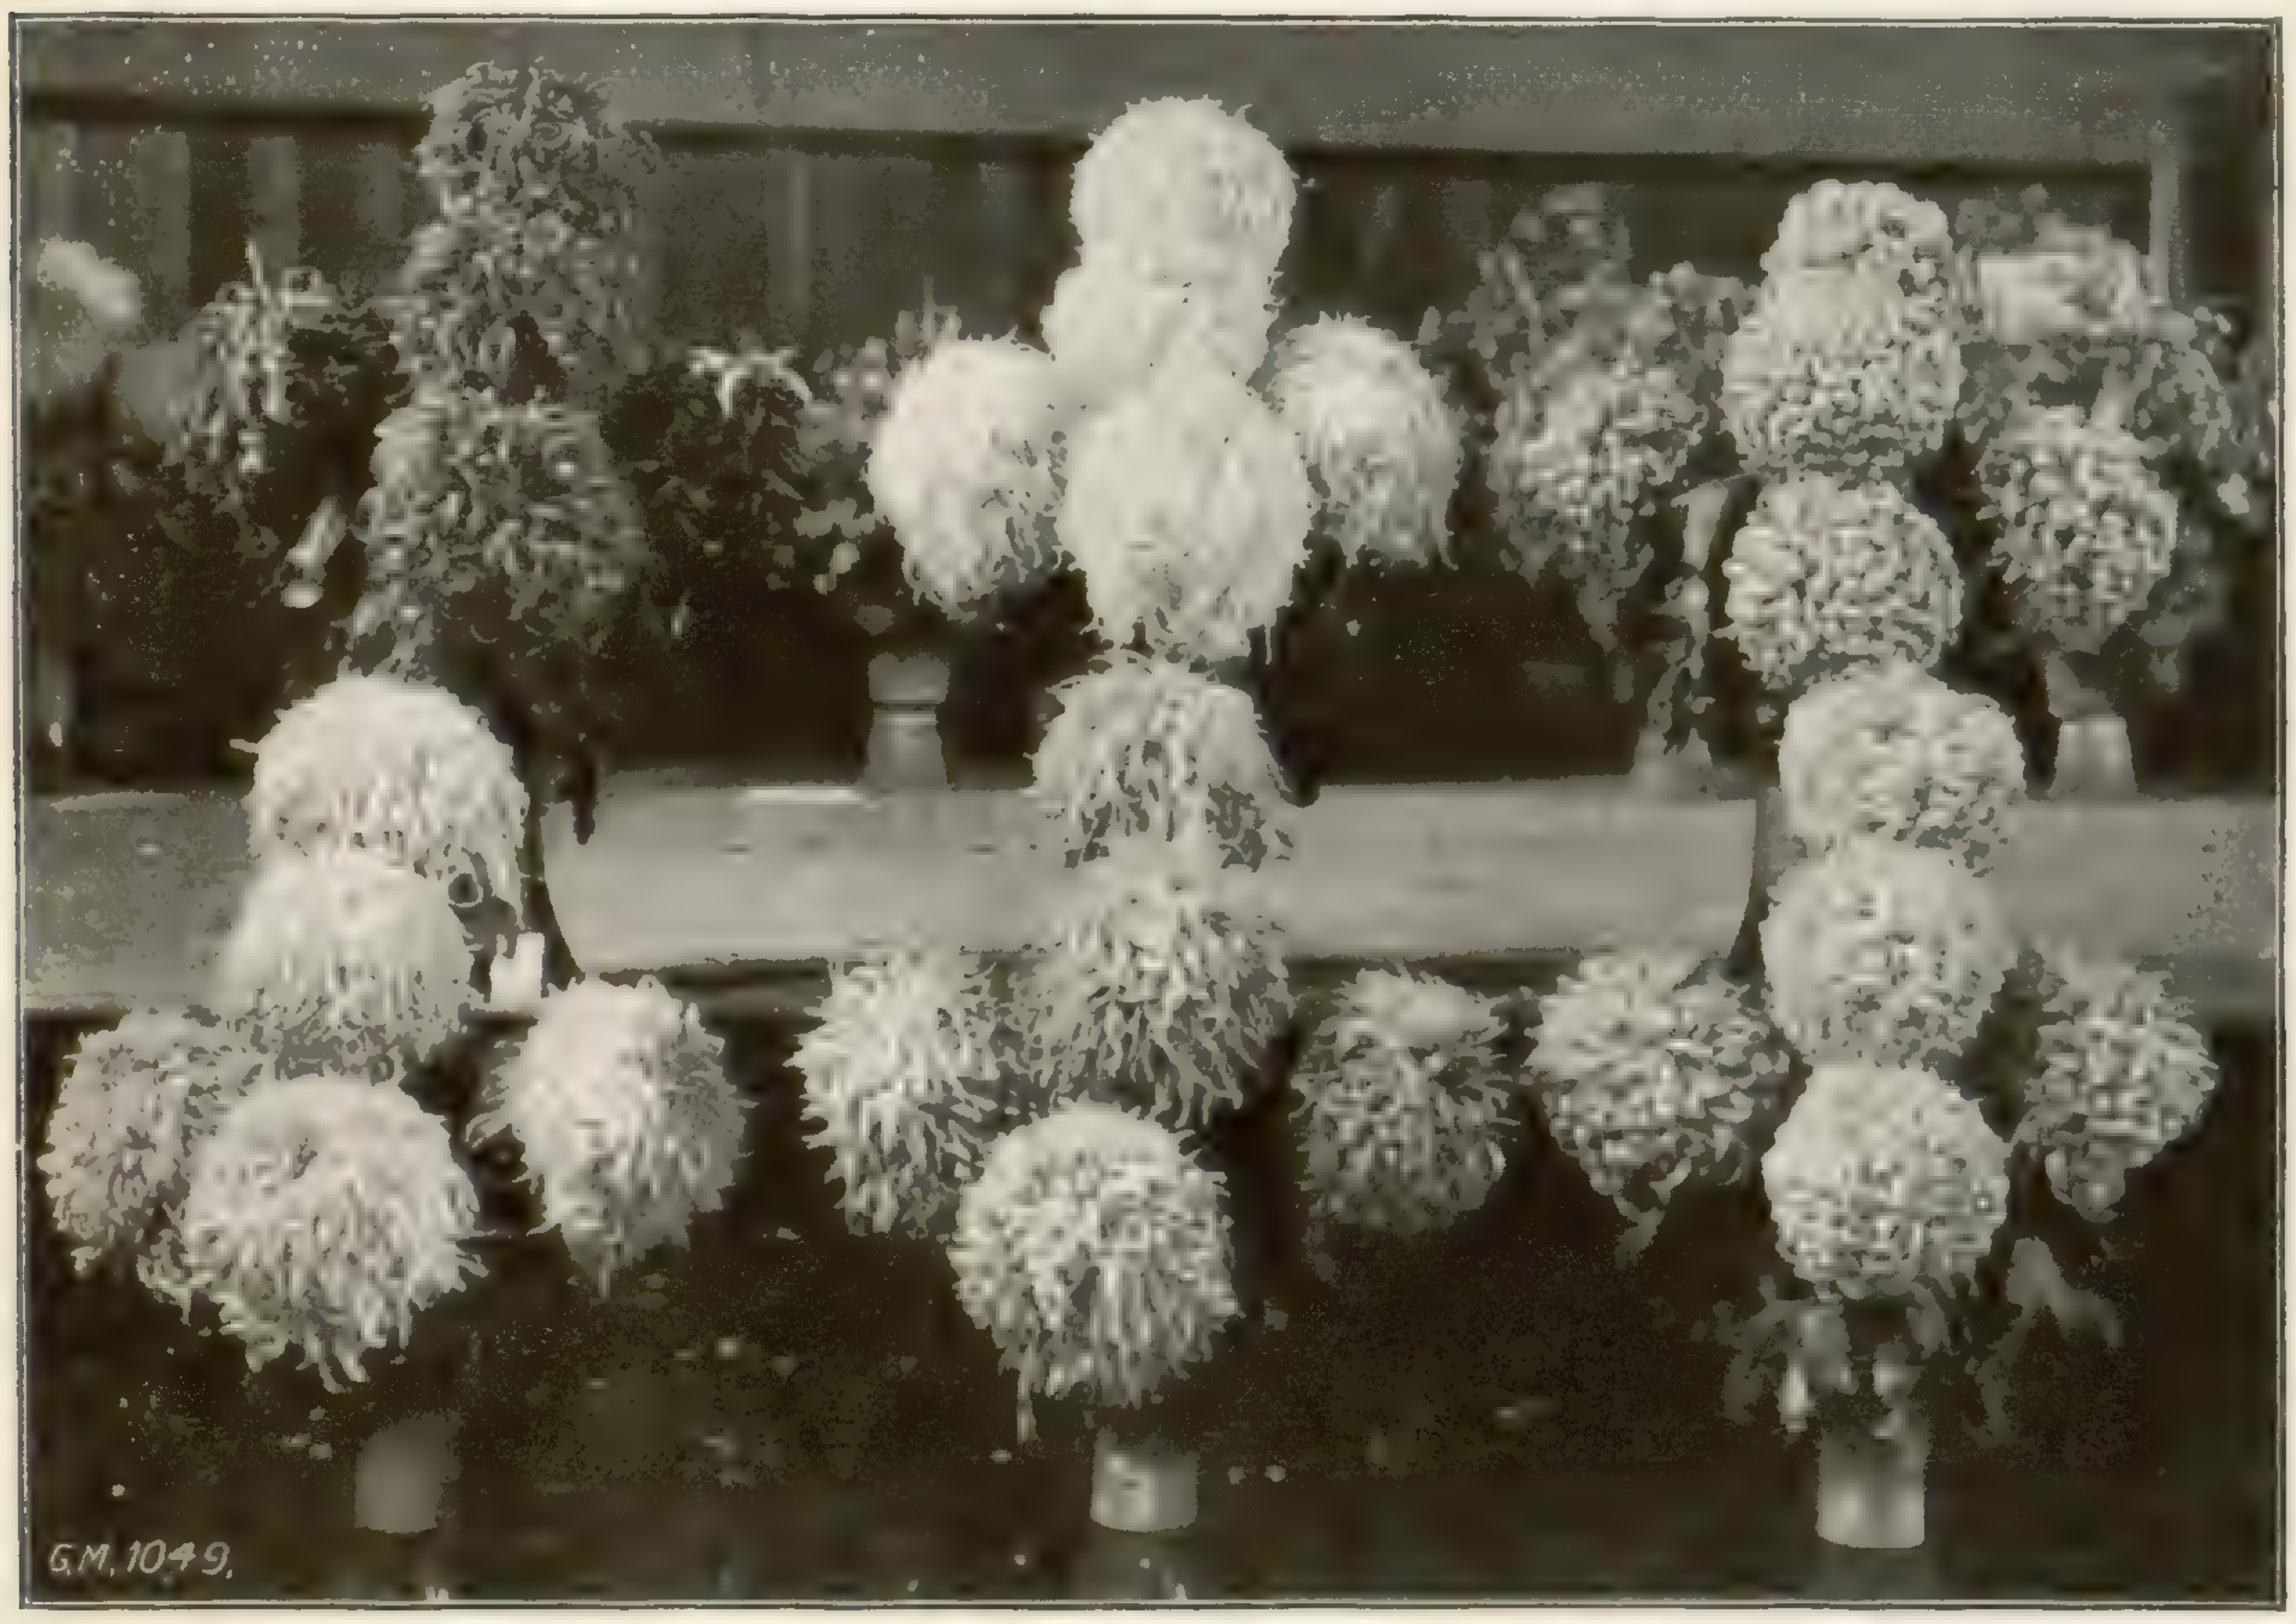
Primulas were not largely shown. Mr. A. Cryer was first with fine examples; second, Mr. R. Peyton. Cyclamens made a pleasing effect. For twelve plants Mr. Shambrook, gardener to the Rev. H. Buckstone, Sutton Hall, Derby, led with very good examples; second, Mr. J. Deacon. In the local classes Mr. Shambrook first, Mr. A. Cryer second, and Mr. Hume Pinsentt third.

FRUIT, ETC.

For a collection of British-grown hardy fruits, to be grown by exhibitor, the first prize consisted of £5 in cash, and a silver challenge cup, given by Mr. H. S. Bevins. This award was won by Mr. C. V. Powell, Hereford, who, having been the winner in 1907 and 1908, now became the owner of the cup. For a collection of British-grown fruit, arranged on a space of 40 sq. feet, Mr. Goodacre, Elvaston Castle Gardens, obtained premier honours with a splendid collection comprising grapes, melons, plums, apples, and pears; Mr. H. Cotton, gardener to Lord Biddulph, Ledbury, was a good second. Grapes were excellently staged. For three bunches of black grapes Mr. Hugh Anderson was first with very fine Alicante; second, Mr. J. H. Goodacre, with Gros Colmar; and third, Mrs. F. Need, Malvern, with Alicante. For Muscat of Alexandria Mr. C. Harding, gardener to the Marquis of Hertford, Rayley Hall, Alcester, led with fine examples; second, Mr. Goodacre. There were several other classes for grapes. Apples were well staged. For six dishes, culinary, Mr. H. Cotton obtained premier honours, and Mr. C. Harding and Mr. Goodacre were second and third. For six dishes dessert apples Mr. H. Cotton was again first; second, Mr. Thomas Green, gardener to the Marquis of Exeter. Pears were very fine. For eight dishes, distinct, Mr. Bannister, gardener to Mrs. Ames, Westbury-on-Trym, was first; second, Mr. Goodacre. Local classes for apples and pears were well filled.

VEGETABLES.

These made a very fine display. In the class provided by Messrs. Sutton and Sons Mr. Edwin Beckett, Elstree, obtained the premier prize; second, Mr. Thomas Jones, Ruabon. For Messrs. Webbs' prizes, first prize fell to Mr. John Hudson, Leicester; second, Mr. Silas Cole, gardener to Earl Spencer, Northampton; third, Mr. T. Barnett, Ellesmere, Salop. Messrs. Sydenham's, Lim., prizes for a collection of nine varieties, were awarded as follows: First, Mr. Thomas Jones, Ruabon; second, Mr. W. Folkes, Ampthill, Beds. There was also, as usual, a strong contest in the single dish classes.



MR. T. STEVENSON'S SIX VASES OF JAPANESE CHRYSANTHEMUMS,
For which he was awarded the King's Challenge Cup at Windsor.

NON-COMPETITIVE EXHIBITS.

The following awards were made for these: Messrs. E. Webb and Sons, Wordsley, for collection of vegetables, large gold medal; Messrs. John Waterer and Sons, Bagshot, evergreen shrubs, large gold medal; Messrs. Clibran, Altrincham, vegetables, large gold medal; King's Acre Nurseries, Hereford, apples and pears, large gold medal; Messrs. Gunn and Son, Birmingham, Japanese rock and water garden, large gold medal; Messrs. Yates and Son, Birmingham, vegetables, large gold medal; Messrs. R. Smith, Worcester, shrubs, gold medal; Mr. H. Woolman, Shirley, chrysanthemums, gold medal; Messrs. Laxton, Bedford, potatoes and vegetables, gold medal; Messrs. Hewitt and Co., Solihull, gold medal; Messrs. Bakers, Wolverhampton, shrubs, small gold medal; Mr. Godfrey, Stourbridge, shrubs, silver medal; Mr. James Simpson, Harborne, shrubs, silver medal; Miss S. S. Thompson, Handsworth, for a collection of cacti, silver medal; Messrs. R. Smith and Co., begonias, silver medal; Mr. J. Randall, zonal pelargoniums, etc., silver medal; Messrs. Clibrans, winter-flowering new begonias, silver-gilt medal; Messrs. Thomson and Co., Birmingham, vegetables, silver medal; Mr. Ellison, West Bromwich, ferns, silver medal.

Windsor, NOVEMBER 12.

The eighteenth annual autumn show was held in the Royal Albert Institute, and was a great success. Much interest centred in this show on account of the King's Challenge Cup having been twice won by Mr. Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addlestone; this time he was the only entrant, staging fine blooms, and this trophy has found a final home at Woburn Place. Cut blooms were not so numerous as usual, but good groups of chrysanthemums, as well as miscellaneous subjects, were of a high order of merit, and fruit and vegetables well up to the average.

CUT BLOOMS.

For six vases, five blooms in each, of one variety, the King's Challenge Cup was offered with the first prize; this brought but one exhibitor, Mr. Stevenson, who staged extremely fine specimens of Miss L. Thorne, Reginald Vallis, F. S. Vallis, Master James, Lady Talbot, and Walter Jinks. In a class for eighteen Japanese, distinct, arranged in a space 5ft. by 3ft., with the addition of any foliage plants or cut foliage, quality of bloom to be the leading feature, there was again but one competitor. This was Mr. Stevenson, who arranged amongst small palms, ferns, oak, and other sprays, handsome blooms of popular varieties in an effective manner, showing how effective are large blooms when properly associated with decorative material. In the class for twelve incurved and twelve Japanese, distinct, Lady Evelyn Mason gave a challenge cup, in addition to the first prize in cash. There were three competitors, and Mr. C. Page, gardener to J. B. Fortescue, Esq., Dropmore, Maidenhead, won easily the coveted award by the superiority of both incurved and Japanese blooms. The varieties were: Japanese, Lady Talbot, Mdme. P. Radaelli, Mrs. C. Penford, Mrs. Norman Davis, F. S. Vallis, Pockett's Crimson, G. G. Mileham 1908, Reginald Vallis, Mrs. A. T. Miller, and Leigh Park Wonder. Incurved, Beauty of Bucks, Clara Wells, Romance, G. F. Evans, W. Pascoe, Buttercup, Godfrey's Eclipse, Fred Palmer, and Triomphe de Mont Brun as the best. Mr. R. Evens, gardener to H. F. Slattery, Esq., was second. Single-flowered varieties made a bright display, and for six varieties, five sprays to each, not disbudded, Mr. Page was first among eight entrants with excellent vases of Mary Richardson, E. Trower, and Metta; Mr. W. Cole, gardener to Mrs. E. B. Foster, Clewer Manor, was a good second.

Large blooms, arranged in a basket or vase, are usually a great feature at this show. On this occasion five entered for twelve, with stems not less than 12in. long, arranged with any natural foliage. Mr. Page led with typical specimens of F. S. Vallis, Lady Talbot, Mrs. N. Davis, and Splendour associated with richly-coloured sprays of Berberis Thunbergi; Mr. Stevenson second with blooms of Duchess of Sutherland.

For twelve Japanese, distinct, Mr. Stevenson was first among six entrants with an excellent set of popular varieties; Mr. J. Minty, gardener to Mrs. Moir, Cockle, second. For six Japanese, any one variety, Mr. Stevenson was once more successful with grand blooms of Lady Talbot; Mr. Page second with F. S. Vallis; Mr. Minty third. For a similar number of blooms of any one incurved variety, Mr. Stevenson was again the most successful, with grandly-coloured blooms of Buttercup, Mr. Page following with rather coarse specimens of G. F. Evans.

Amateurs are not a numerous body here. The Rev. G. S. Cuthbert won for twelve Japanese with really nice blooms of F. S. Vallis, Reginald Vallis, and Florence Penford; Mr. C. Hanstin, second.

GROUPS.

Groups of chrysanthemums associated with foliage plants are usually popular here, and they are deservedly so, for they are remarkably well arranged. Mr. W. Cole was first with dwarf plants, well furnished with good foliage, and carrying fine blooms, all lightly arranged with crotons, etc.; Mr. E. J. Hill, gardener to A. L. Wigan, Esq., second. The competition for the prizes for a group of decorative chrysanthemums, not disbudded, was even more interesting, owing perhaps to the general scarcity of such classes at the shows. Nothing could be more effective from a decorative point of view. Mr. F. Copp, gardener to E. Iveson, Esq., Ascot, was distinctly first with freely-flowered plants of popular varieties, not too closely packed, which is an all too common fault; Mr. J. Barnes, gardener to Lady Dalton Fitzgerald, second with good plants, effectively grouped, excepting the margin, which was too thin; Mr. G. West, gardener to F. Ricardo, Esq., The Friary, Old Windsor, third, with a collection of well-chosen varieties, freely flowered, but all too closely arranged, just a flat, formal bank.

Mr. J. Minty had the best group of miscellaneous plants arranged for effect in a small space, orchids, nerines, pancratiums, ferns, crotons, and palms all nicely associated; Mr. F. Clarke, gardener to Sir J. McGregor, second. Carnations added variety and interest to the show. For three vases, distinct varieties, six blooms of each, Mr. G. West was first, and Mr. F. Plowright second. Mr. Titt, florist, Windsor, had an interesting exhibit of wreaths, etc.

Reading Gardeners' Association.

At the fortnightly meeting, held in the Abbey Hall, on Monday, November 8, there was a very large attendance of members, the occasion being the president's lecture, "The Preparation and Planting of a New Orchard of One Acre." Presiding at the opening of the meeting, Mr. Parfitt commended to the members their energetic individual and united support of the exhibition, which, before the next fortnightly meeting occurred would be numbered with the things of the past. The President requested Mr. A. F. Bailey to take the chair, and before commencing his remarks, thanked Mr. F. Townsend for so kindly exchanging dates with him, owing to his unavoidable absence from Reading on October 25.

The Reading Gardeners' Association is particularly fortunate in possessing so eminently practical a president, and they have on more than one occasion, notably when they visited his plantation at Caversham in September, 1908, profited by his profound knowledge and ripe experience of fruit cultivation, which, by the way, is practised by him from the sheer inherent love of his "hobby." We shall not pretend to follow the president fully in his lengthy and learned discourse, which conclusively proved, if such proof were wanting, how deeply he has studied and how extensive is his knowledge of matters pertaining to fruit culture. Mr. Parfitt not only imparted the fullest advice as to the preparation, etc., of one orchard, but information was given as to the treatment and laying out the quantity of land stated under several conditions of soil, situation, etc. First dealing with an acre plot, in the preparation and planting of which there was to be no limit to the expenditure, and afterwards advising what should be done, in different degrees, when the outlay was limited to certain figures. Advice was also given as to the best varieties of trees to plant, the proper distance at which the standard trees should be placed apart, also as to the desirability of, for the first few years, occupying the ground between the standards with bush trees. Note-books were very freely used during Mr. Parfitt's remarks, and when he resumed his seat he was loudly applauded.

The able lecture was followed by a most instructing and interesting debate, sustained by Messrs. Bailey, Powell, Tunbridge, Fry, Saxby, Neve, Wilson, etc. Mr. W. G. Pigg, gardener to H. Fitch, Esq., Trevercli, Maidenhead, exhibited a well-flowered Cymbidium Traceyanum. Three new members were elected.

A hearty vote of thanks to the President concluded the meeting.

Bradford.

NOVEMBER 12 and 13.

The chrysanthemum show held each year at Bradford, in the St. George's Hall, is always a very pretty and attractive one, the general arrangement being excellent and effective. A raised shelf all down the centre of each long table accommodates the various pot plants, such as primulas, table plants, hyacinths, etc., and the cut blooms are arranged on either side. Immediately in front of the platform the beautiful bouquets—always a delightful feature, are arranged, with begonias behind and above them on the platform edge. There is barely room left for the band, for round and behind the instrumentalists, and right up to the organ, range the bush and other specimen chrysanthemums. As a spectacle the Bradford Show is one of the best we know, one might say of it that it is admirably stage-managed; even all the tabling is prettily and comfortably draped with red material, and boxes and packing materials are conspicuous by their absence.

CUT FLOWERS.

Four competitors were attracted by the substantial prizes of £10, £7, £5, £3, and £2, offered by the Bradford Society for two dozen Japanese blooms, not fewer than eighteen varieties, on boards, and chief honours fell to Mr. Charles Jones, Spital Old Hall, Bromborough, Cheshire, for a fine set of the following varieties: Lady Talbot, G. F. Bruzard, Frank Payne, Reginald Vallis, Paul Raudet, Bessie Godfrey, W. J. Davis, Mrs. W. Knox, Valerie Greenham, W. A. Etherington, Madame G. Rivol, Mrs. C. Penford, W. R. Church, North Pole, Yellow Etherington, Walter Jinks, White Barkley, and Mrs. Barkley. Mr. A. Chandler, gardener to Arthur James, Esq., Coton House, Rugby, was a close second, his F. S. Vallis, Reginald Vallis, Bessie Godfrey, and Mr. G. Mileham being especially good; Mr. G. W. Drake, Cardiff, third; and Mr. W. Iggulden, fourth. For a dozen Japanese blooms, distinct, Mr. Chandler led the way with F. S. Vallis, Bessie Godfrey, J. H. Silsbury, Reginald Vallis, and Valerie Greenham, as his best specimens; Mr. C. Jones second, and Mr. W. Iggulden third.

Only two competitors came forward in the class for two dozen incurved blooms, and here Mr. G. W. Drake, Cathays Terrace, Cardiff, was awarded first place for very large and, on the whole, good blooms, of such varieties as Mrs. Judson, Doris Rayner, Le Peyron, Embleme Poitevine, Mrs. Wynn, C. H. Curtis, and Triomphe de Montbrun; Mr. A. Chandler second with smaller and rougher flowers. Two competitors entered in the class for a dozen incurved blooms, distinct, and here Mr. Drake was again to the front, winning with big blooms of May Phillips, Mrs. B. Hankey, Nellie Threlfall, Boccacio, Mrs. Judson, M. Muelenare, Mrs. J. Wynn, Embleme Poitevine, Madame Vremblay, Pantia Ralli, Ialene, and C. H. Curtis; Mr. Chandler was again second.

Some very fine blooms were to be seen in the class for eighteen Japanese blooms, in six varieties, set up in vases. Mr. W. Iggulden, Locks Hill, Frome, led the way with F. S. Vallis, Madame P. Radaelli, Lady Talbot, Bessie Godfrey, Madame G. Rivol, and Reginald Vallis; Mr. A. Chandler followed, and he had fine vases of Bessie Godfrey and F. S. Vallis. Mr. W. Moorby, Rhodes Street, Shipley, annexed the chief award for a dozen vases of single chrysanthemums with some pretty sprays, but if the order had been for six sprays of each, instead of three, the display would have been very greatly improved; Mr. J. Thornton second, and Mr. L. Shearman, Undercliffe Cemetery, Bradford, third.

The great local class was for eighteen Japanese blooms, and here the silver cup offered by the Lord Mayor of Bradford as first prize was won by Messrs. H. Clark and Son, Rodley, with a very even, clean set of Mr. A. T. Miller, Bessie Godfrey, C. H. Broomhead, F. S. Vallis, Mrs. G. Mileham, Formality, Madame P. Radaelli, Mrs. T. Dalton, F. S. Vallis, A. Davis, Edith Jamieson, Reginald Vallis, J. H. Silsbury, and Bessie Godfrey. Mr. J. Thornton came second; Mr. W. Aldridge, gardener to Mrs. Constable, Manor House, Otley, third; and Mr. H. Foster, St. Ives, Bingley, fourth.

In the local class for a dozen incurved, distinct, Mr. J. Thornton, Lumb Hall Nursery, Drighlington, led the way, followed in order by Messrs. H. Clark and Son, Rodley, Leeds; and Mr. Thomas Bird, Valley Street, Windhill, Shipley. In the local class for decorative varieties in vases, Mr. J. Brookes, Park Nurseries, Heaton, led with useful sprays of popular varieties; Mr. W. Moorby, second; and Mr. R. Eichel, Eldwick, third. In the same division Mr. Thornton scored for nine vases of single varieties with a good set, in which Altrincham Yellow and Edith Pagram figured prominently; Messrs. H. Clark and Son, second; and Mr. Moorby, third; six competitors.

PLANTS, ETC.

Mr. A. C. Brown, gardener to C. Beverley, Esq., West Royd, Farsley, scored for six table plants in a strong competition, and he also led for three table plants. Roman hyacinths and lily of the valley were not nearly so good as usual, but primulas were fairly good, Mr. Nutter, gardener to J. Barron, Esq., Claremont, Bingley, leading for six plants, with Mr. F. Howland, gardener to T. Arton, Esq., Micklefield House, Rawdon, second; and Mr. L. Shearman third.

The chief prizewinners in the classes for chrysanthemum plants were Mr. S. Nutter, Mr. S. Thompson, Mr. J. W. Anderson, gardener to O. G. Moss, Esq., Bingley; Mr. W. H. Aldridge, and Mr. Shearman. Mr. R. Eichel was to the front for Begonia Gloire de Lorraine, and Mr. J. W. Dale staged the best scarlet salvias.

Seven pairs of bunches of black grapes were tabled, and those sent by Mr. Howland (Gros Maroc) were considered the best; Mr. E. Midgley, gardener to R. J. Foster, Esq., Harrowins, Queensbury, second; and Mr. Chandler, third. Mr. Midgley scored easily for white grapes, with Mr. Sutcliffe, Raglan Street, Bingley, second.

FLORAL DESIGNS.

The bouquet classes were very well filled; the best hand bouquet was a lovely arrangement of white roses, pancratiums, and lily of the valley from Mr. M. Brooke, 34, North Parade, Bradford; Mr. J. Brooke was second. Mr. M. Brooke had the best bouquet of red roses—Richmond; Mr. J. Brooke a close second. Mr. M. Brooke also led for a chrysanthemum bouquet, using single varieties, and also for a bouquet of carnations, using a scarlet variety. Mr. Howland led for buttonhole bouquets, with neat arrangements of odontoglossums, but Mr. M. Brooke was first for ladies' sprays, with delightful sprays of roses.

Mr. E. Midgley was a fine first for a basket of chrysanthemums in pink, white, and bronze; Mr. R. Eichel second, and Mr. John Brooke third. Mr. F. Howland led for an epergne of chrysanthemums, and he used the popular Mary Richardson, single variety; Mr. Eichel second, and Mr. T. Dawson, Otley, third. Mr. Eichel, Eldwick, scored for a basket of autumn foliage and berries, and Mr. J. Brooke was a good second.

NON-COMPETITIVE.

Mr. J. Brooke, Market Hall, Bradford, contributed a display of floral designs and table plants. Messrs. W. Conway and Sons, Halifax, exhibited a collection of flowering and foliage plants. Messrs. Alex. Dickson and Sons, Lim., Newtownards, Co. Down, brought over a collection of rosy-cheeked apples, some good potatoes, and single chrysanthemums; their Peasgood's Nonsuch, Bismarck, and Emperor Alexander apples were particularly clean, large, and well-coloured.

Ascot Horticultural Society.

As usual, this society held its annual exhibition at the Grand Stand, and we are pleased to record the fact that it was in every way a success. Groups were the chief feature. The president, Sir Edwin Durning Lawrence, Bart., must feel very proud of his gardener, Mr. Lane, who secured three first prizes for groups and four first prizes for vegetables. Mr. Sydney R. Clement, the honorary secretary, was complimented by the judges on the excellent arrangements. The weather was fine, and the attendance was above the average.

PLANTS.

In the class for groups of chrysanthemums, with foliage plants, Mr. W. Lane, gardener to Sir Edwin Durning Lawrence, King's Ride, Ascot, was first; Mr. J. Sargent, gardener to Sir A. C. Lucas, Bart., Heatherwood, Ascot, second; and Mr. E. Young, gardener to Mrs. Morrison, Farm Wood, Ascot, third. For groups of chrysanthemums Mr. Lane was first; Mr. F. Capp, gardener to E. Iveson, Esq., The Chartars, Sunningdale, second; and Mr. W. Haines, gardener to Mrs. Lillingstone, Ascot, third. For a non-disbudded group of chrysanthemums Mr. Capp was first with a magnificent arrangement, the premier including the silver cup offered by the secretary; Mr. J. Sargent second, and Mr. W. Neate, gardener to Miss Thacker, Ascot, third. For a group of miscellaneous plants Mr. Lane was first with some well-grown cattleyas and oncidiums, crotons, etc. Mr. J. Sargent ran him very close for second place with a lighter arrangement. Mr. Lane won for table plants. For six Begonia Gloire de Lorraine, Miss Langworthy, Holly Port, Maidenhead (gardener, Mr. T. Broom), was first; and for six cyclamens, Mr. C. Cooper, The Vineries, Sunninghill, was successful in obtaining the premier award.

CUT BLOOMS.

In the open class for eighteen Japanese, distinct, Mr. C. Moore, gardener to C. A. Pearson, Esq., Farnham, was a capital first with fresh blooms of Mrs. C. Penford, F. W. Leaver, A. H. W. Prior, Mrs. W. Knox, Marquis V. Venosta, Reginald Vallis, J. A. Silsbury, President Viger, W. Watson, Miss S. Oliver, Miss L. Thorn, The Lyon, Mrs. A. J. Miller, George Mileham 1908 (the premier bloom), Mrs. W. Davis, C. A. Broomhead, W. Beadle, and White Venosta. Mr. T. A. Brooms, gardener to Miss Langworthy, Holly Port, Maidenhead, was a capital second, his best blooms being, H. Perkins, Bessie Godfrey, and Australia; W. Wilson, Esq. (gardener, Mr. C. Ribsden), Windlesham, third.

For eighteen incurved, distinct, and eighteen Japanese, distinct, Mr. W. Wilson was the only exhibitor, and the judges very properly awarded him the first prize. His incurved blooms were grandly finished, there not being a weak flower. For eighteen distinct incurved Mr. W. Wilson was again first, staging fairly good flowers of W. A. Browlees, Topaze Orientale, W. D. Perkins, Embleme Poitevine, W. Biddle, Mrs. F. Ashworth, Lady Isabel, Godfrey's Eclipse, Mrs. C. Crooks, Mr. G. Denyer, G. F. Evans, Duchess of Fife, Clara Wells, C. H. Curtis, W. Pascoe, Frau Tristian, Buttercup; Mr. C. Knox second. For six incurved, distinct, Mr. F. Dutton was first, and for six blooms of one incurved variety Mr. F. J. Broome was first with Romance. This stand contained the premier bloom of incurved (grand).

For six table plants Mr. W. Lane was first, and Mr. W. Wilson second.

FRUIT.

For two bunches of black grapes Mr. C. Cooper was first with Gros Maroc; Mr. H. G. Worsfered, gardener to C. H. Asten. Esq., Englefield Green, second; and Mr. W. Lane third. For two bunches of white grapes, Mr. W. Lane was first with grandly coloured Muscat of Alexandria. Mr. Capp obtained premier for six dishes of dessert pears, also for the same number of dishes of cooking apples. Hon. Miss Hill was first for four dishes of dessert apples, richly coloured. Mr. W. Lane was first for nine varieties of vegetables, and also in Messrs. Sutton and Sons, Messrs. Webb and Sons, and Messrs. Sale and Son's classes for collections of vegetables.

COLLECTION OF THIRTY-SIX INCURVED CHRYSANTHEMUMS
For which Mr. W. Higgs was awarded a silver cup at Winchester.

Winchester, NOVEMBER 16 and 17.

For many years this city has been able to boast of having one of the finest of autumn shows in the country, and one of the best of places in which to hold it. The Guildhall is undoubtedly an ideal place for such a display, except that it is hardly large enough to accommodate all the subjects submitted. This year's display was no exception.

PLANTS.

For the best collection of chrysanthemums arranged in a space 8ft. by 7ft., there were five contestants. Mr. A. J. Marsh, gardener to M. Hodgson, Esq., Morton House, Kingsworthy, was first with good blooms on plants well arranged; Mr. A. Macay, gardener to C. R. Schmidt, Esq., Alresford, second. Chrysanthemum plants, grown for conservatory decoration, were a good feature. For nine distinct, each to carry not less than five blooms, Mr. J. Cousens, gardener to J. A. Fort, Esq., 69, Kingsgate Street, Winchester, was first with dwarf, well-flowered examples, and Mr. G. Adams, gardener to Colonel F. A. Dickins, Edge Hill, Winchester, was second.

In a similar class, but confined to varieties with white or yellow flowers, Mr. G. Cousens won with charming plants of F. S. Vallis, Mrs. Judson, C. H. Curtis, and Mdme. R. Oberthur; Mr. Adams second, also good. The best single specimen, untrained, was one from Mr. E. Yarrow, 38, North Walls, Winchester.

Miscellaneous plants, arranged for effect in a space 9ft. by 7ft., were highly attractive. Mr. J. Hughes, gardener to A. P. Ralli, Esq., Twyford Lodge, Winchester, was first with orchids, palms, etc., nicely arranged; Mr. E. Long, gardener to F. C. Birch, Esq., Clovelly, Southampton, second.

CUT BLOOMS.

The class for thirty-six Japanese, in not less than twenty-four varieties, brought six entries, the several collections making a very fine display. Mr. T. Stevenson, gardener to E. Mocatta, Esq., Addlestone, was first with heavy blooms of Lady Talbot, F. S. Vallis, Leigh Park Wonder, Duchess of Sutherland, Mdme. G. Rivol, W. Jinks, Purity, Mrs. L. Thorn, and Mrs. A. T. Bott; Mr. C. Moore, gardener to C. A. Pearson, Esq., Frensham Place, Farnham, second; Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead, third.

There were four entries in the class for twenty-four Japanese, in not less than eighteen varieties, and Mr. H. Lloyd, gardener to Major Wyndham Payne, Bransgore House, Christchurch, was first with heavy blooms, well arranged; Mr. H. Lloyd, gardener to Captain Wiener, Ewell Castle, Surrey, second. In the class for twelve Japanese, distinct, Mr. D. Edwards, gardener to W. Garton, Esq., Sarisbury Court, Swanwick, was first, and Mr. A. Macay second.

At this show there were but two classes for blooms arranged in vases, all the remainder being shown on the ordinary boards. For six varieties Japanese, three blooms of each, six competed, and Mr. Stevenson won with very fine examples of Lady Talbot, Mrs. G. Mileham, F. S. Vallis, J. H. Silsbury, A. Davis, and Edith Jameson; and Mr. H. Lloyd was second. In the class for five blooms of any white variety, Mr. G. Adams won with Mdme. R. Oberthur amongst five competitors.

Incurved varieties were very fine indeed, quite the best seen this year. For thirty-six, in not less than twenty-four varieties, or more than two of any one variety, there were four entrants, and Mr. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead, occupied the post of honour with massive, well-finished blooms of the leading varieties in cultivation. In the class for eighteen, in not less than twelve varieties, there were three entries, and Mr. Edwards was first with large, even blooms, and Mr. Hughes was second with smaller, yet good examples.

Single-flowered varieties, not disbudded, and arranged in vases, made a brave display. There were seven competitors, and Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore House, Bishop's Waltham, was first with huge masses of Edith Pagram, Roupell Beauty, and Mrs. E. Roberts; Mr. J. Hughes second. In a similar class for any decorative varieties, except singles, there were nine entries. Mr. A. E. Taylor, 3, Hill Side Terrace, Winchester, was first with an extremely fine exhibit, comprising Source d'Or, Phœbus, Emperor of China, and Soleil d'Octobre; Mr. E. Long second.

DECORATIVE CLASSES.

The most tastefully arranged stand of flowers, foliage, and grasses, suitable for table decoration, was very attractive. Mrs. Jeffery, Nursling, was first; Mrs. Bealing second; Mrs. E. Ladhams, Shirley, third. For the best arranged dinner table decoration of flowers, in a space 3ft. square, Mrs. Rapley, Warblington Cottage, Havant, was first with a low arrangement of bronze chrysanthemums; Mrs. Bealing second with carnations, roses, and lily of the valley; Mrs. Walters, Fareham House, third.

For the most tastefully arranged stand of flowering shrubs, coloured foliage, grasses, etc., all to be gathered in the open, Mrs. Jeffery was first, and Mrs. Smith, St. Cross, second.

Mr. S. Bide, Alma Nursery, Farnham, was awarded a gold medal for a fine display of floral decorations.

FRUIT.

Fruit was remarkably good. Mr. Ellwood was first for two bunches of black grapes. Mr. Hall, gardener to Lord Swaythling, South Stoneham, won for two bunches of white grapes, also for three dishes of dessert apples, for kitchen varieties, and for pears.

Hitchin, NOVEMBER 11.

Although the morning was very bright and pleasant, the weather at Hitchin changed to cold drizzle just as the visitors began to arrive, and we fear the "gate" must have suffered during the afternoon and evening. The show, held in the Town Hall and Gymnasium, on Thursday, November 11, was a very successful one floriculturally, and even better as a whole than the bright and attractive ones that have preceded it in recent years. Not only were flowers good, especially in the vase classes, and those for decorative and single flowers, but hardy fruits and vegetables were excellent, and the competition good. There is one weak point about the management of this otherwise excellent society, i.e., excessive leniency towards exhibitors in the matter of the time for judging. This year, in the hope of providing ample time for those competitors residing in outlying and rather unget-at-able places, the hour of judging was fixed at 11.30, but it was 12.15 before the judges could start. We suggest this is unfair to competitors and judges, and as most of the members of the large committee are competitors, the matter is in their hands to alter.

CUT BLOOMS.

Vase classes are a great feature of the cut flower section at Hitchin, and, as there are a number of good growers in the district, the blooms are always of a high standard. In the premier class for six vases, three blooms of one Japanese variety in each vase, and each bloom to have not less than 1ft. of stem attached, there were four competitors for the challenge cup presented by T. Fenwick Harrison, Esq., to which 30s. is added as first prize; four prizes are offered. The chief honours fell to Mr. J. Coutts, gardener to M. R. Pryor, Esq., Western Park, Stevenage, for a fairly heavy set of blooms of F. S. Vallis, Mdme. Paolo Radaelli, Reginald Vallis, Mrs. A. T. Miller, Valerie Greenham, F. S. Vallis, and Mrs. E. Crossley. He was closely followed by Mr. Hartless, gardener to T. Fenwick Harrison, Esq., Hertingfordbury, who had rather smaller but very fresh blooms, some of them scarcely at their best; Mr. Munt, gardener to W. Bailey Hawkins, Esq., Stagenhoe Park, Welwyn, third; and Mr. Pateman, gardener to C. A. Cain, Esq., The Node, Welwyn, fourth.

Another good class was for four vases of Japanese blooms, staged under similar conditions, and here Mr. T. Sadler, gardener to Mrs. Cotton Brown, Walkern Hall, Stevenage, scored with fresh flowers of Mrs. G. Mileham, F. S. Vallis, Mrs. Knox, and Mrs. A. T. Miller; Mr. R. H. Crockford second; and Mr. W. G. P. Clark (the hon. secretary), third.

In a very close competition, Mr. Hartless annexed the premier award for a dozen Japanese blooms, distinct, on boards, and here he scored with very bright examples of Bessie Godfrey, Sappho, Edith Smith, Master Fred, Mrs W. Knox, Lady Hopetoun, Mdme. Paolo Radaelli, Norman Davis, Duchess of Sutherland, Mrs. A. T. Miller, Reg. Vallis, and Mrs. R. H. Pearson; Mr. W. Munt was a fine second; and Mr. J. Coutts third. Mr. Hartless's Bessie Godfrey was judged to be the best bloom in the show. Mr. T. C. Sadler led for six Japanese blooms on boards, and was followed by Mr. H. Harding and Mr. Crockford.

Mr. Hartless had the best six incurved, one variety, winning with good, shapely flowers of Romance; Mr. Munt second with Mrs. B. Hankey; and Mr. Sadler third with Mrs. Denver. Mr. Munt scored for six incurved, distinct, but neither he nor Mr. Hartless, or Mr. Creswell, gardener to the Earl of Lytton, Knebworth House, Knebworth, showed particularly well in this class.

Two classes stood out conspicuously on this occasion, and served to demonstrate the popularity and usefulness of single and decorative varieties. For three vases of single varieties, six sprays of one variety in each vase, there were nine competitors, and nearly all showed well, but the set of Edith Pagram, Bronze Pagram, and E. Forbes, stood out above the rest, as the bold sprays of large disbudded flowers were splendid; these were from Mr. H. Bates, gardener to Miss E. Robertson, Sele Grange, Hitchin; Mr. R. H. Crockford, gardener to C. Poyntz Stewart, Esq., Chesfield, Stevenage, was an excellent second; and Mr. A. Wilson, gardener to A. Ransom, Esq., Burslow, Hitchin, was third. Of equal attractiveness and utility was the class for three vases, six sprays each, of decorative varieties, and here Mr. W. Munt was placed first for very fine sprays of clean, medium-sized flowers of Lizzie Adcock, Etoile Blanc, and Crimson Source d'Or; Mr C. H. Green second; and Mr. W. Robinson third, from eleven entries.

Mr. Hartless was first for five blooms of one Japanese variety with Miss D. Oliver, Mr. Munt following with Mrs. A. T. Miller. For five coloured Japanese blooms, one variety, Mr. Hartless scored with Mdme. G. Rivol; Mr. J. Coutts second with F. S. Vallis; Mr. Munt third with Mr. G. Mileham.

PLANTS.

For a table group of miscellaneous plants, arranged for effect on a space 6ft. 6in. by 3ft. 6in., Mr. A. Titmuss, gardener to W. Tindall Lucas, Esq., Foxholes, Hitchin, led with bright salvias, chrysanthemums, begonias, etc.; Mr. Munt second with orchids; and Messrs. Abbers Brothers, Hitchin, third. Mr. E. Osman, gardener to S. Lucas, Esq., Tile House, Hitchin, was a good first for a group of chrysanthemums, and both he and Mr. W. G. P. Clark, York Road, Hitchin, who was second, showed well. Mr. Osman and Mr. Titmuss won the prizes for specimen plants. In the smaller group class, chrysanthemums only, Mr. W. G. Willmott, Enside, Chiltern Road, was a capital first with well-grown plants very well arranged; Mr. A. Wheeler, gardener to Mrs. Foster, second; and Mrs. G. C. Taylor third.

Mr. Hartless and Mr. Munt were first and second respectively, both for three palms and for six table plants, while Mr. Munt was first, and Mr. Pateman second for three zonal pelargoniums. Mr. Crockford had the best three Begonia Gloire de Lorraine, but these were not so fine as we have seen them at Hitchin. Mr. Sadler was first for one orchid with a big Cypripedium insigne, and Mr. Munt was second with a good C. Spiceranium.

FRUIT AND VEGETABLES.

Mr. Pateman scored for nine dishes of apples, with Rival, Cox's Orange Pippin, Mother, Bismarck, Gascoigne's Scarlet, Peasgood's Nonsuch, The Queen, Lord Derby, and Emperor Alexander. Mr. Sadler beat Mr. Pateman for dessert pears, with Beurre Diel, Doyenne du Comice, and Pitmaston Duchess. Mr. R. Parke, led for culinary pears with Red Warden, Catillac, and Uvedale's St. Germain. Mr. Hartless led for white grapes, and Mr. Munt for black grapes.

Vegetables were well shown, and there were numerous classes provided by the society, by Messrs. Sutton and Sons, and Messrs. Jas. Carter and Co. Leading prizewinners in this division were Mr. H. Bates, gardener to Miss E. Robertson, Sele Grange, Mr. H. Harding, gardener to Mrs. Harris, Sele Lodge; Mr. Munt and Mr. Hartless.

FLORAL DECORATIONS.

Table decorations were good, no fewer than twelve competing in the class for chrysanthemum flowers, and six in the class for any other flowers than chrysanthemums. In the latter class roses were very largely used. The prizes in these classes were awarded by popular vote, the first hundred visitors receiving voting papers, but our representative had to leave before the result was made known. Mrs. W. G. P. Clark had the best vase of flowers—roses; and Sister Ernestine, Warrenhoe, Hitchin, led for a basket of chrysanthemums with a very fine arrangement of both large and small flowers of yellow and crimson varieties.

South Shields Chrysanthemum Exhibition.

The annual exhibition of this society was held on Wednesday and Thursday, November 10 and 11, and in common with most exhibitions, the exhibits fell short on account of the most untoward season. The cold and very wet autumn was not favourable for the development of the blooms, so the dates fixed proved a little too early, especially for the pot plants, many of them being only in bud, others not fully developed. Nevertheless, many very fine flowers were staged in the Japanese section, and also in the classes for incurved. The bouquets, epergnes, and dinner-table decorations were, as usual, most artistic, and quite a feature in themselves.

In the chief class for thirty-six Japanese, the premier award was the President's silver cup, valued fifteen guineas, and £10 in cash. Mr. A. Chandler, gardener to Arthur James, Esq., Rugby, was a good first with the following well-developed varieties: F. S. Vallis (2), (one of these was selected as the premier bloom), Reginald Vallis (2), Magnificent (2), Bessie Godfrey (2), P. Viger (2), J. H. Silsbury (2), J. Lock, Mrs. G. Mileham, Lady Talbot (2), George Mileham, C. H. Totty, Dorothy Goldsmith, W. Gee, Rose Pockett, Henry Stowe, Mrs. O. Miller, Algernon Davis (2), Mrs. Norman Davis, Valerie Greenham, Duchess of Sutherland, Marquis V. Venosta (2), Mrs. E. Crossley (2), and Miss Hilda Rowley; Mr. G. W. Musk, gardener to Captain Laycock, Bawtry, Notts, was second; Mr. C. Jennings, gardener to F. W. Jameson, Esq., North Fereby, Yorks, was third; and the fourth prize fell to Mr. G. E. Thomas, gardener to the Marquis of Ripon, Studley Royal.

In the class for eighteen Japanese, Mr. Chandler and Mr. Jennings again occupied the first and second positions, with Mr. Reay, gardener to James Readhead, Esq., Westoe Hall, third. The same exhibitors took the chief prizes in the smaller classes of Japanese. The incurved blooms were not numerous, but much better developed than one could have expected in such a late season. Mr. C. Jennings was again first with a very good stand of twenty-four varieties, thus winning Mr. John Readhead's silver cup, valued five guineas, for the third time outright. He consequently rivalled Mr. Chandler's success in the chief Japanese class in winning the President's silver cup three times in succession. There was some interesting competitions in the local classes for cut blooms; and Mr. Hetherington, gardener to C. T. Kendal, Esq., North Shields, was the only exhibitor of a group, and won Mr. Wm. Readhead's silver cup and £5 cash.

Especial mention should be made of the bridal and other bouquets, and the epergnes. These experts in the art—Mrs. James Summers and Miss Summers, of Sunderland—exhibited some splendid arrangements, and won the chief prizes. Some very choice orchids, with pancratiums, lilies of the valley, etc., with some croton foliage, being the principal flowers used. There was also some very high-class fruit on the decorated table by the same exhibitors. The basement of the Royal Assembly Hall was filled with a splendid exhibition of vegetables. The leeks, for which some good prizes were given, being the principal attraction.

Royal Botanic Society.

NOVEMBER 12.

Early in the current month an appeal was issued by the Council to the Fellows of the society for contributions to the fund being raised for the purpose of meeting the more pressing liabilities. On the 12th inst., a meeting of the Fellows was held at the society's gardens for the purpose of considering the results of the appeal. Mr. P. S. Stephens, K.C., who occupied the chair, said the society owed £2,000 to the bank, which had agreed to accept £1,000 on account, and the balance of £1,000 on January 31. Unless £500 was paid at once, and £500 in the first week of next month, the society would be in the hands of the bank, which had threatened to take action. The letter to the Duke of Teck, which we published in our issue of the 13th inst., had not officially reached the Council, and they had not, therefore, been able to take any tangible steps in the matter. The amount of the debts owing was actually £4,000 less than a few months ago; £1,809 was required to pay an overdraft, and there were sundry accounts which brought up the total deficiency to £3,293.

Mr. Rubenstein spoke in favour of the Council approaching the Royal Horticultural Society with a view to amalgamation. Mr. Cecil Raleigh expressed his objections to this being done, and proposed that a hundred of the Fellows present should meet the present emergency by subscribing £5 each. In a few minutes it was announced that £379 had been raised in addition to the promises that had been received.

East Anglian Horticultural Club.

At the November meeting of this club, it was in every way sympathetic that a vote of condolence was moved to Mr. John Clayton, manager at Messrs. Daniels Bros., Lim., Norwich, at the recent loss of his wife. Mr. Clayton should have given a paper that evening at the club, but, under the circumstances, had to postpone it. Mr. H. Perry opened up what proved to be a most animated discussion upon "What is a Spray of Naturally Grown Chrysanthemums?" It was eventually decided, upon the suggestion of Mr. H. Goude, Catton Grange Gardens, that in future the schedule should stipulate that it should read a terminal spray, which would constitute one growth only from the point of the last break. Mr. H. Goude secured the special prize for the best two plants of Begonia Gloire de Lorraine. Mr. H. Shoesmith, Cringleford, won for the new

Begonia Ideal, also for orchid and black grapes with very creditable specimens. Mr. W. Palmer, gardener to J. B. Coaks, Esq., Thorpe, had a nice trio of Japanese chrysanthemums, and a well-grown cattleya. The excellence of the exhibits throughout was well maintained, as was also the discussion upon the several matters introduced.

OBITUARY.

MR. J. C. TALLACK.

It is with much regret that we have to record the death of Mr. J. C. Tallack, which occurred in the Shipley Hall Gardens on the 12th inst., under distressing circumstances. For a considerable period Mr. Tallack had suffered much from insomnia, and some months ago he had the misfortune to fracture his thigh, and it would appear that his slow recovery from his accident affected his mind and gave rise to the delusion that he was suffering from an incurable disease. Mr. Tallack's death was due to his taking cyanide of potassium, which, we hardly need say, is one of the deadliest of poisons.

THE LATE MR. J. C. TALLACK.

Mr. Tallack had been head gardener at Shipley Hall, Derby, the residence of J. C. Mundy, Esq., nearly eleven years, and during this period the gardens were greatly altered and improved, both inside and out. All the glass structures have, under his direction, been moved or remodelled, and several new features added. Of the latter the fine pergola and the water lily ponds, both in the open and under glass, are especially noteworthy. Mr. Tallack was an all-round gardener of the highest rank, and he was exceptionally well read, a keen observer, a forcible writer, and a successful lecturer. For nearly twenty years he has been a contributor to these pages, and his most recent educational work has been under the auspices of the Nottingham University College.

The news of Mr. Tallack's death has been received with profound regret by his wide circle of friends, and the deepest sympathy is felt for Mrs. Tallack and the other members of his family.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

VARIETIES OF MIGNONETTE.—E. G., Nottingham: You are quite right. In a great many gardens the inferior mignonette known as the Common is grown instead of the finer types. The common mignonette is undoubtedly beautiful and fragrant, but it is not equal to the improved forms, and nothing but the best should, where practicable, have a place in gardens, whether large or small; and in the case of this annual it is practicable, for none of the forms are really expensive. The following are remarkable for their distinctiveness, and can be specially recommended: Bismarck, a robust form, with large spikes of rich red flowers; Giant Crimson, a strong-growing variety, bearing fine spikes of flowers of the colour indicated by its varietal name; Machet, a dwarf-growing variety with dense spikes of red flowers; and Golden Machet, a stronger-growing type, with long spikes of yellow flowers. If two varieties are sufficient, Giant Crimson and Golden Machet should be selected.

KUMQUATS.—M. R. G., Horsham: The Kumquat is a small, elongated orange, and a form of Citrus japonicus. Grown as a pot plant, this makes a very attractive subject for house or conservatory decoration, as the bright golden fruits are freely produced, and are very effective. The ordinary treatment accorded the orange will suit the kumquat. Kumquats are largely used in crystallised form, and in this fashion, in fancy boxes, they form a fairly important item of the dried or crystallised fruit trade about Christmas time and the New Year.

A DOZEN KINDS OF HERBS.—F. C. S., Swindon: It is seldom that a dozen kinds of herbs are asked for at once, but the class should prove an interesting one if it is instituted. The following would make a good set: Mint, parsley, sage, thyme, lemon thyme, fennel, hyssop, rosemary, horehound, tarragon, and sweet marjoram. Other kinds available are angelica, anise, balm, basil (bush and sweet), borage, chamomile, chervil, chives, clavy, coriander, dill, pot marigold, sweet cicely, rue, sorrel, and tansy. All these kinds may be grown without difficulty, but those for which there is a regular demand are few in number.

ACETYLENE GAS REFUSE FOR LAWNS. —E. W. R., Poole: We are given to understand that the refuse of the calcium carbide used in the manufacture of acetylene gas is very useful as a top-dressing for lawns. It is best applied quite early in the spring, as it has then the effect of deepening the colour of the grass, and also of bringing worms to the surface.

ROLLING LAWNS.—N. W. T., Peterborough: There are two very emphatic "don'ts" to be remembered in connection with the rolling of lawns, and these have reference to frosty and to very wet weather. There is no objection to rolling in showery weather, but in very wet weather rolling will work the surface soil into a paste that, under the influence of sun and wind, will dry hard and prevent the proper aeration of the soil. At this season of the year, provided the soil is not over-wet, rolling will do a great deal of good; but a good sweeping should precede the rolling, to distribute worm casts and remove fallen leaves.

LARGE GOOSEBERRIES.—C. B., Neyland: We are glad you do not want a "long lecture" on each variety of gooseberry, because we have neither time nor inclination for such a lecture, and you would have been disappointed had you desired one. We would point out that high cultivation, severe thinning, and ample feeding are necessary to secure very large gooseberries, even in the case of those varieties that are naturally larger than the majority. Further, the very largest varieties are not by any means the heaviest croppers, and, as already noted, big berries mean severe thinning. For reds you may select Bobby and Dr. Woolley; green—Surprise, and Telegraph, or Green London—Thumper is of pendulous habit; white—Careless is good, but Princess Royal is pendulous; try Freedom; yellow—Leveller and Catherina. We do not know the other yellows you mention.

NAMES OF PLANTS.

S. A., Huddersfield.—Sanchezia nobilis variegata.

W. H. S., Sodbury.—1, Lycaste lanipes; 2, not recognised.

A. J. P., Sidmouth.—Appears to be a leaf of Strobilanthes Dyerianus.

E. Y., Falmouth.—1, A poor form of Cattleya labiata; 2, Symphoricarpus racemosus; 3, Tabernæmontana coronaria.

S. N. J., Bradford.—1, Physalis Franchetti; 2, Filicium decipiens; 3, Asparagus Sprengeri; 4, Clerodendron fallax.

C. G. P., Bedford.—1, Aralia (Elœodendron) Chabrieri; 2, Phrynium variegatum; 3, Acalypha Godseffiana; 4, Reidia glaucescens.

NAMES OF FRUITS.

C. E. H., Barnsley.—1, Swan's Egg; 2, Colmar.

T. P. B., Enfield.—1, Bowood; 2, Beurre Hardy; 3, Forelle.

E. G., Abingdon.—The pear is Glou Morceau, and the apple Brunswick Codlin.

M. B., Ballymascanian.—1, probably Sugar-loaf, fruit partly rotten; 2, Dutch Mignonne; 3, Rosemary Russet; 4, Cockpit.

F. T., Hadley.—1, Doyenne du Comice; 2, Beurre Diel; 3, Marie Louise d'Uccle; 4, Glou Morceau; 5, rotten, not recognised; the apple is Blue Pearmain.

G. B., Dublin.—A, not recognised; B, Durondeau; C, Blenheim Pippin; D, Chaumontel; E, not recognised; F, Emperor Alexander; G, Hawthornden; H, Col. Vaughan; I, Belle Dubois; J, Heliote Dundas; K, Court Pendu Plat.

A THOROUGHLY COMPREHENSIVE, INFORMING, RELIABLE, AND UP-TO-DATE PUBLICATION.
276 pages, Illustrated, bound in cloth. To be obtained of Seedsmen, etc., NINEPENCE Net, or Free by post for this amount direct from the Publishers, the Fourth Edition of

ROYAL HORTICULTURAL SOCIETY.

The annual examinations of the Royal Horticultural Society are becoming of such world-wide acceptance that perhaps you will allow me, through the agency of your excellent journal, to bring them to the notice of your readers, now that the dark winter evenings, with their invaluable opportunities for study, are again with us.

The society's certificates issued to successful candidates are accepted in all parts of the globe, as indicating the possession of theoretical and practical knowledge of horticulture.

The examinations were undertaken by the society as long ago as 1893, in response to the demand for such tests made under the authority of a practical body. They are now four in number, viz.: Senior General, Junior General, the Public Parks, and the School Teachers' Examinations.

The two first test the applicants' knowledge in the principles and practice of horticulture. The examinations are not confined solely to the British Islands, but are held in any part of the Empire, being altered and adapted to the various local conditions.

The Public Parks Examination is intended for the employees of County Councils, City Corporations, and such-like public bodies.

The London County Council have frequently testified to the assistance given them in this way by our society, and their present system of garden appointments and promotions is based upon the applicants' place in the pass list; about 100 of their men enter annually.

School teachers are examined in cottage and allotment gardening, the matter having been undertaken by the society in order to satisfy the increasing demand in country districts for school teachers to be competent to teach the elements of gardening.

The society has recently printed in book form all the questions set since 1893, in order that candidates may inform themselves of the general scope and character of the examination for which they propose to enter, and be thus enabled to direct the study of their leisure hours in the most profitable direction.

W. WILKS, Secretary.

Royal Horticultural Society,
Vincent Square, Westminster, S.W.

DARLINGTON.

NOW IS THE TIME TO BUY AND PLANT

EASILY-GROWN HARDY PERENNIALS.

By G. H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."
Price **5/-** net; Post Free, packed in box, **5/6**

Some Features of the Work:—

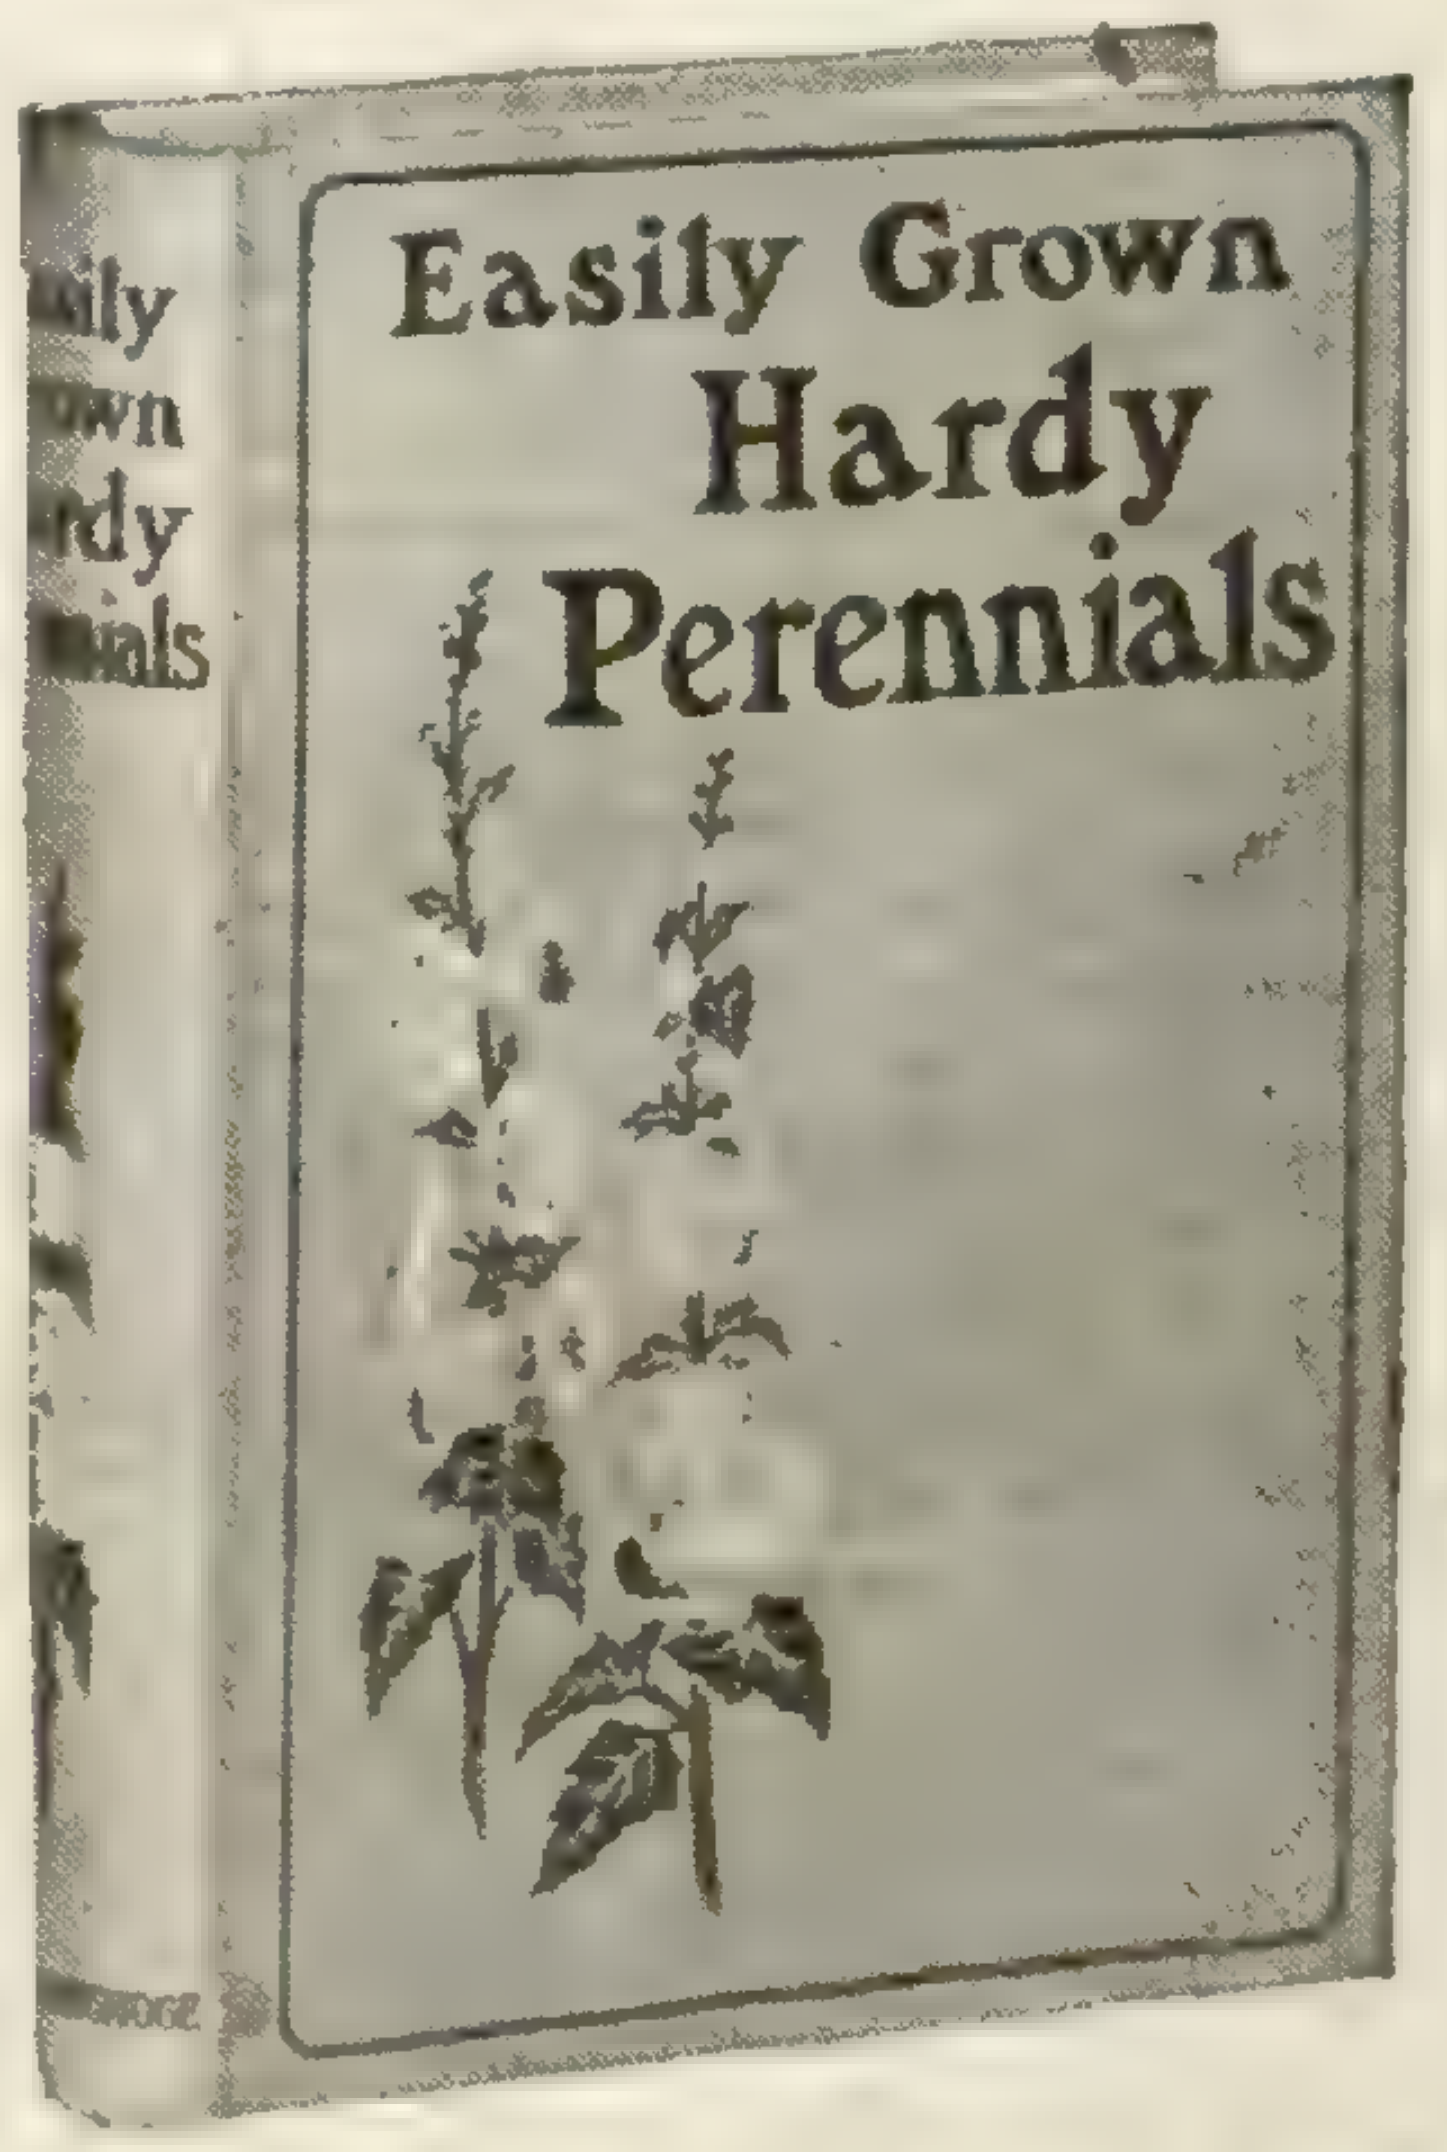
Soil and Position.—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

Planting.—The best time and method of planting are also clearly set forth.

Pests.—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

Propagation.—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

Illustrations.—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



Botanical Name.— Gives the botanical or generic name of each genus of plants described in the book.

Common or Popular Names.—Supplies the common or popular English names of all the plants described.

Natural Order.—The botanical family to which kind belongs.

Habit and Uses.—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

Species and Varieties.—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

476 PAGES, AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.

"The cultural details are very valuable."—*Gardeners' Chronicle.*

THOMSON'S CELEBRATED MANURES.
For full advertisement see back page.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Single Chrysanthemums.

For a long period subsequent to the introduction of the chrysanthemum into this country, cultivators and raisers, with remarkable unanimity, would not have anything to do with the single varieties, of which it may be assumed large numbers were raised annually. They were resolutely destroyed as they made their appearance in the seed beds, and there can be no doubt that during the first seventy or eighty years of the history of the flower in the British Isles a considerable number of really beautiful forms were destroyed because their blooms did not possess a sufficient number of ray florets to assist in the realisation of the ideals that the raisers had set up. With a thorough acquaintance with the literature of the subject, there is no great difficulty in formulating an opinion as to the views that obtained with regard to the relative merits of single and double flowers for at least two-thirds of the last century, or of properly appreciating the reason why the latter were held in such high favour. The chrysanthemum that Blanchard brought to Europe had blooms that differed very materially from those of varieties now in general cultivation, and those who were busily engaged in the production of new forms would naturally reject such seedlings as gave evidence of reversion. Moreover, the trend of the public taste was in favour of double flowers, not alone of those of the chrysanthemum, but of the dahlia, the hollyhock, and some other of the favourites, and of necessity the raisers had to provide that for which there was the largest demand. We must not, therefore, in a consideration of this question, condemn past generations of raisers as wanting in taste or judgment because of their attaching so much importance to the increase in the fulness of chrysanthemums and some other flowers. A quarter of a century or so ago the introduction of several charming single chrysanthemums directed attention to the fact that beauty, so far as it relates to these flowers, was not confined to the formal incurved, the fantastic Japanese, or the compact little pompons, and suggested to cultivators that a selection might with advantage be grown in conjunction with the other sections. They were not, however, regarded with much favour for some time, and it was not until the end of last century that they became really popular. Since then their popularity has increased at a rapid rate, and at the present time the increase is such as to suggest that some slackening of the pace thereof might be an advantage. Whether a slight check to the popularity of single chrysanthemums would be advantageous or otherwise, we are strongly of the opinion that it is desirable there should be a more rigorous selection in the case of varieties intended for distribution, and that the several bodies entrusted with the important duty of making awards to novelties should appreciably raise their standard of merit. We have been much impressed during the season now rapidly reaching its close with the desirability of some change in the directions indicated. Both at the London meetings and provincial exhibitions we have seen numbers of varieties that are considerably below the standard by which they should be judged, and it should hardly be necessary to point out that varieties more or less indifferent will check the popularity of the section, and greatly reduce the demand for novelties, and thereby prevent the raisers obtaining an adequate return for their labours. From a careful examination of large numbers of varieties that have come under our notice during the present season, it appears to us that in forming an estimate of the merits of a considerable proportion sufficient attention has not been paid to the flower as a whole. To form a proper estimate, it is essential that the disk as well as the ray florets should be taken into consideration, for, however attractive in colour or perfect in form the latter may be, the bloom will be unsatisfactory if it has in its centre a prominent mass of green florets. It may be difficult to obtain perfect harmony in the colouring of the two classes of florets, but there should be some approach thereto, and raisers should make strenuous efforts to effect an improvement in the centres, and they will be greatly assisted in the attainment of this object if they take the variety known as Mary Richardson as a model. There is room also for improvement in the ray florets of many varieties, but it is difficult to indicate the lines on which it should proceed, because it is not desirable to materially restrict the variations in the form of the blooms. Generally speaking, the florets should be more or less uniform, and be sufficiently close together for a considerable part of their length for the edges to touch each other or very slightly overlap. It is a very general impression that single chrysanthemums should have one row of ray florets only; but, excepting in the case of such varieties as Mary Anderson, one row is not enough, and recognising this fact, the National Chrysanthemum Society, in its definition of a single chrysanthemum, stipulates that there should not be more than two rows. With one row the flowers have a somewhat ragged appearance, and one of but little value for decorations, and more than two or three rows suggest that the blooms have been produced by plants that have been subjected to a starving method of culture.

MR. WILLIAM SMITH,
Hon. Secretary Norfolk and Norwich Horticultural Society.

Mr. William Smith, whose portrait we have the pleasure of giving in this issue, may not have obtained renown as a cultivator or raiser of any of the several classes of useful and ornamental plants to which the practical horticulturist must perforce give his attention, yet he has rendered services of immense value to horticulture. As honorary secretary of the Norfolk and Norwich Horticultural Society, Mr. Smith, who, by the way occupies a prominent position among the members of the legal profession in Norwich, has given the best of all proofs that he is in full sympathy with horticulturists and their work. We, at all events, cannot conceive that a gentleman engaged in one of the most exacting of professions should undertake and carry on for a long number of years the arduous duties of secretaryship of one of the principal horticultural societies in the provinces, with its three exhibitions annually, unless he had a strong affection for the garden and its occupants. However that may be, Mr. Smith has occupied his present position for a goodly number of years, and, by his remarkable administrative ability, and courtesy, is held in the highest esteem by those who are associated with him in the management of the society—which is properly considered one of the most important of the institutions in Norwich—and is regarded with respect by all who are interested in the society and its affairs. Writing with a personal experience extending over many years of the manner in which the secretarial duties are performed on the occasion of the exhibitions at Norwich, we have no difficulty in fully agreeing with the members of the executive and others acquainted with the work of the Norfolk and Norwich Horticultural Society that this venerable body is fortunate in its honorary secretary, or in joining with them in the hope that Mr. Smith may long continue to occupy that position.

Gardens Round Hertford.—In the issues of the Gardeners' Magazine for December 4 and 11 we shall give an illustrated account of the more noteworthy gardens round Hertford. The gardens that will be described and illustrated include those of Bayfordbury, Brickendonbury, Brickendon Grange, Fanshawes, Goldings, Poles, and Presdales.

New Victoria Medallists of Honour. — We have much pleasure in making the announcement that the President and Council of the Royal Horticultural Society have appointed Mr. W. Botting Hemsley, F.R.S., Mr. J. H. Goodacre, and Mr. A. Mackellar to fill the vacancies existing in the Victoria Medal of Honour in Horticulture. Mr. Hemsley, who specially distinguished himself in the botanical department of the Royal Gardens, Kew, recently retired under the age limit from the important position of Keeper of the Herbarium and Library. Mr. A. Mackellar as so well-known is the King's gardener at Windsor, where, as at Sandringham, he has done splendid work. Mr. J. H. Goodacre is head gardener at Elvaston Castle, Derby, and has obtained a high reputation as a fruit grower, and has achieved remarkable success as an exhibitor at the principal shows in the United Kingdom. We gave a portrait of Mr. Hemsley, with a brief account of his work, in the Gardeners' Magazine of August 10, 1907, and of Mr. A. Mackellar in the issue of October 12, 1907. We should also have given a portrait of Mr. Goodacre long ere this had not his modesty stood in the way.

National Rose Society.—The annual general meeting of the National Rose Society will take place at the Westminster Palace Hotel on Thursday, December 9, at 2.30 p.m. In addition to the ordinary business, such as receiving the report of the committee, passing the accounts, and electing the officers and committee for the ensuing year, a considerable number of alterations in the rules will be proposed. The proposed alterations are the outcome of a desire to rearrange some of the rules with a view to render them more explicit. It is proposed to change "General Committee of the Society" to "Council of the Society." As there are now four departmental committees, the proposed change in title of the governing body should be an advantage. The departmental committees would appear to have greatly increased the duties of the members of the executive, for, we learn from the balloting list of officers and members of committee, that Mr. E. Mawley, V.M.H., the hon. secretary, attended twenty-eight meetings of these bodies, in addition to nine meetings of the general committee, and that the Rev. F. Page-Roberts, the president, attended twenty-one meetings of the departmental committee, and nine meetings of the general committee. Mr. H. E. Molyneux, Mr. C. E. Shea, Mr. H. R. Darlington, and Mr. E. J. Holland also made a large number of attendances.

Professor W. Bateson, M.A., F.R.S., Fellow of St. John's College, Cambridge, and Professor of Biology in the University, has been appointed, by the Council, Director of the John Innes Horticultural Institution at Merton, Surrey.

Sweet Pea Trials for 1910.—The committee of the National Sweet Pea Society will hold its annual series of trials at the Times Experimental Station, Ladygrove Farm, near New Guildford, in 1910, and will test novelties, and grant awards and certificates according to merit. No awards or certificates will be granted to sweet peas unless they are sent for trial at Guildford. For these trials the varieties will be accepted only from the raiser or introducer; and a charge of 2s. 6d. for each variety will be made. Novelties will be received under number, although names are much preferred. Any variety meriting an award must, if under number, be named before such award can be granted. At the request of numerous seedsmen the committee will conduct a further and distinct trial solely for the purpose of testing correctness and purity of stocks of sweet peas. A charge of 5s. per variety or stock sent for trial will be made. Sweet peas for these trials must reach Mr. C. Foster, Ladygrove Farm, near New Guildford, not later than January 15, 1910. For the novelty trials not less than fifteen seeds should be sent, and for the purity trials, not less than two dozen seeds of each variety or stock. At the same time a list of the varieties, together with the amount due for trial charges, should be sent to the hon. secretary, Mr. C. H. Curtis, Adelaide Road, Brentford, Middlesex.

Flower Imports in October were not so large or valuable as in the corresponding month of last year, the total value having been £3,512, or a decrease of nearly £1,000. For the ten months ending October 31 there was a substantial increase, the total value being £210,597.

National Rose Society's Conversazione.—Instead of the usual annual dinner it has been decided by the committee to hold a conversazione in the large room at the Westminster Palace Hotel, Victoria Street, Westminster, on Thursday, December 9, from 4.30 to 6 p.m., to which all members are cordially invited. Each member is entitled on application to one free ticket and to purchase other tickets for friends, including ladies, at 2s. each. Application for tickets must be made to the hon. secretary, Mr. E. Mawley, V.M.H., Rosebank, Berkhamsted, on or before Saturday, December 4, in order that suitable arrangements for refreshments may be made. A selection of music will be played by members of the Alexeda Orchestra, and Miss Holbrook, of the Guildhall School of Music, will sing. Mr. R. F. Felton, florist to H.M. the King, has kindly promised to decorate the tables with roses and other flowers.

National Sweet Pea Society.—The annual general meeting of members of the National Sweet Pea Society will be held in the North Room, Hotel Windsor, Victoria Street, Westminster, S.W., at 3 p.m., on Friday, December 10, 1909. A Sweet Pea Conference will also be held at the Hotel Windsor on the above date, commencing at 7 p.m., when the following papers will be read: "The Imperfect Seeding of Waved Sweet Peas," by Mr. William Cuthbertson, J.P.; "Sweet Pea Names and Naming," by Mr. W. J. Unwin. For the convenience of members dinner will be provided at the Hotel Windsor, at 5.30 p.m., on the above date. Tickets 5s. each (exclusive of wine). Application for tickets must be made to the hon. secretary, Adelaide Road, Brentford, Middlesex, not later than December 9.

Importation of Gooseberry Bushes into Ireland.—The Department of Agriculture draws the attention of nurserymen and others to Article 5 of the American Gooseberry Mildew and Black Currant Mite (Ireland) Order, 1908, which renders it unlawful to land in Ireland gooseberry and currant bushes brought from any place outside Ireland without a licence from the Department of Agriculture for Ireland. There is reason to believe that during the past season a few consignments of bushes were landed in Ireland in contravention of this order, and as, in addition to the forfeiture and destruction of such bushes, all persons concerned in the landing of same are liable to severe penalties, the Department desire to announce that they will institute legal proceedings in any case of breach of the regulations of this order which may come under their notice after this date.

Allotments and Small Holdings.—We learn from the "Journal" of the Board of Agriculture that the total quantity of land held in England and Wales on December 31, 1908, for the purpose of allotments was 17,529 acres, of which 3,478 acres had been purchased, and 14,051 acres hired. The actual quantity let in allotments amounted to 16,809 acres, and the number of tenants to whom it was let was 58,648 individuals and two associations; the average size of each allotment is, therefore, about 1r. 6p. The number of applications received for allotments during 1908 was 21,540, and the total quantity applied for was 15,695 acres. There were 18,366 applicants for not more than one acre each, the total quantity applied for being 4,779 acres, while there were 3,169 applicants for allotments exceeding one acre and not exceeding five acres, and the quantity applied for by them was 10,806 acres. The number of applicants in England and Wales who have been provided with allotments by local authorities during 1908 is 6,147, of whom 2,002 have been provided for by Parish Councils, 1,606 by Urban District Councils, and 2,539 by Town Councils. These figures include all those persons who have been accommodated with allotments on land which was in possession of the Councils prior to January 1, 1908, when the Small Holdings and Allotments Act, 1907, came into operation, as well as on the land which was acquired by Councils under that Act during the year 1908.

YORK CHRYSANTHEMUM SHOW.

Blessed with the opportunity of holding its show in the spacious, light, and elegant exhibition building and its galleries, at York, the Ancient Society of York Florists is able to provide ampler accommodation than is the case in many other cities and towns. On November 17, 18, and 19 the thirtieth chrysanthemum show was held, and it was of all round excellence, and as the schedule provided for pillar groups, bush plants, fruits, and vegetables, the show was an interesting one. The chief cut blooms and group classes were in the main building, the choice fruits in a side hall, and the hardy fruits and vegetables in the wide galleries.

GROUPS AND PLANTS.

There are three open group classes at York, one for a circular display of chrysanthemums, one for a pillar group of chrysanthemums, and one for a pillar group of flowering and foliage plants. There were six pillar groups in all, and these, rising to a height of 23 feet, make a striking feature, and one not found at any other show in the kingdom, so far as our experience goes.

For a circular display, arranged on a space not exceeding 80 sq. ft., the premier award of £6 was made in favour of Mr. J. W. Hields, Acombe, York, who was the only exhibitor. He had the usual conical arrangement, and, with a kentia as centrepiece, he displayed fairly good blooms of Mrs. W. Knox, Reginald Vallis, F. S. Vallis, Mr. A. T. Miller, and other popular Japanese varieties, bordering the whole with ferns.

Mr. G. Cottam, Alma Gardens, Cottingham, Hull, won the premier award of £6 for a pillar group of chrysanthemums and green foliage plants. His was a good effort, though the general outline was a little too formal, that is to say, the group was of practically the same width from base to summit. The whole effort was produced by dwarf bushy plants of single and decorative chrysanthemums, lashed to the pillar, and associated with ferns, bamboos, and aralias. The Source d'Or varieties, with Ladysmith and Mary Richardson, were those chiefly used, and the combination of colour was good. There were two competitors, and second prize fell to Mr. J. Key, Clifton Nursery, York, whose group was weak at the point where it commenced to ascend the pillar, but the upper portion was good, and his asparagus, Pteris tremula, and nephrolepis gave the necessary light and elegant greenery.

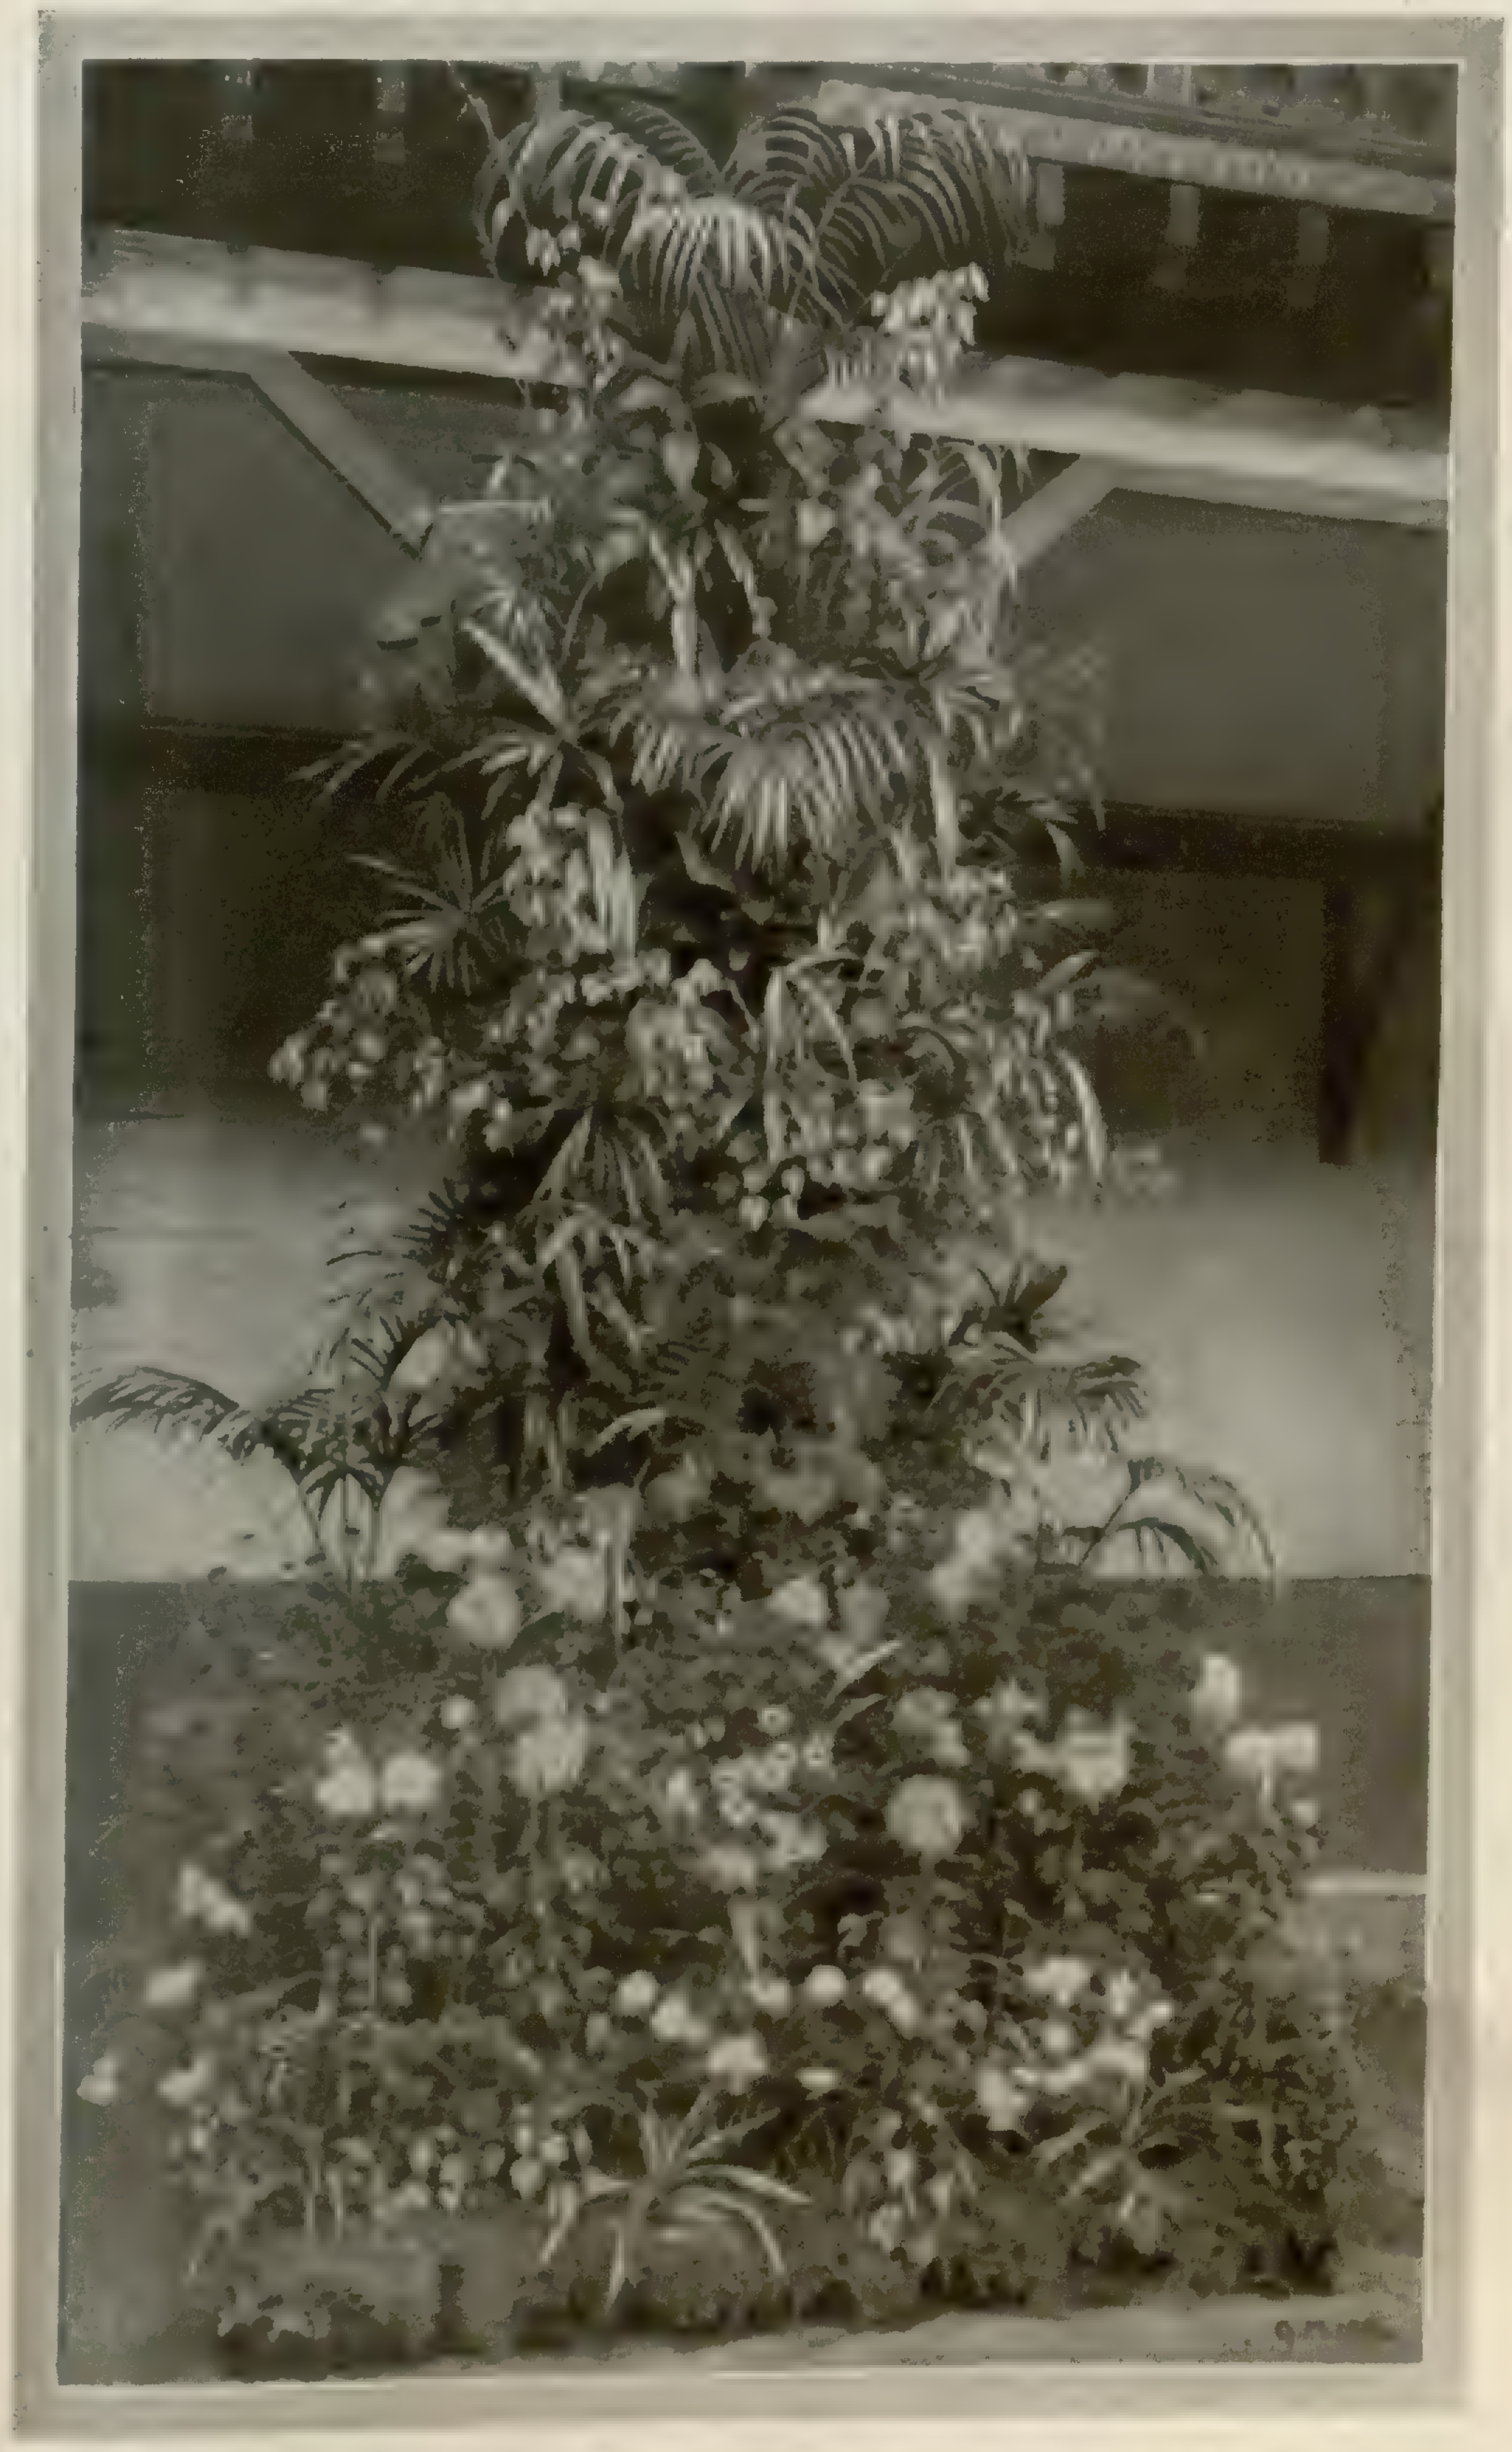
Mr. F. H. Ward, Scarcroft Nursery, York, led in the class for a pillar group—(see illustration)—formed of chrysanthemums at the base, to a height of 6ft., and miscellaneous plants from this height to the gallery. He had a base of Source d'Or varieties, with a few large yellow Japanese blooms, and a foreground of bright crotons, pandanus, and an edging of ferns. The pillar part was composed of bright broad-leaved crotons, Abutilon Szovitzi, dracænas, palms, ferns, and asparagus, these making at once a bright, pleasing, and elegant feature. Mr. G. Cottam was second, but his pillar portion was too scanty and stiff to be altogether pleasing; Messrs. R. Simpson and Sons, Brook Street, Selby, third; and Mr. T. M. Petch, Bayle Gate Nurseries, Bridlington, fourth.

Mr. L. Hanchant, gardener to the Frederick Hotels Company, Lim., Hotel Majestic, Harrogate, led the way for a table display of chrysanthemums and foliage, arranged for effect on a space 6ft. by 4ft.; two vases of yellow and white and red flowers were very effective, bamboo and asparagus sprays being associated with them. The stemless flower heads of single and small decorative varieties strewn on the white table, among sprays of Asparagus Sprengeri, were not pretty—it was barbarous treatment; Mr. F. H. Ward was second with vases of bronze and yellow Source d'Or, surrounding a base of white and pink flowers; Mr. G. Wynne, gardener to Mrs. Richardson, Burn Hall, Easingwold, third; six competitors.

Very formal also were the groups in the local amateurs' class, where a semi-circular area of 50 sq. ft. was provided. Mr. J. W. Hields, Acombe, York, was an easy first, his group consisting of dwarf single-stemmed plants, with good foliage to the base, and carrying fair flowers, but the precise arrangement of the blooms detracted from the elegance of the display; Mr. F. S. Rawling, Harcourt Street, Heworth, second.

CUT FLOWERS.

There were no fewer than nine competitors in the class for three dozen Japanese blooms in not less than twenty-four varieties, and here the president's (Alderman J. Agar, J.P.) prize of £10 10s. was won by Mr. A. Chandler gardener to A. James, Esq., Coton House, Rugby, who is in good form this year. Some of his blooms were very fine, while others were of moderate size, but his was a bright stand, and included a number of richly coloured blooms. The varieties were F. S. Vallis, Mr. A. T. Miller, Lady Talbot, Reginald Vallis, Mrs. C. F. Coster, Splendour, W. Mease, Marquise V. Venosta, Mrs. G. Mileham, C. H. Totty, J. Peed, President Viger, Algernon Davis, J. H. Silsbury, Madame P. Radaelli, Madame G. Rivol, J. Lock, Magnificent, Edith Jameson, Valerie Greenham, Mrs. H. Weeks, Mrs. F. W. Vallis, Leslie Morrison, and O. H. Broomhead. Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, was second; Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, Northampton, third; and Mr. W. Iggulden, Lock's Hill Nurseries, Frome, fourth.

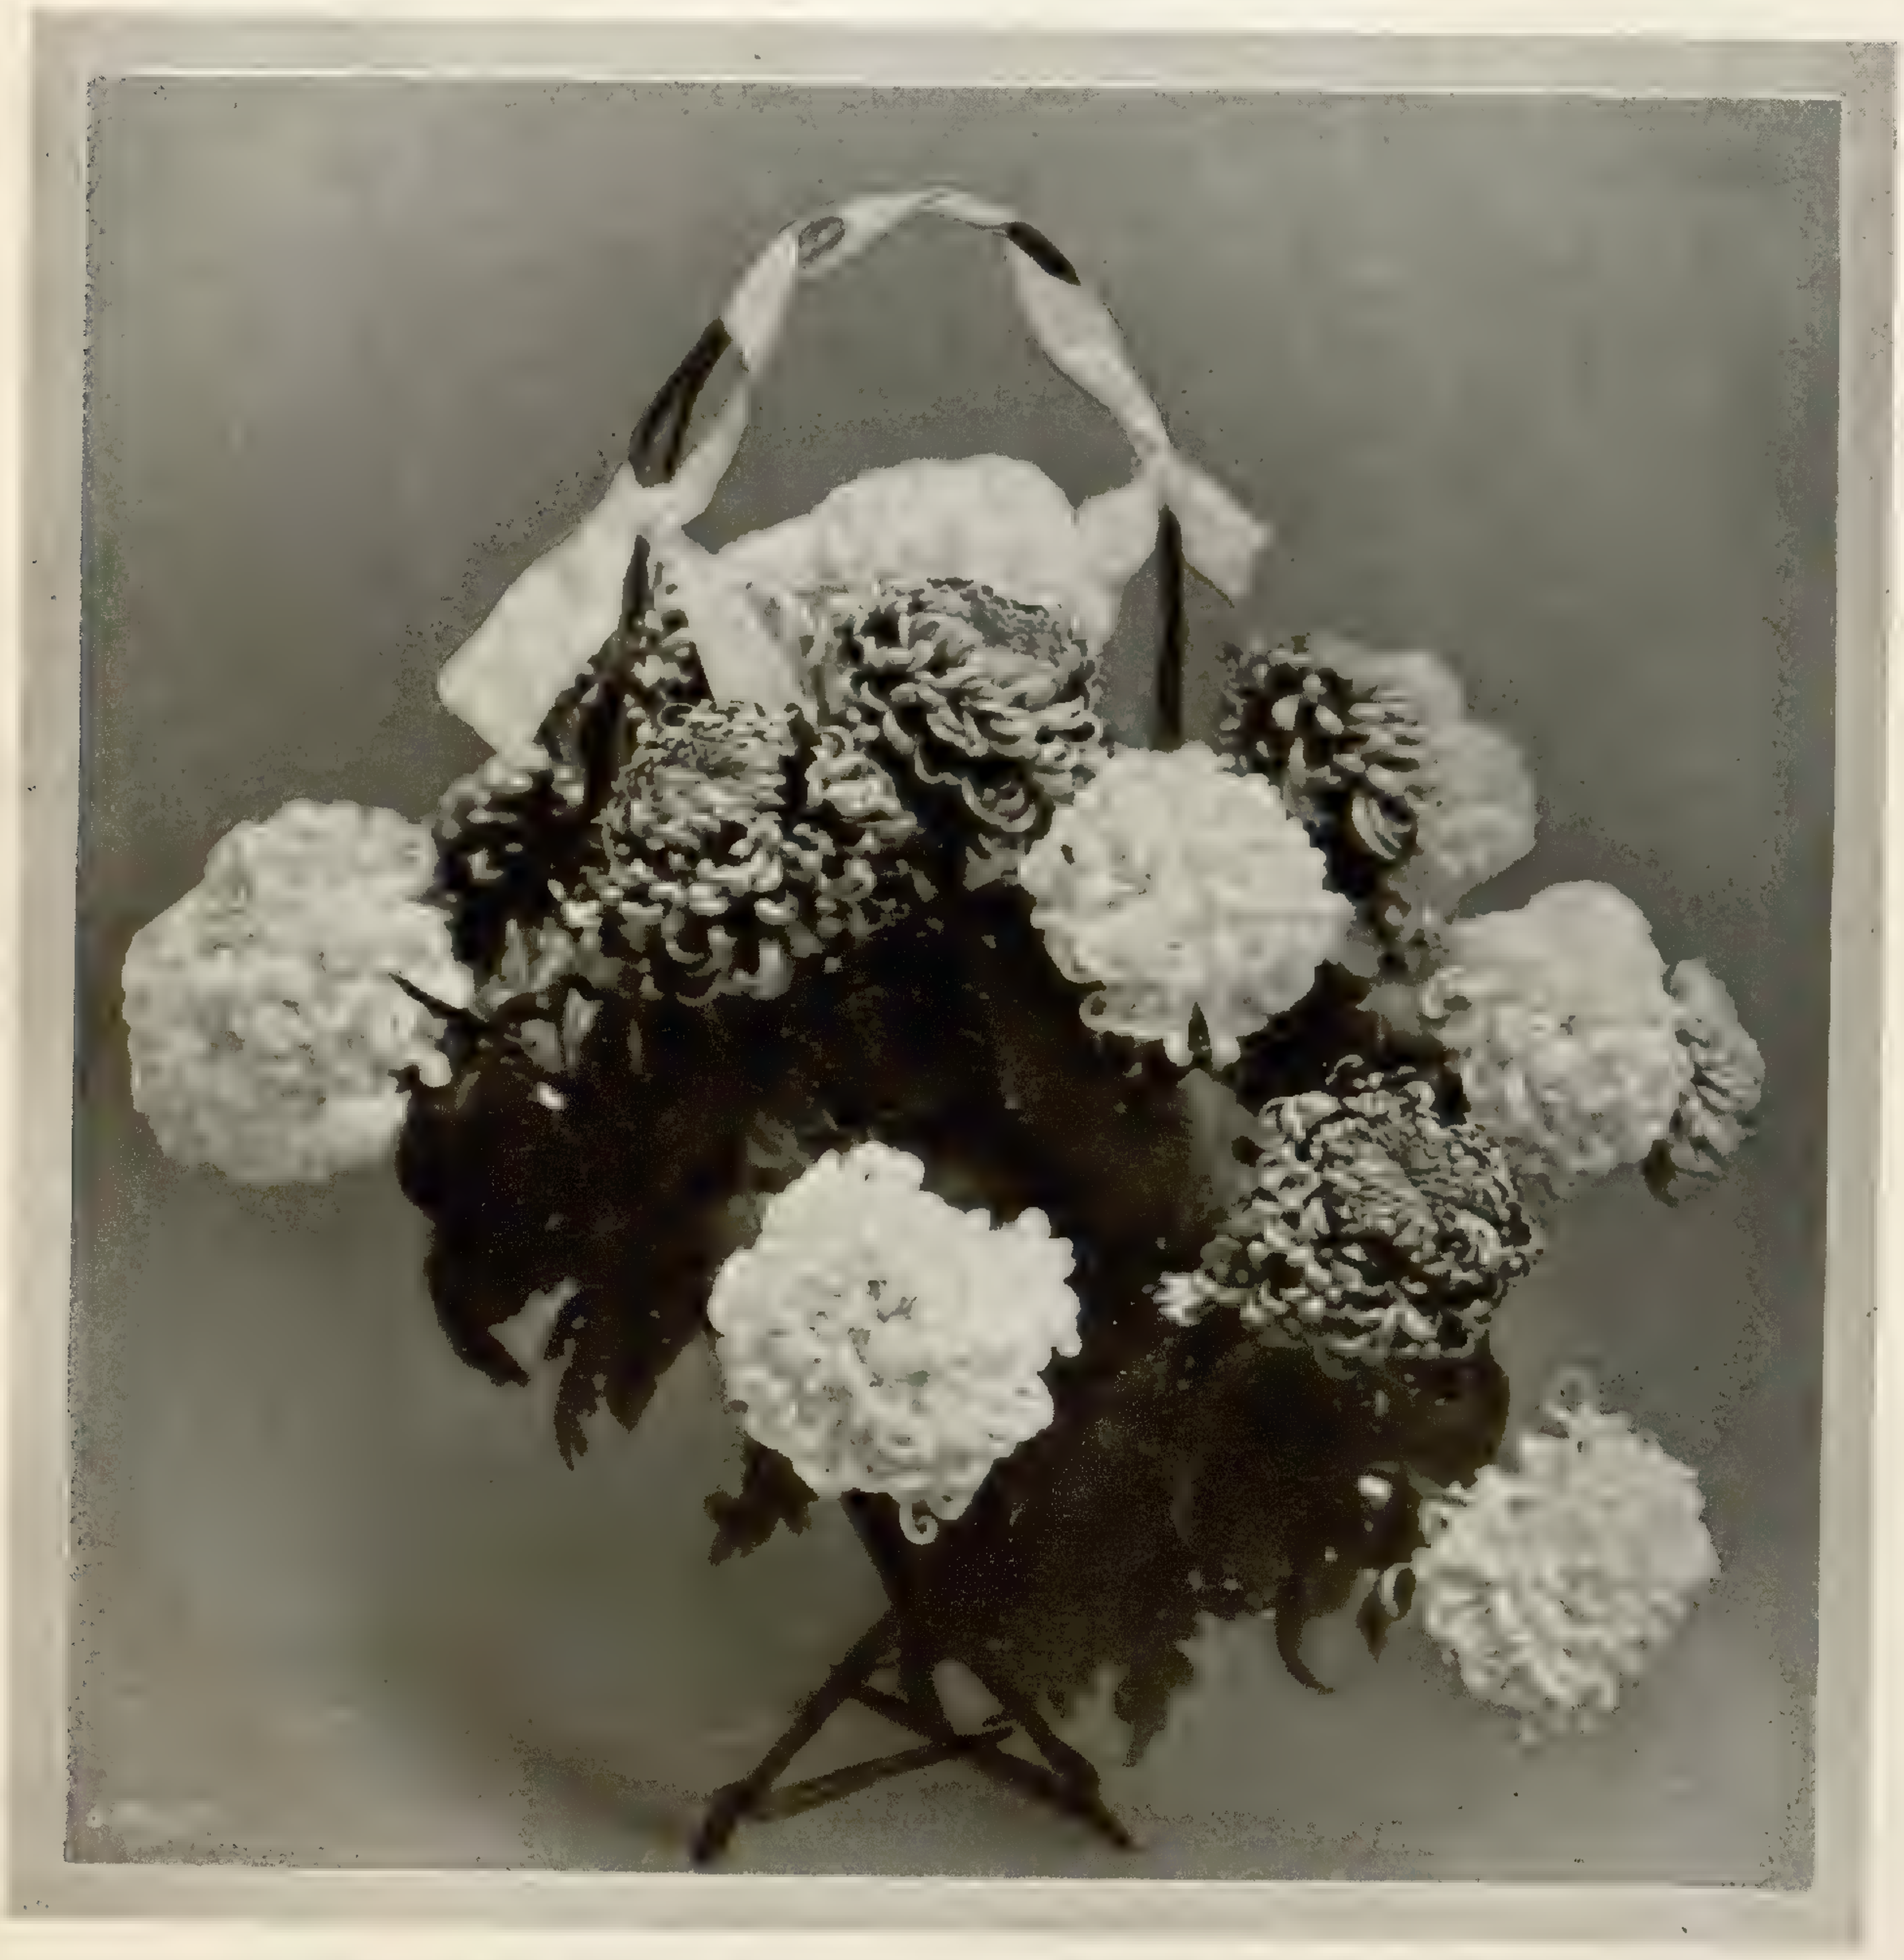


PILLAR GROUP OF CHRYSANTHEMUMS AND MISCELLANEOUS PLANTS AT YORK.

Arranged by Mr. F. H. Ward, who received the premier award.

Some very good bush plants were set up by the two competitors in the class for six specimens; Mr. J. Everard, gardener to Mrs. Gutch, Holgate Lodge, York, led with Souv. d'un Petite Ami (over 36 blooms), J. Shrimpton, Val d'Andorre, C. H. Curtis (with ten good blooms), F. S. Vallis (12 blooms), and Phœbus. Mr. R. Harrison, gardener to J. H. Shouksmith, Esq., The Laurels, Bishopthorpe, second. Mr. Everard was also first for three bushes of single varieties, and here he had handsome specimens of Mrs. E. Roberts, Miss Wilcox, and Miss Beatie Rowden.

The vase classes were scarcely up to the highest standard, though there were many good flowers set up. For two vases of Japanese varieties, three blooms of each variety, Mr. W. Iggulden, Lock's Hill, Frome, was a comfortable first with Lock's Hill and F. S. Vallis; Mr. D. Williams, gardener to the Earl of Feversham, Duncombe Park, Hemsley, second; and Mr. J. Hanchant, third. The class for four vases of Japanese blooms, three flowers in each vase, brought out four competitors, Mr. D. Williams securing the first prize with Mr. A. T. Miller, J. H. Silsbury, F. S. Vallis, and Reginald Vallis; Mr. W. Iggulden second, and Mr. G. W. Musk third. In the class confined to growers residing within a radius of ten miles of York city, for four vases of Japanese varieties, three blooms of each, Mr. J. Dobson, gardener to Sir J. Grant Lawson, Bart., Middlethorpe Lodge, York, led with Bessie Godfrey, Reginald Vallis, Mr. A. T. Miller, and Mr. G. Mileham, in good form; Mr. W. Richardson, gardener to Mrs. Whitehead, Deighton Grove, York, second; and Mr. C. F. Atkinson, gardener to A. Leetham, Esq., Shelly, Holgate, York, third. Mr. G. W. Richardson led for two vases of Japantse blooms from six competitors.



BASKET OF CHRYSANTHEMUMS AT YORK.
For which Mr. L. Hanchant was awarded the first prize.

Mr. Searle scored for a dozen incurved blooms, followed in order by Mr. J. McPherson and Mr. Barker, gardener to the Earl of Newcastle, Clumber Park, Worksop. Mr. Searle was first, Mr. J. McPherson second, and Mr. G. W. Richardson third for six incurved blooms.

Mr. S. Everard was a capital first for six vases of single chrysanthemums with good sprays of well-developed blooms of Mrs. Ritson, Mrs. E. Roberts, Altrincham Yellow, Metta, White Pagram, and Miss M. Bird; Mr. A. Alderman, gardener to the Hon. H. W. Fitzwilliam, Wigganthorpe, York, second; Mr. J. Dobson third. Mr. F. Styan, Rawcliffe Lane, York, was a fine first prizewinner in the class for a dozen vases of decorative varieties, with Bessie Chapman, La Triomphante, Source d'Or, Soleil d'Octobre, W. Holmes, Mary Richardson, etc.; Mr. Alderman, second; and Mr. F. Dean, gardener to J. Rowntree, Esq., Clifton, York, third.

Mr. J. W. Hields; Mr. W. Sharp, The Lodge, Heworth Green; and Mr. H. Parkinson, Mill Lane, Heworth, were prominent prizewinners in the local cut flower classes.

The best basket of chrysanthemums was undoubtedly that illustrated in the present issue, of big white and crimson flowers, arranged by Mr. L. Hanchant with great taste; Mr. F. H. Ward, second; and Mr. Heppell, Silver Street, York, third. In another class Mr. F. C. Harrison was first, while Mr. Dean had the best vase of flowers—Source d'Or. Miss Whitehead, Deighton Grove, York, led for a florally decorated dessert table with a pleasing design in the ever-popular Mary Richardson single chrysanthemum; Mr. Petch, Baylegate Nurseries, Bridlington, second, with carnations; and Mr. Dawson, South Parade, York, third, with single white flowers.

FRUITS.

Mr. J. McPherson led the way for six distinct dishes of dessert fruits with Gros Guillaume and Muscat of Alexandria grapes, Ribston and Cox's Orange Pippin apples, Doyenne du Comice and Pitmaston Duchess pears; Mr. A. R. Searle second, and Mr. W. Jackson third; six competitors.

The very good prize of £5 is offered for the best six bunches of grapes, and there was a keen contest for it among five entrants; Mr. J. McPherson won with big bunches of Gros Guillaume, Gros Colman, and Muscat of Alexandria; Mr. J. E. Hathaway second with Gros Guillaume, Alicante, and Muscat of Alexandria; and Mr. J. Corbert, gardener to the Marquis of Normanby, Mulgrave Castle, near Whitby, third. Mr. J. McPherson led for black grapes with good clusters of Alicante, and he also scored for white grapes with Muscat of Alexandria. Mr. Searle was second for black grapes, and Mr. W. Jackson for white grapes.

Apples and pears were very largely shown, and, considering the season, they were good. There were four competitors in the class for six dishes each of culinary and dessert apples and a dozen dishes of pears, in every case six fruits being required for a dish. The leading award of £3 was won by Mr. J. E. Hathaway, gardener to J. Brennand, Esq., Baldersby Park, Thirsk, whose pears were very good, and consisted of Beurre Fouqueray, Pitmaston Duchess, Beurre Diel, Louise Bonne of Jersey, Doyenne du Comice, Doyenne Boussoch, Marechal de la Cour, Charles Ernest, Beurre Bachelier, Emile d'Heyst, and Beurre Benoist; Rival, Cox's Orange Pippin, King of Tompkins County, Peasgood's Nonsuch, and Sandringham were his best apples. Mr. A. R. Searle won second place with clean, but smaller examples; and Mr. G. W. Musk, gardener to Captain J. F. Laycock, Wiseton, Bawtry, Notts, was third.

Mr. J. C. McPherson, gardener to Baron de Forest, Londesborough Park, Market Weighton, led for six varieties each of dessert and culinary apples, winning with a very clean, bright set of Charles Ross, Bramley's Seedling, Fraise d'Hoffinger, Peasgood's Nonsuch, Gascoigne's Scarlet, Newtown Wonder, King of the Pippins, Worcester Pearmain, Wealthy, Ribston Pippin, Blenheim Pippin, and Cox's Orange Pippin; Mr. Searle second, and Mr. Hathaway third. Mr. Hathaway scored for six dishes of pears, followed in order by Mr. G. W. Musk and Mr. T. G. Goodall, gardener to Lord Deramore, Heslington Hall, York. Mr. Musk scored with Peasgood's Nonsuch for one dish of culinary apples, and Mr. J. McPherson led for a dish of dessert apples with Ribston Pippin.

In the county classes for fruit Mr. Hathaway led for six dishes of culinary apples, with Mr. Goodall second. Mr. W. E. Hyde, Wadsley Lane, Wadsley Bridge, Sheffield, scored for six dishes of dessert apples, with Mr. Hathaway second. Mr. Hathaway won the piece of plate offered by the society's Chaplain, the Rev. Gordon Salmon, for the best six dishes of pears; Mr. W. Jackson, gardener to Lord Hotham, Dalton Hall, Beverley, second; and Mr. D. Williams, gardener to the Earl of Feversham, Duncombe Park, Helmsley, third.

VEGETABLES.

In Messrs. Sutton and Sons' class for six kinds of vegetables there were nine entries, Mr. W. E. Hyde winning premier honours. In the class provided by Messrs. Webb and Sons there were seven competitors, Mr. G. W. Reader, Naburn, leading the way. The latter also won the leading prize in Messrs. J. Backhouse and Son's class for nine kinds, four entries. Mr. J. Whitehead, Appleton-le-Street, led in Messrs. Kent and Brydon's class for nine kinds.

Prominent prize-winners in the single-dish classes, where the competition was on the whole very keen, were Mr. F. Styan, Mr. R. Cowling, Easingwold; Mr. G. W. Reader, Mr. G. How, Brawby; Mr. R. Harrison, Mr. Butler, gardener to Rev. R. W. Powell, Escrick Rectory; and Mr. D. Williams. Onions and potatoes were largely shown, and well shown, too.

NON-COMPETITIVE.

On the platform, and rising right up to the organ, Messrs. James Backhouse and Son, Lim., York, arranged a very big and graceful semicircular display of conifers and bamboos, the latter being very much in evidence, and showing up well in front of the dark conifers. Pampas grasses were also used, but what was needed to make this display an unusually fine one was some bright colouring, such as a few bushes of good decorative chrysanthemums would have provided; but it was a fine contribution, nevertheless. Messrs. Backhouse had also an exhibit in the gallery consisting of a small group of stove and greenhouse foliage plants, begonias, liliums, single chrysanthemums, and perpetual carnations, with a collection of fair-sized clean fruits of popular apples forming the foreground. In another part of the building this firm contributed a display of choice floral designs.

A very large and interesting display was made by Messrs. Clibrans, Altrincham, who filled a considerable space with well-grown vegetables, that included a fine selection of potatoes, good leeks and celery, ornamental gourds, and some splendid onions, beet, and carrots. The other part of their exhibit consisted of large vases of popular Japanese chrysanthemums, well arranged with palms and asparagus; with these were popular decorative varieties, and a selection of pretty single varieties, these latter including the distinct and dainty Altrincham Yellow, Cyril H. Evans, a new and useful bronze variety, Queen of Spain, the popular Mary Richardson, and Countess of Stamford.

In the spacious gallery Messrs. Laxton Brothers, Bedford, displayed an attractive collection of apples, setting up about fifty varieties in neat baskets, piled up; Warner's King, Peasgood's Nonsuch, Charles Ross, Allington Pippin, Gascoigne's Scarlet, Stirling Castle, and Sandringham were varieties that looked particularly well thus staged. Mr. F. Kirby, Feasegate, York, contributed a display of those many essentials for the conduct of gardening operations known comprehensively as "sundries."

The Gardeners' Magazine stall, with its portraits of prominent horticulturists, beautiful garden scenes, horticultural handbooks, and coloured plates, was a prominent exhibit.

PRUNING GOOSEBERRIES.

There is no subject concerning which so much misapprehension exists, as judged by the results embodied in practice, as the pruning of gooseberry trees. Even in large places, where the wall trees and the houses are admirably managed, one often sees by the condition of the gooseberry trees, that they have been pruned by rule, rather than by an intelligent understanding of the principles involved.

The first and great necessity is a clear conception of the various reasons for the process, for, unless the goal to be attained is known, the course that is taken can be nothing more than an aimless wandering. As I understand the case, the first reason for pruning is that the tree may be made to produce the greatest amount of fruiting wood possible; the second, that such wood may be so situated as to give the fruit the maximum amount of light and air that can be obtained; and the third, that the fruit may be so placed that it can be gathered without unnecessary trouble, caused by the tangled nature of the growth and the sharpness of the spines. An examination of a number of different gooseberry trees during the fruiting season will show that the fruits are produced on wood of all ages, but that the finest fruits are mostly to be found on the younger growths, though not necessarily confined to them.

The problem is, therefore, to devise a method of pruning by which the tree may be furnished with the maximum amount of young, vigorous wood from one to four or five years old; that this wood may be so situated that the fruit may have all the sun and air possible; and also that there may not be too many crossing boughs to prevent the hand of the picker passing readily through the tree for the purpose of gathering the fruit.

It is quite obvious, in the first place, that all the growth must be trained in a more or less perpendicular fashion, since anything in the way of horizontal growth effectually shades that beneath it from the beneficent beams of the sun. Probably the best form in which to train the tree would be the goblet shape, but for one drawback, and that a serious one, namely, that the gooseberry blossoms during the time when spring frosts are prevalent, would be exposed to the risk of being destroyed, particularly if the frost comes before the leaves have unfolded.

To my mind, there is no method that so effectually fulfils all the requirements that I have mentioned as that which I term, for want of a better name, the radial system, which is simply the continuation throughout the tree of the fan training adopted for most stone fruits on walls and trellises. The same necessities apply to both, viz., the extension of the branches without harming one another, the need to preserve some of the fine young wood produced on the tree in the form of side shoots, the desirability of being able to cut out altogether the old black wood which is only producing a few small berries.

The necessary spacing of the branches for benefit of light and air in the case of the wall tree is equally needed in that of the gooseberry, and, further, the absolute freedom from any crossing branches would render it easy to pick the fruit if the bushes could be pruned exactly on these lines.

If it were possible to train the boughs and branches of the gooseberry bush exactly in this manner, when one looked at the bush from any point the branches would appear to run straight to the centre without any crossing. I would not, for one moment, suggest that it is possible to get anything more than a rough approximation to this ideal. The natural habit of some varieties is directly opposed to such training, and all the pruning possible will not make them shapely and satisfactory, as judged by the standard I have just now set up. Weight of fruit, the effect of storms, and other factors operate to destroy the symmetry of the tree even when the pruner has succeeded passably, but, notwithstanding all this, I believe it is of immense advantage in pruning gooseberries to have this ideal in mind, and to strive to carry it out as nearly as possible.

The advice generally given, to "thin out the young growths," is a hideous mockery to a novice when confronted with a thrifty tree some eight or nine years old, for he does not know where to begin, or which to take out among the multitude of young shoots. But, with this ideal clearly in mind, he selects first of all the leading shoots of the branches, shortening them as much as is needed for the production of future leaders, then removing all shoots upon it which do not follow, more or less, the direction of the branch, and, further, those which, if they fulfil this point, are too much crowded.

If he sees that a certain bough or branch is becoming old and weak, he can generally find a vigorous young piece running in the same direction that can be used to replace it, either by the immediate removal of the old down to the young piece, or else by preparing for the removal at next pruning season by leaving in the younger and shortening it in the same way as a leading shoot.

At the same time, though the pruner may have this governing idea to work by, it must necessarily be modified, to some extent, by each particular variety. A careful examination should be made to discover, if possible, the peculiarities of each, which should be carefully borne in mind when pruning. Some varieties, for instance, bear much more on the spurs than others, and will admit of the young wood being removed or "spurred in," while others bear far better on the young wood, and need that the tree shall be constantly replenished with the same.

Some varieties, again, have a very erect habit, and need constantly cutting to an outside bud to open out the tree, while others are of a pendulous, drooping character, rendering it necessary to select an upward bud to cut to for the leaders, in order to produce any sort of a tree at all.

Again, considerable care is necessary to watch how the tree responds to the pruning, as some varieties produce such enormous quantities of wood every time they are pruned, that it is policy to cut them as little as possible. Such a variety is Red Warrington, which is formidable enough to the picker, owing to its "three thorns," without the task being rendered more difficult by the enormous crowd of shoots it makes. A drastic thinning, which is necessary to render it easy to reach the fruit, only serves to accentuate the trouble.

I have met with one or two varieties that have a distinct peculiarity, in that the buds at the base of the young shoot are in a great many cases blind, so that when such shoots are cut off to within about an inch of the branch they die, because there is no bud to break, and an ugly patch of blank wood results. Such varieties need the spurs left longer than is usual, to include the first bud, when such a failure will be prevented. Golden Drop, Langley Beauty, and other members of that family are upright growers, and produce an enormous quantity of wood, but as they bear particularly well on the spurs the majority of it can be cut out.

Cousen's Seedling, another yellow berry, on the other hand, is very drooping, and of very much the same habit as Red Warrington, though with less vigour. Lancashire Lad is a good erect grower, which does not produce an extraordinary quantity of wood, neither is the wood often any too stiff and robust, consequently the leaders and shoots will put up with a pretty severe shortening without being unduly excited into growth.

This is not the case with Crown Bob, for a too drastic shortening of the strong shoots leads to the formation of several even stronger ones the next season. It is an upright grower, however, bearing its largest fruits on the one and two-year-old wood, it presents no other special difficulty to the pruner.

Berry's Kent is between the two last-named in vigour, having much the same habit as Lancashire Lad, and comparatively easy to prune.

Speedwell is of a most peculiar habit, forming an abundance of natural spurs and scarcely any wood at all, often, therefore, needing hard pruning to produce the requisite amount of wood to properly furnish the tree.

Coiner, an improved Gunner, is of good vigorous, upright growth, and presents no special difficulties at all, producing just enough wood to enable the pruner to select that which suits him best, without a superabundance to embarrass him.

These are just a few of the better known varieties which occur to my mind now to exemplify the varying habits and styles of growth which need studying; but, above all this, I believe it is of paramount importance to have a purpose in mind.

F. W. Hammond.

Pilgrims' Hatch.

Vine Eyes.—In pruning vines choose some of the best and ripest wood for the renewal of stock by means of eyes, and tie up in bundles and plunge them in ashes to await the time of propagation, which will be early in the new year. These should not be kept in heat, but in a cold frame.—W. A. Cook, Leonardslee Gardens, Horsham.

THE JASMINE.

In writing of these shrubs it may first be said that the name was derived from the Persian yâsmin, and that the odour of its flowers is so peculiar as to be incomparable, and it is probably the only floral perfume which cannot be imitated by art. While it grows from 12 to 20 feet high, its stem is feeble, and requires support. The fragrant white flowers appear from June to October, and are found chiefly on the young shoots. On account of their exquisite fragrance the flowers are highly esteemed in the East, and are frequently referred to by the Persian and Arabian poets. The narrow-leaved jasmine, J. angustifolium, is a beautiful evergreen climber, 10 to 12 feet high, and is found in the Coromandel forests, and was introduced into Great Britain during the past century. Its leaves are a bright and shining green, its large terminal flowers are white with a faint tinge of red, fragrant, and are produced throughout the year. Another variety, I would mention in passing, a general favourite, and one that is with us in autumn and winter, cheering and brightening the dull dark days from November to January, I mean, of course, Jasminum nudiflorum.

BASKET OF CHRYSANTHEMUMS.
For which Mr. W. Laws was awarded first prize at Norwich.

One writer, as long ago as 1839, said the white jasmine has been called a sweet emblem of amiability, and always acceptable whenever we meet it. It graces alike the lowly casement of the lone window, and the proud parterre of the rich and gay, the bosom of the village lass, and the Oriental vase of the drawing-room. The common jasmine, which grows naturally at Malabar, is registered in the "Hortus Kewensis" as a native of the South of Europe, but it is thought that it did not leave the East until the taking of Constantinople by the Turks, whose fondness for flowers would induce them to transport it to the land they conquered in 1453. It certainly would not have been passed unnoticed by Pliny and other ancient authors had it either been grown naturally or been introduced to Greece previous to their time. Dioscorides is the only Greek author that notices it, and as he has given no description of the plant or flower, but only tells us that the Persians obtained an oil from a white flower with which they perfumed their apartments during their repasts, it is probable that he only became acquainted with the jasmines during his attendance on Antony and Cleopatra in Egypt, whose unbounded luxury would naturally cull this essence from the land of odours. At what time this plant or shrub first perfumed the British atmosphere is uncertain. Mr. Aiton says in 1548; "Hortus Cantabrigiensis," and Curtis's "Botanical Magazine" the same date. But we consider it to be much longer acquainted with our soil, as it seems to have been so common in the time of Gerard as to have been considered a native plant by some persons. This excellent author says: "Jessemin is fostered in gardens, and is vsed for arbors, and to cover banquetting houses in gardens; it groweth not wilde in Englande, that I can vnderstand of, though Master Lyte be of a different opinion. The white jasmine is common in most places of Englande."

If we may believe a Tuscan tale, we owe our thanks to Cupid for the distribution of this pretty shrub. We are told that a Duke of Tuscany was the first possessor of it in Europe, and he was so greatly fearful lest others should enjoy what he alone wished to possess, that strict injunctions were given to his gardener not to give a slip, nor so much as a single flower, to any person. To this command the gardener would have been faithful, had not the god of love wounded him by the sparkling eyes of a fair, but portionless peasant, whose want of a little dowry, and his poverty, alone kept them from the hymeneal altar. On the birthday of his chosen one the gardener presented her with a nosegay, and to render the bouquet the more acceptable, he ornamented it with a branch of jasmine. The young nymph wishing to preserve the bloom of this new flower, put it into fresh earth, and the branch remained green all the year, and in the following spring it grew, and was covered with flowers, and it flourished and multiplied so much under the maiden's cultivation that she was able to amass a little fortune from the sale of the precious gift which love had made her, when, with a sprig of jasmine in her breast, she bestowed her hand, and her wealth, upon the happy gardener of her heart; and the Tuscan girls to this day preserve the remembrance of this adventure by invariably wearing a bouquet of jasmine on their wedding day, and they have a proverb which says, that a young girl wearing this nosegay, is rich enough to make the forfortune of a good husband. Let us, therefore, cultivate more abundantly what love has scattered so happily, for the supple and pliant branches of the jasmine accommodate themselves to numerous situations in the garden and the shrubbery.

"Here jasmines spread the silver flower,
To deck the wall or weave the bower."

They should be woven into the trellised arch or alcove, climb the palisades or pergolas, rest on the branches of the broad-leafed laurel, cover the dead wall, and run wildly over the shrubs of the wilderness walks. Whilst obedient to the shears of the gardener, they are formed into bushy shrubs, and little trees, for the near approach of the dwelling, where in the morning and evening their star-topped tubes send forth a shower of fragrance that alike embalms, refreshes, and purifies the surrounding air.

"'Twas midnight, through the lattice wreathed,
With woodbine; many a perfume breathed
From plants that wake while others sleep,
From timid jasmine buds that keep
Their odour to themselves all day,
But when the sunlight dies away;
Let the delicious secret out,
To every breeze that roams about."
—T. MOORE.

From the tube of this Eastern flower the bee extracts the most exquisite honey, and the painted butterfly is never seen to greater advantage than when resting on the delicate petals of the white jasmine. When the jasmine was introduced into France it was supposed to require all the heat that could be given it; it next occupied a place in the orangery, and at length found its way into the open garden, where it thrives as freely as a native plant, and still holds the situation of a favourite with the Parisian ladies, and is always the most saleable bouquet in the French market. We have often been surprised that our cottagers who possess little gardens, should not cultivate flowers more freely for sale, particularly the jasmine, which is so hardy, and so easy of culture, and with which they might even form their fences, or suffer it to run over their hedges, without taking away any of their potato ground. In the market (a writer says) they would find one bunch of jasmine flowers bringing them as much money as three cabbages or a bunch of turnips. As far back as the time of Charles II. Evelyn says: "Were it (jasmine) as much employed for nosegays, etc., with us as in Italy and France, they might make money enough of the flowers. One sorry tree in Paris, where jasmines abound, has been worth to a poor woman nearly a pistole a year (a Spanish gold coin of value about 8s. 6d.)." At the present time I am quoting from a book published in 1836; it says, "a great deal of money is made by the nurserymen in that neighbourhood (Paris), who train them up with a single stem, and then pot them, and send them to the flower market covered with blossoms, where they soon find customers amongst those who are wise enough to preter familiar beauty to costly rarity, and you see it there flourishing equally in the cobbler's window and on the palace balcony.

Halstead. H. C. Philbrick.

(To be continued.)

FIRST PRIZE COLLECTION OF FRUIT AT NORWICH.
Shown by Mr. J. Hilson.

Araucaria excelsa.—The old "Norfolk Island Pine" is an extremely useful subject for furnishing indoors during winter. When well-grown it forms a stately plant, the branches being arranged in regular whorls. It is a conifer that appears capable of enduring the most adverse conditions, and yet presents a healthy appearance after months of confinement. Its greatest service arises from its habit of growth, as it can be employed in rooms or corridors where lack of space precludes the use of wide-spreading palms. It requires an abundance of water during the growing season, and indoors, during winter, its requirements in this respect are above the average. When not requisitioned for decorative purposes, it should be given a well-lighted position in the palm house, in order to recuperate its strength and regain its colour.—Thomas Smith.

CUPRESSUS OBTUSA AND ITS VARIETIES.

Cupressus obtusa and its numerous varieties constitute an interesting group of garden coniferæ, for many are of great decorative value, while the remainder are worth growing on account of their peculiarity of growth. The species belongs to the section of the genus which is frequently known as retinospora in gardens, and, like the other species in the same group, it exhibits a certain difference in growth between juvenile and mature examples, but the difference is less pronounced than in the allied species C. pisifera.

It is a native of Japan, and was introduced to British gardens in 1861 by Mr. John Gould Veitch. Its distribution in Japan is fairly wide, while it is met with in mountainous regions up to an altitude of 3,250 feet. In its native country it has acquired a considerable reputation as a timber tree, the wood being of fine grain, durable, and valuable alike for interior work in houses and for use out of doors where damp-resisting wood is a necessity. Under natural conditions it attains a height of 80 to 100 feet, with a trunk diameter near the base of 3 to 4 feet. It is distinct from other cupressuses by reason of its flattened branchlets and small, blunt, rather bright green leaves, with a silvery under surface. The cones are from one-third to half an inch in diameter, and round. C. obtusa grows with the same rapidity as others of its class, but is not well adapted for wind-swept areas. The most distinct varieties are as follows:

C. o. pygmæa, a miniature form of the type, which never attains a height of more than a couple of feet or so, and is excellent for rock-work. It is possible that this is one of the forms used by the Japanese for their celebrated dwarf trees, for forms of C. obtusa appear to be very popular for the purpose. C. o. aurea differs from the type in having golden foliage. C. o. compacta is a dwarf form with pretty frond-like branchlets, rather stronger growing than pygmæa. C. o. Crippsi is another golden-leaved kind. It is a strong grower, of good colour, and an excellent ornamental plant.

C. o. erecta viridis is distinguished from the type by reason of its stiff, erect habit, the branches having lost a great deal of that flat frondose appearance so typical of C. obtusa. C. o. filicoides forms a small tree with a curious branching arrangement, the branchlets being small, neat, and frondose, very like that of some small-leaved fern. C. o. gracilis is a very graceful variety, with semi-pendulous branchlets clothed with dense foliage on the older parts of the branches, the ends, however, being less densely covered. C. o. gracilis aurea is a counterpart of the last-named, but has golden leaves. When well grown it is an extremely ornamental plant, not of large size, but suitable for a lawn specimen.

C. o. Keteleeri cannot by any means be recommended for general cultivation, for it belongs to that abomination in all plants, and especially in conifers, where the variegation is restricted to patches here and there over the whole plant. In this instance the main colour is green, and the variegation takes the form of sickly-looking silvery patches. C. o. lycopioides is a very curious variety, with many of the branches slightly fasciated, and with very dark leaves. It is very distinct, and when well grown is ornamental.

C. o. nana is a dwarf-growing variety after the style of compacta, there are distinct forms of it, two of which are aurea, with golden foliage, and gracilis, of looser habit than the type. C. o. tetragona aurea is a pretty golden-leaved variety of distinct appearance; it, however, cannot always be depended on to grow well, especially where the atmosphere is at all impure.

This exhausts the best known of the cultivated varieties; and, though we occasionally see other forms catalogued, they frequently turn out to be one or other of the above-mentioned kinds.

W. Dallimore.

FRUIT TREES THAT FAIL.

Every year thousands of fruit trees are propagated in nurseries, thousands are sold and planted, and yet the demand does not appear to grow less. How is this accounted for? In the first place, because there is a good deal of fresh land broken up and planted with fruit year by year, and, secondly, a good many trees are wanted every season to take the place of specimens which fail. It is of the latter that I now write, and in doing so leave out of consideration the old veteran fruit trees, which, after living a long life of usefulness, fail in the ordinary course of nature, and make room for young specimens. One is disposed to wonder how the nursery trade would be affected if every tree that was sent out grew and flourished, and replacement was never necessary. It would certainly make a difference, but such a thing is not likely to happen, for fruit trees, like human beings, fail at all ages, and for reasons of varying character.

As I write the planting season is just beginning, and between now and next spring hundreds of trees will be planted, in the hope that they will flourish and bear fruit. Last year the same thing was done with the same hope, and the year before, and for many years past; but, if one knew, it would be shown that a large percentage of the trees planted, say, within the last ten years, have proved to be anything but profitable investments for the individuals who purchased and planted them. In a way every man who plants a fruit tree takes a certain risk, as there can be no possible guarantee that it will grow. There is a reasonable prospect that it will, of course, but most of us have had experience of trees failing after everything that is humanly possible has been done to ensure success, and this is an ordinary risk which every fruit grower has to take. The instances, however, of trees failing through reasons that cannot be explained are few compared to those in which the grower is responsible for the loss, and it is, therefore, true of nurserymen that they increase business through the shortcomings of their customers.

Perhaps it is in the cultivation of fruit in orchards that more failures could be recorded than in any other department, and every year scores of young trees are planted which never live to bear fruit and become profitable. To obtain convincing evidence of this one should visit an orchard country which Nature has adapted for fruit culture, and examine trees that have been planted in recent years. It would soon become apparent why some trees fail, and the shoulders of the grower would have to carry the blame. Take, for instance, the West of England, which is a veritable orchard land, and possesses possibilities untold for the culture of apples and pears. Does this favoured district contribute what it might towards the fruit supply of the country? Alas! no, and one cannot help thinking that if fruit culture had been taken up here in the past on the same lines and at the same time as when foreign growers set out to supply the markets of Great Britain, import figures would read differently to what they do, but, there, that is part of another story.

To return to the trees that fail, a large number of the West Country orchards are attached to farmsteads, and the trees for planting are supplied by the landlord. It is true of some landlords that they are not particularly generous in providing trees, and they are content to see the orchards on their estate deteriorate for the want of renovation, without, perhaps, realising that the value of the property is deteriorating as well. Happily, however, there are landlords who know the value of orchards, and spend considerable sums of money on young trees for their tenants year by year, and while some of the latter do their part in the interests of themselves and the landlord as well, others fail in their duty, and through their failure the trees naturally fail also, and little encouragement is afforded to the landlord.

Strangely enough, the failure of trees to grow and prosper can often be traced to the neglect of what are simple details in cultivation, and for which it is difficult to find any excuse. Take the planting to begin with. The Woburn experiments have shown that the best results have followed unorthodox planting, and it would appear as if the worse one treated a tree when planting the better it would do. This may be so, but it must be remembered that there are thousands of trees which were planted carefully and well, according to practical views, that have done as well as trees possibly could, and a policy which would tend to encourage certain people to be more careless than they are now would be a risky one to teach, and there is certainly evidence enough to suggest at any rate that the failure of trees to succeed is due to the rough and ready way they were put in the ground.

But planting is not responsible for so many failures as other things, and there seems to be an idea on the part of some people that when a young tree is planted all responsibility in respect of its welfare is at an end. In short, there are hundreds of trees in orchards to-day which give the impression that they were planted, and promptly forgotten. In too many cases no pruning is done at an early stage to form the head of the tree, which, through the failure of this detail, perhaps bears a few small fruits at the start, but fails to get away into growth, and six or seven years after it was planted it is a stunted, old-young looking specimen, not much bigger than when it left the nursery. When will people realise that the first business of a young fruit tree is to grow? And if its early energies are devoted to bearing instead, the development of branches is checked, if not stopped entirely.

Correctly speaking, of course, horned stock and horses should not be allowed to graze in orchards containing young trees. In some cases, however, there is no alternative, and in such the trees should be protected. Unfortunately, this is too often neglected, and what can be expected from young trees that act as rubbing posts for cattle and horses? In a word, the failure of hundreds of trees can be traced to this cause, or through the bark on the stems being gnawed away by sheep or ground game. Again, when a young standard is planted it is staked and tied, but stakes will decay in time, and ties will break. The careful man watches for this, goes round his trees from time to time, and takes the proper measures to prevent damage to the stems by blowing about or bruising the bark, knowing, as he does, that neglect of these matters leads to canker and other troubles. But all are not careful, and some will walk past the tree that has broken away from the stake and wants a tie, half a dozen times without seeing it, and they never notice that the bark is being gnawed off the stems until it is nearly all gone, and the doom of the tree is sealed. Indeed, it is not too much to say that the majority of failures with young orchard trees can be directly traced to the want of attention to what are apparently little things.

A great mistake in orchard planting is that of putting in poor trees. By such I mean ill-grown specimens, with gnarled or weakly stems, and poor, unformed heads, which dwindle and struggle for a few years, but are rarely a credit to themselves or their owner. Nurserymen who have reputations to maintain do not send out poor trees, but towards the end of the planting season there are to be seen in public market places big bundles of trees which are sold by auction and private contract at prices which appear ridiculously low compared to what nurserymen charge. It is doubtful where the trees come from, they bear no tradesman's name, and the varieties are a doubtful quantity. They sell, for the simple reason that they appear cheap, and a proportion may turn out satisfactory, but I have seen enough of this method of purchasing fruit trees to know that at the best it is risky, and it is infinitely better when purchasing trees to go to a reliable tradesman for them, and pay a fair price. Indeed, false ideas of economy may be included amongst the various reasons why fruit trees fail.

H.

PROTECTION.

Protection in some form or other is generally practised in gardens, particularly where half-hardy subjects are extensively cultivated. Materials are employed to protect either the roots or branches. Root protection is needed where the roots consist largely of surface fibres, as in many half-hardy shrubs, or when the rootstock starts into growth during winter as in ostrowskia, Cushion irises, and the somewhat shrubby romneya; again, when bulbous or tuberous, the roots are liable to be destroyed or weakened by frost, and such instances occur in Crinum Powelli and eremurus. Grafted and budded plants often suffer from the same cause as is the case with tea roses. In these examples the protective agent should consist of some light open material in the form of a mulch; wheat straw, coal ashes, cocoanut fibre, and fresh peat moss are among the best materials to employ.

Materials are sometimes required to protect the branches from winds which in many gardens are in the nature of draughts or currents caused by walls, hedges, or dense shrubberies. A thick impervious hedge is not so good a shelter, from the standpoint of a wind-break, as one stout enough to withstand gales and yet allow the wind to pass through, as in the latter case the hedge acts as a filter, breaking the power of the wind, whereas the former merely diverts its course, causing the wind to seek an exit whence it emerges with as great power as before. With this knowledge it must necessarily be, that most half-hardy plants can be made largely self-supporting by introducing them among the hardiest shrubs, employing the latter in the capacity of nurses, and thereby forming a living shelter to safeguard the weaker subjects.

Temporary shelters are at times necessary, as during extreme periods of frost, and hurdles laced with straw, birch, or spruce are very serviceable as windbreaks, and mats made of straw, fibre, or other light material are the most suitable articles for affording temporary protection during periods of extreme frost.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in THE AMATEUR'S GREENHOUSE, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

NEW JAPANESE CHRYSANTHEMUMS.

From the many enquiries received from growers who have not the opportunity to see the new varieties, I know there is a strong desire to add each year some new varieties of merit to collections.

Following my usual practice then, I give herewith the names of those I have seen and can recommend for the benefit of readers of the Gardeners' Magazine. Really good novelties are not numerous, rather the reverse this season. Somehow we do not obtain many from France or America and fewer than usual from Australia, but we are dependent more on home supplies, many of which, it must be said, have but a short life, much more so than formerly. How is this? It is also strange that we obtain so few sports; these seem to run in families, especially from Mdme. P. Radaelli, and some few others. If some scientist could enlighten the world as to the cause of sports and the best means of controlling them, how much more we should gain in new varieties, because, no doubt, many of our best and longest lived varieties, not confined to the Japanese section, have originated as sports. We do not appear to be any nearer this end than we were thirty years ago.

POLYGONUM POLYSTACHYUM IN THE CAMBRIDGE BOTANIC GARDENS.
Flowers white.

With English-raised varieties there is too strong a tendency to place them on the market before they are thoroughly proved, and hence the short existence so many have.

Miss Lillian Hall (Davis) is a true incurved Japanese, with broad florets of a silvery-rose colour, much resembling in that respect Mrs. Barkley.

Miss Ellie Greene (Mileham) has long drooping florets of a graceful character, pleasing in colour, rose-pink, quite a promising variety.

Mrs. Robert Brown (Carpenter) has extremely long and wide petals, some I measured were seven inches in length, forming a large bloom of a drooping character. The colour is brick-red on the surface, with a bronzy-buff reverse.

Yellow Mrs. Charles Beckett is a capital variety for grouping, being especially dwarf, with good foliage. The broad florets turn slightly up at the tip; in colour it is a soft yellow.

Miss Annie Nicoll is a pale blush sport from the deep purplish-pink Walter Jinks, itself a large showy variety. By some the newcomer is said to be pure white, but I have found it distinctly flushed with pink, and later blooms are more heavily suffused.

Ella Ainsley (N. Molyneux) belongs to the race of bright coloured varieties emanating from this raiser, which only need a trifle more size to render them perfect as exhibition flowers. This newcomer has wide florets that reflex gracefully, showing the full surface colour, which is rich crimson.

Kate Ainsley (N. Molyneux) is fully eight inches in diameter, the semi-drooping florets curl at the point, building up a full-centred flower. The base colour is gold, with crimson or purple stripes on the medium wide florets.

Frank Molyneux (N. Molyneux) is fully nine inches in diameter. The colour is terra cotta with a gold suffusion. The reverse gold.

Mrs. F. C. Stoop (Carpenter) has medium-sized petals of a semi-drooping character, building up a full flower. The colour rose, edged and striped with a deeper tint on a cream-coloured ground.

Beecham Keeling has semi-drooping florets, terra-cotta red, with a reverse of chestnut.

Mary Poulton (Poulton) has closely-fitting florets, a full and deep flower of a rich shell pink colour.

White Queen (Silsbury) is a deeply-built flower, with reflexing florets, ivory white, quite a promising variety.

George Hemming (Mileham), rich amaranth, promising as a full-sized decorative variety.

Mrs. Trevor Williams (Jones). This variety has wide florets, which are semi-drooping with twisted points; the colour buff, deeper in the centre as the florets unfold, the points are distinctly flushed with rose.

Mrs. L. Thorne, although not quite new has not been seen in good order until this year, and now it deserves a special note, it being one of the finest yellow flowered varieties in cultivation. The blooms are of full size, loosely incurving, and of high quality. The colour is soft yellow.

E. Molyneux.

POLYGONUM POLYSTACHYUM.

Those who value the strong-growing polygonums for the wild garden or border should possess this handsome species on account of its late flowering. It grows about five feet high, with large terminal panicles of white flowers, which are produced in September and October, rendering a very pleasing contrast both in habit and colour with Michaelmas daisies and other late-flowering subjects.

The accompanying photograph shows a plant growing in rather poor soil in the Cambridge Botanic Garden, where with other strong-growing kinds, such as P. sachalinense, P. cuspidatum, and var. crispum, and P. sericeum, a succession of flower is produced for several months.

These strong-growing species are very pretty when allowed to cover good big stretches in the wild garden or by the side of a stream or lake, and in the case of P. cuspidatum and P. sachalinense, the golden and brown stems when dead are worth retaining until nearly Christmas, being quite ornamental, especially when viewed on sunny days.

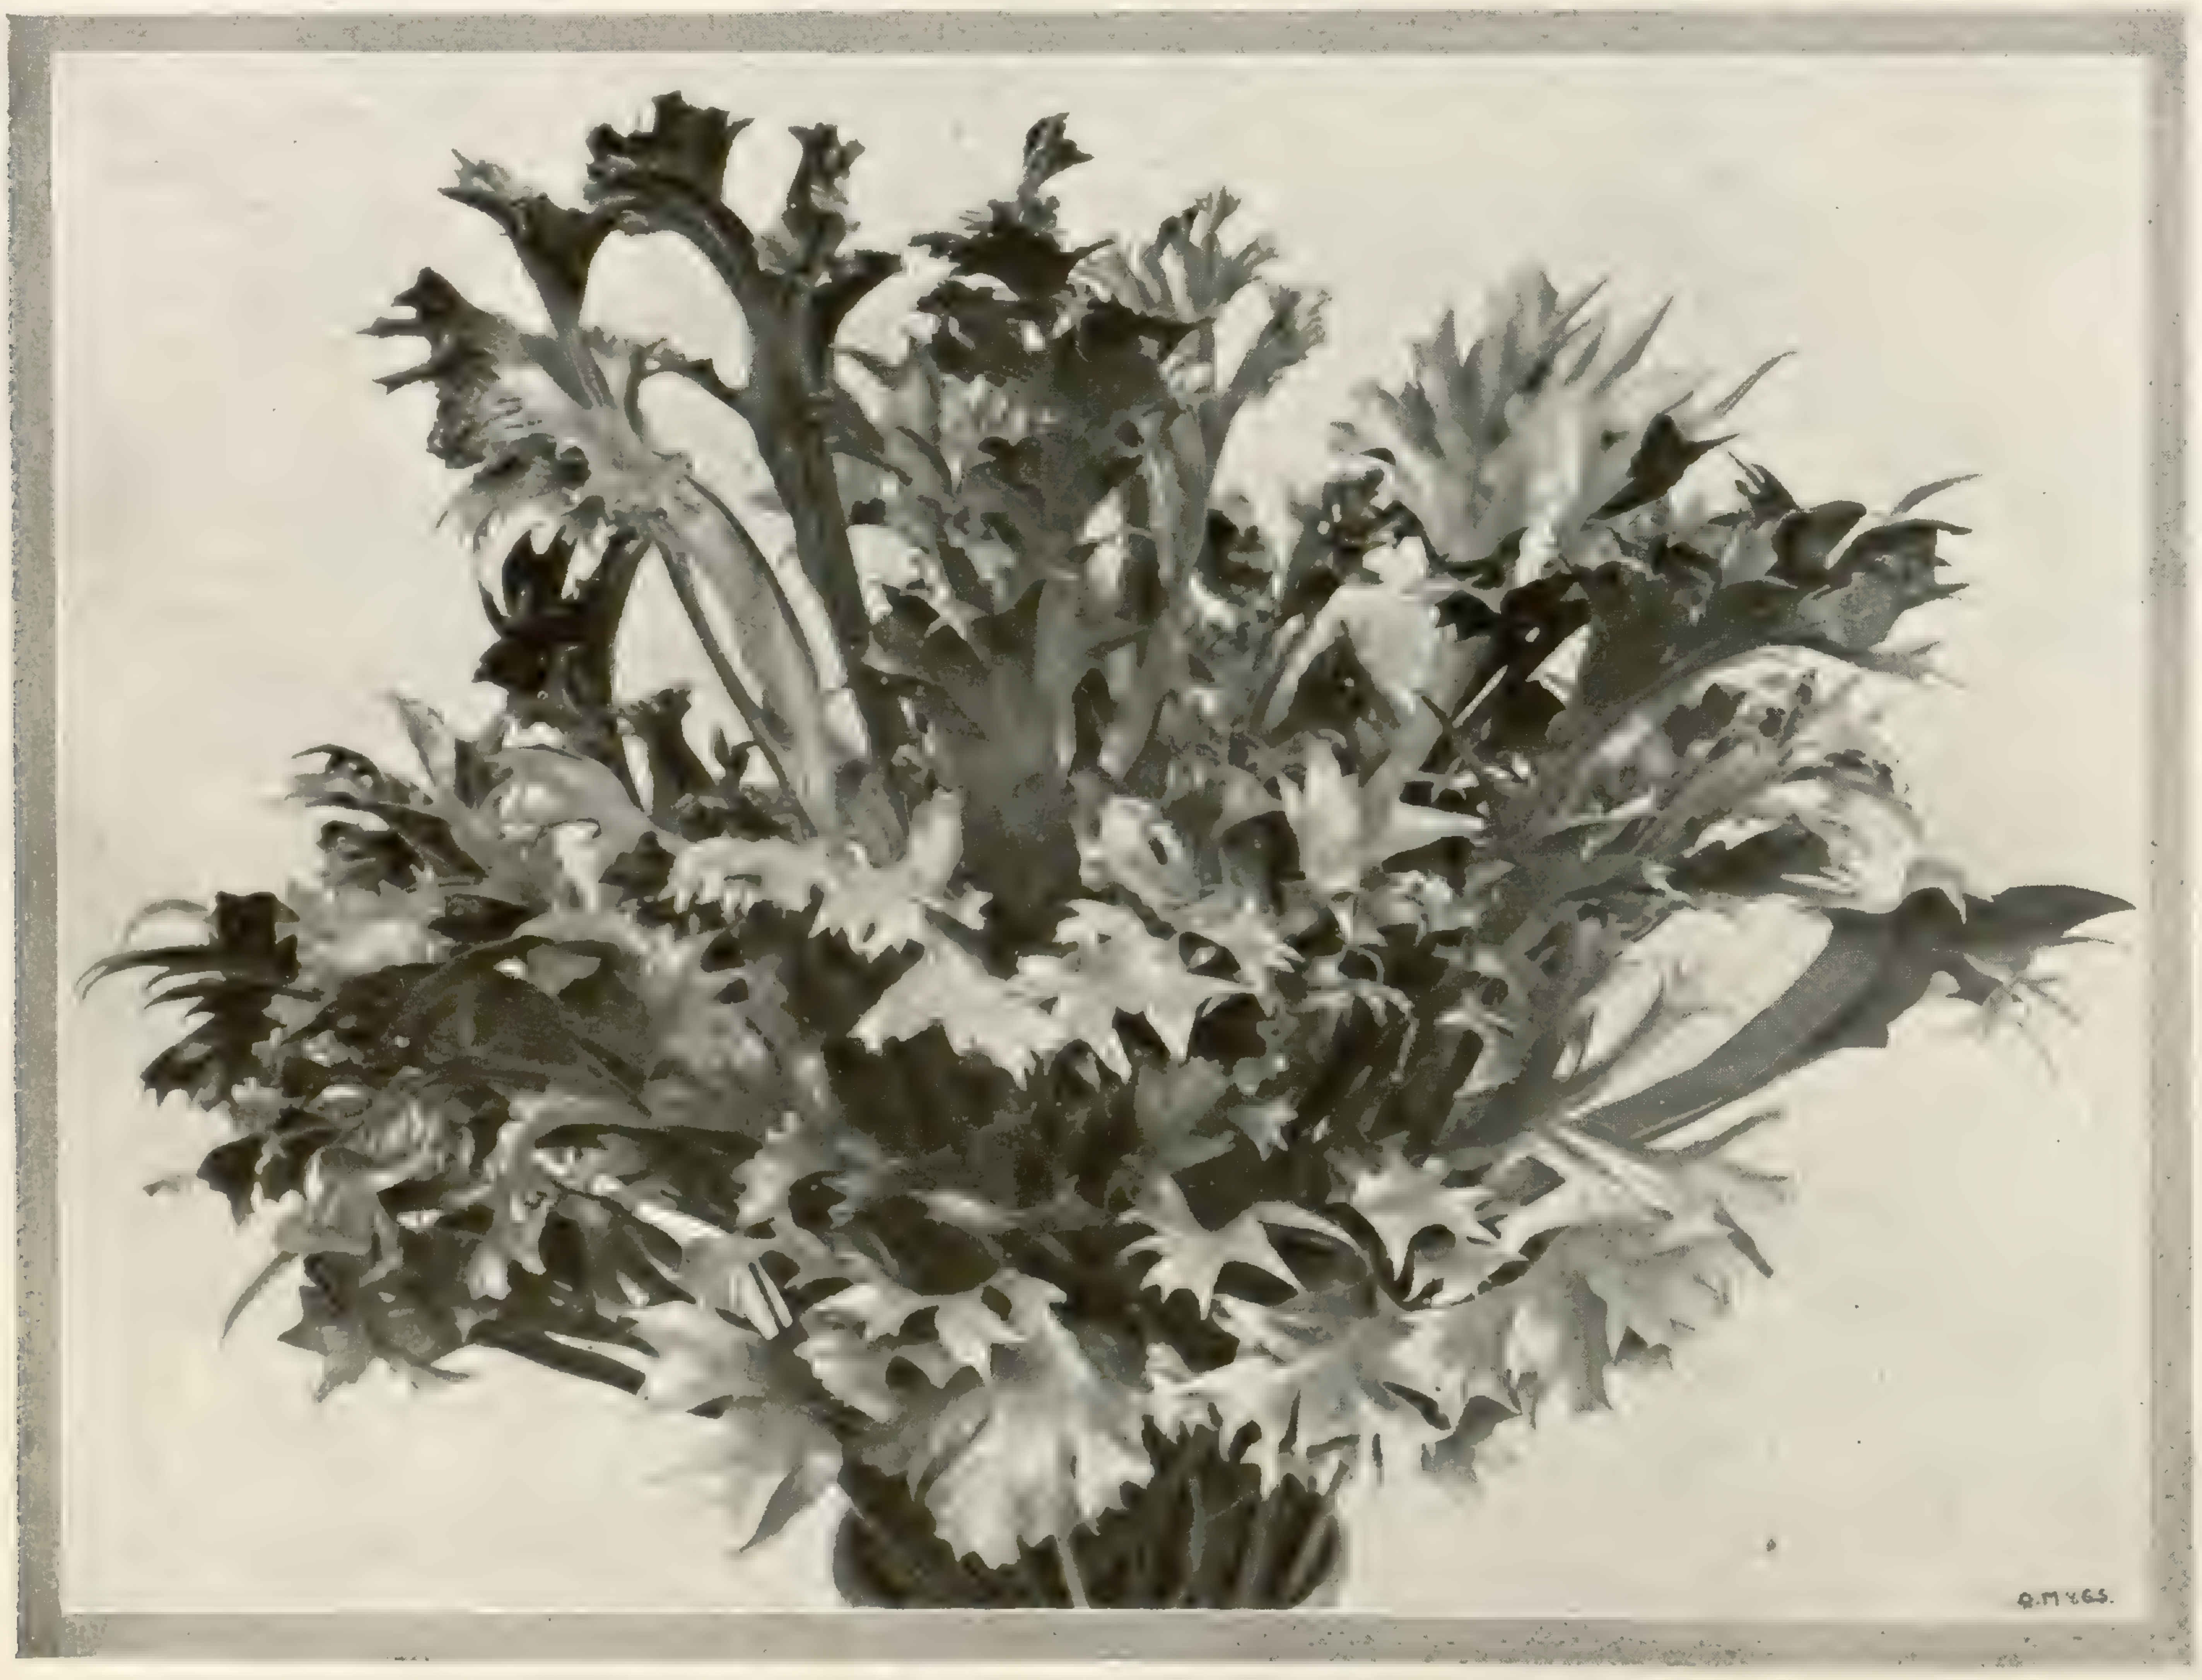
Cambridge.

POLYPODIUMS FOR HOUSE DECORATIONS.

Though the polypodiums are very numerous, and are found growing in almost all parts of the world, there are not so very many species that are suitable for house decorations. Some grow too large, others are by far too dwarf, while some are deciduous, their foliage being too soft to withstand the variable temperatures of the dwelling-house. Still, there are more than enough species and varieties that may be selected from this extensive genus to suit the tastes of the most fastidious. There are, however, not many that are indigenous to the British Isles, although the varieties of the common polypodium are somewhat numerous, and a goodly proportion of them most beautiful.



POLYPODIUM IRIOIDES RAMO-CRISTATUM.
As grown by Messrs. W. Hill and Son.

A considerable proportion of the species produce creeping rhizomes, which must be kept near the surface of the soil if the plants are to thrive satisfactorily; some, in fact, produce them on the surface, and these are well adapted for growing both in pots and baskets. The soil should be of a light, peaty nature, to enable the water to pass through it freely, and the drainage in all cases be ample, as but few of the species do well when over watered. Most gardeners are well acquainted with the old Phlebodium aureum, which at one time played an important part in a collection of stove ferns at the great exhibitions. This is synonymous with Polypodium aureum, and was introduced as far back as 1742. Since that time many fine species have been introduced, and not a few forms have been raised in this country. P. Mayi is one of these. The fronds are similar in colour to those of aureum, but they are of a fine wavy character the whole of their length; the edges of which are quite crispate. This is undoubtedly one of the finest varieties yet introduced, and grows well in the greenhouse either in a pot or basket. P. Schneideri is another hybrid that should be found in every collection. The fronds are deeply cut, and having that beautiful glaucous tint found in aureum they are most attractive. When well grown they attain a length of about two feet, and are borne on a wiry leaf-stalk of six inches in length. P. nigrescens in a small state is very handsome.

P. Billardieri is a very useful and ornamental greenhouse species from New Zealand. The fronds usually stand nearly upright, and in old plants they are deeply cut, in fact, the cutting reaches almost to the midrib. They are of a fine leathery texture, which enables them to withstand the sudden changes of temperature in the dwelling-house. P. glaucum and its varieties cristatum and magnificum are grand kinds for decorative purposes, their fronds being of a fine leathery texture. P. neriifolium and its varieties cristatum, furcatum and cristatum are also very ornamental in a young state, as their fronds are of that dark green leathery texture so desirable for indoor decorations. P. irioides is a singular looking erect-growing species from New South Wales. The fronds are from a foot to eighteen inches in length, and of a pale yellowish green colour. P. irioides ramo-cristatum is a most useful variety, the fronds being beautifully crested. This is a variety raised in this country, and is a fine subject for decorative purposes, especially when well grown in pots of about five or six inches in diameter. The fine specimen herewith illustrated was in Messrs. W. Hill and Son's collection.

APPLE CHRISTMAS PEARMAIN.

Mr. Markham (on page 889) draws attention to this apple, and expresses a wish to know other growers' opinions of its merits. Of its behaviour as a standard I cannot speak, but as a bush tree or pyramid I have found it a very heavy cropper, so much so that it should make a good apple for market. My experience of it has been with trees planted in fairly heavy land. It makes an excellent espalier tree, and crops as freely when grown as a trained tree as it does in the bush form.

Independent of its prolific habit, it has other good points in its favour, such as size, colour, quality, and long keeping properties, and there is little doubt that when better known it will be grown in quantity. It is not up to Cox's Orange Pippin in flavour, but I may safely say there is as yet no variety in commerce which can equal Cox's for quality. The man who raises an apple equal in flavour to Cox's Orange Pippin, of good constitution, and one that will come in at a later season than it, will have done something to be remembered by for ever in the horticultural world. One has occasionally heard of such varieties, but so far we have not met with them.

T. H. Slade.

Jerusalem Artichokes.—These will have completed the development of their tubers sufficiently for them to be lifted. When lifted, they may be stored in sand in the root room. Nothing will be gained in leaving them longer in the kitchen garden quarters, and the ground can, when cleared, be prepared for future cropping.—C. Flack.

CULINARY PEARS.

In the majority of gardens the call for stewing pears during winter and spring is constant, and to meet the demand a few good dependable varieties should be given a fairly good position. During the early part of the season we find that many pears grown for dessert are the best of cookers, but their season, as a rule, is so short that good keepers of the stewing varieties must be included in a collection of pears. Catillac is no doubt one of the most commonly planted, as it is a grand cropper, and thrives satisfactorily in most soils, either on standards or bushes, and although a little gritty, it is exceptionally good when properly cooked, and, in addition, the fruits keep sound, when properly stored, till late in spring. Large trees of almost any variety not required might well (at the proper season) be headed back and grafted, and in this way heavy crops of useful sized pears will quickly follow.

I grew Bellissime d'Hiver some years ago, and considered it to be one of the very best culinary pears for quality, the flesh being fine grained, tender, sweet, with a slight musky flavour, and the fruits kept sound till March, and sometimes till April. Uvedale's Saint Germain is one of the largest varieties grown, and although not one of the finest of croppers, healthy espalier trained trees bear satisfactorily.

The variety Vicar of Winkfield, in its season, makes a good cooker, and is generally appreciated by lovers of cooked pears. Gilogil is a very handsome pear, that crops heavily, and the trees make capital standards.

But one of the heaviest of croppers I know is the variety Verulam, and large trees rarely fail to bear; the fruits in some seasons are very dark brown on the sunny side, they are always of useful size, and the tree crops heavily and the fruit keeps well.

Although there is a constant demand for stewing pears, I do not think it necessary to grow more than three or four varieties, and these might be given a position not quite so good as that devoted to the more choice dessert kinds. Young trees growing too vigorously to be fruitful should be lifted and replanted, and larger trees will need root pruning, but this work, it is needless to say, should be taken in hand and carefully carried out on all trees making too much wood, and also when the roots are in a bad state. I have repeatedly brought unfruitful trees into a very satisfactory state of bearing by giving attention to the roots at the proper time.

H. Markham.

From a photograph of a fruit grown by Messrs. G. Bunyard and Co., Lim.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CŒLOGYNE CRISTATA. — Where this species and its varieties are required to produce their flowers about Christmas or the beginning of the New Year, they should now be removed from the houses wherein they have been placed to ripen their growths to a warmer house where more liberal treatment can be given. I would like to point out the difficulties that are frequently met with in winter, when C. cristata and its varieties are cultivated in or near large towns, where there is a prevalence of fog and the light is subdued. It will often be found when an attempt is made to have them in flower early in the year, that the flower spikes turn black and form a pulpy mass some time before they reach the stage at which the flowers are expanding. It will almost always occur after a thick fog or a period of subdued light. I have tried various methods to counteract this, and the results have been such as to convince me that, where it is desired to flower them satisfactorily, there is no alternative under unfavourable outside conditions but to keep them as cool as possible for some weeks yet, and thus retard their flowering until late in the spring. The variety C. c. alba is naturally late-flowering, and is generally found to do satisfactorily in the neighbourhood of large towns.

DENDROBIUMS.—The early-flowering deciduous dendrobiums, such as D. aureum, D. Ainsworthi in its varied forms, and D. Wardianum will now be producing their flower buds from the alternate side of the pseudo-bulbs to that where the leaves have been shed. Should these be required to flower early in the season, the most forward may now be selected and placed under slightly warmer conditions, and thus gradually removed into the hot-house or stove. Here more liberal treatment, as far as atmospheric moisture is concerned, can be given; care must be taken to avoid too much heat and moisture at first. Sudden changes from a practically cool, dry atmosphere to one that is hot and humid usually results in the flower buds turning into growths. Too much moisture at the roots, or spraying liberally, frequently brings about the same result thus early in the season. Only sufficient root moisture is necessary to retain the pseudo-bulbs in a normal plump state, until the flowers have become separated in the bud; as soon as this can be ascertained, more liberal treatment may be given. Keep them well up to the light so that the colour characteristics of the flowers may be developed to the best advantage. Where a succession of flowering examples of the deciduous dendrobiums is required a few should be placed under more liberal treatment weekly for the next few weeks. With the turn of the year growth becomes more rapid, and they may remain under resting conditions for longer periods.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

GARDENIAS.—For flowering at this season of the year gardenias are better managed when heated pits can be set aside for them, as the necessary warmth and moisture can then be given. If planted out in such structures that the lights have been removed after growth was completed and buds formed, an abundance of flower will be freely produced when the necessary light and heat can be assured.

RESTING BULBS.—This is a time of rest for a large number of bulbs, and rest means a renewal of strength, but it is also a time when the cultivator should not lose interest and require to be reminded of what is under the stage. If but little, some attention is absolutely necessary in the case of a great number of such bulbs. Supposing no water is necessary during November, December, and, in many cases, January, premature growth must be guarded against, excess of heat or cold, etc. It is good practice to have the compost prepared for such bulbs some months previously. It always appears to me to be in a better state for potting when it has been mixed some time before being used. The different ingredients become incorporated, and in that state the compost is preferable for potting purposes.

TEMPERATURE, ETC.—At this quiet season the temperature by night and day can be lowered, where the usual collection of stove plants are grown, and from 63 to 65 deg. may be taken as a suitable night temperature. A lower temperature than this should only be adopted during very cold weather, then it will be an advantage to the plants in general, by preventing exhaustion from too much evaporation by the overheating of the pipes. A lower temperature than the above in mild weather would be found insufficient to dispel moisture, which if allowed to remain on the plants would soon cause the foliage or flowers, as the case may be, to suffer. To find the plants the first thing in the morning, as it were, bathed in moisture is a result of low temperature. According to the state of the weather the temperature for the day may rise 5, 10, or 15 deg. Admit air when a rise has been obtained, but close early at all times. Damping down or syringing must be done with care during dull or rainy weather, but little will be necessary, a slight spray with the syringe being sufficient besides sprinkling the floors. Should it be found necessary to syringe heavily for any special purpose take advantage of a bright day, and have a little extra heat in the pipes, so that the moisture may soon be dispersed.

CROTONS would be found an exception to the above rules, as they do not suffer from an excess of atmospheric moisture provided the above temperature is maintained; on the other hand, it appears to be suited to their requirements. These and kindred subjects that require a trifle more attention in this direction can easily be accommodated with a little management.—W. FYFE, Lockinge Park Gardens.

FRUITS UNDER GLASS.

PEACH HOUSES.—The earliest house should now be closed, and if the necessary cleansing and pruning and training have been carried out, as advised in these columns, all will be in perfect readiness. Simply close the ventilators, and damp down daily in fine weather, and maintain a temperature ranging from 45 to 50 degrees. A few strawberry plants may be placed on the shelves. These should be examined to see if there are worms in the pots, and they should have the surface soil cleaned, and, if necessary, give a top-dressing of good loam. If the leaves are not free from insects sponge them with a little tepid water, and then wash the pots, so that all will be perfectly clean. Succession peach houses should now have attention, and as I have already dealt with root pruning and planting it is not necessary to do more than say that if these details have not been carried out they should not be any longer delayed. In pruning cut out as much old wood as can conveniently be spared. Of course, it is quite necessary in the case with very large trees to have some big branches, but to a great extent these can be covered up by small fruiting wood.

EARLY VINERY.—If ripe grapes are required at the end of April it will be necessary to cleanse and start the house. This is done by closing all ventilators. Should mealy bug have been prevalent it is well to examine the rods again, and wash them with some trustworthy petroleum emulsion mixed with warm water. The stages should be dressed with raw petroleum, well rubbing it into the cracks. This is the only way to effectually eradicate this dreaded pest. Give a good watering with water at a temperature of 70 deg., and keep the temperature at about 50 deg., which should be fairly easy without fire heat, and syringe the rods twice daily in sunny weather, at other times once. Plants that are to be forced may be introduced for the purpose of being started.

SUCCESSIONAL VINERIES.—Prune the rods as soon as the leaves have fallen, and make preparations for cleansing both the vines and the interior of the house—glass, wood, and ironwork—and finally the borders; if the wood of the rods has not been so satisfactory as desired, the border should be overhauled. For instance, if the cultural requirements have been well attended to the roots must be at fault, and this can only be found out by a thorough examination. There are soils in some localities that will grow grapes thoroughly well, and the treatment may be quite ordinary; but much can be done towards obtaining better results by improving the border by the addition of fresh soil. The vines will suffer but little check if the operation be performed carefully, and thus early.

POT VINES.—These may be treated similarly to permanent vines, but may be grown in any light house or pit. The pots should be plunged to the rims in fresh tree leaves, which will give a little heat to the roots, and keep the house at a temperature of 50 deg. Bend the rods down to induce the buds to push regularly throughout the whole length of the rods. Pot vines can be grown, of course, in the house with permanent vines, providing there is light enough, and this is a very good way of keeping up a supply.—W. A. COOK, Leonardslee Gardens.

THE KITCHEN GARDEN.

SPRING CABBAGE. — The plants that were put in early will have become established in their new quarters. Those occupying south borders to supply the first heads will be benefited by having a light application of nitrate of soda sprinkled round them and the surface of the soil loosened with the hoe frequently. The later plants intended for the main crop should be lightly forked between, and the stems during the process may be earthed-up, as the soil about them will act as a protection against frost and steady them during strong winds. A dry day is preferable for carrying out this work.

OLD CABBAGES.—These are frequently left to produce a second crop during the latter part of autumn and early in winter, which usually proves most useful. As soon as the heads are cut have the plants removed at once. They are great impoverishers of the soil, consequently the land should be enriched with the best manure available, and, if possible, be deeply trenched before being again planted with further crops.

TURNIPS. — The August-sown turnips in all cases that have come under my notice have been a success this season. Many of the bulbs have arrived at perfection, and should be lifted for use, and stored in a similar manner to the artichokes. The smaller bulbs will continue to improve in size to a small degree as long as the weather is not severe, and may be left in the quarters.

CELERY.—Owing to continual rain the earthing-up of celery has been very difficult. Where the late plants have not received their final earthing take advantage of the first fine day for completing the work. Take care to well pat the soil with the spade on each side of the rows, to form a smooth surface and throw off the water, and prevent any considerable quantity reaching the hearts.

CUCUMBERS. — Up to the present the weather has been fairly favourable to maintain the temperature to suit cucumbers without resorting to strong firing. During the next three months the crop will require the most careful attention. Frequent light top-dressings of rich soil and dustings of an approved artificial manure, watered in with warm water will assist growth. Crop lightly and maintain a humid atmosphere, and on warm days syringe freely to remove all traces of red-spider from the leaves.

EARLY POTATOES. — A beginning with the earliest crop of tubers should be made, either by planting in pits, or frames over hotbeds. Put in boxes quantities of the best sets, and place them in the light to start them into growth in readiness for planting later.—CHARLES FLACK, Cholmondeley Castle Gardens.

THE PERPETUAL FLOWERING CARNATION SOCIETY.
GREAT WINTER SHOW OF CARNATIONS, ROYAL HORTICULTURAL HALL, Vincent Square, Westminster, S.W., WEDNESDAY, December 8th.
Admission, 1 p.m. to 5 p.m., 1s.
Schedules and Particulars from the Honorary Secretary, Mr. HAYWARD MATHIAS, "Lucerne," Stubbington, Fareham, Hants.
ANNUAL DINNER, WINDSOR HOTEL, same evening, at 7 p.m. Tickets from Mr. E. F. HAWES, Royal Botanic Gardens, London, N.W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Norfolk and Norwich Horticultural Society.

NOVEMBER 17 to 19.

Excellent as was the autumn show held by this society last year, it was surpassed by that of the current season which, if it did not establish a record, was in every way worthy of the society and its traditions. We have not in any year seen the St. Andrew's and Blackfriars Halls better filled, or the products of higher quality. Cut blooms of chrysanthemums, which were rather weak at last year's exhibition, were on this occasion staged in immense numbers, and as a whole in remarkably fine condition; miscellaneous cut flowers were plentiful, and in the classes for floral arrangements the competition was keen, and the exhibits highly attractive by reason of the great taste evinced by the exhibitors. As in former years, the spacious Blackfriars Hall was filled to its utmost capacity with fruits and vegetables, which were presented in a condition that clearly indicated the remarkable cultural skill obtaining in the county. As usual, the arrangements were admirably carried out under the direction of Mr. W. Smith, the honorary secretary, and, favoured by fine weather, there was a large attendance of visitors.

CUT BLOOMS.

As already mentioned, there was a magnificent display of cut blooms; Japanese varieties were, as a matter of course, strongly represented, and incurved varieties were considerably above the average, both in numbers and quality. Classes were provided for naturally grown flowers shown in vases, and these were well filled, but the collections were in some cases rather poor owing to the exhibitors interpreting the term naturally grown too literally.

There was a strong competition in the great class for forty-eight Japanese blooms in not less than thirty-six varieties. Here Mr. C. Nichols, gardener to T. A. Rising, Esq., Manor House, Ormesby, was a splendid first with blooms remarkable for their large size, freshness, and good colour, especially noteworthy were the blooms of Madame P. Radaelli, Reginald Vallis, J. W. Molyneux, Lady Talbot, W. A. Etherington, Mafeking Hero, F. S. Vallis, Madame Rivol, Algernon Davis, R. H. Broomhead, Bessie Godfrey; and a second bloom of Reginald Vallis, which was selected for the award for the best bloom of the Japanese varieties in the show; Mr. Nichol was also awarded for this collection the Royal Horticultural Society's silver-gilt Flora medal for the best exhibit in the show; Mr. F. J. Brown, gardener to Miss Langworthy, was a capital second; and Mr. E. F. Bull, gardener to J. W. Brooke, Esq., Adrian Lodge, Lowestoft, was a close third. In competition for the prizes for thirty-six blooms of Japanese varieties, Mr. A. Hill, gardener to F. J. O. Montague, Esq., Lynford Hall, obtained premier honours for superbly developed blooms of the finer varieties; Mr. H. Goude, gardener to E. Reeve, Esq., The Grange, Old Catton, followed for second place with a fine set of blooms; and Mr. E. Leach, gardener to W. H. Palmer, Esq., Ormesby, had excellent blooms for the third place.

Some excellent contributions were made to the class for twenty-four Japanese blooms, distinct, and the first and second prizes were awarded to Mr. J. King, gardener to E. J. Hacker, Esq., Ormesby, and Mr. A. Gibson, Thelveton Hall Gardens. Both staged finely developed blooms of well-known varieties. In competition for the prizes for twelve Japanese, Mr. H. Andrews, Earsham Hall, was first, and Mr. H. Gill, Crinfer Hill, Slarston, second. There was a strong competition in the classes for six blooms. In that for any white Japanese, Mr. E. Hill was first with superb blooms of Mrs. A. T. Miller, and in the class for six blooms of any variety other than white, Mr. W. Palmer obtained premier honours with Reginald Vallis. The bright yellow F. S. Vallis was splendidly shown in this class by several exhibitors.

Incurved varieties were shown in a condition considerably above the average, and it was interesting to see these old-fashioned flowers so well represented. Mr. E. Hill occupied the post of honour for twelve varieties with splendidly-developed blooms of Romance, Mrs. G. Denyer, Pantia Ralli, Godfrey's Eclipse, and other well-known varieties; Mr. J. Wynn, Sedgeford Hall, was second, with blooms, large in size, but rather wanting in finish; Mr. W. Turner third. For six blooms of any one incurved variety, Mr. J. Wynn was first with grand blooms of the beautiful pink incurved J. Wynn. One of these was selected as the best bloom of its class in the show.

A class was provided for chrysanthemum blooms, arranged on a space of six by four feet, in which quality of flowers and taste in arrangement had to be considered. The competition for the first place was very close between Mr. W. Palmer, gardener to J. B. Coaks, Esq., Fern Hill, Thorpe, and Mr. C. Nichols, gardener to T. A. Rising, Esq., Manor House, Ormesby. The last-named had a trifle the best blooms, but they were placed in wine bottles, and the layer of evergreens on which the latter were stood detracted much from the effect. The blooms from Mr. Palmer, who obtained first place, were arranged in vases, and the foliage used was light and pleasing. Mr. T. Simpson, gardener to the Earl of Stradbroke, Henham Holt, who was third, staged his flowers, which were decidedly good, in a formal bank that was not particularly pleasing.

There was a keen contest in the classes for hall vases and baskets of chrysanthemums, and for the last-named Mr. W. Laws, gardener to G. E. White, Esq., Eaton House, Norwich, was first with a tastefully arranged basket of single varieties, of which an illustration is given herewith. Dr. Back, Acle, was second with an effective arrangement of a rose-coloured single chrysanthemum, and crimson foliage.

PLANTS.

Of late years specimen chrysanthemums have not formed a strong feature, and on this occasion they appeared to be limited to the collections of bush-grown plants, and these, it must be said, were well flowered and in every way satisfactory. Groups of chrysanthemums were, as usual, of a high order of merit, and arranged in a line down St. Andrew's Hall, they proved immensely attractive to the visitors. Mr. W. Palmer was successful in obtaining premier honours, his group being remarkable for the high development of the blooms, the excellent leafage, and the taste evinced in the arrangement. Mr. C. Burtenshaw, gardener to H. Skelton, Esq., St. Helen House, Norwich, was a close second with a group equally remarkable for high quality and tasteful arrangement; and Mr. W. Rush, gardener to F. P. Hurd, Esq., The Fernery, Thorpe, who was third, had a fine group.

Three classes were provided for winter-flowering begonias, and in each specimens of quite exceptional excellence were represented. In these classes the plants had to be grown in six-inch pots, and they were simply pyramids of flower about thirty inches high, and eighteen inches in diameter. Mr. Goude was first for three specimens of the white Turnford Hall, and Mr. Coombs, gardener to Lord de Ramsey, Haverland Hall, Norwich, occupied the first place for three specimens of Ideala. We were especially interested in the last-named for, as far as we are aware, this was the first time that begonias of the Ideala type have had a class specially provided for them, and the specimens were certainly the finest that have yet been seen in competition.

The premier award for six specimens of Gloire de Lorraine was made in favour of Mr. H. Goude, who is deserving of the highest praise for the success he had achieved in the cultivation of this popular begonia.

There was a good competition in the orchid classes, and prominent among the exhibitors were Mr. W. Mason, gardener to Rider Haggard, Esq., Ditchingham House; Mr. Lewis Smith, gardener to E. Fellowes, Esq., Shotesham Park; and Mr. Coombs.

FRUITS AND VEGETABLES.

As is customary at the Norwich exhibitions, these products formed features equally remarkable for their attractiveness and educational value. There were three entries in competition for the prizes for a collection of fruit in twelve varieties, and the fruit was meritorious throughout. Artistic arrangement of the collection had to be taken into consideration by the judges, and in this respect Mr. J. Hilson, gardener to Sir F. Adair, Bart., Flixton Hall, Norwich, was far ahead of the other competitors, and, as his fruit was exceptionally high in quality, he was awarded the challenge bowl and the cash prize offered as the premier award. Mr. Hilson had fine clusters of black and white grapes, and excellent apples and pears, and, in association with the fruit, he had very excellent dracænas, and a few other plants, and light vases of single chrysanthemums.

Grapes were splendidly shown, and, in competition for the prizes for three bunches of Alicante, Mr. H. Goude, gardener to E. Reeve, Esq., The Grange, Old Catton, Norwich, was first with finely-shouldered clusters, remarkable for the large size and fine colour of the berries; Mr. W. Palmer, gardener to J. B. Coaks, Esq., Fern Hill, Thorpe, Norwich, was a close second, with shapely, well-finished bunches, and Mr. F. Faint, gardener to Sir S. Hoare, Sidestrand Hall, third. The most successful of the exhibitors of Black Hamburgh grapes, which were well represented, were Mr. W. Palmer, Mr. J. Fitzpatrick, 221, Dereham Road, Norwich; and Mr. E. F. Bull, gardener to J. W. Brooke, Esq., Adrian Lodge, Lowestoft. There was a strong competition in the class for three black varieties, one bunch of each, and the first place was occupied by Mr. A. V. Coombe, gardener to Lord de Ramsey, Haverland Hall, with splendidly-finished clusters of Appley Towers, Alicante, and Gros Maroc; Mr. H. Goude followed closely for second place. The last-named was first for a single bunch of black grapes with Alicante, and Mr. A. V. Coombe was a very close second with the same variety. Muscat of Alexandria was especially well represented, and at the head of the several competitors for three bunches was Mr. W. Allan, gardener to Colonel the Hon. E. Harboard, Gunton Park, Norwich, whose clusters were of large size and superbly finished; Mr. J. Farrow, gardener to J. Powell, Esq., Hampstead House, Southlawn, was second. For three bunches of any other white grape, Mr. W. Palmer was first with richly-coloured bunches of Golden Queen, and Mr. H. Andrews, gardener to Captain J. P. Meade, Earsham Hall, second with Foster's Seedling. The best bunch of white grapes was that of Muscat of Alexandria from Mr. W Allan; and Mr. W. Palmer was second with the same variety.

Apples were strongly represented, the whole of the classes being well filled, and the quality high. In competition for the prizes for nine dishes of culinary varieties Mr. G. D. Davison, gardener to Colonel Petre, Westwick House, Worstead, was first with magnificent fruit of Annie Elizabeth, Bismarck, Mère de Ménage, Warner's King, Lane's Prince Albert, Bramley's Seedling, Peasgood's Nonsuch, Gascoigne's Scarlet, and Lady Henniker; Mr. T. Simpson, gardener to the Earl of Stradbroke, Henham Hall, who was second, had fruit in a high state of development; Mr. W. Allan third, with fruit of excellent quality. For six dishes of culinary apples, Mr. T. Jones, gardener to E. G. Cubitt, Esq., Honing Hall, Norwich, was first with exceptionally fine examples; Mr. J. Hilson, gardener to Sir F. Adair, Bart., Flexton Hall, Norwich, was a close second, with fruit hardly so large, but superb in finish. There was an equally strong competition in the classes for dessert apples, and as the fruit was throughout high in colour and well finished the numerous collections were most attractive. For nine dishes, Mr. F. Hanson, gardener to Sir F. Crossley, Bart., Somerleyton Hall, Lowestoft, obtained premier honours with brilliantly coloured and otherwise good examples of King of Tompkins County, Cox's Orange Pippin, Gascoigne's Scarlet, Ribston Pippin, Charles Ross, James Grieve, Baumann's Red Winter Reinette, and Blenheim Pippin. Mr. W. Allan was a close second, with fruit of great excellence. The prizes for six dishes were awarded to Mr. G. Davison, Mr. F. Jones, and Mr. E. Chambers, gardener to Captain H. H. Francis, Long Stratton; Mr. H. Goude had the best three dishes of dessert varieties.

A class was provided for one dish of Cox's Orange Pippin, and there were fourteen or fifteen entries. By far the finest dish was that shown by Mr. W. Allan, but for some inexplicable reason the judges awarded it the third prize. The fruits were of relatively large size, finely coloured, and so perfect in finish that not a single blemish could be discovered on any one of them. Mr. F. Hanson, who was placed first, had excellent fruits, but they were smaller than those shown by Mr. Allan, and several bore traces of apple scab; Mr. M. Berry, gardener to A. Donavon, Esq., Carbrook Hall, who was placed second, also had a good dish. The awards should undoubtedly have been awarded to Mr. Allan, Mr. Hanson, and Mr. Berry in the order of their names as here placed, and it would be of much interest to know why the awards were made otherwise.

Pears were, as usual, exhibited in large numbers, and were of remarkably high quality, if not quite so perfect in finish as was the case with those shown at Norwich last year. The competition was very strong in the class for six dishes, and at the head of the several competitors was Mr. G. D. Davison, who staged magnificent fruits of Durondeau, Marie Louise, Pitmaston Duchess, Glou Morceau, Emile d'Heyst, and Doyenne du Comice; Mr. W. Allan was second, and Mr. F. Hanson third, both staging fruit of much merit. In competition for three dishes of pears Mr. J. Hilson obtained premier honours with exceptionally fine fruit, and Mr. H. Goude was a close second. The best dish of culinary pears was that of Catillac, from Mr. G. D. Davison, the fruits being of the largest size and perfect in every way. Mr. Davison was first also for a dish of dessert pears with Doyenne du Comice at its best.

Vegetables were shown in immense quantities, and in such condition as to prove to demonstration that their cultural requirements are fully understood in the many gardens within a wide radius. In the classes for collections and single dishes the competition was of the keenest, and we should have liked to refer to the more noteworthy exhibits in some detail, but the great pressure on our space at the present time renders it impossible to do more than refer to them in a general way.

NON-COMPETITIVE.

The contributions to the non-competitive class were not numerous, but those staged were of great excellence. Messrs. Sutton and Sons, Reading, exhibited a comprehensive collection of the choicer kinds of vegetables, which was arranged with quite exceptional taste, and formed one of the most attractive of the many features; Messrs. Daniels Bros., Norwich, filled the end of the Blackfriars with a fine collection of flowers, fruits, and vegetables; and Messrs. Hobbies, Lim., contributed a large bank of single chrysanthemums.

Scottish Horticultural Association.

With a tremendous record of entries the show held by the Scottish Horticultural Association, in the Waverley Market, Edinburgh, on November 18, 19, and 20, promised to be one of the finest ever held in that famous and spacious rendezvous. But, alas! "the best laid schemes," etc., proved all too true, and bitterly cold weather a day or two before the show, and 19 degrees of frost early in the morning of the opening day, prevented many would-be competitors from putting in an appearance, and turned the Waverley Market into an enormous refrigerator, and made most of those who did bring their exhibits wish they had stayed at home.

As may be imagined, the show was not up to the average in extent, and, owing to the incidence of the season the quality of the big blooms in the leading classes was, though very high, not up to the best Waverley Market standard. The bush plants were good, and there was a first rate display of hardy fruits and grapes, while the bouquets were especially fine, and, with other floral arrangements, constituted one of the best features of the show.

BRIDE'S AND BRIDESMAIDS' BOUQUETS AT EDINBURGH.
Shown by Miss Todd and Miss Alice Todd.

Everything was in good order, as usual, and those in authority, notably such old friends as Mr. Richardson and Mr. M. Todd, rendered varied assistance to the pressmen, but as neither the one or the other was an Erebus or a Terror in full working order, they could not raise the temperature. In a very long experience we never remember having to work during a show morning under such dreadful climatic conditions.

THE CITY OF EDINBURGH CLASS.

The great cut flower class at Edinburgh is an open one, for the City of Edinburgh and Queen Victoria prizes, presented by the Lord Provost, Magistrates, and Town Council of the City. The first prize is the City of Edinburgh Cup and £20; second, £15; third, £10; and fourth, £5. The schedule requires fifteen vases of Japanese chrysanthemums, in fifteen varieties, three blooms in each vase. There were six competitors, and the coveted chief award was won by Mr. Morton, gardener to the Dowager Coun-

THE CITY OF EDINBURGH CLASS FOR FIFTEEN VASES.
The first prize set shown by Mr. Morton is in the foreground.

tess of Seafield, Cullen House, Cullen, who had good, clean, fine-sized examples of Lady Talbot (10), Lady Conyers (9), Reg. Vallis (9½), Bessie Godfrey (8½), Mr. A. T. Miller (11), Mr. G. Mileham (7), Algernon Davis (10), Madame G. Rivol (8½), Madame P. Radaelli (10½), Miss Hickling (9½), W. Beadle (10), Victoria and Albert (8), Elsie Fulton (8), Edith Jameson (10½), and J. H. Silsbury (9½); total, 139½ points out of a possible 180, as twelve points are allowed as a maximum for each vase. Mr. David Nicoll, gardener to the Messrs. Bell, Rossie, Forgandenny, came second, with Madame P. Radaelli (10), Madame G. Rivol (9½), J. H. Silsbury (9½), Mr. A. T. Miller (9), Lady Talbot (9), Splendour (8), Purity (10½), F. S. Vallis (10), Victoria and Albert (8), Edith Jameson (9), Mrs. F. W. Vallis (8½), Mrs. C. Beckett (9), Hon. Mrs. Lopes (10½), Bessie Godfrey (9), and Melchet Beauty (8); total, 137½. Mr. James Beisant, gardener to Lady Armistead, Castle Huntley, third, with a total of 131 points; Mr. W. Iggulden, Lock's Hill, Frome, fourth, with 127½ points. Mr. Stewart and Mr. J. E. Davis, who were not placed, had respectively 125 and 111 points.

CUT FLOWERS.

The Scottish Challenge Cup, for eight vases of Japanese blooms, three flowers of each variety, was won by Mr. J. Finnie, gardener to A. R. Brown, Esq., Summerhill, Shandon, with a total of 73 points, allotted as follows: F. S. Vallis (9), Mrs. F. W. Vallis (9½), Lady Talbot (9), Marquise V. Venosta (9½), Bessie Godfrey (9½), Reg. Vallis (9½), Mr. A. T. Miller (9), and J. H. Silsbury (8). Mr. L. McLean, gardener to D. Thomson, Esq., Greenfield, Alloa, second, with 71 points; and Mr. R. Addison, gardener to Sir Walter Dalrymple, Bart., Luchia Gardens, North Berwick, third, with 68 points.

The premier award for twenty-four Japanese blooms, in the open class, was won by Mr. McKellar, Portmarnock, Ireland. All the flowers in this class were staged on boards, and there were six competitors. Mr. McKellar's best blooms were of F. S. Vallis, Lady Talbot, Mrs. Knox, Hon. Mrs. Lopez, Magnificent, Reg. Vallis, Rose Pockett, and Madame Paolo Radaelli; Mr. David Nicoll, gardener to Messrs. Bell, Rossie, Forgandenny, a good second; and Mr. Alex. Morton, gardener to the Dowager Countess of Seafield, Cullen House, Cullen, third.

Mr. A. Stenhouse, Morningside Asylum, Morningside, led for two vases of Japanese blooms with Mrs. Beckett and Madame Paolo Radaelli; Mr. J. Macdonald, gardener to Mrs. Bremner, Stratham House, Morningside, second; and Mr. R. Griffin, gardener to the Rev. R. Macnair, Brizlee, third.

For two vases of three blooms, one variety, Mr. A. R. Brown, Summerhill, Shandon, was a fine first with lovely flowers of Bessie Godfrey; Mr. McKellar second with F. S. Vallis; and Mr. J. E. Davis, gardener to Colonel Stewart Richardson, Ballathie, Stanley, Perth, third, with the latter variety.

Mr. J. L. McKellar, Portmarnoch, had the best six vases of Japanese varieties, leading in a stiff competition with Reg. Vallis (10), F. S. Vallis (9½), Mrs. J. Hadaway (8½), Valerie Greenham (8½), Edith Jameson (9½), and Mrs. Norman Davis (9); total, 55 points; Mr. D. Mackay, gardener to C. Dickson, Esq., Vuurbaak, Lasswade, second with 54 points; and Mr. J. McLean third with 50½ points.

Decorative varieties were beautifully shown, and for three vases Mr. A. E. Todd, Stoneybank, Musselburgh, was a fine first with Mr. Galloway second, and Mr. Knight third; eight competitors. The best three vases of singles were from Mr. A. Knight, who showed Edith Pagram, and Bronze Pagram, well, but hardly any of the varieties in the whole of the class were labelled: Mr. Galloway second, and Mr. A. McMillan third. Mr. Pirrie had the best six vases of single varieties, his Pagram varieties, seedlings, and Mary Richardson being all superbly shown; Mr. P. Bell second.

FLORAL DESIGNS.

For one bride's bouquet and a pair of bridesmaids bouquets, Miss Todd, Stoneybank, Musselburgh, won the premier award with exquisite designs in odontoglossum and lily of the valley in the first case, and Cattleya labiata, Cypripedium insigne, and lily of the valley in the case of the bridesmaid's displays. Miss Alice Todd second, her bridesmaid's bouquets of Lilium speciosum rubrum being particularly good; Mr. J. Ford, gardener to T. G. Bishop, Esq., Dalmore, Helensburgh, third. Miss McBoe, Bridge Street, Leith, had the best bouquet of carnations, winning from seven entries. Miss Alice Todd scored for a bouquet of flowers (carnations and chrysanthemums excluded), with a dainty exhibit; Miss Todd second with oncidiums and Vanda cærulea. Mr. Adam Holmes, Bellevue Bank, Helensburgh, led for a bouquet of chrysanthemums.

There were six baskets of chrysanthemums, and here honours fell in order of mention to Miss R. Newlands, Bridge Street, Leith, who had a beautiful arrangement of bronze and yellow flowers tastefully disposed; Mr. J. Beats, Binrock, Dundee; and Mr. A. Horton, Helensburgh.

No fewer than twelve baskets of hardy foliage and berries were submitted, and these were of various designs. The first prize was awarded to Mr. F. R. Urquhart, gardener to Henry Mungall, Esq., Gatton Side House, Melrose, who, over a foundation of yellow holly had berberis and symphoricarpus sprays; Mr. A. Horton, gardener to W. Middleton Campbell, Esq., Camis Eskam, Helensburgh, second; and Mr. A. Hogg, gardener to H. Hope, Esq., Luffness, Aberlady, third.

For a basket of orchids, Mr. Duncan Mackay, gardener to C. Dickson, Esq., Vuurbaak, Lasswade, led with a bright design in odontoglossums, oncidiums, Cattleya labiata, and Odontoglossum grande and Dendrobium Phalænopsis; Mr. R. McAndie, gardener to Sir A. B. Milne, Bart., Inveresk Gate, Musselburgh, second, with a very neat exhibit; and Mr. A. Knight, gardener to Sir Wilfrid Lawson, Bart., Brayton, Cumberland, third.

Mr. Hogg, Luffness, was placed first for an epergne of chrysanthemums, but there was nothing of special merit in the class. Mr. A. Sinclair Henderson, Seathwood, Dundee, was first for a vase of chrysanthemums and foliage, with a grand arrangement of big yellow and bronze flowers; Mr. D. Kidd second, and Mr. Jas. Beats third.

Seven competitors entered in the table decoration class, and here Mr. J. Beats was placed first, and he had a very pretty design in yellow and bronze single varieties; Mr. P. Bell, gardener to the Earl of Home, Bothwell Castle, second; and Mr. A. Knight third.

PLANTS.

A dozen classes were provided for chrysanthemum plants, and the chief of these was for six large-flowered varieties. There were three competitors, and each showed big, well-staked bushes, freely flowered. Mr. W. Pulman, gardener to D. R. W. Hine, Esq., Holly Road, Colinton Road, Edinburgh, was placed first for half a dozen excellent examples, but he and his fellow competitors had not deemed it worth while to label the varieties. Mr. Jas. Fraser, gardener to Mrs. Simson, Bondley Towers, Colinton, second; and Mr. W. Michie, gardener to Lady Steel, Boroughfield, Edinburgh, third. For four specimens of Japanese varieties, Mr. W. Michie was first, but three of his specimens were hardly yet at their best; Mr. Fraser second.

Mr. Pulman was successful for one specimen of a white or yellow variety, and scored with Souv. d'un Petite Ami, in fine condition. In the class for a specimen of any other colour than white or yellow Mr. Pulman was once more to the front. The best specimen single-flowered chrysanthemum was a huge bush of Ladysmith, shown by Mr. Michie; Mr. J. Fraser was second. Four competitors came forward in the class for six specimens of Japanese or incurved varieties, and Mr. Pulman again asserted his superiority, and showed dwarf plants well flowered; Mr. Fraser, second; and Mr. W. Armstrong, gardener to Dr. Scott, Musselburgh, third.

The pompons proved interesting, and here Mr. Michie was first, Mr. Pulman second, and Mr. T. P. Bell, London Street, third, for six plants. Mr. Bell was the leading prizewinner in the amateurs' class for chrysanthemum plants.

In the miscellaneous plant classes Mr. Knight led for lily of the valley; Mr. J. MacNeil for Roman hyacinths; Mr. R. Whammell, gardener to Lieut.-Colonel More Nisbett, The Drum, Gilmerton, for salvias; Mr. J. Turnbull, Valleyfield Gardens, Penicuick, for hardy ferns; Mr. G. D. Kerr, Langton, Duns, for Primula obconica—beautiful plants of a good strain; Mr. Kerr for Chinese primulas; Mr. D. McLean, Raith, Kirkcaldy, for winter-flowering begonias; Mr. A. Williams, Jedburgh, for Begonia Gloire de Lorraine, with three plants each well over a yard high; Mr. J. McNeill, gardener to Major Thorburn, Peebles, for decorative foliage plants; and Mr. A. Knight for eight decorative foliage plants.

TABLES OF FRUIT.

Two decorated tables of fruit were set up, and first prize was won by Mr. D. Kidd, gardener to Lord Elphinstone, Carberry Towers, Musselburgh, who showed neat bunches of Muscat of Alexandria, Appley Towers, and Gros Maroc grapes; Ribston Pippin, The Queen, Gacsoigne's Scarlet. Cox's Orange Pippin, Peasgood's Nonsuch, Emperor Alexander, Newtown Wonder, and Blenheim Pippin apples, Pitmaston Duchess. Marie Benoist, Doyenne du Comice, Durondeau, and Beurre Diel pears, a melon, and a dish of tomatoes. Mr. Kidd was also awarded a silver medal for his floral arrangements, in which he used the single chrysanthemum Mary Richardson. Mr. G. Mackinley, gardener to the American Ambassador, Wrest Park, Ampthill, Beds, second, his fruits including grapes, apples, pears, melons, plums, oranges, peaches, and medlars. Each exhibit in this class was arranged on a space of 10ft. by 5ft., and had to consist of eighteen dishes of fruits, in not less than nine kinds. The chief prize of £10 10s. was presented by Lord Elphinstone, the hon. president of the association.

GRAPES.

Mr. D. Kidd led for four bunches of grapes with Muscat of Alexandria, Diamond Jubilee, Alicante, and Gros Maroc, all of medium size, but well coloured; Mr. James Beisant, gardener to Lady Armitstead, Castle Huntley, Longforgan, second. For two bunches each of Appley Towers and Lady Hutt grapes Mr. J. Beisant led, with Mr. J. McNeill, gardener to Major Thorburn, Craigerne, Peebles, second. For one bunch each of black and white grapes Mr. T. MacPhail, gardener to Mr. and Mrs. Hamilton Ogilvy, Archerfield, Dirleton, was first with Muscat of Alexandria and Lady Downes; Mr. J. Law, gardener to J. S. Laidlay, Esq., Inverie, Dirleton, second; and Mr. T. Gray, gardener to D. Norman Ritchie, Esq., The Holmes, St. Boswells, third.

In the class for two bunches of Alicante grapes Mr. J. Highgate, gardener to the Marquis of Tweeddale, Yester, scored with good-sized, well-finished clusters; Mr. H. Johnston, gardener to D. Shankland, Esq., Oakleigh, Greenock, second; and Mr. J. Shiells, gardener to Sir James King, Bart., Carstairs House, Carstairs Junction, third; twelve entries. Mr. J. Shiells led for two bunches of Gros Colmar with small, but very large berried bunches; Mr. James Beisant, second, and Mr. R. Dickson, West Colinton House, third; five entries. Mr. Kidd had the best pair of bunches of Lady Downes; Mr. G. Scott, gardener to A. Sinclair Henderson, Esq., Seathwood, Dundee, second; and Mr. MacPhail, third; four entries.

For two bunches of any variety, Mr. G. Pirie, gardener to C. W. Cowan, Esq., Dalhousie Castle, Bonnyrigg, led with deeply-coloured clusters of Cooper's Black; Mr. Beisant second with Mrs. Pince; ten entries.

HARDY FRUITS.

In the Scottish class for eighteen dishes of apples, Mr. R. G. Sinclair, Congaldon Gardens, Drem, scored with a very even, clean, and bright set of Peasgood's Nonsuch, Annie Elizabeth, Ecklinville, Loddington, Lord Derby, Bismarck, Warner's King, Bramley's Seedling, Norfolk Beauty, Allington Pippin, The Queen, James Grieve, Gascoigne's Scarlet, Emperor Alexander, King of the Pippins, Worcester Pearmain, Cox's Orange Pippin, and Golden Noble. Mr. James Day, gardener to Sir Malcolm McEachrane, Galloway House, Wigtown, second; and Mr. C. Webster, gardener to the Duke of Richmond and Gordon, Gordon Castle, Fochaber, third.

Mr. McKellar, Portmarnock, Ireland, had the finest set of eighteen varieties of apples in the open class, and his was an excellent collection, and included good dishes of Lane's Prince Albert, Bismarck, Mère de Ménage, Charles Ross, etc.; Mr. R. Sinclair second, and Mr. G. Mackinlay third. Mr. Mackellar led for eight dishes of apples and four dishes of pears, with Mr. G. Mackinlay second.

In the Scottish class for six dishes of pears Mr. J. Galloway, gardener to the Earl of Wemyss, Gosford, Longniddry, scored with Hacon's Incomparable, Beurre d'Anjou, Beurre Bosc, Doyenne du Comice, Pitmaston Duchess, and Duchess d'Angoulême; Mr. A. Hogg, second; and Mr. Melville, Rosemount, Monckton, third. In the open class for six dishes of pears Mr. R. Aitken, gardener to A. W. Inglis, Esq., Logan Bank, Milton Bridge, was a capital first among eight competitors, Mr. Mackinlay coming second, and Mr. Hogg third.

Mr. Mackellar won first place for six dishes of culinary apples with clean, heavy fruits of The Queen, Newton Wonder, Bramley's Seedling, Bismarck, Lord Derby, and Peasgood's Nonsuch; Mr. R. Currie, gardener to Rev. G. H. Davenport, Foxley, Hereford, second: and Mr. W. F. Staward, Belford Hall, Northumberland, third. Mr. McKellar was also to the front for six dishes of dessert apples, leading here with very bright fruits of The Houblon, Worcester Pearmain, Charles Ross, King of the Pippins, Rival, and Cox's Orange Pippin; Mr. R. Currie, second, and Mr. R. Sinclair third.

Mr. Sinclair led for three baskets of dessert apples, followed by Mr. J. Harris, Silsoe, Beds; while for three baskets of culinary apples Mr. G. Ormiston, Dalrymple Loan, Musselburgh, was first, and Mr. Sinclair second. In each class the baskets had to contain 12lb. of fruit.

VEGETABLES.

Vegetables were again shown excellently, and the classes for single dishes were very numerous. For a collection of six kinds, seven competitors, Mr. J. Gray, Middlewood, Uddington, was first; Mr. D. McMilhan, Hillfoot, Dollar, second; and Mr. F. Urquhart, third. There were seven exhibits of twelve kinds of vegetables, and here the chief award fell to Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Notts, for clean, beautiful samples of Ailsa Craig onions, Black beet, Perfection tomatoes, Autumn Mammoth cauliflowers, Prizetaker leeks, Superb Pink celery, Red Intermediate carrots, Superlative potatoes, Princess of Wales beans, Dwarf Gem Brussels sprouts, Orange Jelly turnips, and Telegraph cucumbers; Mr. R. Stuart, gardener to Lord Lauderdale, Thirlestane Castle, Lauder, second; and Mr. Galloway third.

Other leading prizewinners in the vegetable classes were Mr. G. W. Taylor, Dorchester; Mr. J. Melville, Mr. J. Gibson (potatoes), Mr. A. Dickson, Innerleithen, and Mr. R. Stuart (leeks).

NON-COMPETITIVE.

Messrs. Young and Co., Hatherley, Cheltenham, put up a very pretty little group of perpetual carnations, showing charming flowers of May Day, White Enchantress, Mikado, Britannia, Lady Audley Neild, Mrs. Burnett, and Rose Dorée. The Government of British Columbia filled a considerable space with a fine display of bright, well-graded, and finely packed apples. Messrs. Tillie, Whyte, and Co., Edinburgh, displayed good vegetables. Messrs. H. Pattisson and Co., Streatham, set up a few examples of their excellent horse boots.

Messrs. Sutton and Sons, Reading, were represented by a very attractive and interesting display of onions, their excellent bulbs of Ailsa Craig, Reading, Bedfordshire Champion, The Sutton Globe, Red Rocca, Trebons, Crimson Globe, Sutton's A1, and a specially selected high, conical seedling that promises well. There were about thirty varieties in this admirable contribution. Mr. H. N. Ellison, West Bromwich, was represented by a large table of finely-grown nephrolepises, adiantums, and other useful and elegant ferns.

Messrs. Storrie and Storrie, of Dundee, showed pot fruit trees, a collection of apples, and some scarlet salvias. Bouvardias, begonias, and perpetual carnations came from Messrs. John Forbes, Lim., Hawick. Grapes were finely shown by those famous growers, Messrs. William Thomson and Sons, Clovenfords, the baskets of finely coloured Gros Colmar cut from vines planted in 1869 being striking examples of continuously good cultivation.

Messrs. W. Wells and Co., Merstham, Surrey, showed a big bank of chrysanthemums, both plants and cut flowers, and their display was greatly admired; Bessie L. Payne, a golden chestnut Japanese variety, with gold reverse, won the silver medal as the best novelty in the show. Messrs. J. and A. Glass, Princes Street, put up a very large exhibit of floral designs. Messrs. Wilson and Co., Prestonfield Nursery, Craigmillar, contributed a table of ferns and foliage plants.

Leeds Paxton Society.

This society's twenty-first show, held in the Albert Hall, Leeds, was not up to the usual standard of excellence. This was most unfortunate, as one looks for something super-excellent when a society celebrates its coming of age. The season, no doubt, accounts for some of the falling off in quality and quantity, while in the matter of accommodation the society is not well served, and no doubt this also militates against progress.

GROUPS.

The first prize of £5, for a group of miscellaneous plants, arranged on a space of 70 sq. ft., was won by Mr. J. Phillips with a bold display, in which crotons figured largely, in association with poinsettias, Begonia Gloire de Lorraine, chrysanthemums, lily of the valley, and Vanda cærulea. The design was a trifle heavy, but a good one nevertheless. Mr. J. Harrison secured the second prize with a lighter arrangement that was somewhat lacking in colour, and had not a good finish at the back. Both these groups were arranged under the gallery, and backed on to the wall.

Premier place in the class for a table of single chrysanthemums, associated with fine foliage plants, fell to Mr. J. Phillips, who had good crotons, and some bronze and yellowish singles arranged lightly in green vases; the second prize was secured by Mr. J. Harrison, gardener to F. H. Fulford, Esq., Headingley Castle, who had long sprays of white, yellow, and pink single chrysanthemums, a Cocos Weddelliana, and nephrolepis; Mr. R. B. Gilchrist, gardener to W. Mathieson, Esq., Horsforth, third, with a very bright table.

The best table of Begonia Gloire de Lorraine and foliage plants was easily that shown by Mr. J. Harrison, who had nicely flowered examples of this popular winter-flowering plant, and small, bright, narrow-leaved crotons; the second prize table was also a good one, the white-flowered B. Gloire de Lorraine being prettily used with the type; whose table it was did not appear on the prize card; Mr. A. Lupton, gardener to E. O. Simpson Adel, Esq., third, with plants that were rather drawn up.

One interesting and rather pretty class at Leeds is for a group of miscellaneous plants, arranged on a table 6ft. by 3ft. There were three competitors, however, and the first prize was won by Mr. J. Phillips, gardener to J. C. Nicholson, Esq., Headingley, Leeds, who used bright, neat crotons, and a few orchids, over a setting of fittonias; Mr. W. N. Hague, gardener to W. D. Cliffe, Esq., Meanwood Towers, second, with crotons, narrow-leaved dracænas, Rex. begonias, and scarlet salvias. Mr. W. Crossfield, gardener to T. G. Mylchrist, Thorner, third.

Mr. H. Carter, gardener to C. Watson, Esq., J.P., Barton Grange, was awarded a second prize for his group of chrysanthemums, arranged on a space of 60 sq. ft., not more than six foliage plants allowed beyond a margin of ferns. The blooms were poor, and the bamboos used to support them were so much in evidence as to detract very materially from the effect of the display.

Mr. Norman had the best primulas; Mr. Hague the best six table plants; Mr. Norman the best six salvias—big, bright examples; and Mr. Gilchrist the best pair of orchids.

CUT FLOWERS.

The chief open class for cut blooms was for eighteen each of incurved and Japanese varieties, distinct, the leading award being a silver challenge cup and £7 7s.; second prize, 4 guineas; and third prize, 3 guineas. Mr. C. Jennings, gardener to F. W. Jameson, Esq., Aston Hall, North Ferriby, was easily first, winning the cup with a good set of Mr. A. T. Miller, F. S. Vallis, Lady Talbot, J. H. Doyle, Rose Pockett, O. H. Broomhead, D. Gouldsmith, Norfolk Blush, Mrs. W. Knox, Magnificent, Algernon Davis, Splendour, Mrs. E. Crossley, Reg. Vallis, Viscountess Venosta, Harold Wells, Mrs. G. Mileham, and J. H. Silsbury. His incurved, of fine size and fairly good finish, were Lady Isabel, Romance, Doris Raynor, O. J. Muelenare, Miss Threlfall, Embleme Poitevine, G. F. Evans, Mrs. B. Hankey, Madame L. Faure, Mrs. W. Clibran, Mrs. F. Ashworth, Marjory Shields, Buttercup, Madame Ferlat, D. Southam, W. Pascoe, J. Hygate, and Triomphe de Montbrun; Mr. G. Jarvis, gardener to Mrs. Whitaker, Cliffe House, Hessle, second. The best dozen Japanese came from Mr. C. Jennings, whose best flowers were of Lady Talbot, F. S. Vallis, Magnificent, and Viscountess Venosta; Mr. G. Jarvis second. Mr. Jennings was placed first for a dozen incurved blooms, distinct, with Mr. Jarvis second.

In the local class for a dozen blooms each of Japanese and incurved varieties Mr. H. Carter won the Mylchrist Cup with a fairly good set; he had a good Mr. G. Mileham, J. H. Silsbury, Buttercup, Romance, Mrs. J. P. Bryce, and Madame Ferlat; Mr. F. Norman, gardener to A. T. Walker, Esq., second.

Twelve vases of single chrysanthemums, distinct, should have proved a good class, but there were only three competitors, Mr. G. C. Coates, gardener to S. L. Haldane, Esq., Coltman Street, Hull, leading with some good flowers of Edith Pagram, Altrincham Yellow, Bronze Pagram, Lady Mayoress, E. Roberts, etc.; the flowers were badly labelled, as in so many cases the names were curiously and confusingly contracted. Mr. G. Buck, Horsforth, second, and Mr. Jarvis third. Mr. Carter led for six bunches of stove and greenhouse flowers, with arums, camellias, Rondeletia speciosa, Oncidium flexuosum, Anthurium andreanum, and red lapagerias; Mr. Coates second, and Mr. Jarvis third. Mr. Carter had the best three vases of carnations, and was followed by Mr. Coates and Mr. Harrison.

Mr. H. Carter was also successful in the class for six vases of single chrysanthemums, but here again the competitors had not named their flowers; Mr. Gilchrist second, and Mr. J. Phillips third. Mr. Norman and Mr. A. Lupton were first and second respectively for three vases of pompones, all unnamed. Mr. A. Lupton, gardener to E. O. Simpson, Esq., won first prize for six vases of decorative or naturally grown chrysanthemums, and he had Source d'Or and Soleil d'Octobre good; Mr. J. Phillips second, and Mr. F. Norman third. Here again was a whole class with not a vase labelled. Mr. Norman scored for six Japanese, and Mr. Carter for six incurved, and the former was first for six white Japanese blooms of one variety, with Mr. A. T. Miller; for twelve Japanese blooms in vases, and for a dozen incurved blooms in vases.

VEGETABLES AND FRUITS.

In the Messrs. Suttons' class for a collection of six kinds of vegetables Mr. A. Blakey, gardener to G. H. Shaw, Esq., Howdon, won first prize with a really good set of Ailsa Craig onions, Student parsnips, King Edward VII. potatoes, Superb Pink celery, Prizetaker leeks, and ten beautiful specimens of Early Giant cauliflowers; Mr. J. R. Groundwell, Scott Hall Gardens, Burlingthorpe, a good second. In the open class Mr. Hague led with some excellent produce that was not very well arranged; Mr. D. Crossfield, second; and Mr. F. Norman, gardener to A. T. Walker, Esq., The Elms, Weetwood, third.

For two bunches of black grapes there were three entries, the lead being taken by Mr. A. Blakey, gardener to G. H. Shaw, Esq., Howden; Mr. F. Howland, gardener to T. Aston, Esq., Rawdon, second; and Mr. F. Norman, gardener to A. T. Walker, Esq., The Elms, Weetwood, third. In a similar class for white grapes Mr. F. Norman led, Mr. F. Howland receiving third prize, no second being awarded. For six dessert apples Mr. A. Blakey won, followed by Mr. W. N. Hague, while the lead in the class for baking apples was taken by Mr. W. N. Hague, who was followed by Mr. A. Blakey and Mr. W. Crossfield. For dessert pears Mr. Blakey won, Mr. W. N. Hague was second, and Mr. Crossfield third.

In the local class for black grapes Mr. H. Carter was first, Mr. F. Howard second, and Mr. F. Norman third. Mr. Norman was first for white grapes, Mr. R. B. Gilchrist was second, and Mr. Howland received third prize.

NON-COMPETITIVE.

A small, but choice, collection of chrysanthemum blooms came from Messrs. W. Wells and Co., Lim., Merstham, Surrey. Among the Japanese were Mrs. R. Luxford, Splendour, Rose Pockett, and December Gold. Good singles were Coronation and Kathleen Stewart. A display of Colonial grown fruit was arranged by the Government of British Columbia; the apples were of good size, rich colour, and in good condition.

Messrs. Mansell and Hatcher, Lim., Rawdon, Yorks, exhibited a very fine group of orchids, which constituted a leading feature of the show. In the centre of the group was a good specimen of Cattleya Portia superba with four large spikes, and the background consisted of other fine cattleyas and oncidiums, with odontoglossums and cypripediums in the foreground. There was also on this firm's stand a large vase of Lilium sulphureum from bulbs imported direct from Burma by them. A table of ferns, begonias, and spiræas, set up by Messrs. E. J. Batchelor and Sons, Harrogate, contained all the newer varieties of nephrolepis, some of which were grown in baskets.

Chester, NOVEMBER 17 and 18.

The Chester show was of the usual interesting nature, the fruit forming the most important feature, and, as usual, the card attached to each dish gave information as to the stock and soil in which the fruit was grown. Only the names of the first prize-winners can be given, although, in the amateurs' and farmers' section many of the exhibits were of high merit.

Dessert apples: Ribston Pippin, Mr. A. Billington, gardener to E. B. Baker Wilbraham, Esq.; Cox's Orange Pippin, Mr. J. Shaw, gardener to Godfrey Fitzhugh, Esq.; King of the Pippins, Mr. J. Fleet, gardener to Mrs. Thompson; Allington Pippin, Mr. A. B. Earle; Gascoigne's Scarlet, Mr. T. Jennings, gardener to W. E. Whineray, Esq.; Blenheim Pippin, Mr. W. Dunning, gardener to Rev. W. M. Kinlock; American Mother, Rev. Canon Garnett; Dutch Mignonne, Mr. George Aitken, gardener to Philip Yorke, Esq.; James Grieve, Mr. G. Aitken; any other variety (Adam's Pearmain), Rev. Canon Garnett; any new variety (The Houblon), Mr. John Weaver, for which a bronze medal was also added.

Dessert pears: Marie Louise, Mr. W. Reeves, gardener to E. P. Jones, Esq.; Pitmaston Duchess, Mr. W. Reeves, with fine fruits; Doyenne du Comice, Mr. H. Bateman, gardener to Egerton Leigh, Esq.; Glou Morceau, Mr. George Aitken; Beurre Diel, Mr. H. Bateman; Winter Nelis, Mr. T. Winkworth, gardener to R. Brocklebank, Esq.; Easter Beurre, Mr. G. Aitken; any other ripe variety, Mr. J. Fleet; any other late keeping variety (Olivier de Serres), Mr. J. Fleet; any stewing pear (Catillac), Mr. J. Clack, gardener to J. G. Frost, Esq.

Culinary apples: Peasgood's Nonsuch, Mr. G. Aitken, with bronze medal; Newton Wonder, Mr. P. Greene, gardener to Thomas Gee, Esq.; Mère de Ménage, Mr. G. Franklin, gardener to G. Lisle Smyth, Esq.; Lane's Prince Albert, Mr. P. Greene; Dumelow's Seedling, Mr. W. Dunning; Wareham Russett, Mr. H. Dutton, gardener to B. C. Roberts, Esq.; Warner's King, Mr. P. Greene; Bramley's Seedling, Mr. P. Greene; Alfriston, Mr. E. Rowland, gardener to the Hon. C. Parker; Lord Derby, Mr. P. Greene; any other variety (Emperor Alexander), Mr. P. Greene; any other keeping variety (Yorkshire Greening), Mr. W. Dunning; any new variety (Byford Wonder), Mr. J. Weaver.

Dessert apples, six varieties: Rev. Canon Garnett, with well-coloured fruits. Kitchen apples, twelve varieties, Mr. R. R. Salmon. Kitchen apples, six varieties: Mr. T. Winkworth. Apples and pears, twenty-four varieties, Mr. G. Aitken, who had excellent Peasgood's Nonsuch apple and Doyenne du Comice pears. Dessert pears, six varieties, Mr. G. Aitken.

For two bunches of white grapes, Mr. J. Clack led with Muscat of Alexandria, and for two bunches of black grapes, Mr. C. Flack scored with well-coloured Alicante.

For six vases of naturally-grown chrysanthemums, Mr. A. Walker, gardener to Mrs. A. Ross, was placed first, and for six vases of single varieties, Mr. T. Griffiths, gardener to A. D. Campbell, Esq., led.

Groups of naturally-grown chrysanthemums were excellent, and Mr. G. Gilbert, gardener to T. Gibbons Frost, Esq., led with a pleasing display, second, Mr. E. Stubbs, gardener to Major MacGillycuddy. For a group of singles, Mr. E. Stubbs led with good, bright blooms; Mr. H. Lawson, gardener to Dr. Lawrence, second; and Mr. A. Walker third.

The best eighteen Japanese blooms, in six vases, came from Mr. C. Goves, gardener to Sir Gilbert Greenall, Bart., who showed good F. S. Vallis and W. Etherington; Mr. E. Ellis was second; and Mr. P. Jakeman, gardener to Sir W. Forwood, Bart., third.

The following exhibits were arranged not for competition: Messrs. Dicksons, chrysanthemums and carnations; Mr. F. W. Dutton, single chrysanthemums; Messrs. McHattie and Co., chrysanthemums and fruit; and Messrs. Clibrans, silver medal for cut chrysanthemums. Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, put up a table of apples and pears, all superbly coloured, and of fine size. There were about eighty dishes very tastefully arranged. Mr. H. Large, gardener to G. W. Hayes, contributed some well-grown begonias Gloire de Lorraine, which received a well-merited cultural certificate.

Manchester.

NOVEMBER 18, 19, and 20.

This show, held at the White City under the auspices of the Manchester Royal Botanical Society, with Mr. P. Weathers as secretary, proved the best held for some years, the blooms being good and the classes well filled.

For plants of nine large-flowered varieties, Mr. J. Smith, gardener to James Brown, Esq., as usual, held the leading position, but with plants hardly up to his usual style, though Souv. de W. Clibran and Mad. Ferlat were excellent. Mr. J. Royle, Sale, and Mr. J. Siddall, gardener to L. Breslaurer, Esq., took the other awards. For six Japanese specimens, Mr. Smith was again to the fore, followed by Mr. J. Royle and Mr. G. Wild. For six pompones, Mr. Smith won with well-flowered plants; Mr. H. Brocklehurst, gardener to A. R. Kelly, Esq., second. For a display of cut flowers, Mr. W. J. Garner and Messrs. Muirhead and Willcock were placed as named.

In the cut bloom class for twenty-four incurved and twenty-four Japanese, distinct, Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., Woolton, held the coveted position with a telling stand, his best being F. S. Vallis, Mrs. A. T. Miller, Leigh Park Wonder, Hon. Mrs. E. Lopes, Mrs. Barkley, Mrs. E. Crosley, Buttercup, Miss F. Ashworth, Pantia Ralli, Amber Gem, Daisy Southam, and Romance; Mr. G. Hunt, gardener to Pantia Ralli, Esq., Epsom, second, with good blooms.

For thirty-six blooms, representing all sections except singles, Mr. Haigh again stood out with heavy blooms, his Descartes (anemone) and Cullingfordi (reflexed) being very good; Mr. J. Stoney, gardener to Lieut.-Colonel J. B. Gaskell, J.P., Woolton, followed with bright flowers; Mr. W. Metcalfe, gardener to Sir W. J. Crossley, Bart., Altrincham, third. For twelve incurved, Mr. G. W. Drake led with a good stand, Messrs. J. Hunt and G. Haigh coming second and third.

Mr. T. Stevenson, gardener to E. Mocatta, Esq., Addlestone, Surrey, led for thirty-six Japanese, with a grand, even lot, the size and colour being good; his stand included F. S. Vallis, Purity, Algernon Davis, Superb, Master James, Lady Talbot; Mr. G. Hall, Melchet Court, Romsey, second; and Mr. G. W. Drake, Cardiff, third. For eighteen Japanese, the prize takers were Messrs. T. Stevenson, W. Iggulden, and G. Hall, the first standing well to the front. In the class for twelve blooms, the winners were Messrs. T. Stevenson, G. Hall, and W. Iggulden; and in the local class Mr. C. Goves, gardener to Sir Gilbert Greenhall, Bart., Messrs. G. Haigh and J. Stoney, were placed as named.

For twenty-four incurved, Messrs. G. W. Drake, G. Hunt, and C. Goves were placed as named; and for twelve, the prizes went to Mr. S. Ollier, gardener to F. Ashworth, Esq., Knutsford; Mr. W. Metcalfe, and Mr. C. Goves. The awards for the baskets of chrysanthemums went to Messrs. J. Nixon, W. J. Garner, and A. Porter.

Mr. W. Foster, gardener to S. Petrocochino, Esq., had the best Roman hyacinths; Mr. G. Bramwell and Mr. W. Foster led for primulas; and Messrs. W. Bramwell, D. Roberts, gardener to Mrs. Tattersall, and E. Smith had the best cyclamens. Mr. J. Smith won for a miscellaneous group, his palms being in excellent health.

Messrs. Toogood and Sons, Southampton, received a gold medal for a meritorious display of vegetables. The British Columbian Government secured a like award for a display of apples, and Messrs. F. Dicks and Co., and Messrs. Muirhead and Willcock also had non-competitive exhibits.

Aylesbury.

NOVEMBER 18.

Cultivators at this Bucks centre were favoured with open weather on the occasion of the thirtieth annual show, which was held in connection with a "bread competition," as in the past two seasons, over 2,000 loaves being staged for the prizes offered by milling firms in various parts of the kingdom. The idea appears to have caught on, as the attendance of visitors demonstrated.

The schedule of prizes for chrysanthemums had been very carefully revised, and certain classes eliminated, the incurves being limited to six of one variety. There was the usual array of bush specimens, but the development of the blooms had been seriously retarded by want of sunlight, and some of the specimens in the sixes and fours had but one flower expanded. The pompon bushes were fairly well bloomed, but the Cedo Nulli group do not tell for much with their flat flowers. Several groups were arranged around the sides of the Town Hall, but none of them appeared specially striking owing to the poor quality of the blooms. One fine group, however, made a feature. It was arranged by Mr. H. Warren, gardener to Lady A. Rothschild, Aston Clinton, who had an immense kentia palm flanked by two smaller examples, these gracefully shaded about eight lines of ponderous blooms, in which F. S. Vallis was very noticeable, faced by a circling line of specimen Gloire de Lorraine begonias, with a massing of ferns and foliage for an edging; an award of merit was given.

In the cut bloom section Mr. W. Tipler, gardener to Mrs. E. D. Lee, Hartwell Park, was a most successful exhibitor, securing the awards for two dozen blooms and eight vases (triplets), his premiers being Mrs. W. Knox, Splendour, Mrs. A. T. Miller, Lady Hopetoun, The Duchess, Beatrice May, Glitter, The Lyon, Reginald Vallis, Mrs. N. Wright, and F. S. Vallis. For six, one variety, incurved, the card rested on a fine lot of Mad. Ferlat, staged by Mr. G. Clark, gardener to T. Gurney, Esq.; Mr. Tipler second with C. H. Curtis, grand in colour, but scarcely fully developed; while for one bloom, the cards went to Mr. J. C. Bridge and Mr. Tipler as equal first, the latter with F. S. Vallis, and the former with Romance, a magnificent compact bloom. For six Japanese, one variety, Mr. Bridge was first with F. S. Vallis, and Mr. Tipler second with Leigh Park Wonder. The bowls of Japanese blooms, with foliage, were excellently arranged, Mr. G. G. Giles, occupying the post of honour with a taking exhibit. Mr. Tipler was awarded premier honours for half a dozen bunches of Japanese blooms, for singles, and for spidery, plumed, or thread-petalled varieties.

Fruit was interesting but small in quantity, and deficient in colour. Of apples, Cox's Orange Pippin and King of the Pippins were fairly good; the best of the culinary sorts being Peasgood's Nonsuch, Warner's King, Emperor Alexander, Lane's Prince Albert, and Newton Wonder. For grapes (Alicante) Mr. Tipler led; Mr. C. Partridge, gardener to Colonel H. Bernard, Chearsley Manor, second; with Mr. H. Brandon, gardener to Mrs. H. Gurney, third.

Vegetables are always a feature; nearly 1,000 specimen tubers were staged in the single dish potato classes. Carrots were better than has been noted elsewhere, and onions, though scarcely as large as the usual run of Ailsa Craig types, were a grand lot and numerous. The employees at the printing works contributed largely of their allotments produce.

Bolton.

NOVEMBER 19 and 20.

The twenty-third annual show was held in the Albert Hall, and compared very favourably with its predecessors. Groups and tables of plants were the predominant feature, the plants utilised being admirably selected and successfully cultivated.

For the circular group of miscellaneous plants Mr. W. Burgess, gardener to John Harwood, Esq., secured the first award and the silver challenge cup with a praiseworthy arrangement, in which crotons and palms played an effective part; the centre was a well-built pyramid, but would have been improved by a few more flowers. Mr. H. Shone, gardener to J. W. Makant, Esq., was second with an effective display of good material. Mr. J. Wainwright, gardener to E. T. Crook, Esq., was third with a highly creditable display. For a group of chrysanthemum plants, undisbudded, Mr. W. Burgess was to the fore, thus securing another challenge cup with a combination of bright-coloured flowers well arranged; Mr. H. Wainwright, gardener to Charles Taylor, Esq., followed with a group that lacked lustre and variety. In the class for a group of large flowering chrysanthemums, Mr. D. Wilson, gardener to Miss Annie M. Philips, was the first and only competitor, and secured a silver challenge cup.

The best table of orchids came from Mr. W. Holmes, gardener to J. McCartney, Esq., who had a choice selection, well arranged, in which Lycaste Skinneri alba, cattleyas, oncidiums, and odontoglossums were nicely arranged on a base of nephrolepis; Mr. H. Arthur was second with a pleasing combination. Mr. W. Holmes was again to the fore for a table of cypripediums with many choice varieties; Mr. H. Arthur was an excellent second. In the four classes for Roman hyacinths the first-prize winners were Messrs. W. Holmes, C. Weaver, D. Wilson, and Jos. Trevina. Mr. Jas. Entwistle took the lead for carnations.

For a ball-room bouquet Mr. J. Nixon won with orchids, and for a bridal bouquet Mr. A. Adshead was to the fore with odontoglossums.

For twelve Japanese and twelve incurved blooms, distinct, Mr. G. Drake, Cardiff, led, his best examples being F. S. Vallis, Lady Talbot, V. Greenham, G. F. Evans, and C. W. Matthews; Mr. A. Chandler, gardener to A. James, Esq., Rugby, second. For thirty-six Japanese, Mr. Chandler came out top with good blooms; Mr. C. Jones, gardener to Sir E. Evans, Bart., Bromborough, and Mr. G. Drake secured the remaining awards. For six vases of singles Mr. H. Shone led, and Mr. R. Tyrer was second. For six vases of decorative varieties Mr. D. McKelvie, gardener to H. Stone, Esq., Roby, was to the fore.

For two bunches of Alicante grapes Mr. H. Shone led, with Mr. J. Wright, gardener to E. Lord, Esq., second. For two bunches of white grapes Mr. T. Barclay, gardener to S. Cook, Esq., St. Helens, won. In the classes for three dishes of dessert apples, three dishes of culinary varieties, and three dishes of pears Mr. J. Bayley, gardener to Lady Hindlip, was first in each case with moderate fruits.

Mr. J. Lloyd led for primulas, Mr. W. Burgess for cyclamen, Mr. D. McKelvie for begonias, and Mr. J. Lloyd for table plants. Mr. H. Shone had the best palm, a Phœnix rupicola, and Mr. J. Wainwright had the winning hanging basket, and also led for a hanging basket of flowers.

Mr. H. Wainwright had three good single chrysanthemums, and Mr. W. Burgess one plant and one single specimen, the latter being well flowered.

Mr. J. Lee, Bebington contributed, not for competition, fifty dishes of apples, all the fruit being of fine form.

Royal Horticultural Society.

The recent severe weather was reflected in the Royal Horticultural Hall on Tuesday last, as exhibits were fewer than usual; there was a bright display, however, chrysanthemums, begonias, orchids, carnations, and fruits being all brought up in large numbers. There was an excellent attendance during the afternoon.

FLORAL COMMITTEE.

A grand group of chrysanthemums was set up in a delightfully artistic manner by Mr. H. J. Jones, Ryecroft Nursery, Lewisham, and during the middle of the afternoon it was a difficult matter to get near the display. There were beautiful baskets of yellow, and crimson and gold varieties, Japanese and single forms being often associated with the most pleasing results. Some of the bolder vases and stands were of such varieties as Crimson King, Buttercup, True Gold, Mdme. G. Rivol, Mrs. Hygate, F. S. Vallis, and Mrs. Elliott. Single varieties were splendidly shown, and this popular section was represented by Mensa (A.M.), Cloth of Gold, J. B. Lowe (A.M.), Gen. Bullough, Pictor (blush pink), and Kathleen May (crimson). It was a splendid group, and a fine feature of the show.

Messrs. R. and G. Cuthbert, Southgate, showed several pans of red hyacinths, Sir John Foxburgh and King of the Reds particularly early-flowered. Single chrysanthemums in great variety were elegantly disposed by Mr. L. Lawrence, Shoreham Cottage, Shoreham; the majority were seedlings, and demonstrated the interest that the raising of single varieties must create.

Messrs. Jas. Veitch and Sons, Chelsea, submitted a fine lot of well-grown chrysanthemums in 48-sized pots, all finely flowered and of highly decorative character. The leading varieties were Niveus, Arcturus, Wm. Grix, Market Red, Kitty Bourne, the fine pink Ursa Major, the rich rosy-cerise Roupell Beauty, and the very elegant white Feltham White. The same firm filled a table with their beautiful winter-flowering begonias, and more than half the plants shown were exhibited at Westminster a month previously. Brilliantly flowered, sturdy, and defiant of the season were such fine things as Mrs. Heal, Julius, Winter Cheer, Ensign, Success, the pretty dwarf Agatha, and the new and very bright-flowered Elatior. All these are splendid for winter flowering.

Mr. Bullock, gardener to Mrs. Wythes, Copped Hall, Epping, also demonstrated the value of these winter-flowering begonias by staging a big group of well-grown examples of Ensign, grouping these with palms and ferns. Begonia Ensign was also very well shown by Mr. Burrell, gardener to J. A. Dunn, Esq., Coombe Cottage, Kingston Hill, Surrey, who set up about thirty good plants. Single chrysanthemums, put up in triangular bunches by Messrs. H. Cannell and Sons, Swanley, made a good show; Mars, Yellow Pagram, Cannell's White, Mrs. Chas. Willis, and Mrs. W. J. Hartin were prominent varieties.

From Messrs. Stuart Low and Co., Enfield, came a bright lot of perpetual carnations, the most notable varieties being Britannia, Enchantress, May Day, Mrs. Crook—a new red and pink flaked variety, and a number of new seedlings; they also showed Begonia Patrie. The striking Lilium nepalensis was exhibited by Messrs. Mansell and Hatcher, Rawdon, Leeds, a fine companion to L. sulphureum. Mr. Page, Tangley Nurseries, Hampton, brought up a magnificent zonal pelargonium, with blooms 3 inches and 3¼ inches across, vivid scarlet with tiny white eye, named His Majesty (A.M.); it is a grand winter bloomer, and also promises to be a good summer bedder.

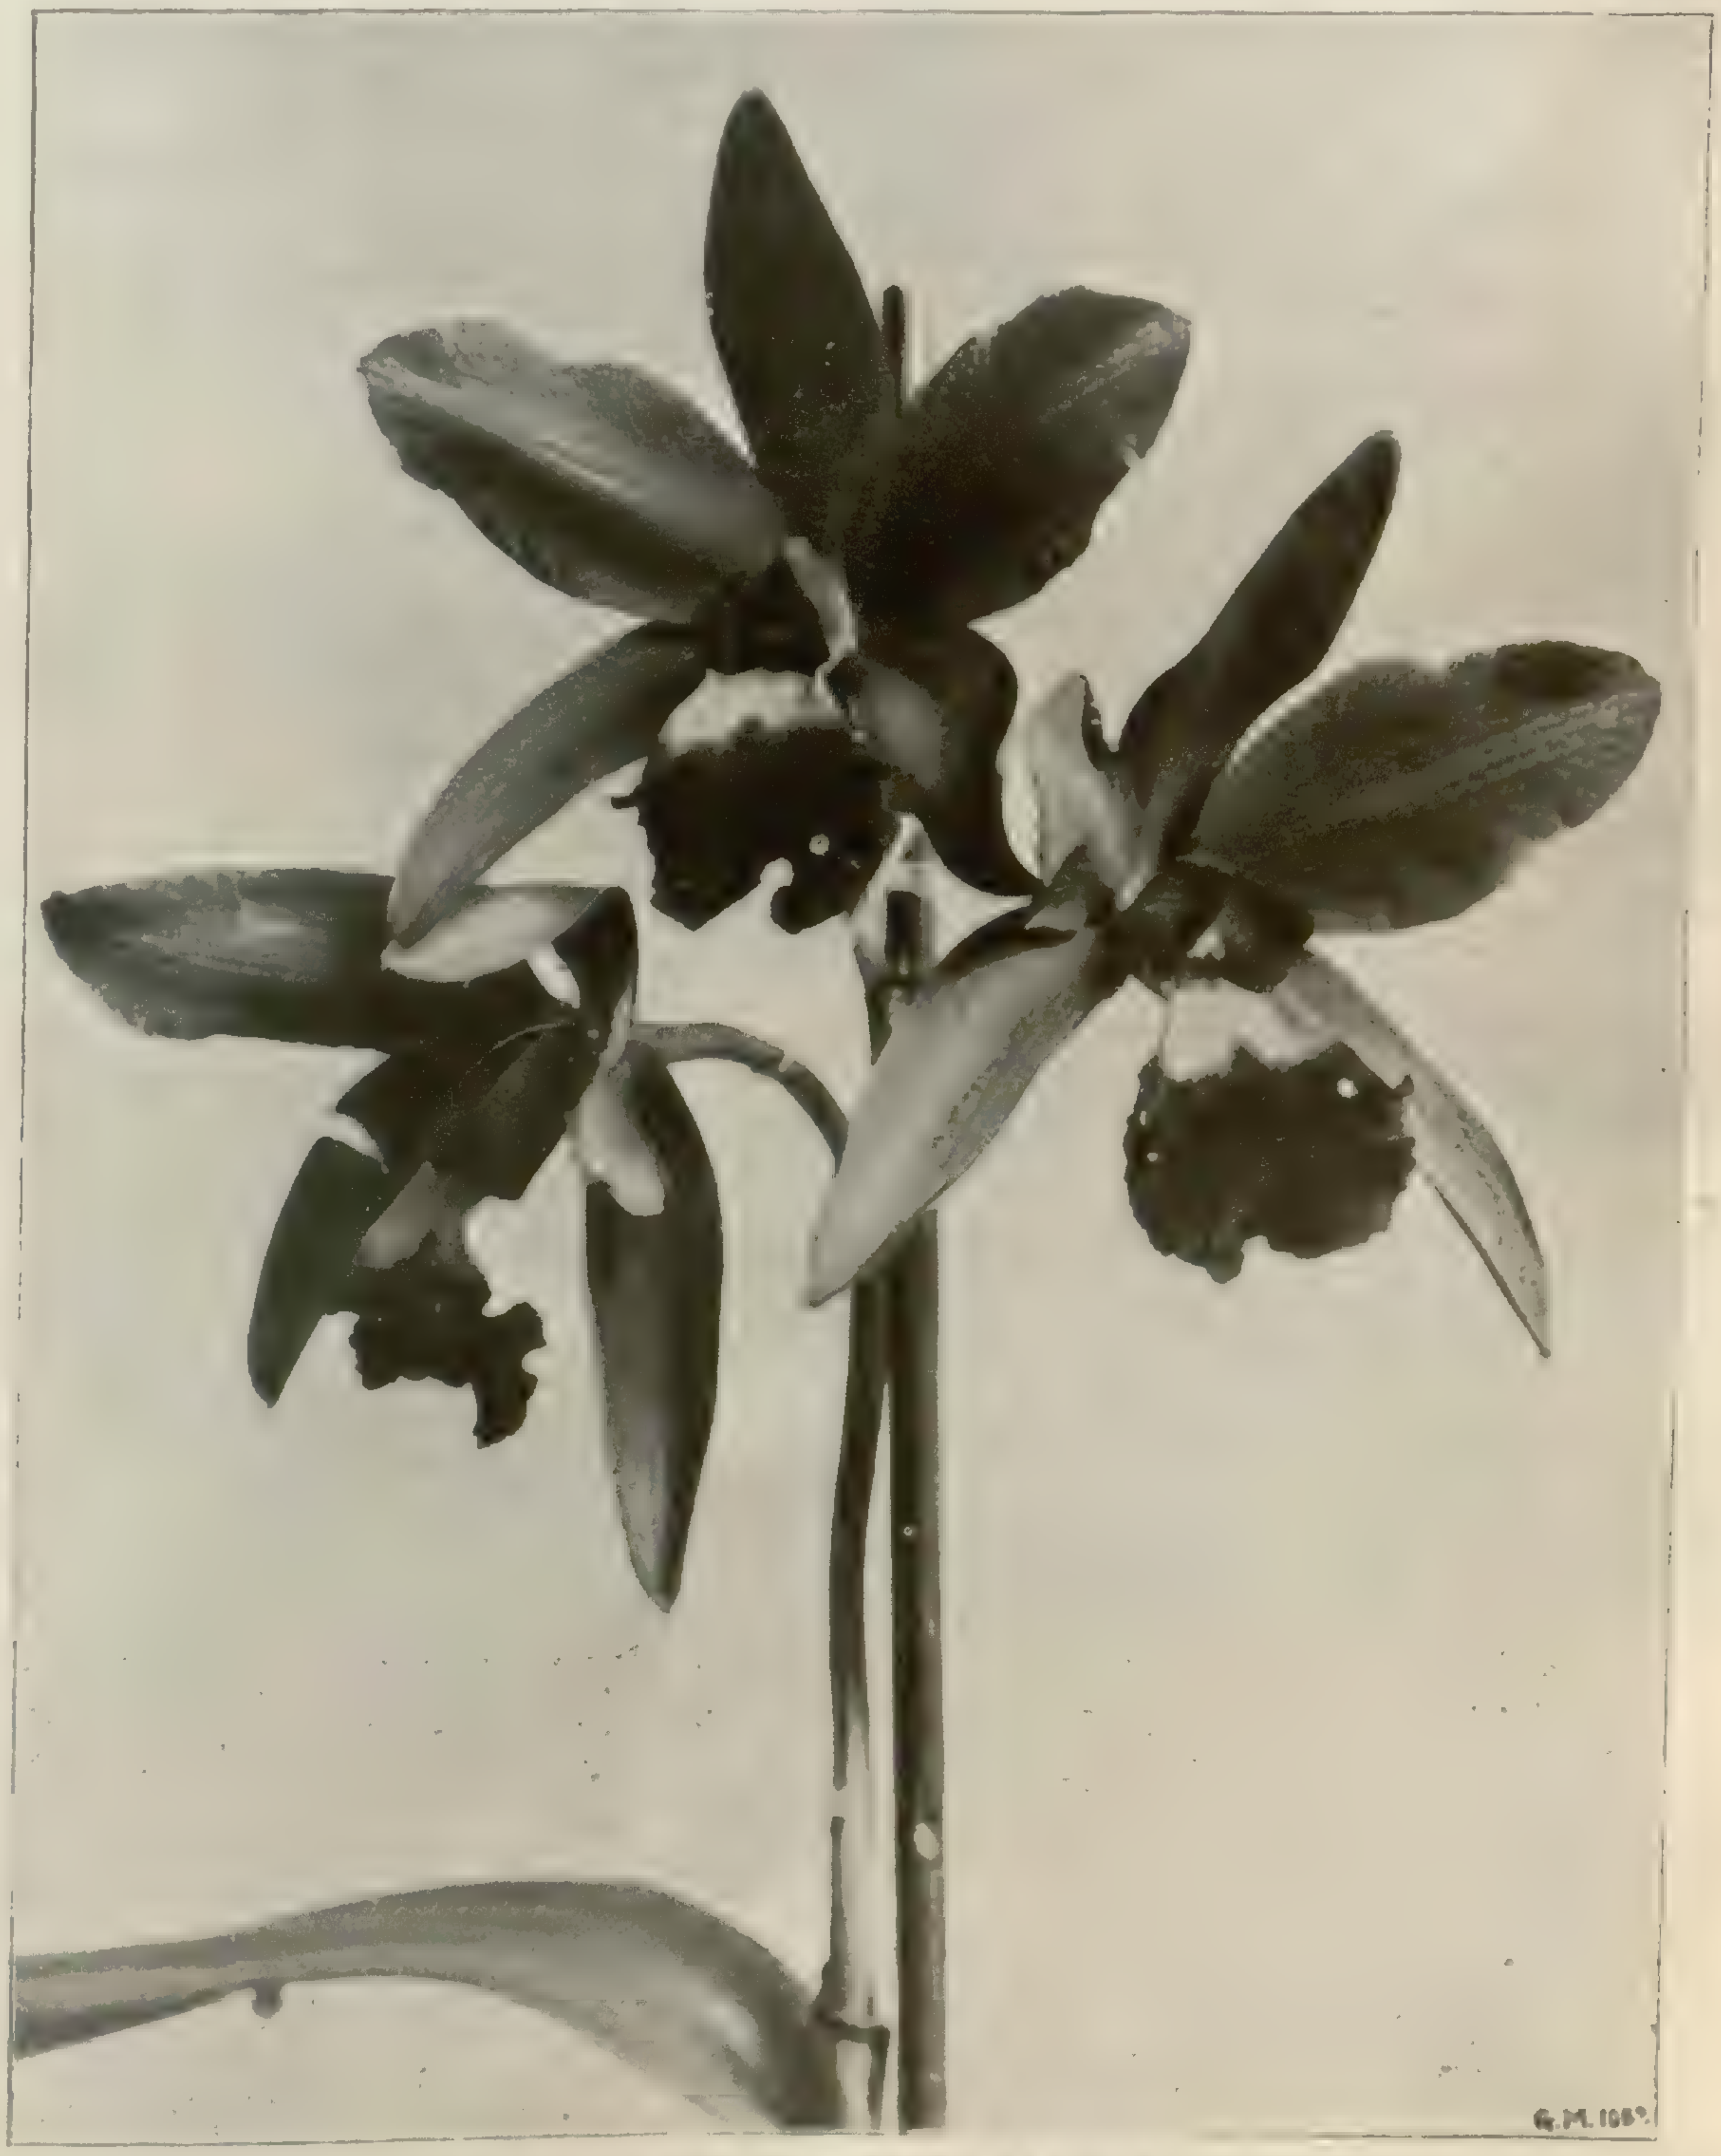
Some charming perpetual carnations were set up by Mr. A. F. Dutton, Iver, Bucks, the flowers of Pink Delight, Wanaka, May Day, and Alvina being particularly good. Mr. T. Crosswell, gardener to Mrs. Bullivant, Eden Park, Beckenham, showed a lovely pale cream yellow single chrysanthemum named Miss Lilian Bullivant (A.M.). Messrs. Wells and Co., Merstham, were represented by a bright group of chrysanthemums that included Japanese, decorative, and single varieties, the latter being very much in evidence; Felicity, Kathleen Stevens, Lady Brook, White Pagram, and Miss Kathleen Wells (large crimson) single varieties, were fine, and the new amber-coloured Japanese variety named Bessie G. Payne (that was the silver medal variety at Edinburgh) was finely represented. Other good things were Miss M. Smith and R. F. Felton, two good decorative varieties. Messrs. J. Peed and Son's contribution, from West Norwood, consisted of alpines and succulents.

A large group of cut perpetual carnations from Messrs. Cutbush and Son, Highgate, N., was notable for its fine flowers of Lady Norah Brassey, Beacon, Victory, Aurora, Enchantress, May Bennett, Mrs. Burnett, Lady Ridley (the first perpetual yellow-ground picotee), Helen M. Gould, White Perfection, and Rose Doré. A selection of varieties of Primula obconica submitted by Messrs. Sutton and Sons, Reading, was interesting, as it contained pink, crimson, white, and deep pink varieties, and indicated the increasing range of colour in this useful plant.

Mr. Frank Lilley, Guernsey, put up a large group of single chrysanthemums in considerable variety. Messrs. G. Williams and Sons, Cardiff, displayed single, decorative, and Japanese varieties of the Autumn Queen, their stand of the big single rose-coloured Caledonia proving as attractive as their big blooms of Lady Talbot and F. S. Vallis.

Very finely grown, dwarf, free-flowered chrysanthemums, in 48-sized pots, as exhibited by Messrs. Butler Brothers, Burr Farm, Bexley, were superb examples of high cultivation. Each plant was a perfect specimen and of immense decorative value. Messrs. H. B. May and Sons, Edmonton, contributed a set of beautiful selaginellas and a set of the newer nephrolepises, the latter including N. recurvata and N. splendens (A.M.).

Mr. Frank Brazier, Caterham, contributed a big semicircular display of Japanese and single chrysanthemums, arranged with Michaelmas daisies, palms, and other foliage plants.



LÆLIO-CATTLEYA KING MANOEL.

A distinct hybrid with bright orange-red flowers, exhibited by Francis Wellesley, Esq., at R.H.S. Meeting on Tuesday last, when it received an Award of Merit.

ORCHID COMMITTEE.

Some very fine specimens of Cypripedium insigne Sanderæ, one of them carrying sixteen fine blooms, came from Messrs. J. and A. A. McBean, Cooksbridge, Sussex, together with a few other cypripediums. Mr. Bolton, Wilderspool, Warrington, showed the white Cypripedium Boltoni (F.C.C.), a beautiful thing derived from C. insigne Sanderæ. Mr. H. J. Chapman, gardener to Mrs. N. Cookson, Oakwood, Wylam, showed the chaste new Calanthe Cooksoniæ, pure white. The interesting Cirrhopetalum longissimum (F.C.C.), with long pink flowers, was shown by Mr. White, orchid grower to Sir Trevor Lawrence, Dorking, and attracted a great deal of attention.

Messrs. Charlesworth and Co., Haywards Heath, brought up Odontoglossum ardentissimum, O. Armainvilliersense, the new violet and purple-brown Zygo-colax Charlesworthi, Cattleya Venus, C. lucida, C. Rhoda, and the lovely buff-tinted Lælio-cattleya Melthorpe Beauclerk. Mr. G. Day, gardener to H. S. Goodson, Esq., Putney, sent Odontoglossum crispum Cooksoni and L.-c. Golden Oriole. A well-grown plant of Cypripedium Ville de Paris, with five flowers, was shown by Mr. Davis, gardener to J. G. Fowler, Esq., Glebelands, South Woodford. Mr. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, showed the handsome Cypripedium Waterloo, and the brilliant and novel Lælio-cattleya King Manoel (A.M.), with vivid orange-coloured flowers, and yellow and maroon lip (see illustration).

Messrs. Stanley and Co., Southgate, were represented by a small group of cypripediums. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, exhibited several splendid plants, the kinds being Lælio-cattleya Golden Beauty Westonbirt var., with a head of twelve golden blooms; L.-c. Barbarossa Westonbirt var. (F.C.C.), with four big flowers; L.-c. Paulina, and Cattleya Dirce superba.

A very fine lot of cypripediums was well set up by Messrs. Jas. Veitch and Sons, Chelsea, the plants being all arranged about on a level with the eye, and set in a bed of maidenhair fern. Among the many good things were C. Thalia, C. vexillarium, C. insigne Harefield Hall, C. Maudiæ magnificum, C. St. Alban, C. Fairrieanum, C. insigne Sanderæ, C. Spicerianum, and C. insigne Chantini. The group of orchids from Messrs. Stuart Low and Co., Enfield, contained Cattleya labiata, Cypripedium insigne Sanderæ, Dendrobium formosum giganteum, Ionopsis paniculata, oncidiums, etc. Messrs. J. Cypher and Sons, Cheltenham, displayed a bank of useful cypripediums, their best being C. insigne Harefield Hall, C. i. Sanderæ, C. Mdme. Jules Hye, C. Minos Veitchi, and varieties of C. insigne. Mr. Maurice Mertens, Ghent, again brought forward some charming odontoglossums of hybrid origin.

FRUIT AND VEGETABLE COMMITTEE.

Some well-grown apples set up in large baskets, by Messrs. W. Seabrook and Sons, Chelmsford, made up a big group; Warner's King, Ribston Pippin, Bismarck, Blenheim Pippin, Cox's Orange Pippin, Allington Pippin, Peasgood's Nonsuch, and Beauty of Kent were all uncommonly good. Beurre de Naghan pear, a fine variety, was well shown by its introducers, Messrs. J. Cheal and Sons, Crawley, who also submitted a basket of the new apple Encore.

Messrs. Ambrose Palmer and Co., 87, Mount Street, Grosvenor Square (Nurseries, Halliford, Middlesex), contributed some splendid fruits of Doyenne du Comice, Bergamot d'Esperen, and Beurre Clairgeau pears, and Lane's Prince Albert, Cox's Orange Pippin, and a few other apples. From the Woburn Experimental Fruit Farm came an exhibit of fruits, showing the effect of grassing near standard trees after twelve or fifteen years of tillage—all small fruits; a set from trees carefully planted in trenched ground (normal), in untrenched ground (relative value 209), and carelessly planted in untrenched ground and generally neglected (relative value 105). In another set it appeared that no manurial dressing gave a relative value of 105 as compared with a normal crop (100), as a result of light and heavy dressings of manure. Summer pruning gave a value of 70, light pruning 100, and no pruning a relative value of 131. It would seem from these exhibits that careless planting, no manuring, and no pruning pay best in apple culture—at Woburn.

COMPETITIVE EXHIBITS.

Messrs. Seabrook and Sons, Chelmsford, were first for four dishes each of dessert and eight of cooking apples, and showed Chas. Ross, Mother, Cox's Orange Pippin, Bismarck, Gascoigne's Scarlet, and Peasgood's Nonsuch in excellent form. Messrs. Ambrose Palmer and Co., Halliford, gained a silver-gilt Banksian medal in this class, and their dish of Chas. Ross was very fine.

Mr. Gerrish, gardener to J. G. Williams, Esq., Pendley Manor, Tring, Herts, led for three dishes of dessert and six dishes of cooking apples with a fine set of Rival, Chas. Ross, Cox's Orange Pippin, Peasgood's Nonsuch, Emperor Alexander, Lane's Prince Albert, Lord Derby, Bismarck, and Gloria Mundi; Mr. W. H. Bacon, gardener to Sir Marcus Samuel, Bart., The Mote, Maidstone, second; and Mr. A. Tidy, gardener to C. H. Combe, Esq., Cobham Park, Surrey, third.

In the pear classes Mr. A. Tidy scored for seven dishes of dessert and two of cooking varieties with excellent examples of Pres. Drouars, Chas. Ernest, Pitmaston Duchess, Beurre d'Anjou, Doyenne du Comice, General Todleben, Beurre Diel, Duchess d'Angoulême, and Uvedale's St. Germain. Mr. Bacon second, and Mr. C. Page, Dropmore, third. For six dishes of pears Mr. T. Pateman, gardener to C. Cain, Esq., The Node, Welwyn, Herts, was first, and Mr. H. Markham, gardener to Viscount Enfield, Wrotham Park, Barnet, second.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Lælio-cattleya Barbarossa Westonbirt var., from Lieut.-Col. Holford (grower, Mr. Alexander), Westonbirt, Gloucester.

To Cirrhopetalum longissimum, from Sir Trevor Lawrence, Bart., Dorking (grower, Mr. White).

To Cypripedium Boltoni, from Mr. W. Bolton, Warrington.

To Lælio-cattleya Nelthorpe Beauclerk, from Messrs. Charlesworth and Co., Haywards Heath.

Award of Merit.—To Cattleya Dirce superba, from Lieut.-Col. Holford.

To Lælio-cattleya King Manoel, from Francis Wellesley, Esq. (gardener, Mr. Hopkins), Westfield, Woking.

To Zygo-colax Charlesworthi, from Messrs. Charlesworth and Co.

To single chrysanthemums Mensa and J. B. Lowe, from Mr. H. J. Jones, Lewisham.

To zonal pelargonium His Majesty, from Mr. W. H. Page, Hampton.

To single chrysanthemum Mrs. W. Buckingham, from Mr. L. R. Russell, Richmond.

To single chrysanthemum Miss Lilian Bullivant, from Mrs. Bullivant (gardener, Mr. Crossfield), Eden Park, Beckenham.

To Nephrolepis splendens, from Messrs. H. B. May and Sons, Edmonton.

MEDALS.

Silver-gilt Flora.—To Mr. H. J. Jones, Ryecroft Nursery, Lewisham, for chrysanthemums; to Messrs. Jas. Veitch and Sons, Chelsea, for begonias and chrysanthemums.

Silver Flora.—To Messrs. W. Cutbush and Sons, Highgate, for carnations; to Messrs. H. B. May and Son, Edmonton, for ferns and selaginellas; to Mr. L. R. Russell, Richmond, for shrubs and chrysanthemums; to Messrs. J. Veitch and Sons, Chelsea, for orchids; to Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Silver Banksian.—To Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. J. and A. A. McBean, for orchids; to Messrs. Butler Brothers, Burr Farm, Bexley, for chrysanthemums; to Messrs. H. Cannell and Sons, Swanley, for chrysanthemums; to Messrs. W. Seabrook and Son, Chelmsford, for apples.

Bronze Flora.—To Mr. M. Bullock, gardener to Mrs. Wythes, Copped Hall, Epping, for Begonia Ensign; to Messrs. Stuart Low and Co., Enfield, for carnations; to Messrs. Williams and Son, Cardiff, for chrysanthemums; to Messrs. W. Wells and Co., Merstham, for chrysanthemums; to Mr. F. Lilley, Guernsey, for chrysanthemums.

Bronze Banksian.—To Mr. J. A. Dunn, Kingston, for Begonia Ensign.

SCIENTIFIC COMMITTEE, November 9.

Present: E. A. Bowles, M.A., F.E.S., F.L.S. (in the chair), J. T. Bennett Poë, A. W. Hill, R. A. Rolfe, W. E. Ledger, W. Hales, J. Douglas, and F. J. Chittenden (hon. secretary).

VARIATION IN BLUE PRIMROSES.—Attention was drawn to the fact that several primulas had varied in the same directions as P. sinensis, particularly noting the fimbriation of the edges of the petals which occurred in P. obconica, P. japonica, P. Sieboldi, and P. x. Kewensis. It was enquired whether any member of the committee had noticed similar variations in the common primrose, P. acaulis. Mr. Chittenden said he had once seen a plant with the edges both of the petals and sepals much cut in a cottage garden at Chelmsford, but no other member of the committee had noticed any. Mr. Douglas and Mr. Fraser pointed out that if seedlings showed signs of roughness at the edges of the petals they would be discarded immediately by florists, and no record would be kept. The committee would be glad to hear of instances of parallel variations in different species of primula under either natural conditions or when cultivated. For instance, double forms of P. acaulis are well known in gardens, but appear to be very rarely wild, and there seems to be only one record of their being raised from seed (by Mr. Murray Thompson, in litt.), while doubling of a similar nature has occurred in P. sinensis.

VARIATION IN BLUE PRIMROSES.—From the garden of Sir Arthur Hort, Bart., came red flowers of primroses which in the spring bear blue flowers. It was suggested that the change may be due to the cell sap being acid in reaction instead of alkaline, owing, perhaps, to some variation in external conditions such as temperature.

SCILLA SOCIALIS.—Mr. W. E. Ledger showed a specimen of this uncommon Natal plant, flowering profusely. It was figured by the late Mr. Wilson Saunders in "Refugium Botannicum," t. 180, and the present plant appeared to be a direct descendant of the plant originally figured. When treated liberally, it appears to increase fairly rapidly, though slow to grow when starved, numerous plants forming around the central one.

MALFORMED ORCHIDS.—Mr. G. Wilson, F.L.S., showed malformed Lycaste Skinneri, odontoglossum, and cattleyas, upon which Mr. Rolfe, who examined them, reported as follows:—"The flower of Lycaste Skinneri has a free, dark purple filament, ¾-inch long, opposite to one of the side lobes of the lip, and as the latter has lost its colour and become like the petals in texture, it is an evident case of replacement. There are three flowers of Cattleya labiata, one in which the lip has reverted to a simple petal, giving a regular perianth, while the column is straight and has an additional perfect anther, showing that one side-lobe of the lip has been developed as an anther, while the other has been suppressed. In a second flower the sepals have become petal-like in shape and colour. In the third flower there are two sepals, two petals, and a slender column and anther, the lip being totally suppressed, and the flower dimerous. The other is a three-flowered inflorescence of Odontoglossum crispum, in which the column is abortive in each case, and the lip rather full, though otherwise normal."

TRIFOLIUM HYBRIDUM MALFORMED.—Mr. H. T. Gussow, of the Central Experimental Farm, Ottawa, Canada, sent some specimens of Trifolium hybridum, which was sent to the botanical division of the Experimental Farm, Ottawa, Ontario, Canada, by a farmer whose crop showed a peculiar development throughout. The heads were produced in axillary, compound, long, peduncled umbels. The umbels measured from ⅓ to 1 inch in breadth and were 8 to 26 rayed. The pedicels were from 2 to 4 mm. long, flattened, and 1 mm. broad. Involucre none, or reduced to several scale-like bracts, 1 mm. long, acutely linear; involucel, scale-like, membraneous bracts 1½ to 2 mm. long, umbellets 6 to 12 flowered. The flowers, unfortunately, could not be examined, as they had not sufficiently developed. Any botanist might have been puzzled to identify the plant if the inflorescences only had been sent. The plant at first sight looked more like an umbelliferous than a leguminous plant.

Banbury.

NOVEMBER 17 and 18.

Bright, but very cold weather attended the holding of the twenty-fourth exhibition in the town of sweet cakes. Entries for the show proved such a record as to exclude all non-competitive exhibits, much to the disappointment of the several traders who liberally support the association. About 560 specimen blooms were staged, a large proportion being ponderous examples of popular varieties. The schedule provided for no plants save and except primulas, cyclamens, winter-flowering begonias, and a table of orchids. In this last-named section the twenty-guinea challenge cup, cash, and the N.C.S. certificate of merit went to Mr. G. F. Hallett, gardener to Lady Fermor Haskett, Easton Neston, for a very tastefully arranged grouping of cattleyas, vandas, odontoglossums, oncidiums, tuberoses, and brilliant narrow-leaved crotons, faced by pretty specimens of Gloire de Lorraine begonias, and edged with a dense massing of ferns; the second award fell to Mr. J. M. Bush, gardener to F. J. Myers, Esq., Charlton Lodge, who was strong with calanthes, vandas, carnations, tuberoses, etc., in addition to other subjects named above. The several exhibits of Gloire de Lorraine begonias were quite a feature, these being strong bushes of grand colour; the place of honour was assigned to Mr. G. H. Bonner, gardener to S. J. Waring, Esq., Watlington Park.

For nine vases, of three blooms each, the challenge cup, cash, and N.C.S. certificate went to Mr. Bush, who was in splendid form; his best were Bessie Godfrey, Marquis of Northampton, Mrs. Dalton, Walter Jinks, Edith Smith, F. S. Vallis, Mrs. W. Cole, Reginald Vallis, and W. E. Etherington; Mr. S. Brown, gardener to W. C. Cartwright, Esq., Aynho Park, was a good second; Mr. Hallett, third. For eighteen blooms Mr. Bush held his own with a matchless even set, including Duchess of Sutherland, Pockett's Surprise, Mrs. N. Davis, Splendour, O. H. Broomhead, Mrs. Barkeley, Algernon Davis, Edith Jameson, Maud Jefferies, Hon. Mrs. Lopes, Madame P. Radaelli, Madame Rivol, and others previously mentioned.

Twelve incurved was a good class, the blooms all beautifully finished, the premier award going to Mr. F. Tapper, gardener to Sir S. Scott, Bart., M.P., the varieties being Mrs. Hygate, W. Pascoe, Embleme Poitevine, Madame G. Denyer, C. H. Curtis, Hanwell Glory, Clara Wells, Romance, Pearl Palace, Captain, Mrs. Judson, and Pantia Ralli; Mr. Hallett, second. For six, one variety, the awards fell to lovely forms of C. H. Curtis, Frank Tustin, and Buttercup. In the class for six Japanese (white), Mr. Bush led with Mrs. W. Cole; Mr. Bonner, second, with Miss Elsie Fulton; for six (not white), the awards were in favour of Mr. G. A. Sadler, gardener to Rev. W. Bradford; Mr. Bush, and Mr. G. Low, gardener to Lady Gordon-Lennox, Broughton Castle, each staging F. S. Vallis. In the amateurs' section, six of one variety proved a good class, the prizes going to Mr. W. J. Florey (schoolmaster), Chipping Warden, with Mrs. N. Davis; Mr. L. H. Southam, for Reginald Vallis; and Mr. R. H. Harper, with F. S. Vallis.

Fruit was a large and attractive section, Mr. E. Cox, gardener to Lady Keighley, securing the society's ten-guinea challenge cup and cash for a table of dessert fruit and flowers, also the premier for Muscat of Alexandria grapes; Mr. Brown leading in the class for Alicantes. For six dishes of culinary apples, Mr. G. Stockley, gardener to T. L. M. Cartwright, Esq., Newbottle Manor, was first; while for a like number of dessert varieties Mr. D. S. Power, gardener to Lord North, Wroxton Abbey, headed the list; the premier dozen of culinary apples were Gloria Mundi, and of dessert King of the Pippins. Cox's Orange Pippin was largely staged. Pears were numerous, but wanting in colour; several of the Pitmaston Duchess were large, and there was one very bulky exhibit of shapely Beurre Diel; the variety Doyenne du Comice secured the awards in the single dish class.

Vegetables were a large show, some 80 dozens being staged, and the onions numbered 150 bulbs, the premier twelve, in the open, from Mr. J. Swain, cemetery keeper, Banbury, being very large, and of grand form. Mr. R. Wadham, gardener to Mrs. Bradshaw, Steeple Aston, secured the champion award for a collection of vegetables in which the leeks were gigantic; Mr. S. Boss was first in the amateur section for a well-balanced set of varieties. Mr. A. Busby, gardener to Colonel Murray, Deddington, headed the list with six dishes of potatoes, his selection being Royal Kidney, Twentieth Century, King Edward VII., Up-to-Date, Windsor Castle, and Purple Perfection; while for one dish Mr. S. Bricknell, gardener to T. W. Holland, Esq., Chipping Warden, led with Duchess of Cornwall; and Mr. E. Cox, second, with Edgecote Purple. Carrots, parsnips, and celery formed a large portion of the exhibits staged.

Reading Gardeners' Association.

The coming of age celebration of the above flourishing society was held on Wednesday, November 17, in the Small Town Hall, Reading, and took the form of a fine non-competitive exhibition, to which admission was charged, and the proceeds divided between the two gardening charities. The association numbers about 350 members, and was, therefore, able to hold a fine exhibition.

Three large groups were arranged on the platform. The one from Mr. Johnson, gardener to S. B. Joel, Esq., Maiden Erleigh, was composed of chrysanthemums and foliage plants; that from Mr. Townsend, gardener to Leonard Sutton, Esq., Hillside, Reading, was of seedling chrysanthemums; and the third, from Messrs. Sutton and Sons, was also composed of chrysanthemums raised from seeds sown on January 23 last.

Some splendid fruit, including oranges and citrons, were submitted by Mr. Powell, gardener to Mrs. Noble, Park Place, Henley, who also showed new potatoes growing on old retarded tubers. Zonal pelargoniums, collections of fruits, chrysanthemums, begonias, etc., etc., were all set out with great taste, and every exhibitor did his best to make the occasion a notable and successful one.

Mr. F. B. Parfitt, the president, declared the show open, and in his address he reviewed the history of the association, and pointed out the great help it had been to the horticulture of the Reading district, and to the gardening charities.

The following is a list of the exhibitors:

Collections of Fruit.—F. B. Parfitt, Esq., Caversham; A. W. Jackson, Esq., Shiplake (gardener, Mr. J. H. Crook); Mrs. Noble, Park Place, Henley-on-Thames (gardener, Mr. T. J. Powell); S. B. Joel, Esq., Maiden Erleigh (gardener, Mr. F. Johnson); Mr. G. W. Layley, Beenham; Martin J. Sutton, Esq., Holme Park, Sonning (Mr. R. Doe); A. F. Walter, Esq., Bearwood (Mr. W. Barnes); Mr. J. Roberts; Miss Cripps (Mr. G. Durrant); Mrs. Simonds (Mr. J. Timms); Mr. Howlett; F. Lowenadler, Esq., Badgemore (Mr. T. Hatton); Sir W. Farrer, Sandhurst Lodge (Mr. W. J. Townsend); Mrs. Bland Garland, Lower Redlands (Mr. H. Wilson); J. Ridges, Esq., Leighton Park (Mr. G. Tovey); Mrs. Austin, Whitley Lodge (Mr. W. Bennett); Dr. C. M. Powell, Caversham (Mr. G. Boxall); His Grace the Duke of Wellington, Strathfieldsaye (Mr. A. G. Nicholls); T. R. Harmon, Esq., Sindlesham House (Mr. T. Neve). W. Pole Routh, Esq., Oakfield (Mr. H. House); Mr. F. W. Macdonald; Count Gourowski, Woolhampton Park (Mr. G. Kemp).

Collections of Vegetables.—Sir W. Farrer, Sandhurst Lodge (gardener, Mr. W. J. Townsend); University College, Reading (Mr. Drew); L. R. Erskine, Esq., Binfield Manor (Mr. C. Earl); Mrs. Wheeler, Hatchgate (Mr. T. Judd); Mrs. Collins, Stoneham House (Mr. H. Goodger); Mr. E. J. Dore; Mrs. Simonds (Mr. Timms); Mr. G. Hatch, The Gardens, Caversham Hall, Suffolk.

Groups of Plants, etc.—Rufus D. Isaacs, Esq., K.C., M.P., Fox Hill (gardener, Mr. Exler), Primula obconica; L. G. Sutton, Esq., Hillside (Mr. F. Townsend), seedling chrysanthemums, Primula obconica, and Primula sinensis; L. R. Erskine, Esq., Binfield Manor (Mr. C. Earl), cut seedling chrysanthemums; M. H. F. Sutton, Esq. (Mr. H. C. Loader), seedling chrysanthemums; W. Howard Palmer, Esq., Heathfield, Wokingham (Mr. W. C. Moles), pelargoniums; Colonel Thornton, Maidenhatch (Mr. W. Clarke), begonias and cyclamen; Captain D. M. Millar, Blandford Lodge (Mr. Reeves), geraniums; G. Bird, Esq. (Mr. Abrahams), geraniums; Mrs. Bland Garland, Lower Redlands (Mr. H. Wilson), chrysanthemums; Mr. G. Stanton, Upper Culham, dried flowers and grasses; Messrs. Sutton and Sons, seedling chrysanthemums; S. B. Joel, Esq., Maiden Erleigh (Mr. F. Johnson), chrysanthemums, begonias, etc.; Miss Cripps, Preston (Mr. G. Durrant), chrysanthemums, etc.; A. G. Vanderbilt, Esq., Shiplake (Mr. G. Preston), foliage plants.

British Gardeners' Association.

The November meeting of the London Branch took place at Carr's Restaurant on Thursday, November 11, Mr. E. F. Hawes presiding. The Chairman announced that 360 circular letters had been sent out to candidates at the recent Borough Council elections, and a good percentage of favourable replies had been received. It was also announced that the Executive Council had unanimously agreed to allow the Richmond branch to be transferred to the London branch. A hearty welcome was extended to the members from Richmond.

A paper was read by Mr. E. F. Hawes, entitled, "Should be have fuller State recognition of Horticulture?" The lecturer pointed out that the increasing amount of capital invested and the corresponding increase in the number of gardeners employed, together with the number of gardening societies formed, were all proofs of the great advance which horticulture has made of late; but all the different societies and organisations formed were acting independently of each other, thereby missing the advantages of a well-organised combination, such as those enjoyed by many other professions. He thought it would be of immense advantage to have a Central Chamber of Horticulture on which all societies could be represented. In conclusion, Mr. Hawes said he hoped that the London branch would endorse his opinion, "that the time had come when some definite action should be taken to secure a fuller recognition of horticulture by the State."

The discussion was opened by Mr. Barnes, who considered better education and more individual effort on the part of gardeners themselves would do more to raise their social status and secure better conditions of employment than any gratuitous benefits conferred by the State as a result of political agitation. Mr. Raffles, who followed, thought that those who produced the necessities of life should be especially favoured by the State. He pointed to Belgium as an example of what can be done by State representation of horticulture. Mr. Tidy suggested that experts should be employed by the State to give advice upon all matters connected with economic horticulture. It was of the utmost importance that the cultivator should know just what crops his land is best capable of producing, what plant foods it is most deficient in, how these may best be supplied, and how he can best deal with the various insect and fungus pests he may have to contend with.

Mr. Hawes, replying, said there were plenty of good men sufficiently educated and quite capable of filling the positions named in the gardening profession, but their social standing was not deemed sufficiently important. He thought that representation in Parliament would be an important step in the right direction, and one that would be bound to result in benefit to the whole horticultural profession. A resolution was passed by the meeting in favour of Mr. Hawes's proposals, and the matter was referred to the Executive Council for further consideration.

Bromley.

The twenty-eighth annual exhibition of this society, held in the Grand Hall, Bromley, Kent, on November 10 and 11, proved one of the finest displays yet held there. The various classes were arranged to the best advantage,and the competitive exhibits occupied every inch of available space. The entries were well above the average, from ten to twelve competitors being found in most of the classes, while the quality of the blooms showed no evidence of the unfavourable season.

The challenge cup class for forty-eight blooms, equal numbers of Japanese and incurved, always creates a keen competition. This year the successful competitor was Mr. Simon, gardener to W. W. Mann, Esq., Ravenswood, Bexley, and he was closely followed by Mr. Lyne, gardener to H. F. Tiarks, Esq., J.P., Foxbury, Chislehurst, last year's winner; Mr. Dove, gardener to H. Bennett, Esq., Albyfield, Bickley, was a good third.

Mr. Rigby, working single handed for the Rev. A. C. Cooper Marsden, Wickham Road, Beckenham, carried off the Griffith Challenge Cup in the class for six vases, Japanese; his Mrs. G. Mileham and Reginald Vallis were magnificent specimens, one in the latter vase being awarded the National Chrysanthemum Society's Certificate as the best Japanese bloom in the show. Mr. Govier, gardener to J. I. Smail, Esq., Warrenwood, Hayes, last year's winner, took second place.

In the classes restricted to single-handed gardeners Mr. Rigby took the lead throughout.

The incurved section was better represented this year than it has been for several years; all the classes were well filled, and there was a refinement in the blooms that has been lacking recently. The National Chrysanthemum Society's Certificate for the finest incurved bloom in the show was awarded to one staged by Mr. Hudd, gardener to Mrs. Chalmers, Farrants, Bickley, the variety being Hanwell Glory, the judges remarking that it was as fine a specimen of that variety as they had ever seen.

The two classes for singles were a feature of the show, the 120 vases occupying a terraced stage the whole width of the hall, and thus making a grand display. The decorative classes, open to lady exhibitors only, are always an interesting feature of these shows, and the nine examples of dinner table decorations were much admired; the vases of decorative varieties of chrysanthemums arranged with foliage for effect, and stretching the whole length of the building, also attracted much attention and admiration.

Fruit and vegetables, although well represented, were not so numerous or so fine in quality as last year.

Maidstone and Mid-Kent Natural History and Philosophical Society.

"THE WONDERS OF FERNLAND."

On Monday, the 8th instant, under the auspices of this society, at the Museum, Maidstone, Mr. Charles T. Druery, V.M.H., F.L.S., gave a lecture entitled "The Wonders of Fernland," illustrated by a large number of lantern slides. The first of these showed views of the vegetation of the Coal age, as presumed from the fossil remains of ferns and their allies found in coal and associated strata, and, taking these as his text, the lecturer pointed out that, although we were apt to regard ferns as mere decorative plants in these days, in the long distant past they had practically built up the material upon which our present prosperity was mainly based, since without coal this could never have been attained.

The next slides illustrated with the aid of the lecturer's remarks, the difference between seed bearing or flowering plants and spore bearers or presumed non-flowering plants, though the latter, he demonstrated, really bore the equivalent of flowers and of pollen and seeds, and were reproduced by a process of fertilisation on similar lines. The many ways in which Nature departed from the normal process, and yet succeeded in reproducing the parental form, were then described and shown upon the screen.

The lecturer then entered upon his special field of variation, as exemplified in our native ferns, to a far greater degree than all the innumerable exotic ferns in the world had so far shown themselves capable of.

In succession a number of the most beautiful "sports" of the Lady Fern, the Common Polypody, the Hartstongue, the Buckler Fern, the Hard Fern, the Bracken, and last, but not least, the Shield Ferns, were shown, these consisting mainly of wild "sports," the spontaneous work of Nature as found in our woods, glens, roadsides, and shady lanes. These were followed by some extraordinarily beautiful improvements of these obtained by selective cultivation through their spores. Two slides, showing the pedigree of some of the finest, were particularly interesting as exemplifying the immense strides which may occur even in a single generation once the normal form has departed from ordinary lines and indicated a "break" as a hint to the selective cultivator. Incidentally, the marvellous fertility of ferns was shown in the forms of a simple multiplication sum, based on the annual number of fronds produced by a single fern, the number of divisions major and minor, the number of spore heaps on each of these last, and finally the number of capsules in a heap and the number of spores in each, the total reaching 1,120 millions, as the annual crop of a single fern. The lecture concluded with views of several British ferneries, winding up with one of the lecturer's own, which evoked great admiration, and demonstrated beyond all question the value of our native ferns as superb decorative plants for shady and unheated conservatories. A hearty vote of thanks was accorded the lecturer.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on Monday, November 8. Mr. Charles H. Curtis presided. Six new members were elected. The death of Mr. Nathan Cole was announced, and the sum standing to his credit in the society's books, viz., £14 14s. 6d., was granted to his nominee. Mr. Cole was one of the founders of the society, being No. 4 on the list, and had been on the benevolent fund eleven years. The amount of sick pay for the past month was £33 15s.

Offices: 148 & 149, Aldersgate Street, London.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

CROWN IMPERIALS.—R. S. J., Farnham: These handsome bulbous plants should be planted as early in the autumn as possible, October for preference, and it is an excellent plan to lift, divide, and replant them every third year. Lift and replant at once, when weather permits. A few strong bulbs should be potted up, and put in a cold frame, as they will come in useful for conservatory decoration next spring.

VARIATIONS OF THE ACRE.—C. H. M., East Grinstead: The imperial acre, consisting of 4,840 square yards, is now the generally accepted standard of measurement for land, and it is generally known as the English acre. The Scotch acre, not now much used, is 6,150 square yards; the Irish acre 7,840 square yards. In some parts of England the acre used to represent distinct variations from the recognised standard, and from each other. Thus there was the Devonshire acre of 4,000 square yards; the Cornish acre of 5,760 square yards; the Lancashire acre of 7,840 square yards; the Cheshire and Staffordshire acres of 10,240 square yards; and the Wiltshire acre of 3,630 square yards. The French "Arpent" is 1 3-16 English acres; the Prussian "Morgen" is nearly ¾ of an English acre; and the Strasburg acre is about half an English acre.

ASTER COLWALL BEAUTY.—M. M., Eastbourne: This beautiful, double Michaelmas Daisy was raised by Mr. Ballard, The Court, Colwall, Malvern; it was a great success in the trials of perennial asters conducted by the Royal Horticultural Society at Wisley in 1907; gained an A.M. on September 26 of that year; was figured in our issue of October 3, 1907; and was distributed by Messrs. T. S. Ware, Lim., Feltham.

VANDA CÆRULEA.—P. G., Oxford: As soon as the flower spikes have been removed either suspend the plants from the roof, or raise them on pots so that they are as near the light as possible, consistent with safety. The intermediate house will suit them at this period, and, as there is practically no active growth, very little water will be needed during the winter.

BRIAR STOCKS FOR ROSES.—M. H. C., Cheltenham: If you have the opportunity obtain your briars from the hedges on the land of some friendly farmer or landlord, and, after trimming the roots as necessary, plant them at once. The reason why there are so many failures in the propagation of standard roses is that the hawkers from whom the majority of the stocks are purchased, treat the briars so badly and expose the few roots so much that, even when the plants survive the winter, and the stems respond to the warmth and moisture of spring, the root system is so poor, or almost non-existent, that they soon collapse.

BLACK CURRANTS.—J. B. W., Henley: Unlike the red currant, which should have a clear stem six or eight inches out of the soil, black currants should be planted rather deeper, and without a clear stem. Thus planted strong, vigorous shoots will spring from the base, which will, in course of time, replace the older branches, and prove most productive. Any contemplated planting should be carried out without delay. In-

corporate with the soil that is to be worked back among the roots some charred garden refuse, and a litle decayed manure, and mulch with rough litter immediately the work is completed. A suitable distance to dispose the bushes is five to six feet both ways, and some other crop may be grown between them for a year or more. The system of pruning is totally different from that practised with red currants. The aim should be to retain all the young vigorous branches intact, cutting clean out at the base any that are crowded or stunted. The centre of the bush should be left as open as possible to admit full light and air to the remaining branches. The knife should be used freely on aged trees, and if not actually unhealthy they may thus be rejuvenated if other details of culture are of the best.

NAMES OF FRUITS.

J. S. N., Leamington.—Hope to give the names in our next issue.

G. M. F., Leeds.—1, Beurre Diel; 2, Beurre Hardy; 3, Beurre Bosc.

E. S., Sidmouth.—1, Fearn's Pippin; 2, Dutch Mignonne; 3, Bismarck.

H. B., Lincoln.—1, King of the Pippins; 2, Stirling Castle; 3, Claygate Pearmain.

L. A. O., Chelmsford.—1, Peasgood's Nonsuch; 2, Lane's Prince Albert; 3, Waltham Abbey Seedling; 4, Dumelow's Seedling.

NAMES OF PLANTS.

M. P., Whittlesea.—Rudbeckia speciosa.

B. W., Sidmouth.—1, Maranta zebrina; 2, Saintpaulia ionantha.

C. F. H., Chester.—1, Plumbago rosea; 2, Ficus Parcelii; 3, Oncidium flexucsum; 4, Maxillaria picta.

F. E. A., Redcar.—1, Lilium sulphureum; 2, Veronica Andersoni variegata; 3, Calceolaria Burbidgei.

E. I. S., Southampton. — 1, Cypripedium insigne Maulei; 2, Cattleya Bowringiana; 3, Pellionea Duveauiana.

J. M., Uttoxeter.—3, Rondeletia speciosa; 4, Cestrum aurantiacum; other specimens not recognised, send when in flower.

THOMSON'S CELEBRATED MANURES.
For full advertisement see back page.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

GOOD BOOKS FOR CHRISTMAS PRESENTS.

"Sound advice how to ensure the most beautiful floral effects."—*Dundee Advertiser.*

Price 7/6 net; by post, packed in box, 8/-

THE FLOWER GARDEN

By T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

A Complete Guide to Planting and Management of the Flower Garden and the Cultivation of Flowers, Plants, Trees, &c., adapted for Outdoor Culture.

THE CONTENTS INCLUDE—

- Fashioning the Garden.
- Beds and Borders.
- Walks and Paths.
- Lawns and Tennis Courts.
- Rockeries and Ferneries.
- Arbours, Summerhouses, Arches, and Pergolas.
- Edgings.
- Walls and Fences.
- Garden Practice.
- Propagation.
- Colour Arrangement.
- Bedding.
- Annuals and Biennials.
- Bulbs.
- Hardy and Tender Border Plants and Flowers.
- Climbing Plants.
- Trees and Shrubs.
- Pests and Diseases.

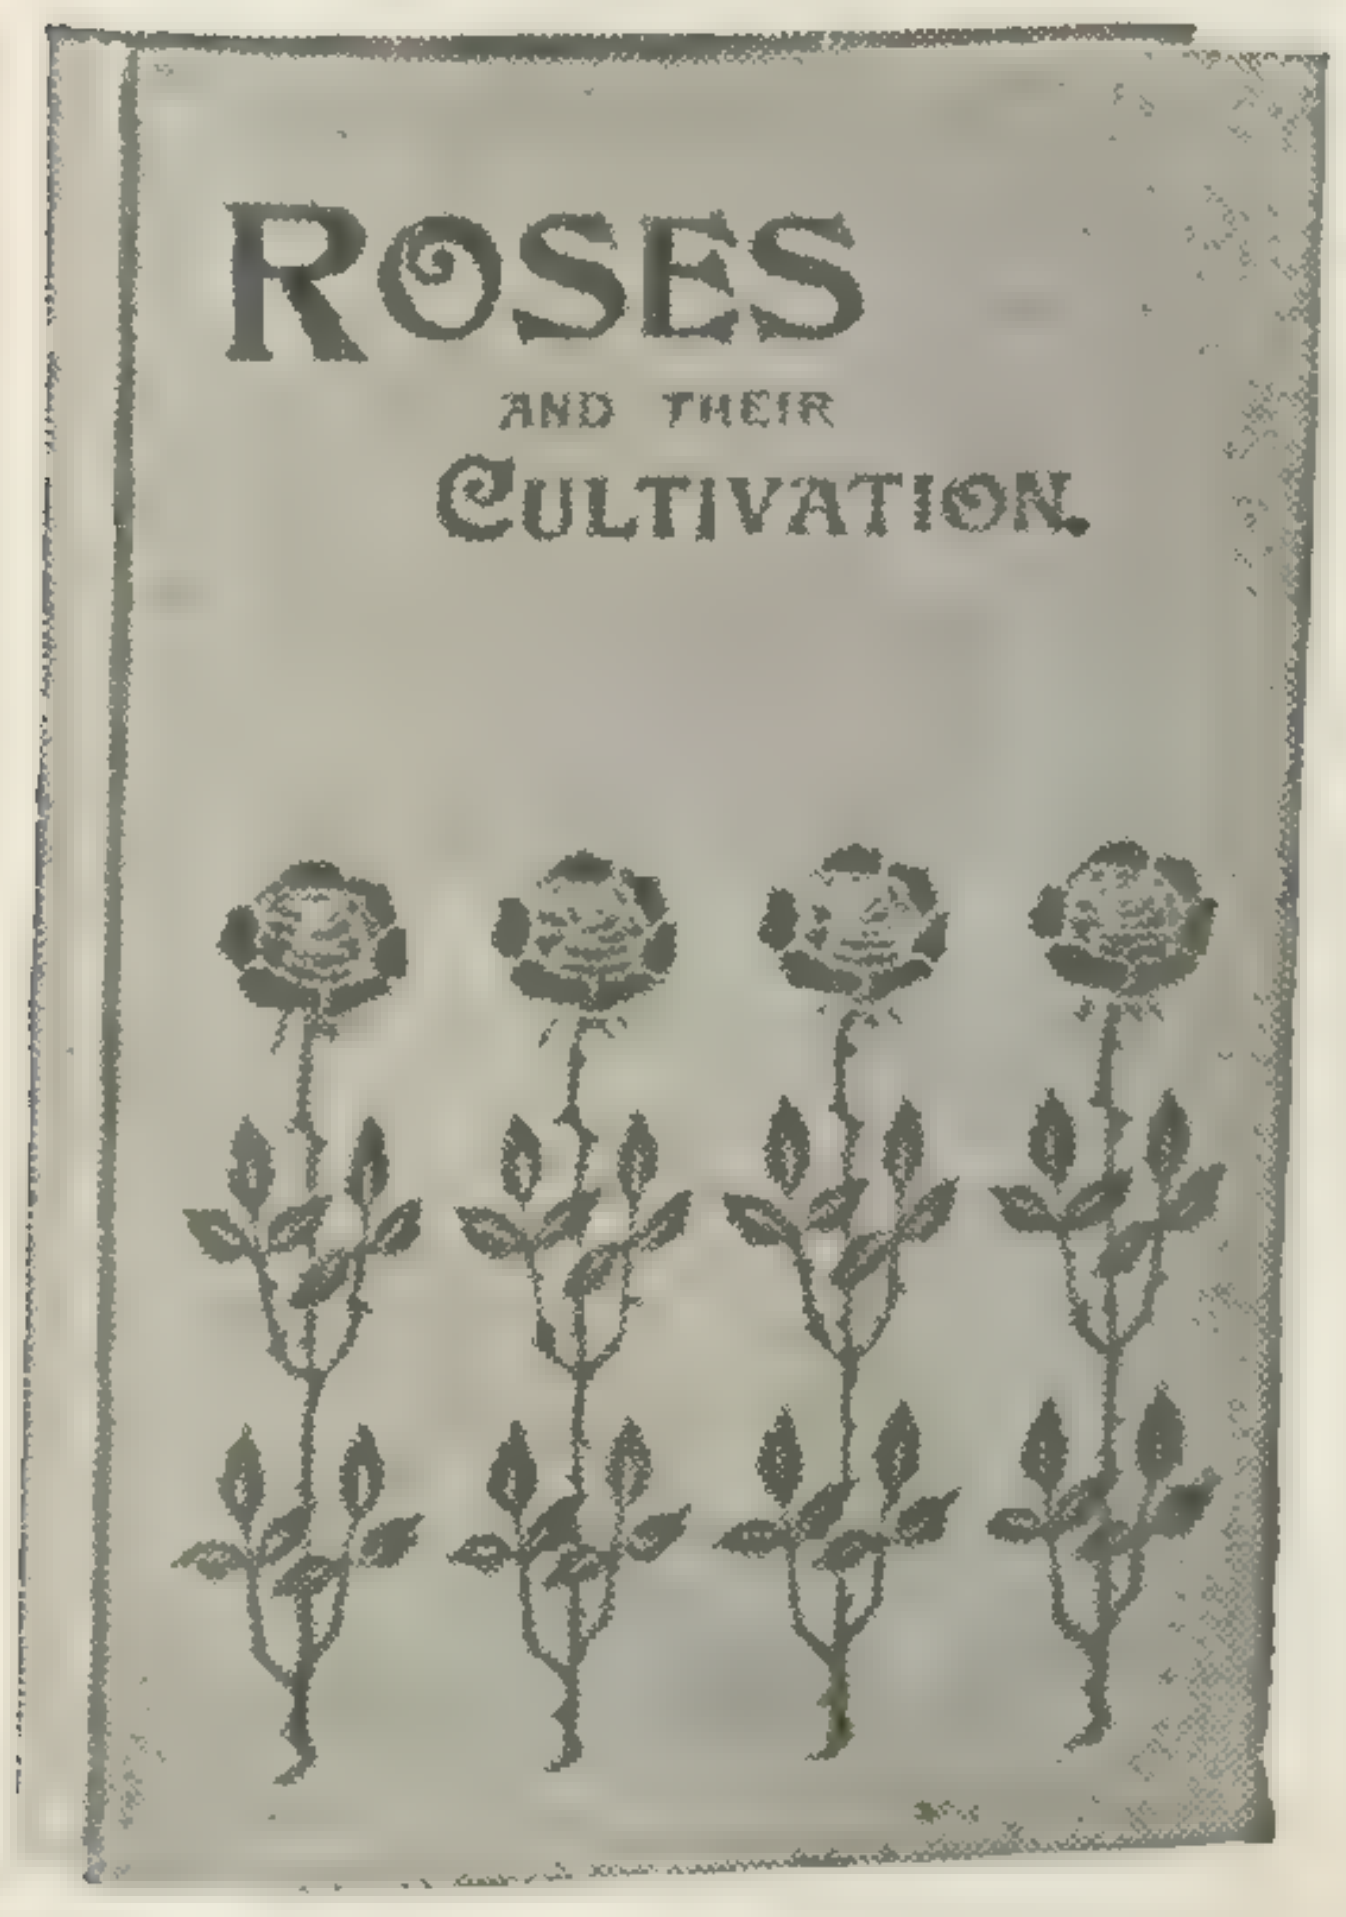
480 PAGES, ILLUSTRATED BY 64 PLATES OF BEAUTIFUL GARDEN SCENES, PLANTS AND FLOWERS, AND MANY EXPLANATORY DIAGRAMS.

JUST PUBLISHED—SIXTH EDITION—including New Features and Illustrations and Revised List of 1,666 Different Roses.

64 Illustrations, 16 Plates and Frontispiece. 198 Pages. 2/6 net; by post 2/10

ROSES AND THEIR CULTIVATION.

SIXTH EDITION.



By T. W. SANDERS, F.L.S.

A Complete Guide to the Selection and Culture of

STANDARD ROSES. PILLAR ROSES.
GREENHOUSE CLIMBERS.
RAMBLING ROSES.
ROSES FOR TRELLISES.
CLIMBERS FOR PERGOLAS.
POT ROSES. DWARF ROSES.
ROSES FOR EXHIBITION.

- How and When to Plant Roses.
- Propagation of Roses—Ways to Grow Them.
- How to Prune, Bud, and Graft Roses.
- Erection of Pergolas and Arches.
- How to Show Roses.
- Insect Pests and Fungoid Diseases—Remedies.
- Types of Roses, full description, Culture, etc.
- Soil and Manures for Roses.
- The Rose Grower's Calendar; showing what to do each month.

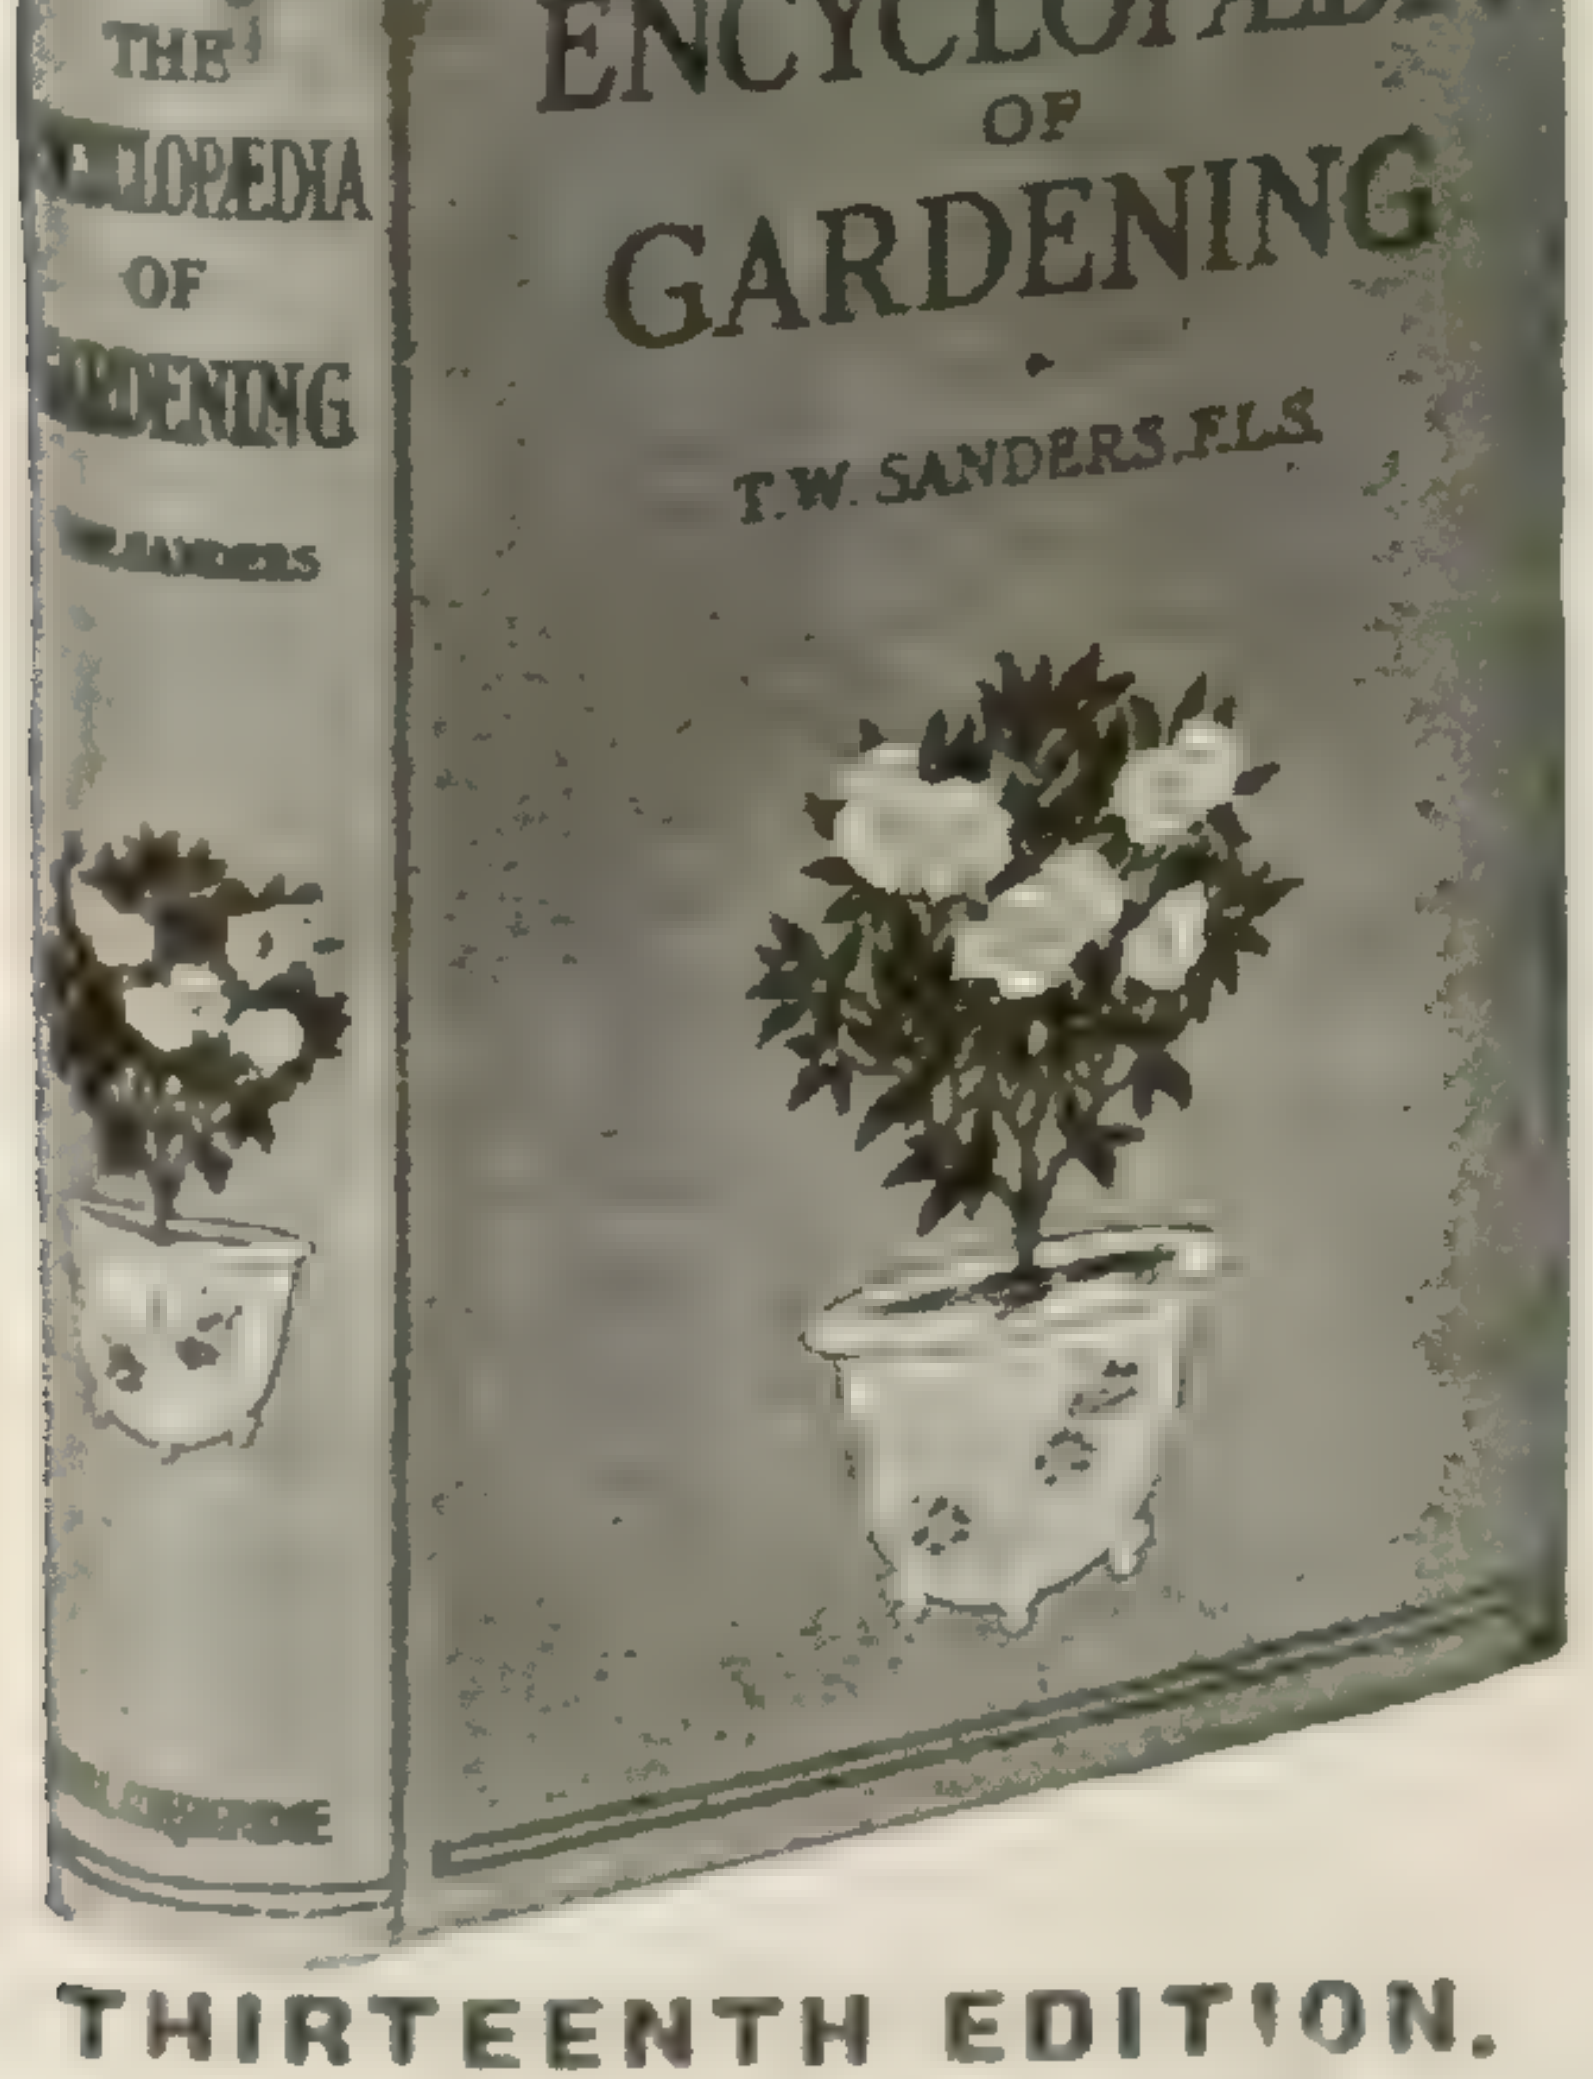
LIST OF 1,666 CULTIVATED ROSES:

Showing Variety, Section or Class, Date Introduced, Colour, Habit of Growth, How Best Grown, Mode and Time of Pruning, Description of Flower.

THE ENCYCLOPAEDIA OF GARDENING.

Crown 8vo, 482 pages, bound in cloth.
NET 3/6; by Post, 3/10.

By T. W. SANDERS, F.L.S., F.R.H.S.,
Editor of "Amateur Gardening."



THIRTEENTH EDITION.
Revised and Improved.

A COMPLETE GUIDE AND DICTIONARY to the Culture, Propagation and Description of Flowers, Fruit, Vegetables, Plants, Trees, Shrubs, etc.

. . . INCLUDING . . .

- Time of Planting.
- Position.
- Soil.
- Manures.
- Temperatures.
- Common or Popular Names.
- Botanical Names.
- Watering.
- Natural Order.
- Date of Introduction.
- Species Cultivated.
- Propagation.
- Colour.
- Height.
- Time of Flowering.
- Duration.
- Forcing.
- Potting. Pruning.
- Cultural Details.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Water.

If we place an ordinary tumbler of water before us as an inspiring agent for an article of horticultural interest, most of our friends would be apt to suggest a modification of its contents, and its subsequent imbibition, but in point of fact, to a mind scientifically disposed, that little volume of liquid, pure and simple, is far too much of a wonder to require such aid.

No other substance on earth appeals to us so much by its pervading nature, its essentiality to all life, its marvellous composition and its diversity of form. Practically, it is everywhere on the earth's surface. The greater part of that surface is covered with the oceans, seas, lakes, small or large, rivers, and streamlets, in which it is collected or flowing in its liquid form. The air itself, even over the most arid deserts, holds it in enormous quantities in suspension as invisible vapour. The soil beneath our feet and the rocks beneath that are all pervaded with it, and all the living organisms, plant or animal, owe their very existence to its presence in their veins or in the cells which form them. At the Poles and everywhere where high mountains exist, projecting their peaks high into the colder regions of the atmosphere, we see it in its solid form as ice or snow, built up of crystals of infinite beauty. Nor is this all, for the realms of cloudland show it again in the form of visible vapour, a suspended medium between the invisible aerial form of water and its liquid state. Nothing else in this world of ours presents itself familiarly to our senses with such diversity as water, though most of the earth's constituents, given a sufficiency of heat and an intensity of cold, are able to assume the same forms —solid, liquid, and apparently gaseous. This term "apparently gaseous," leads us to still another phase of water marvels. Water popularly is considered as the enemy of fire, but in point of fact, it is composed of two gases which are the very basis of fire itself, viz., oxygen and hydrogen. The chemist could easily decompose our tumbler of water into a large volume of these two gases in proof of this, and this being done could confirm the rest of our assertion by, after taking due precautions, applying a spark, when, with a violent explosion and a brilliant flash of flame, the water would resume its liquid form. The old idea, therefore, that water was an element is consequently seen to be false, since it is a composite of two gases. A curious fact in this connection is that, while these two gases combined as liquid water can be solidified as ice at 32 deg. Fahrenheit, singly they can only be frozen at an intensely low temperature, so low, indeed, that it is only in comparatively recent years that we have been able to freeze them solid at all. In the case of water, too, we find it the one great exception to the law that with increasing cold bodies continuously contract. Water does so as it approaches the freezing point, but just prior to its solidification or crystallisation, it expands, doubtless owing to some subtle arrangement of its molecules at the moment of solidifying. Superficially considered, this is an unimportant phenomenon, but, practically, we in these now temperate regions owe our existence to it. By virtue of this increase of bulk, ice is lighter than water, and consequently floats. By virtue again of this flotation, the ice formed in our winter seasons on our polar seas, lakes, and rivers, merely forms a crust which the summer sun can reach and melt. Even the great polar icebergs, which break away from the polar glaciers, are carried south or north, as the case may be, into warmer regions, and so are melted away. In this fashion the balance is maintained; but let us conceive what the result would be did ice sink as soon as formed. All our deep waters subjected to long periods of frost would be absolutely solidified, the polar seas would be blocked by the accumulated sunken bergs pushed ever forward by the spreading ice cap, and, as a consequence, the conditions of the old glacial epoch would exist far and away beyond the old regions of invasion, and only the tropical and sub-tropical regions would be available for civilised peoples. To bring the moral home to our horticultural readers, it is clear that, under such circumstances floral evolution would have gone on on very different and less generous lines than it has done, and that not only do we owe an immense debt to water as a vital factor in our plant culture, and in their very composition, but also another to the seemingly unimportant fact that water swells when it freezes.

MR. WALTER SPEED, V.M.H.

Mr. Walter Speed, V.M.H., who for a long number of years has held the important position of head gardener at Penrhyn Castle, in North Wales, is one of our ablest cultivators. The gardens at Penrhyn have a splendid reputation, and it is not so very many years ago that they were regarded as the best kept in Great Britain. Now, however, thanks to the example set by Mr. Speed and his noble employer, there are other establishments where an equally high standard of order, productiveness, and upkeep is maintained. In the general sense of the word, Mr. Walter Speed is not a specialist, but he has nevertheless a special liking for grapes and for roses, both of which he grows remarkably well. As a judge of grapes Mr. Speed holds a very high position, and it has been his lot to adjudicate in the championship grape class at Shrewsbury for many years in succession. Mr. Speed was one of the original recipients of the Victoria Medal of Honour in Horticulture, in 1897, and this award is itself sufficient evidence of his great ability.

Preserving the View of Windsor Castle.—At the meeting of the National Trust for Places of Historic Interest or Natural Beauty, held a few days ago, the members agreed to endorse "The appeal of the council of the National Trust, an appeal which has the support of his Majesty the King, for funds to purchase the land now offered for building lying between the Alexandra Gardens and the Curfew Tower at Windsor, in order that the greensward and trees may be preserved, and the beauty of the famous view of Windsor Castle from the Thames may thus be saved from serious injury." It appears probable that, failing the purchase of this land, the fine trees will be cut down, the spot built on, and the splendid view from the river, and also from the Eton side, will be utterly spoiled. A sum of £3,000 is required for the purchase of the land, and a subscription list has been opened. This has been headed by the King with a donation of £500, and the Prince of Wales has subscribed £250. The Mayor and Corporation of Windsor have promised to support the National Trust in the endeavour to raise the necessary funds.

Royal Gardeners' Orphan Fund.—We are glad to learn that the committee of the Bradford and District Chrysanthemum Society, as the result of their exertions at the recent chrysanthemum show, have been able to send a subscription of £7 to the above charity. We congratulate them upon their successful efforts in a good cause. When we were at the very pretty exhibition at Bradford we noticed that ladies were acting most efficiently at the Flower Stall on behalf of the committee. Would that other committees and their ladies would do likewise.

Jubilee Bulb Show in Haarlem, 1910.—We learn that the great bulb show to be held next year at Haarlem will be continued till May 29, 1910. The late tulips and the many other May-flowering bulbous plants, which will be one of the special features of the show, will not be in full glory before the second part of May, and consequently the continuation of the show till the end of May seems quite necessary. Moreover, this arrangement will enable the visitors to the Brussels International Exhibition, and especially the members of the Botanical and Colonial Agricultural Congresses, to visit Haarlem and its Jubilee Flower Show, for which they will receive special invitations. We have already mentioned that three special temporary shows will be held. A fourth exhibition of this kind is now fixed for May 20-22, 1910, when the Dutch Horticultural and Botanic Society will hold its usual spring flower show in the excellent buildings of the Haarlem Jubilee Show. We understand also that the British Horticultural Traders' Outing will be to Haarlem and Brussels in 1910.

The New Neill Prizeman.—The council of the Royal Caledonian Horticultural Society has unanimously awarded the Gold Neill Medal to the Rev. J. Aikman Paton, of Soulseat, Castle Kennedy, in recognition of the work he is doing in the hybridisation of tuberous-rooted solanums, and his efforts to secure thereby a race of disease-resistant potatoes.

Seeds for Distribution from Kew.—Seed lists will shortly be crowding in upon us, but among the many we shall not find one so peculiarly interesting as that just received from Kew, in the form of an appendix to the "Kew Bulletin." Like the trade lists, this one is dated for the coming year, and there is also the same suggestion to order early. The Kew list, unlike the trade catalogues, contains no prices—indeed, the seeds are free to certain folk. The list is of "Seeds of Hardy Herbaceous Plants and of Trees and Shrubs," all grown (with four exceptions) in the Royal Gardens, Kew, in 1909. These seeds are available only for exchange with botanic gardens, as well as with regular correspondents of Kew, and no application, except from remote Colonial possessions, can be entertained after the end of February.

Mr. F. W. Moore, V.M.H., curator of the Glasnevin Botanic Gardens, Dublin, has had the dignity of Master of Arts conferred upon him (honoris causa) by the University of Dublin. The honour is well deserved by Mr. F. W. Moore, and in conferring it the University has honoured itself.

Children at Flower Shows.—At many of the northern flower shows it is the practice of the committee to invite the local school children to visit the exhibition on the second day. This practice obtains at Nottingham, Sheffield, and York, and at the recent Leeds Show the Lady Mayoress made arrangements for a similar visit, and also offered prizes for the best essays written by the scholars, describing their visit. This early encouragement of a love for flowers is a fine idea, and should be widely copied. We should like to see some of the best essays written by the Leeds scholars

Perpetual Carnation Society.—The first exhibition of this society for the year 1909-10, to be held at the Royal Horticultural Hall on Wednesday next, promises to be a very interesting one. The carnation is becoming increasingly popular for winter flowering, and the competition for Lord Howard de Walden's splendid challenge cup promises to be very keen. The annual meeting and dinner will be held the same evening (December 8) at the Hotel Windsor. Those who propose to join the society should do so at once, so as to secure the fullest possible benefits from membership.

Transport of Flowers in Ice.—The native flowers of Western Australia that were sent to Mr. Chamberlain by Sir Gerald Strickland, Governor of the colony, reached London the other day in such excellent condition that they possessed much of their original freshness and brightness of colour. As in the case of the chrysanthemum blooms sent to Australia by the National Chrysanthemum Society, and the native flowers that were sent therefrom to the Royal Horticultural Society nearly a quarter of a century ago, the flowers received by Mr. Chamberlain were, previous to their dispatch, frozen in blocks of ice. They were brought to this country in one of the cool chambers of the s.s. Ophir.

A New Park for Harrow.—The Middlesex County Council proposes to purchase six acres of ground at Harrow, and this, together with twenty-one acres presented by a resident, will be converted into a public park.

Presentation to Mr. A. J. Hartless.—Until his recent appointment in connection with the University College Gardens, Reading, took Mr. Hartless from London to Berkshire, he was hon. secretary of the London branch of the British Gardeners' Association. That he performed his secretarial duties to the advantage of the association, and the satisfaction of the members was made very evident on Saturday last, when, laying aside business matters, the members of the branch gathered at Carr's Restaurant for a social evening, and the presentation of some tokens of regard to their late hon. secretary. The presentation, made by Mr. E. F. Hawes, consisted of three handsome bronze figures representing Commerce, Horticulture, and Agriculture. The former, the larger and central piece, mounted on a marble pedestal, had the following legend inscribed on an attached brass plate: "Presented to Mr. A. J. Hartless by members of the London Branch of the British Gardeners' Association, as a token of appreciation of services rendered as Secretary from 1907 to 1909."

York Chrysanthemum Show.—At this show, duly reported and illustrated in these columns, the takings at the door amounted to £256 1s., as against £253 7s. 1d. in 1908, and £249 15s. 1d. in 1907. On the second and third days the committee invited the scholars from the Blue Coat School, Grey Coat School, Certified Industrial School, St. Stephen's Orphanage, York Union, and Yorkshire School for the Blind, and these invitations were all accepted.

Fruit Culture at Bournville.—Writing from the Bournville Estate Office, near Birmingham, Mr. J. H. Barlow tells us that information has been received from twenty-one Bournville residents giving the weight of apples picked this year from the trees planted in their gardens. The result shows an average yield of 159lb. weight of apples per garden for the season. In one case the weight of apples this season from nine trees planted 11 years ago was 590lb., the amount realised by their sale being £2 18s. 11d., or at the rate of 1s. 1½d. per week throughout the year. There are over 700 houses with gardens and fruit trees at Bournville. The work of laying out and planting the gardens is done by the Village Trust; and the cost is reckoned as part of the cost of the house. From the particulars given it will be seen what a useful and remunerative investment fruit trees may become.

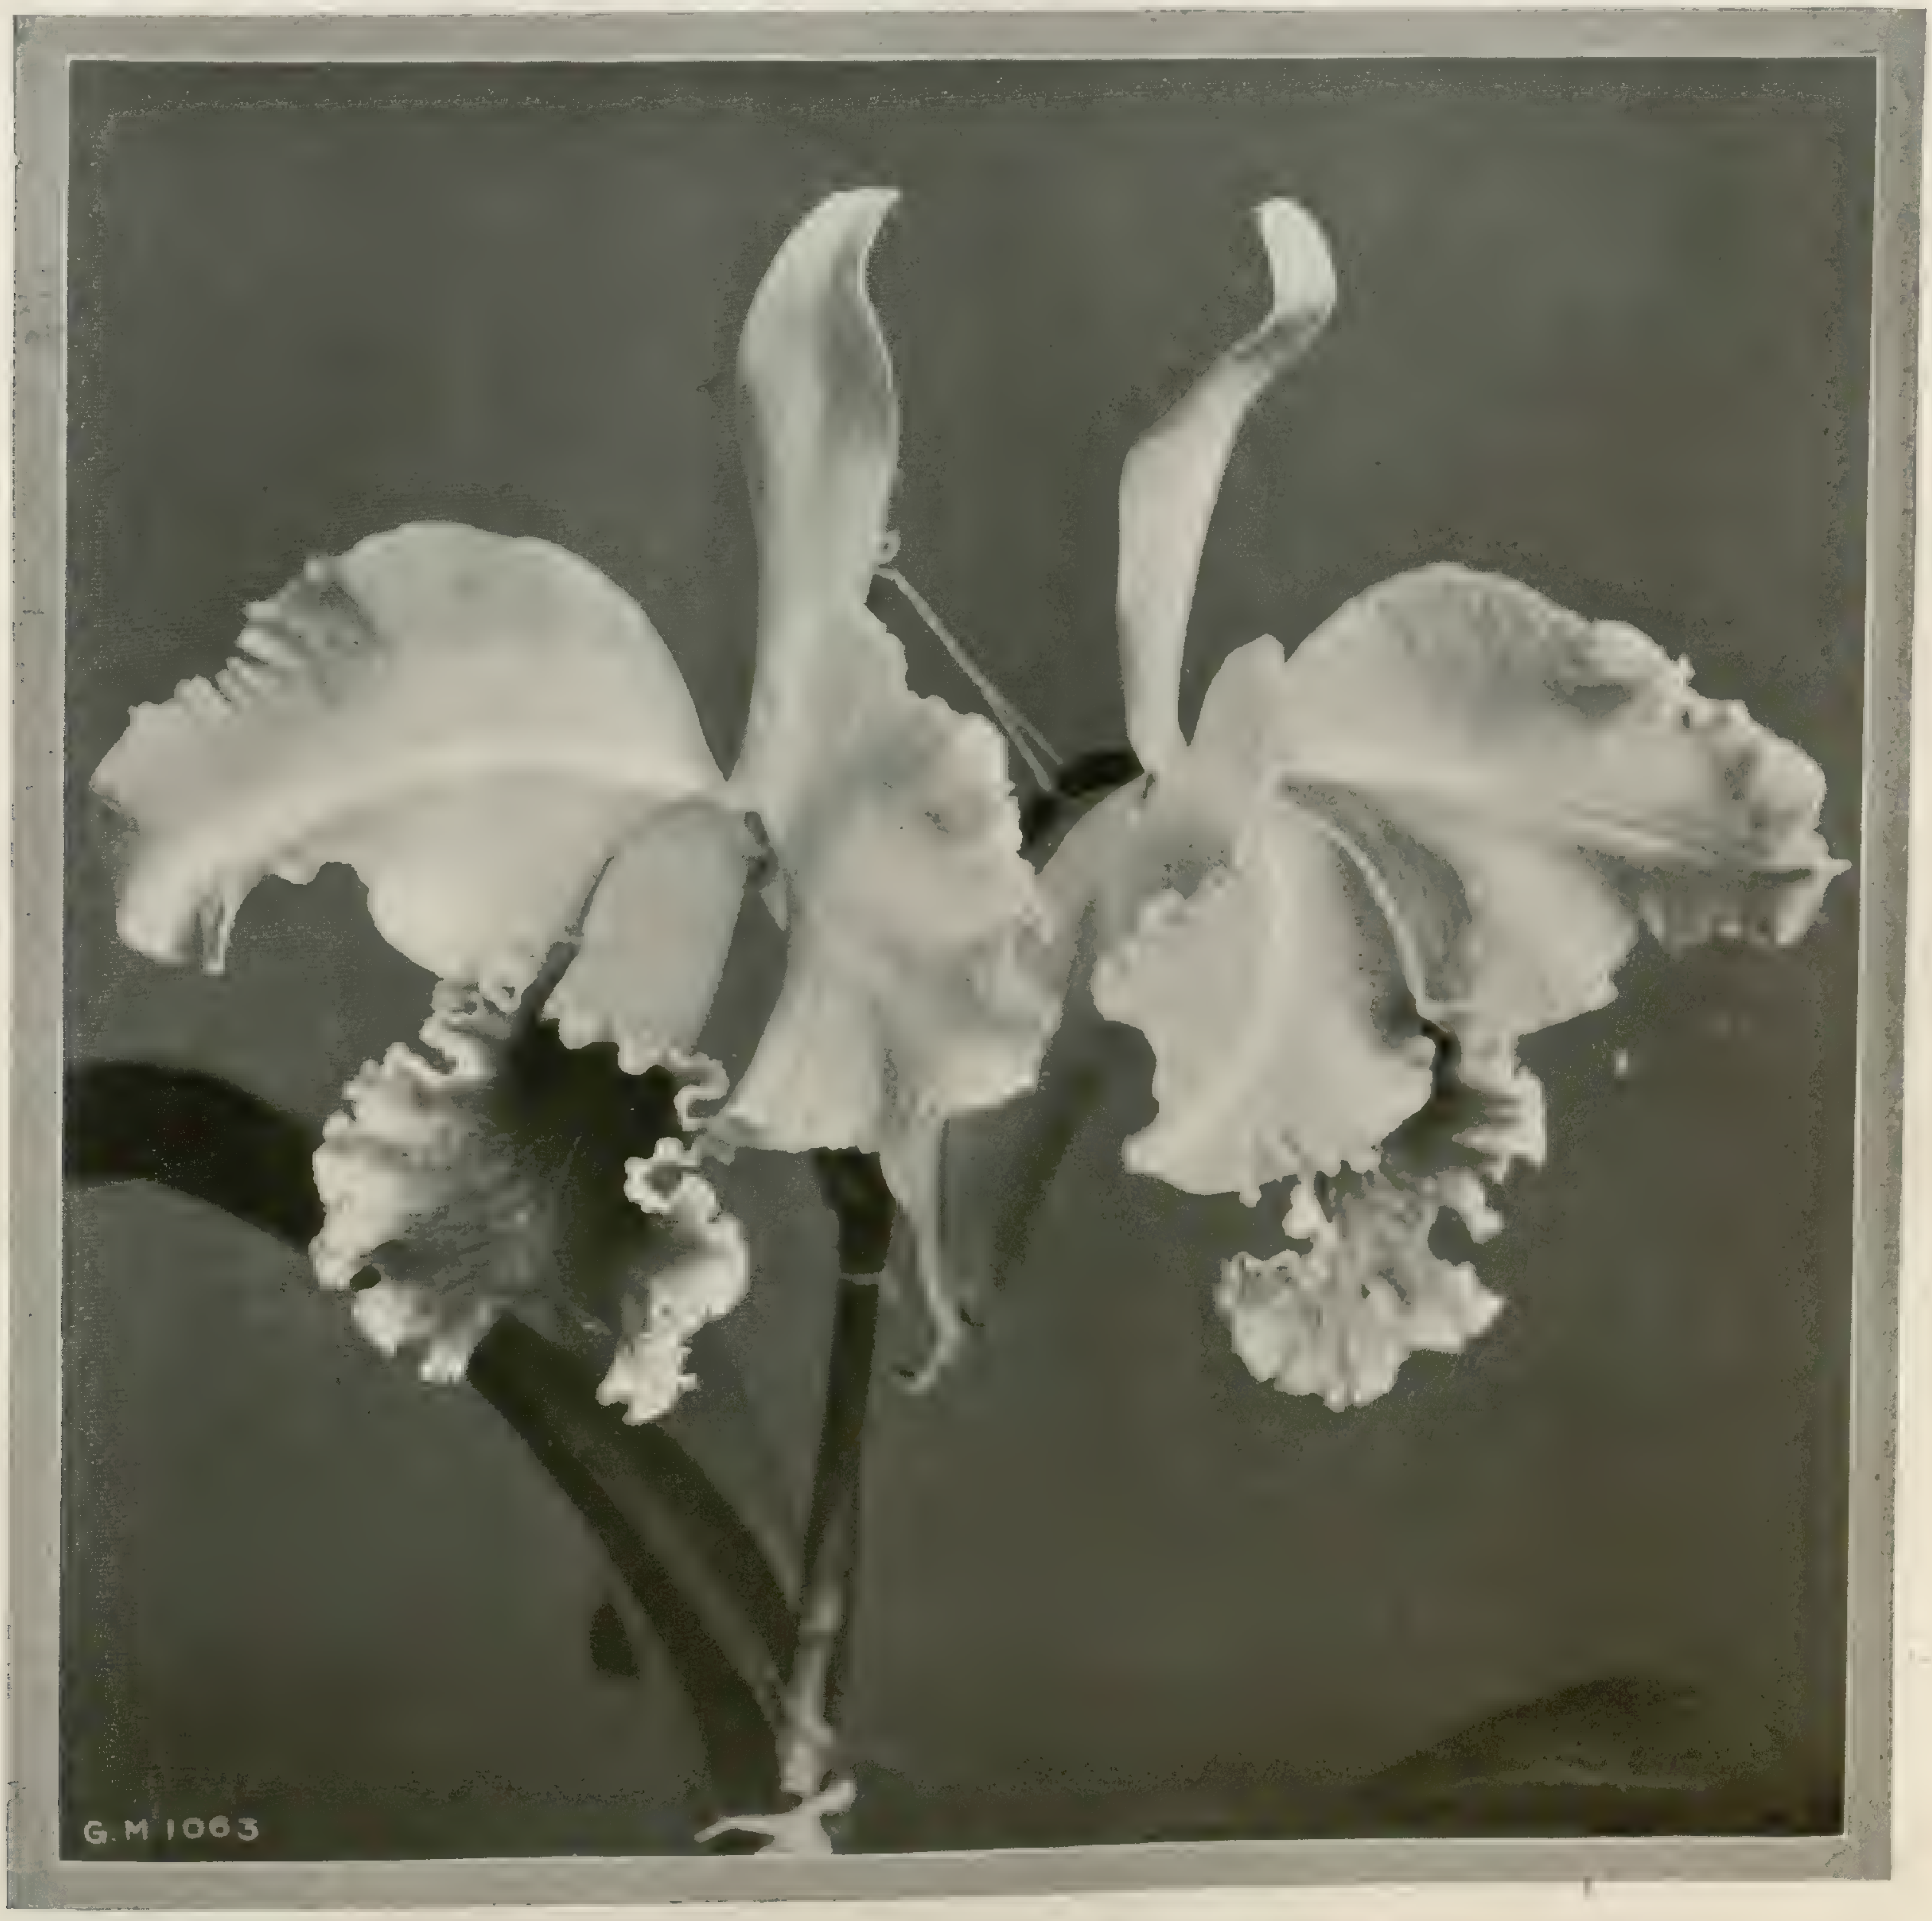
Reafforestation in France.—In one of the recent Foreign Office reports, dealing with the trade of Lyons, the great value of the work carried on, chiefly under the influence of the Touring Club de France, is pointed out. This club has promoted juvenile foresters' societies among the schools, and every member of these societies is bound to plant one tree per year in the commune. As a result, no fewer than 222,515 trees were planted in the Department of the Jura, and 110,800 trees in the Doubs during 1907. At Martignat, in the Jura, as a result of careful planting, the revenue from the forests now pays all local rates and taxes, and last year provided a bonus of 25 francs for each inhabitant of the commune.

Tree Planting on a Large Scale.—According to the "Scientific American," the Pennsylvania railway is planning to set out more than 1,000,000 trees. This will make a total of 3,430,000 trees planted in the last three years to provide for some of the company's future requirements in timber and sleepers. This constitutes the largest forestry plan yet undertaken by any private corporation. Heretofore the company's forestry operations have been confined to a limited area between Philadelphia and Altoona. This year, however, 65,000 trees are being set out on tracts of land near Metuchen and New Brunswick, N.J. In addition there are to be planted within the next month 207,000 trees near Conewago, Pa., 186,000 in the vicinity of Van Dyke, 334,000 at Lewistown Junction, 7,000 at Pomeroy, and 205,000 at Denholm.

NEW PLANTS, ETC.

CIRRHOPETALUM LONGISSIMUM.

A wonderful orchid, bearing an umbel of drooping flowers at the end of a long, slender semi-pendulous stem. Each flower is remarkable for the length and beauty of its lip, this organ being nearly eight inches long, tapering from about half an inch broad to a fine hair point. The colour is a lovely shade of flesh pink. F.C.C., R.H.S., November 23. Sir Trevor Lawrence, Bart., Dorking (orchid grower, Mr. W. White).



LÆLIO-CATTLEYA NELTHORPE BEAUCLERK.
Flowers pink, buff, and purple. F.C.C., R.H.S., November 23. Messrs. Charlesworth and Co., Haywards Heath.

CYPRIPEDIUM BOLTONI.

This shapely, distinct and beautiful cypripedium has descended from C. insigne Sanderæ, but the second parent is not known, though C. niveum is suggested. The flower is of fair size, and wholly white save for a few tiny purple specks at the base of the wavy dorsal sepal. The flower is of great substance, and the proportions of the oval lip are especially fine. F.C.C., R.H.S., November 23. Mr. W. Bolton, Wilderspool, Warrington.

LÆLIO-CATTLEYA BARBAROSSA WESTONBIRT VAR.

This is a bold and striking orchid derived from Cattleya Trianæ Imperator and Læliocattleya callistoglossa. The flowers are very substantial, large, and of fine colour. Sepals and petals are soft purple, and the big lip is rich crimson purple with a yellow throat. F.C.C., R.H.S., November 24. Lieut.-Colonel Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

LÆLIO-CATTLEYA NELTHORPE BEAUCLERK.

A particularly pleasing orchid, the colouring being quite distinct and beautiful. The parents are L.-c. Gottoiana and Cattleya Enid magnifica. The flowers are large. The sepals are pink, and the broad petals are rosy-pink with a charming suffusion of buff spread across the centre. Lip purple, fringed, and margined with white. F.C.C., R.H.S., November 23. Messrs. Charlesworth and Co., Haywards Heath.

LÆLIO-CATTLEYA KING MANOEL.

This very fine orchid lacks something of size, but it is one of the most brilliant of orchids. The parentage is unknown, but probably C. Iris and L. cinnabarina have taken part in its production. The flowers are well posed, substantial, and shapely. Sepals and petals are vivid orange; lip rich maroon with a bright yellow across the narrow portion. A.M., R.H.S., November 23. Francis Wellesley, Esq. (gardener, Mr. Hopkins), Westfield, Woking.

ZYGO-COLAX CHARLESWORTHI.

In this hybrid the neat flowers have a greenish ground, heavily marked with red-purple. The lip is rich violet, finely edged with white. A.M., R.H.S., November 23. Messrs. Charlesworth and Co., Haywards Heath.

CATTLEYA DIRCE SUPERBA.

This has medium sized flowers of bright rosy purple hue, with deeper coloured lip. The parents are C. Vulcan and C. gigas. A.M., R.H.S., November 23. Lieut.-Colonel Holford.

NEPHROLEPIS SPLENDENS.

This is a distinct nephrolepis of graceful habit, and more erect than the recent introductions. N. splendens is a hybrid between N. recurvata and N. Bausei, and is suggestive of the latter. The fronds are about 18 inches to 2ft. long, and about five inches broad, much divided, and very elegant. A.M., R.H.S., November 23. Messrs. H. B. May and Sons, Edmonton.

CHRYSANTHEMUMS.

J. B. Lowe.—A brilliant single variety of large size, and carrying its blooms in good sprays. The colour is bright crimson with golden centre. The florets are rather pointed, but this does not detract from the beauty and effectiveness of the flower. A.M., R.H.S., November 23. Mr. H. J. Jones, Ryecroft Nursery, Lewisham

Mensa.—A beautiful single chrysanthemum with very large flowers of splendid form and substance, the florets being very broad and thick, and the outline of the flower quite circular. White with greenish yellow disc. A.M., R.H.S., November 23. Mr. H. J. Jones, Lewisham.

Mrs. W. Buckingham.—A very large, graceful single variety, of rich rosy-pink colour. A.M., R.H.S., November 23. Mr. L. R. Russell, Richmond.

Miss Lilian Bullivant.—A very elegant and pretty variety, bearing its shapely single flowers in good sprays. The colour, soft primrose, is very pleasing, and this, together with the substance of the flowers, should recommend the variety. A.M., R.H.S., November 23. Mrs. Bullivant (gardener, Mr. Cresswell), Eden Park, Beckenham.

PELARGONIUM HIS MAJESTY.

This is a magnificent new seedling zonal pelargonium, producing big trusses of immense blooms, many of them 3¼ inches across. The rich crimson-scarlet colouring is very fine, and is enhanced by the contrasting white eye. It is a single variety of great merit for winter-flowering. A.M., R.H.S., November 23. Mr. W. H. Page, Tangley Nurseries, Hampton.

CHRISTMAS ROSES.

Helleborus niger and its progeny have not inaptly been named "The Christmas Rose." Conceive but an ignorance of botany, and an intimacy with these beautiful hardy subjects, confined to their use as cut flowers, and the appellation Christmas rose appears most fittingly placed, the first name marking its season, the latter reminding us of its form and likeness to the summer roses of our hedgerows.

The Christmas rose is a lowly but intensely beautiful subject, and hardy in the strictest sense; as a pot plant it is most novel and distinct, requiring but warm greenhouse treatment in order to have the flowers in perfection at Christmas. Imported roots are most frequently employed for pots, and these generally give excellent results, their only drawback being that they have no foliage of their own to accompany the flowers. Where hellebores are extensively grown then home-grown roots will make the best material for pot culture, as it will then be possible to pot up the crowns and retain the foliage, which not only makes an effective setting to the flowers, but also renders the plants more serviceable, in that they may be used for isolated vases or bowls.

In either case, the crowns should be potted up during November or early in December, employing a rich compost of stiff loamy soil, and using pots rather larger than the crowns, as it is possible to obtain two years' service from the plants before repotting. Crowns large enough to fill an eight-inch pot will yield several dozen flowers, and as all the buds do not open at once, a succession is maintained, and the individual blooms remain effective for several weeks. As cut blooms the Christmas roses are in general request, especially for floral designs and all decorative arrangements requiring white flowers, so that, all points considered, it is a most economical subject for the winter months.

The type plant, Helleborus niger, is the most generous bloomer, but, unfortunately, the flowers are produced upon rather short stems, which diminishes their value for certain purposes. The largest flowered forms are major and maxima, and both varieties bloom before the type and carry their flowers upon stout stems which are often twelve inches in length. The large-flowered forms are much the best for pots, and when grown in the open and covered over with handlights, a supply of these flowers may be readily maintained from November till April.

Louth. Thomas Smith.

FORCING STRAWBERRIES.

Probably no forced fruits are more highly valued than strawberries, and as their forcing season is in many gardens about to commence, the subject is one of considerable moment to gardeners generally. Of the several matters connected with the forcing of the strawberry, no other has a greater effect upon the results than the condition of the plants, for unless these are satisfactory no subsequent treatment will wholly bring about satisfactory results. It will, then, be understood, that before anyone can become a successful forcer of the strawberry, the plants must be first skilfully prepared. Owing to the mild and wet weather experienced during the autumn the plants kept growing unusually late, but what effect that will have upon them when forced remains to be seen. It is likely to have a detrimental one upon the crops of those that are early forced.

The growing season for the year having now gone by, that part of my subject may be passed over, and reference be first made to the treatment that should be given during the time the plants are resting. If convenience is at command the best plan is to place them closely together, with their pots plunged in ashes in cool frames or pits, where they can be protected from harmful weather, and yet exposed to that which is favourable. Means of this kind should at least be found for plants that are intended for early forcing; but in cases where this cannot be done, the pots should be plunged out of doors in beds of ashes, and protection be given by coverings of bracken, straw litter, etc. The once commonly adopted plan of stacking the pots upon their sides cannot be recommended, as the plants often suffer from drought.

Before forcing commences advantage should be taken of an opportunity—when the soil is moderately dry—to top-dress with a compost of sound loam, mixed with broken horse manure, soot, and a suitable artificial compound. First free the plants of their useless leaves and surface soil. For early forcing we use plants in six-inch pots, and for late crops those in seven-inch pots. These are larger than some good cultivators recommend, but provided the runners are layered as soon as procurable, given good cultivation, and subsequently well cared for, pots of these sizes are then properly filled with roots, and during the fruiting season, if there is no other advantage further than that saved in watering, that alone is sufficient to recommend it.

For forcing we prefer to at once place the plants upon shelves near the glass in a light pit facing south, to the plan sometimes followed of first plunging their pots in a bed of warm leaves, in order to promote early root growth, for by so doing we avoid the chance of their receiving a check when they are removed from the warm bed; and, moreover, we have not seen, when observing the practice, any gain derived from the pots having been plunged. At the same time we are still old-fashioned enough in our practice to place a thin piece of turf under each pot, and believe sufficient benefit is derived from so doing to repay us for the trouble thus incurred. For late crops we prefer to place the plants upon shelves in a house with an eastern aspect, as here they escape the evils of being exposed to the direct force of powerful sunshine, and also those caused from the necessity of very freely ventilating the house.

In order to secure fruits of the best quality much pains must be taken in carrying out during the fruiting season the necessary cultural details. Watering is one of the principal of these, and it requires skilful attention to prevent the plants suffering from drought on the one hand, and too much moisture on the other, in like manner manures in the form of diluted liquids, or top-dressings of artificials, must be carefully applied from the time the flower spikes commence to form until the fruit begins to colour, and it is much better to administer these in a regular and moderate way than give more powerful applications at longer intervals of time.

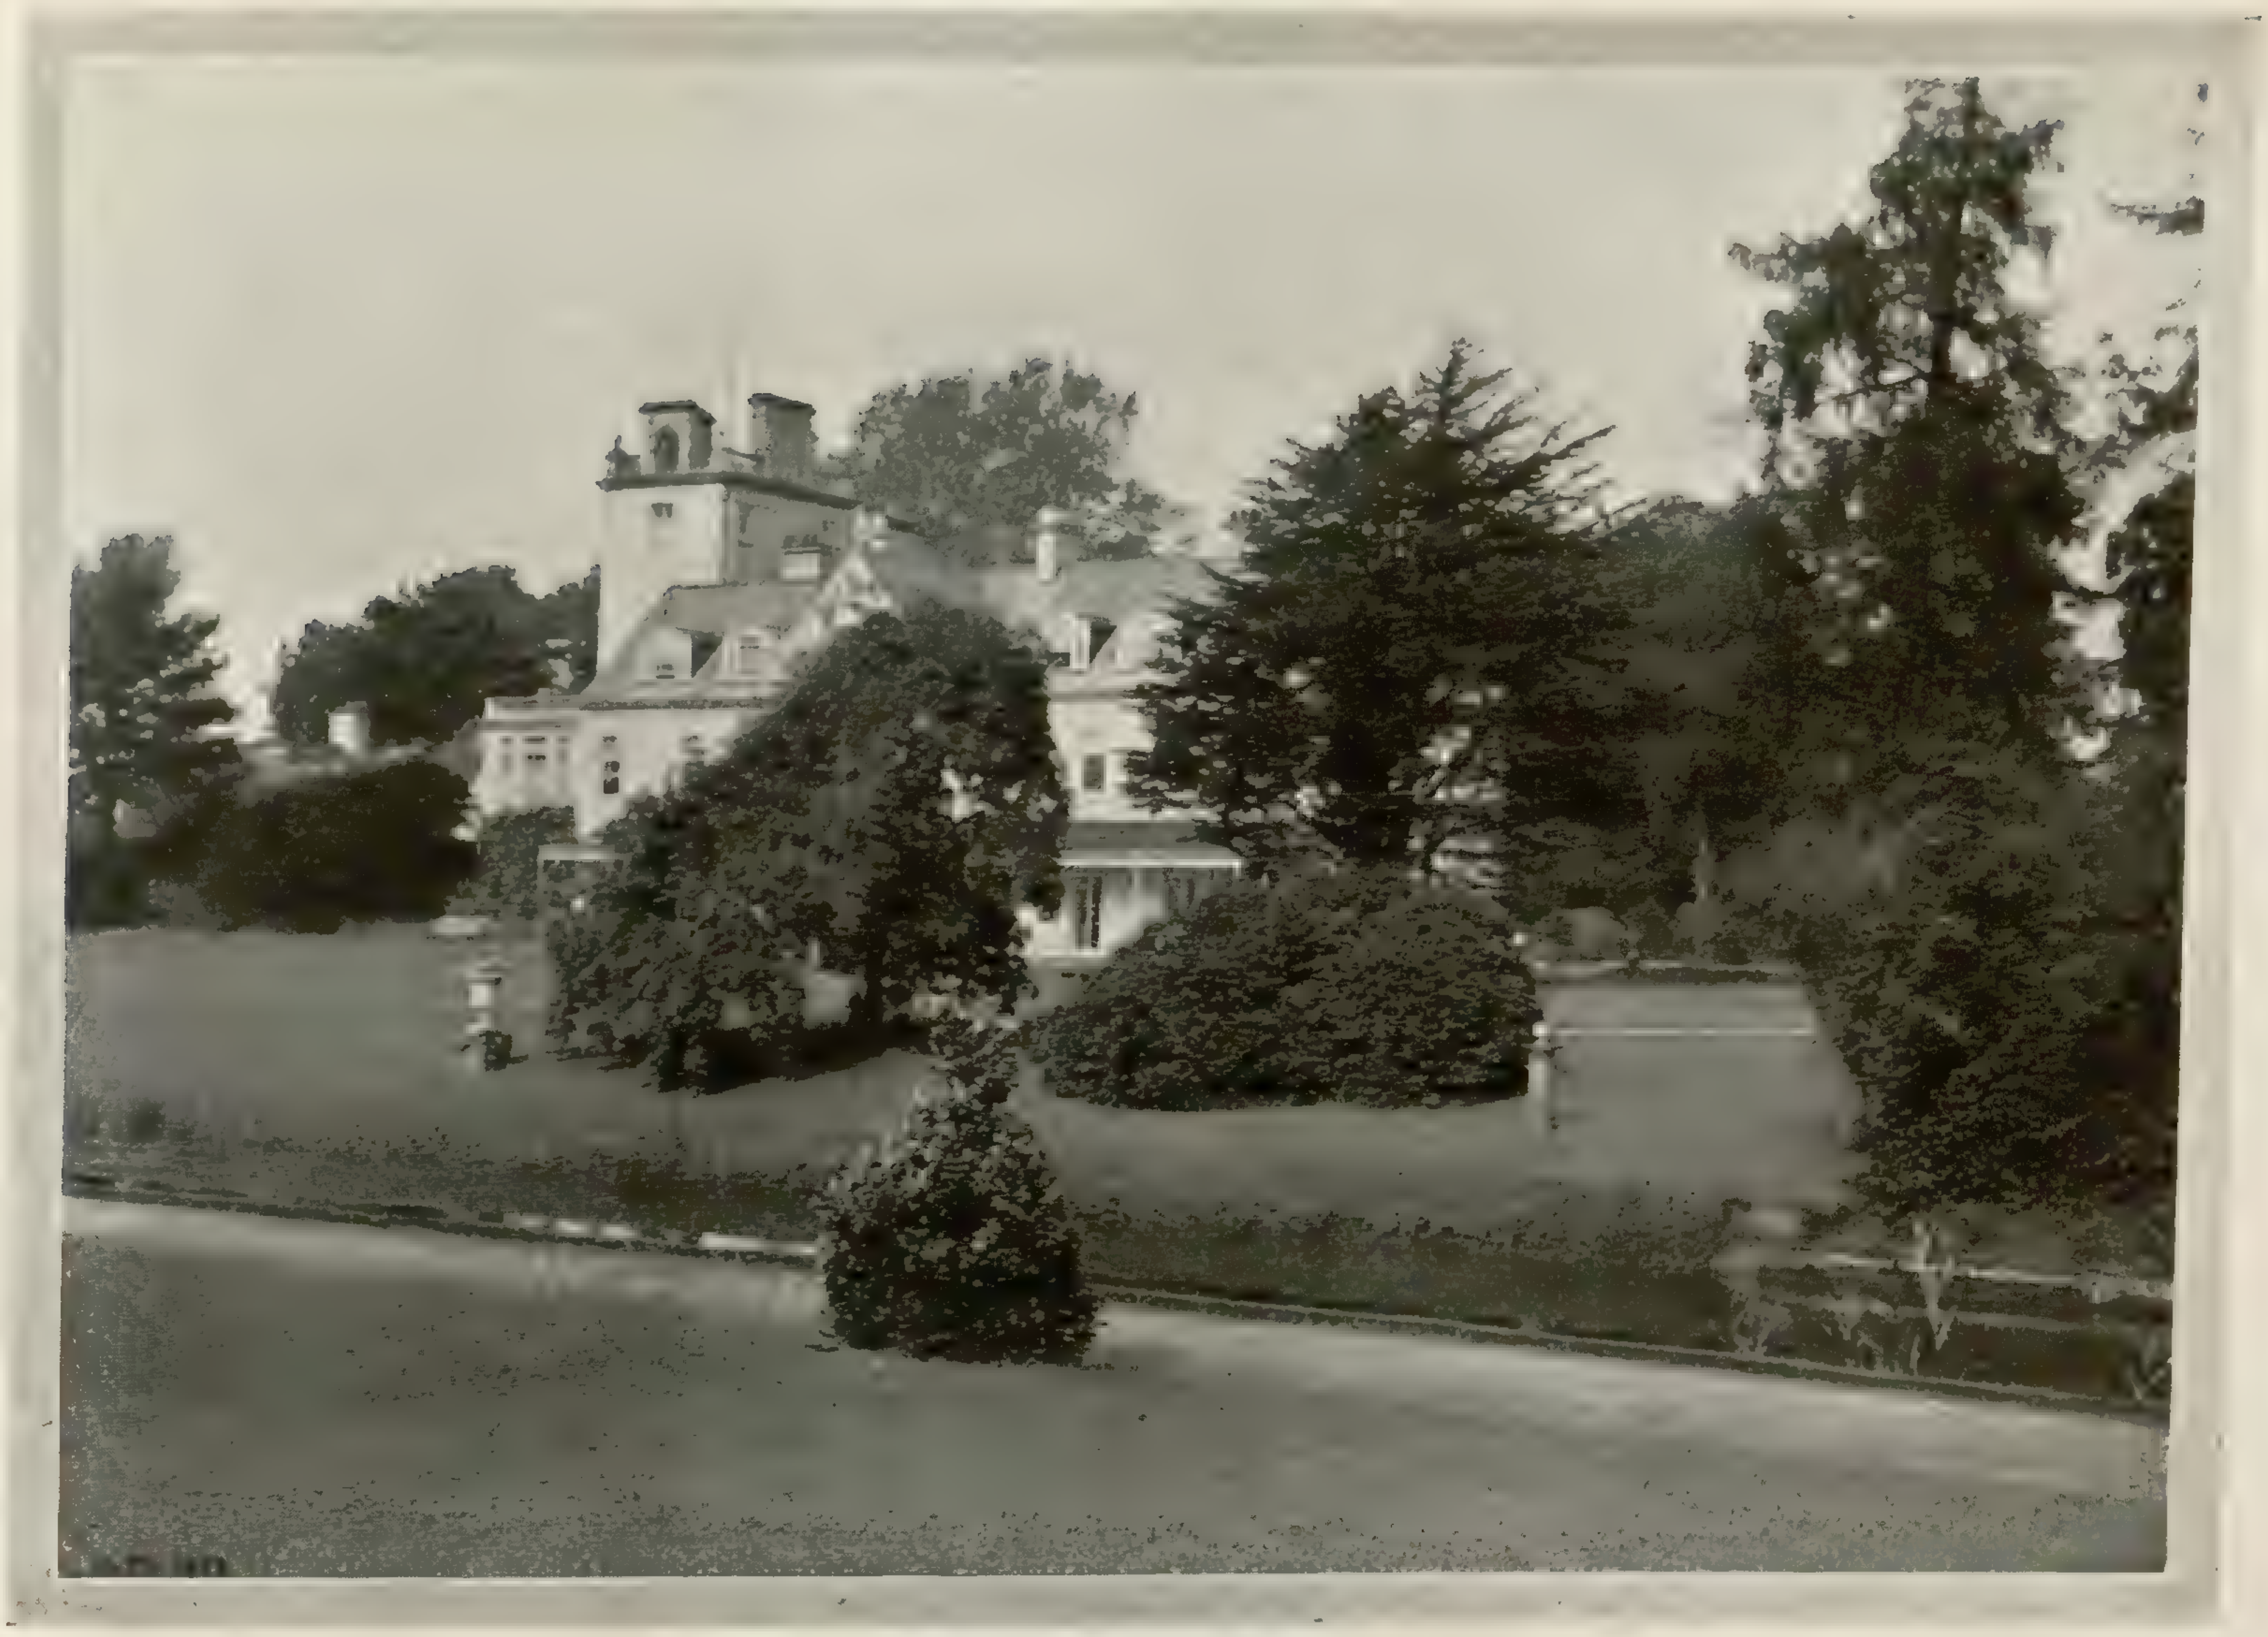
Thinning should be commenced by removing the weakest of the blossom buds as soon as they can be distinguished, and be completed once the leading fruits are formed, at which time they should be supported and fully exposed to the beneficial influence of sun and air. The size of the fruit greatly depends upon the extent to which it is thinned, and if that of the first quality is desired, plants in six-inch pots should not be allowed to carry more than five or six fruits each, while those in pots of the larger size should be reduced to seven or eight fruits; but if quantity is preferred to quality a greater number may be allowed.

The strawberry is very impatient of severe forcing, and consequently high temperatures should not be attempted, from artificial heat 50 degrees at night, with a rise of five degrees by day will suffice, with a corresponding rise from sun heat during the early stages of growth, but these figures should be slightly increased as soon as the blossoms open, and after the fruits are set, a still higher temperature can be upheld. The ventilation of the structure must be regulated according to external conditions, but at all times both by night and day, except in severe weather, should a greater or less amount of air be in circulation, and especially is this necessary while the plants are in bloom and the fruit is ripening.

Artificial aid should also be employed to ensure the perfect setting of the fruit, and for this purpose a rabbit's tail suits admirably. It is essential to the well-being of the plants that a tolerably moist atmosphere is maintained, but for obvious reasons this must not be overdone while they are in blossom, or when ripening their fruit; likewise, though they are greatly benefited when the weather is favourable by being daily syringed, this practice must be withheld during the same seasons. Red spider is liable to be troublesome, especially in hot, dry seasons, but if the foliage is properly syringed, and the other necessary cultural details carefully carried out, it will cause little trouble. Mildew will not be troublesome either if the hot water pipes are periodically painted with a mixture of flowers of sulphur and water. T. Coomber.

The Hendre Gardens.

Orchard Trees of apples, pears, plums, and sweet cherries which have plenty of space for development will not require much attention in the matter of pruning. The two chief points which should be kept in view when operating on these is, in the first place, to shorten the leading shoots just so much as will insure sufficient strength and rigidity in the branches as will enable them to carry a full crop of fruit without breaking down, or from being too easily swayed about by strong winds, or much loss of fruit may ensue. And, secondly, to keep the centres of the trees sufficiently open by a judicious thinning out of the weaker growths, to enable the sun and air to have full effect on all parts of the trees.—George Woodgate.



BRICKENDONBURY: SOUTH FRONT.

GARDENS ROUND HERTFORD—I.

In giving a short account of a few of the more noteworthy gardens round Hertford, the capital of one of the most interesting and beautiful of the home counties, it is pleasant to recall the fact that Hertfordshire has long been remarkable for the high state of development to which horticulture has attained within its boundaries. Great gardens, distinguished by their attractions, interest, and high keeping, abound on all sides, and if they are not enumerated as proof of the assertion it is because they would form so long a list as to be somewhat tedious. Nurseries are not less remarkable, as evidence of horticultural activity, and it is interesting to recall the fact that at Cheshunt and Waltham Cross are establishments which for about three-quarters of a century have occupied foremost positions in association with the commercial culture of roses, and have enriched our gardens with large numbers of beautiful varieties. A few miles distant are the Sawbridgeworth nurseries, which, for a period of fifty years or more, have been famous for the splendid results that have been obtained in the raising of new hardy fruits, notably pears, peaches, plums, and nectarines, that are now represented in all gardens in which any considerable share of attention is devoted to hardy fruit culture. On the other, or western, side of the county are the Great Berkhamsted nurseries, whence was distributed. a culinary apple that for about half a century has enjoyed a high degree of popularity, and, in its class, has no superior for small gardens. Hertfordshire is also obtaining importance as a great market gardening centre, and nowhere has the glass culture of plants, flowers, fruits, and early vegetables attained to such large proportions as at Cheshunt and some other places on its eastern boundary.

It would be pleasant to write of the many attractions Hertfordshire has to those who take an interest in outdoor life; of its delightful scenery, its invigorating air, and the suitability of its soil for the many ornamental and useful plants that usually have a place in the well-equipped garden, and to make some reference to the days when Hoddesdon, a few miles distant from the county town, was the great centre of the orchid cult. This would require considerable space, and, moreover, the object I have in view is not a sketch of the horticultural activities of the county, but a short account of some of the gardens which may be described as typical of the district of which Hertford is the centre. In commencing this pleasurable task it has been found necessary, owing to the large number of important gardens clustering round this old-time town, so rich in historical associations, to take a much smaller radius than usual, and to make no mention of several gardens deserving of the fullest notice. The great gardens of Panshanger, the seat of the Countess Cowper, are within the radius that has been adopted for the present purpose, but they were so fully illustrated and described in these pages by myself a few years since that it is not necessary to now refer to them, except to say that they abound in interest, not alone to the horticulturist, but to all who are able to appreciate the charms of an extensive garden of the highest class.

Brickendonbury.

This fine seat, the property of E. E. Pearson, Esq., is situate on high ground, some two miles to the south of Hertford, and deservedly enjoys considerable fame for the extent, beauty, and high keeping of its gardens. The mansion is a stately edifice, occupying one of the most charming positions in the county, and is approached by a noble avenue of limes about a mile in length. On the way to Brickendonbury one obtains some wide and beautiful views of the finely wooded and undulated land that forms so characteristic a feature of Hertfordshire, and especially noteworthy are the peeps that may be had in passing under the shade of the lime trees. The avenue terminates some distance from the mansion, and immediately the last of the trees are passed the lawns open out and form a fine expanse of velvety turf, on which are many handsome deciduous and evergreen trees and shrubs, big masses of hardy and tender plants, that, in their respective seasons yield so freely of their wealth of floral beauty as to give the visitors a foretaste of the pleasure the gardens are so well able to afford those who can enjoy to the full the more beautiful forms of plant and tree life. There are also in this part of the grounds some bold groups of shrubs with richly coloured foliage, that form a bright foreground to the stately trees that shelter the mansion on the north side.

On the south, or garden side of the mansion, a great breadth of turf slopes away to the water, of which a glimpse is obtained in the first of the several illustrations, and from the windows and the higher ground an uninterrupted view is obtained of a wide expanse of scenery, in which the Brickendon woods are conspicuous, of unsurpassed beauty. The broad belt of turf, which extends for several hundred yards to the left of the water, is separated from the park on its southern side by an elegant iron fence, and alongside this is a narrow border, which, during the summer season, is devoted to tender flowering plants. Last summer the subjects employed were white marguerites, scarlet zonal pelargoniums, and blue lobelias, and as the whole of the plants were perfect in development the effect was remarkably good. On the surface of the stream by which the lawn is intersected float some of the finest of the water lilies, and on the margin irises and other of the semi-aquatics grow vigorously, and bloom freely.

To the right of the mansion is a geometric flower garden, sunk below the surface, and this is furnished for the summer months with tender bedders, and this year the finest of the zonal pelargoniums with scarlet flowers were utilised. That the varieties had been well selected was evident from the fact that when we saw them in September the plants were producing a brilliant display of colour, notwithstanding the continuous rainy weather that had been experienced for at least a month previously. To the right of the mansion is the Dutch garden, which forms a very interesting and attractive feature. In accordance with the practice which obtained when this style of gardening was in vogue, the beds are enclosed with broad belts of closely clipped box, and in the beds are golden yews cut to various shapes and sizes, as so well shown in the accompanying illustration. Sharing the beds with the yews at the time the photograph was taken were upwards of two thousand tuberous begonias, which were flowering profusely, and produced a glorious display of colour. The prevailing colours were crimson, scarlet, red, and orange, and the majority of the plants were seedlings that represented a remarkably fine strain. We noticed a few beds filled with a small-flowered scarlet variety that has been grown at Brickendonbury for many years past, and is highly esteemed for its freedom of flowering and effectiveness. To the right of the Dutch garden the water runs in a northerly direction, and alongside it is a broad walk flanked by a flower border that last summer was filled with stocks, which, by reason of their splendid development, carried the mind away to the Scotch gardens, wherein stocks are grown with exceptional success.

DUTCH GARDEN WITH GOLDEN YEWS AND BEGONIAS, BRICKENDONBURY.

The greater portion of the pleasure grounds are to the east of the mansion, and here are many stately trees, charming vistas, great masses of roses, choice shrubs in great variety, herbaceous borders, and two gardens for roses. Here we have evidence of the many improvements that have been effected in the pleasure grounds since Mr. Pearson came into possession of the estate. Originally some parts of the pleasure grounds on the east and south sides were bounded by large trees and shrubs, but to open them out and remove any sense of restriction the boundary has been carried some distance into the park. At the eastern end the extension has been sufficient to give space for the formation of an avenue of Thuia Lobbi, a wide border for herbaceous plants, and a line of chestnut trees. On the south side the extension has been sufficient to give room for an avenue of chestnut trees, with turf between them, and a border, in which a hedge of the richly coloured rose Gruss an Teplitz is in process of formation. This hedge should, in course of time, form a fine feature, for it has a length of between three and four hundred yards. Wichuraiana and other suitable roses are trained up the stakes supporting the chestnuts, and these are now beginning to bloom freely, and produce an attractive display of flowers. Both Mr. and Mrs. Pearson would appear to have a strong affection for roses, for they have added a garden for rambling roses, of which an illustration is herewith given, and a garden for dwarfs and standards. The second of the two gardens has been established some years, and the standards have now formed large heads, and bloom with remarkable freedom. This garden is quite square, and is enclosed by a yew hedge about six feet high. The roses are arranged in beds on the grass, which is intersected by two gravel walks that cut the turf into four equal portions. This arrangement is an excellent one, for the garden can be visited without risk when the grass is wet, and the gravel is not sufficient to detract from the restful colouring so desirable in a garden of roses. The rambling rose garden is enclosed by a belt of trees of some height, and in the centre the beds are arranged in circles, and filled with ramblers trained to pillars and chains, and round the outer side are numerous oblong beds devoted to dwarf roses. All the pillars in the centre are of iron, and connected by means of light chains. When the whole of the framework is fully furnished, as will be the case next year, the pavilion will present throughout the season a remarkably attractive appearance. It may be of interest to mention that the centre pillar is fifteen feet high, the second circle of pillars ten feet, and those forming the outer circle seven feet high.

The glass department is extensive and fully in keeping with an establishment of the highest class. Suitably situate in the pleasure grounds is a handsome conservatory, wherein by means of divisional screens accommodation is provided for the cultivation of stove, intermediate, and greenhouse plants, and this accommodation is made full use of by Mr. R. Smith, who is not less successful in the cultivation of ornamental plants than of hardy and other fruits. Elsewhere are ranges of vineries and plant houses, and quite recently has been erected a block of medium-sized span-roof houses for the cultivation of melons and cucumbers, and the various decorative plants that require a position not too far distant from the glass, and in these also is abundant evidence of cultural skill of a high order.

Hardy fruit culture obtains prominent attention, and the fruit plantations and the trees that clothe the walls and flank the kitchen garden paths constitute a feature of much importance. The principal fruit plantation is situate on the west side of the kitchen garden, which adjoins the western side of the pleasure grounds, and is bounded on the east side by a wall devoted to fruit trees, and on the other three sides is open, and is thus fully exposed to atmospheric influences. The wall is about ten feet high, and supported on its outer side by buttresses three feet wide, and nine or ten feet apart. The use of the buttresses is due to the wall having been built many years ago alongside a ditch that a short time before had been filled in, with the result that as the soil settled down the wall lost its perpendicular, and had to be supported to prevent it toppling over. The spaces between the buttresses are occupied by peaches, nectarines, and apricots, which annually bear excellent crops, and over the buttresses pear trees are trained, three or four branches being taken up the slope, and other growths are trained horizontally. These trees bear well, and produce fruits remarkable for their large size and high quality. Pears are also largely grown in bush and pyramidal form, and with much success, and some of the trees are shown in the illustration herewith.

Apples occupy an important position in the plantations, in which they are grown as bushes and pyramids. They are also largely grown as espaliers, and alongside the principal walks in the kitchen garden are trellises clothed with trees, which bear freely and produce fruit of large size and high quality.

The trellises are of stout wire, with iron standards, and range between four and five feet high, and the trees are fan-shaped, as Mr. Smith considers that such trees are preferable to those in which the leading branches are trained horizontally. The whole of the trees have been planted by Mr. Smith within the past fifteen years, and many are the object lessons of value in hardy fruit culture that might be learnt in the course of an hour or so among the trees. To refer to cultural methods is not now possible, and those who have a wish to become acquainted with the principal points in Mr. Smith's practice may be referred to the GARDENERS' MAGAZINE for December 22, 1900, wherein they were dealt with at some length.

Brickendon Grange.

Some two miles beyond Brickendonbury, still continuing in a southerly direction, is Brickendon Grange, the seat of J. Trotter, Esq., who is well known in the district for the keen interest he takes in his beautiful gardens and horticultural matters generally. Between these two seats there is much scenery of the most charming description, and the great stretch of woodland immediately beyond the last-named forms a distinct feature in the landscape. The mansion is a handsome red brick structure, which has been greatly enlarged during the past year; it occupies a charming position on the high ground, and if the view is somewhat circumscribed in one direction by the woodlands that clothe the slopes of adjacent hills, views over a wide expanse of open country are obtained in other directions, and both the windows of the mansion and the garden terraces command one of the fairest prospects in the district, which is renowned for the beauty of its pastoral scenery.

RAMBLING ROSE GARDEN, BRICKENDONBURY.

Coniferous trees form a great and interesting feature of the gardens and grounds, and the pinetum, to which Mr. Trotter has made many important additions within recent years, extends over a considerable area, and contains many notable specimens. Some of the trees planted on the slopes devoted to the pinetum are of large size and finely developed, others are of medium size, and give promise of attaining a high state of development, while others are of a size that suggests their being the most recent additions to the collection, in which the owner takes so great an interest. Unfortunately so much of the occupants of the pinetum was not seen as one could have wished, owing to the unkind weather. Two attempts where made, but each day it rained heavily almost immediately the gardens were reached, and the few photographs it was possible to take were taken in the rain, with the aid of an umbrella. There is, near the entrance to the pinetum, a weeping spruce that has its main trunk so bent as to suggest from a distance some unknown and quaintly formed animal quietly browsing on the grass, and probably my readers may some day have an opportunity of seeing an illustration of it.

From the broad walk, immediately along the garden front of the mansion, the lawn slopes away to the west, and, as shown in one of the illustrations given herewith, this slope has been converted into a series of grass terraces by means of rocky banks, over which many alpine and other plants spread and display their varied charms. On the upper terrace are numerous beds, in which both spring and summer displays of flowers are produced, and elsewhere are many beds devoted to roses and various other plants, all of which contribute their full share to the attractions of the garden. The rock banks were of much interest, for banks formed in the same way are not common, and they have much to recommend them for positions where it is desired to avoid the appearance of formality. Growing on these banks were arabis, aubrietias, alyssums, cerastiums, helianthemums, veronicas, campanulas, and similar subjects. Planted in positions where they would not interfere with less vigorous neighbours are bold masses of the spur-valerian (Centranthus ruber), and a remarkably free blooming variety of Chrysanthemum Leucanthemum, which was collected by Mr. Trotter during a tour through Sweden.

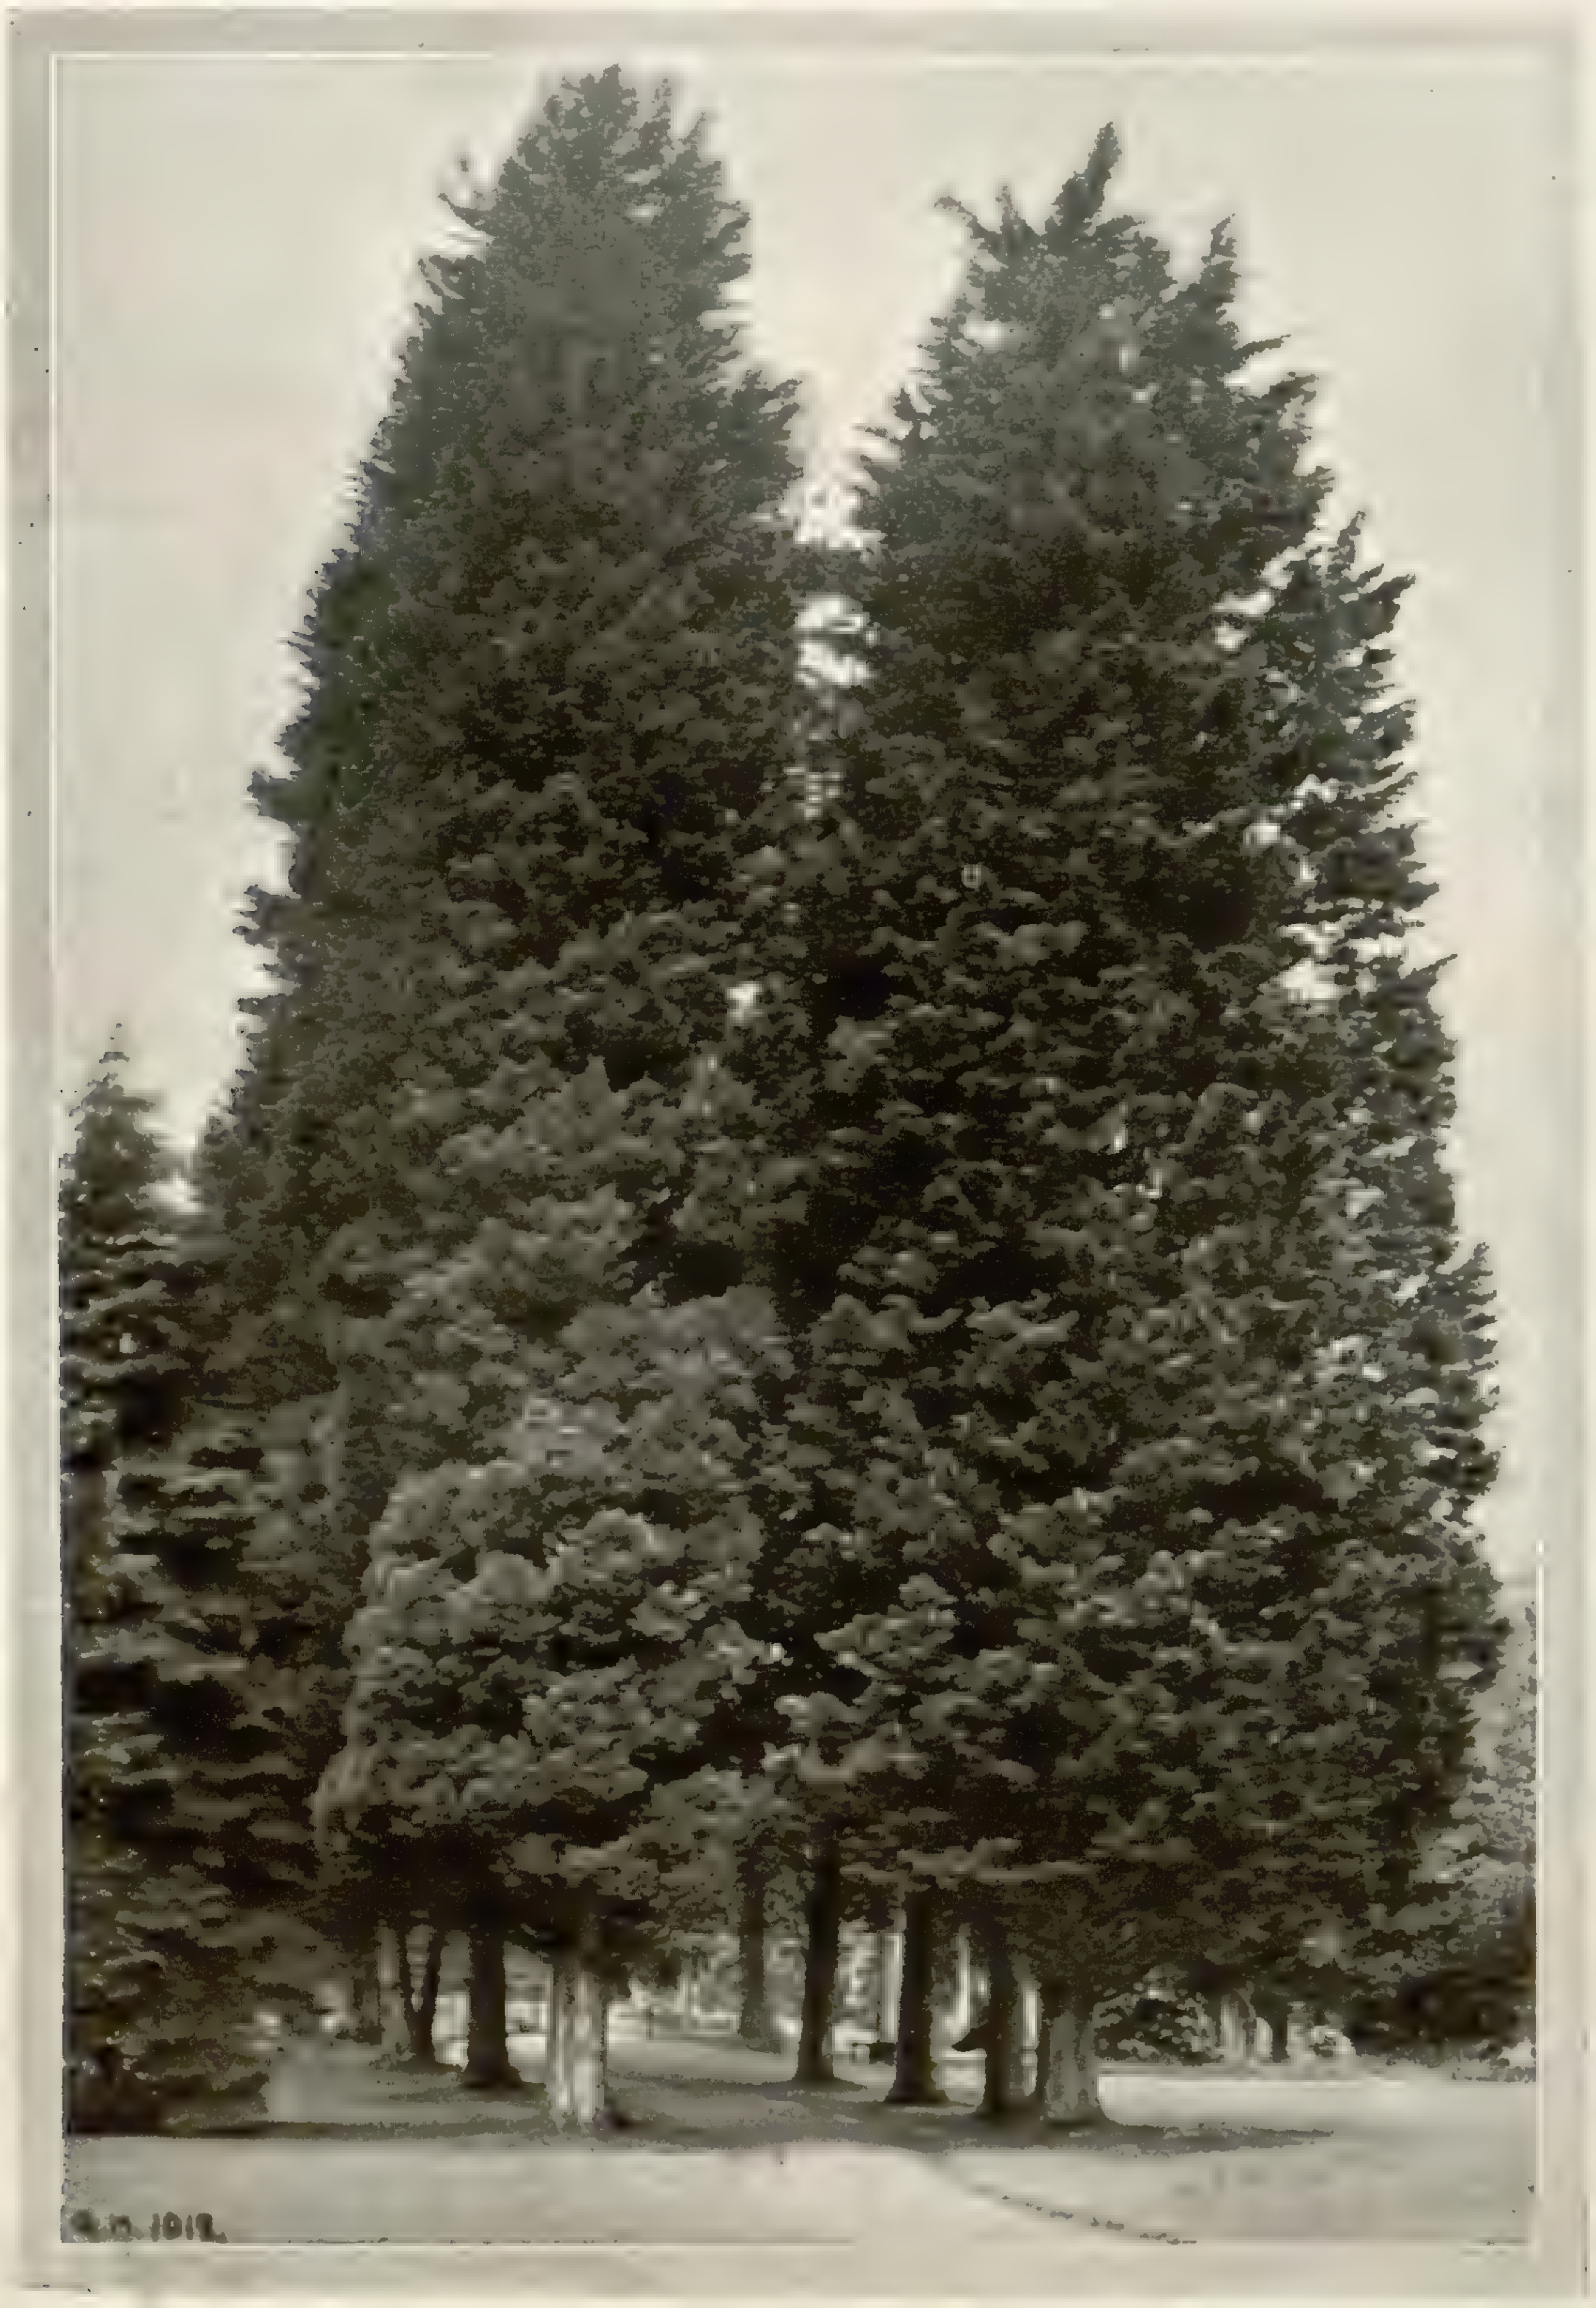
It would appear that a considerable number of the larger coniferous trees that beautify the grounds were planted by a previous owner some sixty years ago, who also planted an avenue of Cupressus macrocarpa extending some distance round the park. The trees that form the southern end are herewith illustrated, and remarkably fine specimens they are. They were, one might suggest, planted too closely together to ensure longevity, and in support thereof it may be mentioned that the two end trees, which have had full exposure on one side, are far superior in development and condition to the others.

On the opposite side of the pleasure grounds is a stream and pool adapted to the requirements of the various water-loving plants, and immediately beyond is one of the most delightful retreats from the sun on a hot summer's day that one could well imagine. On the sloping ground is a plantation or broad belt of Scots fir, probably formed some fifty or sixty years ago, and through this a path several hundred feet in length has been made by the cutting out of one of the rows of trees. The effect produced by the long lines of ruddy trunks is very pleasing, and the walk forms a very distinct, interesting, and useful feature.

The kitchen and fruit gardens are situate on the high ground to the north of the mansion, and here there is much to interest, for Mr. Cox, who has charge of the farm as well as of the gardens, has for very many years enjoyed a high reputation for his skill as a cultivator. For a long period he gave attention to chrysanthemums, and was recognised as a formidable competitor in the classes for Japanese varieties at Hertford and elsewhere. Now these attractive flowers are no longer grown for exhibition, and sweet peas and herbaceous plants, so far as competitive purposes are concerned, have taken their place. Consequently, it was not surprising to find some magnificent rows of sweet peas, in which all the finest of the varieties were

A PRODUCTIVE FRUIT BORDER, BRICKENDONBURY.

represented at their best, or a border of hardy flowers, in which the several kinds had attained a high stage of development. Neither the sweet peas nor the hardy plants are grown specially for the supply of flowers for exhibition, but Mr. Cox believes in so growing the several subjects under his care as to ensure them attaining to a high state of development. In giving practical expression to his views, which are those of other good cultivators, he knows that he obtains thereby finer sweet peas and more effective herbaceous borders, and is able to obtain collections for entering into friendly rivalry with his neighbours, should it be so desired, without any material reduction of material. I shall hope, when the season arrives for sowing sweet peas, to give an illustration of one of the rows, and a few particulars of Mr. Cox's practice, which, judged by the results, is a good one. There is no occasion to particularise the occupants of the border illustrated, but it must be said that it is rich in herbaceous phloxes which grow and bloom most satisfactorily under the conditions that obtain.



AVENUE OF CUPRESSUS MACROCARPA, BRICKENDON GRANGE.

Fanshawes.

Fanshawes, until recently the seat of Mrs. Hardcastle Sykes, adjoins the Brickendon Grange estate, and the two mansions are within a quite short distance of each other. This being the case, it will be readily understood that there is no great difference in the characteristic features of the scenery; and it will suffice to say that as Fanshawes occupies a position whence are obtained views over a wide range of country, the prospect is one that can hardly fail to be a constant source of pleasure to those who appreciate the charms of scenery of a distinctly rural character. The mansion, of red brick, is of noble proportions, and has a handsome elevation, and may well be described as one of the finest examples of the work of present-day architects in the county.

The grounds are extensive, tasteful, and admirably kept, and with their great breadths of turf, noble trees, bold masses of shrubs, pergolas, pillars, and groups of roses, and beds and borders of hardy and tender flowers, form an admirable setting to the mansion. On the north side the handsome porch, by which the mansion is reached from the carriage drive, is draped with the elegant Clematis montana and its charming variety rubens, and as they differ but little in vigour of growth, or in flower production, or time of blooming, the festoons of pure white and rich rose-coloured flowers produce a charming effect when yielding of their floral wealth. The walls on this side of the mansion are clothed with one of the best forms of the well-known Ampelopsis Veitchi, and the great mass of leaves present a refreshing appearance throughout the summer months, and when the breath of autumn has passed over them they assume such exceptionally brilliant hues as to produce a marvellously beautiful effect. On the other, or garden side of the mansion is a specimen of the beautiful rose Rêve d'Or, which is equally remarkable for its large size, and the profusion with which it produces its exquisitely coloured flowers. This specimen, of which an illustration is given herewith, is between twenty-five and thirty feet high, and its vigour suggests that it would very quickly extend over a much larger wall space were it available. Such vigour of growth and abundant flower production and ample leafage could, it need hardly be said, be only obtained by a knowledge of the peculiarities of the variety, which Mr. Croxford, the head gardener, evidently possesses, and skilful cultivation. Whatever may be the attention the tree has received it is amply justified by the results.

A broad walk extends along the whole front of the mansion and a short distance to the right of the fine specimen of Reve d'Or commences a pergola over which the finest of the rambling roses throw their long, slender shoots, and festoons of flowers. The first of the arches is festooned with the elegant Rosa polyantha simplex, and of the many hundreds of examples that I have had the pleasure of seeing, not one can be called to mind that quite equalled this. Rambling and other roses are excellently grown in masses and other ways in the grounds immediately surrounding the mansion, and very beautiful is the feature they form in the season of roses.

Coincident with the commencement of the pergola, there is a large recess, and between the rose supports and the walls of the mansion there is a spacious Dutch garden. The garden is sunk somewhat below the general level, and the sloping banks are clothed with dwarf rock plants of divers kinds, and very pleasing is the effect they produce. The beds are filled in autumn with spring-flowering plants, and in spring with summer flowers, and a succession of bloom is thus maintained over the longest possible period. Last summer the broad, sloping bank at the end of the garden next the mansion was planted with a scarlet zonal pelargonium, probably Paul Crampel, and very brilliant was the effect produced. Trained over a portion of the wall of the mansion alongside the Dutch garden was Clematis Henryi, one of the finest of the white varieties, producing a splendid display of its large, finely-formed flowers, and it was noticed as doing equally well on other aspects. Dorothy Perkins, Crimson Rambler, Jersey Beauty, and Cloth of Gold roses were also noticed as blooming profusely on the southern walls, and very bright was the effect they produced.

In a somewhat retired part of the grounds is a rock garden, wherein ample provision has been made for the successful cultivation of a good selection of alpine plants without the rock being at all obtrusive. On the mounds and sloping banks Anemone blanda, the blue and white forms, aubrietias in variety, alpine pinks, Welsh poppies, saxifrages, comprising both the mossy and silvery-leaved forms, lychnis, Tropæolum polyphyllum, the thymes, and a host of similar subjects form sheets of verdure and flowers, and in the lower parts the Japanese primrose, Kæmpfers irises, Delavay's incarvillea, and the large-leaved Saxifraga umbrosa luxuriate. Near at hand is an attractive border of hardy herbaceous plants, and not far distant was a border of the beautiful sweet pea Mrs. Hardcastle Sykes.

On the north side of the mansion considerable improvements have been effected within the past few years, and chief among them has been the formation of a large wild garden, wherein choice trees and shrubs have been arranged in an informal manner, and many thousands of spring-flowering shrubs planted. Running riot over a yew hedge, and producing a brilliant display of colour, was the beautiful Tropæolum speciosum. An enumeration of the many trees and shrubs that have been utilised in the planting of this interesting garden would probably prove tedious, and it must therefore suffice to say that rambling roses have been freely used by Mr. Croxford, some being trained up rustic poles, and others are running over masses of tree stumps. In an adjoining part of the grounds choice shrubs are freely represented, the finest of the rhododendrons being prominent, among the specimens being one of Pink Pearl, which last season produced fifty-nine trusses. There are also more than sufficient of the best of the lilacs, laburnums, pyrus, and syringas to show that trees and shrubs remarkable for the beauty of their flowers are fully appreciated.

FINELY-GROWN HERBACEOUS PLANTS, BRICKENDON GRANGE.

In walking through the kitchen garden and the plant and fruit houses that are located therein, much was seen of which some mention should be made, but I have already exceeded the space I had allotted for this set of gardens, and must, therefore, bring my observations thereon somewhat abruptly to a close. George Gordon.

*** The second of the two articles on the gardens round Hertford will appear in our issue of the 11th inst.

Begonias and Gloxinias.—At the time of storing these away many of the tubers were not ready to be shaken out of the pots; but by now all will be ready, and if they are attended to before commencing to clean the houses, much unnecessary shifting will be avoided. Shake all the soil from the tubers, and store them in a cool, dry place; if given too much warmth the tubers are apt to get very hard, and will not start so readily as when a cool, even temperature is afforded them.—T. Stevenson, Woburn Place Gardens.

HARDY SHRUBS FOR FORCING.

Experiments have proved that a considerable number of the more beautiful flowering shrubs are amenable to the artificial conditions necessary to the development and production of their flowers during the winter and dull season. Until recent years a few kinds only were employed, and these in a sparing manner, but we now find that large batches of each species are introduced into heat from time to time, resulting in a wealth of inflorescence and glorious display in both conservatory and rooms. This is maintained until the spring, or the season when they are available out of doors.

With regard to selection one cannot speak too highly of the vastly improved lilacs, which are finely represented in Dr. Lindley, Marie Legraye, Madame Lemoine, Charles X., Charles Buchner, and Virginale. Several new forms of the mock orange are eminently adapted for forcing, and the flowers they give are of a refined character. Philadelphus mexicanus, P. Gerbe de Neige, and P. Lemoinei erecta are altogether excellent. The numerous varieties and hybrids of Azalea mollis are invaluable, and readily respond to a temperature of 60 degrees, while as regards floriferousness we have nothing to surpass them among flowering shrubs or plants generally. Very fine must be written against the magnolias, M. conspicua, M. stellata, and M. acuminata being the best for the purpose.

Ever one knows that hydrangeas may be pressed into service, as they have come well to the fore in recent years, and the same applies to the double cherries, which give us flowers of great beauty. Cerasus japonica alba fl. pl., C. rosea plena, C. vulgaris fl. pl., and C. pseudo-cerasus James H. Veitch are all worth attention. The tree pæonies, improved forms of flowering currants (ribes), Staphyllea colchica, and shrubby spiræas, extend the list, not forgetting the beautiful and accommodating Deutzia gracilis and its varieties, D. Lemoinei and D. crenata flore plena, also Pyrus malus floribunda, and the double-flowered peach.

Then something must be said as to the correct way to proceed in order to bring about the best results with these plants. They should, as far as possible, be fairly well established in pots before they are forced. Such plants can be procured from the trade, but the cheapest method is to purchase a few plants of each kind early in the autumn, place them in pots immediately on arrival, and to keep them syringed overhead, and fairly close in a cold frame for a couple of months, or until required for forcing. Forcing is a very simple matter, provided a temperature of 60 degrees is maintained, together with spraying the plants overhead twice daily. Failure is out of the question. It should be explained that in giving the order for the shrubs it must be made clear to the vendor that vigour and a wealth of flower buds is essential to success.

It is a mistake to allow the plants to remain in the forcing house after the flowers have commenced to expand, as their season of beauty is appreciably lengthened if they are transferred to the cool greenhouse. It will occur to the cul-

ROCK TERRACE, BRICKENDON GRANGE.

tivator to apply a mild kind of stimulant when the plants commence to grow rapidly, and before they come into flower.

I would here emphasise the importance of treating these shrubs in a rational manner after they have flowered. To throw them underneath the stage of the house, or to leave them to the tender mercies of our climate in the open garden is a mistake, and I would advise their being kept under cover, and regularly watered until spring and danger of frost is past, when they should be given more roomy quarters and be plunged in an open position in the reserve garden. If sunk to the rims of the pots, and a heavy mulch of manure is placed over them in June, watering will be reduced to a minimum, and, further, the same should not be forced again for two years.

It will be readily seen that if a good collection of these shrubs is brought together a goodly array will be available each winter for forcing. Walter H. Aggett.

A SPLENDIDLY DEVELOPED SPECIMEN OF ROSE REVE D'OR, FANSHAWES.

Aster amellus Riverslea.—Riverslea is the name of a very fine variety of the popular Aster amellus, one of the starworts or Michaelmas daisies, which will never be superseded. As most readers are aware, A. amellus is a dwarf aster about a foot and a-half high, but the variety Riverslea grows about two feet, and is of a lovely rich blue, with a kind of carmine shade about it. It likes a good soil.—S. A.

FORGET-ME-NOTS.

There is assuredly no need for any introduction to the forget-me-nots or myosotis, which are valued highly for spring bedding and for garden decoration generally. Fashion, which has almost abolished many Victorian subjects from our gardens, has raised no finger against the myosotis, which still enjoy a measure of popularity which seems to assure them a certain future. Their delicacy of colouring has probably done much to save these subjects from the displeasure of fashion, while the appealing charm of the whole race has also assisted in keeping them to the fore with garden lovers. I do not know that any ideas of mine concerning myosotis for spring bedding would materially assist in the development of garden beauty, but it may be remarked that the soft azure blue colourings used in conjunction with the snowy grace of the single and double white arabis, or associated with white or pink tulips, are agreebly pleasing.

But it is out in the semi-wilderness (the wild garden) or in the rock and water gardens that one can realise the great possibilities of the myosotis. Here we get a wider, fuller phase of gardening which gives our subjects more latitude, more freedom, than the confined area of formal beds. M. palustris, the moisture-loving forget-me-not, is of great value for the water garden, where its free, graceful habit and hordes of tiny blossoms show to advantage along the marshy margins of the pools and in the shallow water. Indeed, it would be well to further popularise the fine varieties of M. palustris, such as alba, semperflorens, and those sterling forms of the latter, such as The Czar, Count Waldersee, and German Star, as they give a prolonged display of graduated colouring, which is of advantage to those in search of moisture-loving subjects. The delights of a half-shady pool, wherein calthas, bog primulas, hottonias, and many other subjects combine with the myosotis in gemming the margins and the water surface, must be known to be fully realised.

For the rock garden, who would miss the charm of the dainty little M. alpestris, which delights in a well-drained half-shady spot in the rock groupings. Its little white-flowered variety alba is also worthy of note, while the lovely deep blue, and superior M. rupicola, is one of the finest plants among miniature alpines. Other forget-me-nots suitable for the rock garden are the pretty dwarf New Zealander, M. pygmæa, the dwarf form of M. azorica known as the Empress Elizabeth, the charming little Genevan M. cæspitosa Rehsteineri, and the little Italian (M. Stabiana are all deserving of culture for the purpose named.

Now as to the wild garden. I should like to see M. sylvatica, the exquisite woodland forget-me-not, and its varieties naturalised and gracing the slopes and the lightly-wooded ground of the wild garden. There should be delightful stretches of blossom, aiding the narcissi, irises, anemones, foxgloves, campanulas, primulas, and other subjects in the making of those charming vistas of flowers which are the making of this part of the garden. M. sylvatica itself is enchanting when thus allowed free course, while its white variety alba and the improved forms, perfecta, Star of Love, etc., should be included if possible. The M. dissitiflora group might also be used in the embellishment of the wild garden.

In conclusion, the myosotis are also valuable for forming "drift lines," i.e., drifts of soft blue, running in broad irregular bands through groups of taller subjects, such as irises, hemerocallis, yuccas, lilies, and similar plants, which can be arranged in natural groups.

P. S. Hayward.

COTONEASTER MULTIFLORA

This deciduous species of cotoneaster is anything but well known in gardens, though it is one of the prettiest of all when in flower, and its fruits also make it worth growing. It is a Chinese shrub, and has been known under the names of C. reflexa and C. vulgaris var. glabrata, for, like the majority of the cotoneasters, it has been variously named on one occasion or another.

A strong-growing shrub, it forms a bush at least 10ft. or 12ft. high, with pendant secondary branches, from which the white flowers are borne in profusion during May. These flowers are succeeded by fruits the size of medium-sized peas, which, when ripe in August and September, are of a pleasing red shade, and are very conspicuous peeping out from amongst the green foliage. Like the other cotoneasters it thrives in light soil, and attains its maximum size in light but rather rich loam. To be seen at its best it must have plenty of room, and not be crowded by other shrubs. An occasional thinning out of the shoots is necessary, as it is apt to become very thick in the centre.

W. D.

MANURES AND MANURING.

In his presidential address to the British Association some years ago, Sir William Crookes drew public attention very forcibly to the possible early exhaustion of the natural deposits of nitrate of soda and guano, and pointed out that probably before long we would obtain our supplies of nitrate for manurial purposes by using water power to cause the nitrogen and oxygen of the air to combine together by electrical means.

This prediction of the great scientist is already in process of being fulfilled. Two different kinds of manure are now being prepared on a comparatively large scale by obtaining nitrogen from the atmospheric air, and with the aid of electric power causing it to combine with other chemical substances. One of these manures is known to agricultural chemists as "calcium cyanamide," to which the popular name "lime nitrogen" is being applied.

The other manure is called "basic nitrate of lime," which is similar to nitrate of soda, being a nitrate, but combined with lime instead of soda.

For many years past calcium carbide has been prepared in large quantities as a source of acetylene gas, which is now largely used as an illuminant. The carbide is prepared by means of the electric furnace, and its economical manufacture depends on a cheap supply of electricity. It is therefore prepared at places where electricity can be obtained cheaply by the use of water power. Carbide is now produced in great quantity in various parts of the world, and is a quite cheap substance.

The preparation of the two new nitrogenous manures, cyanamide and basic nitrate of lime, at prices which will enable them to compete with the older manures—sulphate of ammonia and nitrate of soda—depends upon a cheap supply of electricity, and these new manufactures, therefore, will probably grow up at places where plentiful water power can be obtained to generate electricity cheaply.

Cyanamide or lime nitrogen is a fine black powder containing from 19 to 21 per cent. of nitrogen, equal to 23 to 25½ per cent. of ammonia, practically, therefore, of the same percentage of nitrogen as ordinary commercial sulphate of ammonia. Cyanamide has a peculiar smell, which is due to the fact that it contains a little carbide, and gives off a little acetylene gas. The smell is much intensified when the material is moistened with water, as more acetylene is then given off. In appearance it resembles basic slag, and like that manure, is very dusty to sow on the land.

When applied to the soil by hand the cyanamide should be mixed with twice its weight of slightly damp earth, or with some other slightly damp substance like kainit. As is the case with nitrate of soda and sulphate of ammonia, cyanamide is soluble in water, and is, therefore, easily washed into the soil. When it is dissolved in the soil it at once begins to undergo change. Its nitrogen is not immediately of use to plants, but has to undergo a chemical change, first into ammonia, and then into nitrate, before it becomes available to the growing crop. Its action is therefore slower than that of nitrate of soda, or nitrate of lime, which are the most active and immediate of the nitrogenous manures. On the other hand, the action of cyanamide is more prolonged than that of nitrate, and in this respect it resembles sulphate of ammonia, but is rather slower and even more prolonged in action than that manure.

Cyanamide is not suitable for application to wet and sour soils, or to soils which contain a great deal of humus matter like peaty soils, where its action may be distinctly harmful instead of beneficial. On the other hand, it can safely be used for all ordinary loams and heavy clay soils.

In making manurial mixtures of cyanamide with phosphatic and potash manures it should not be mixed with superphosphate or dissolved bones. But it may safely be mixed with basic slag, bonemeal, and with all potash manures, such as kainit, muriate of potash, and sulphate of potash.

The other new top-dressing fertiliser, called basic nitrate of lime contains about 13 per cent. of nitrogen, and 25 to 30 per cent. of lime. It is a fine crystallised brownish compound of lime free from smell, and easily soluble in water, and is thus an immediately available plant food.

Nitrate of lime may be essentially compared with nitrate of soda, and from experiments already made with different crops it has been proved that nitrate of lime is fully equal to nitrate of soda as a manure in soils poor in lime. Where better results have been obtained by nitrate of lime than by nitrate of soda, the result is probably due to the lime of the calcium nitrate, for when slaked lime was added to nitrate of soda equally good returns were obtained. Consequently when lime is deficient in a soil it might be expected that calcium nitrate would be superior to nitrate of soda because of the lime it supplies to the land.

Harpenden.

A CORNER OF THE ROCK GARDEN, FANSHAWES.

Chrysanthemums.—Many of the large-flowering varieties will now be past their best, and must be cut down. Place the stools in a cool house or frame where they can have all the light and air possible, as this is quite essential to ensure good strong cuttings. If infested with greenfly give a syringing with an insecticide; and if rust is prevalent, a spraying with sulphide of potassium (½oz. to a gallon of water) will be the first step towards checking this tiresome pest for the coming season.—T. Stevenson.

OWN ROOT ROSES.

Own root roses were in great favour some years ago, when roses were not worked so carefully and closely upon the roots of foster stocks as now. Manetti and De la Grifferaie were apt to overgrow many of our choicest varieties and thus throw up a large number of suckers that were very troublesome. In a large number of cases, too, the suckers were not recognised, and a considerable quantity of useless wood was grown. Our American friends go in largely for roses upon their own roots, and apparently these thrive better there than is the case in England.

With careful working there is little doubt the help of Rosa canina as a foster stock is a great advantage to the majority of naturally weak or indifferent growers. But the briar does not thrive so well upon a light porous soil as in a rather stiff compost, and it is often better to have a few roses upon their own roots instead.

One very great advantage of own root roses is the entire absence of stock suckers. But we need select carefully before growing large numbers in this way. Choose vigorous, or at any rate, very free growers. They can be rooted in the autumn in the open ground, or in pots during early spring. Some of the best results are obtained by taking cuttings from below the first blooms from under glass, when the wood is a little more than half ripened. Use a sandy compost, and put six or seven just inside the rim of a four-inch pot. Keep close for a few weeks, and the majority of them will root, after which they may be grown in the usual way. I am rather partial to some varieties in this form for pot culture. Perhaps the most generally useful varieties as own root roses are the Chinas, Mosses, and Provence, with the growing class of Wichuraianas and their hybrids; indeed, the last are often found rooting at the tips of their branches as freely as the blackberry. But we do not seem to have sufficient strength for some of our medium growers without the aid of some foster stock, and, as previously remarked, roses are generally worked in a much better way than formerly, being so closely upon the roots that very few suckers result.

A. Piper.

THE JASMINE.

(Concluded from page 931.)

The Turks cultivate the jasmine for the sake of its branches, of which the tubes of their summer tobacco pipes are as invariably made, as those for the winter are formed from the cherry tree. As the jasmine does not ripen its seed in our climate it is increased by layering down the branches, which take root in one year (as you will remember, the happy Tuscan girl found), which may then be cut from the old stock, and planted where they are to grow. It is also propagated by cuttings, which should be planted early in the autumn, and the earth covered with sand, ashes or sawdust to keep the frost from penetrating the ground. In situations where it is necessary to prune them, it must never be done until the end of March or when the frost is past. It should be observed that the flowers are always produced at the extremity of the same year's shoots, which are often cut off in the summer by those who are ignorant of its nature, and thus the plant is robbed of the power of treating us with its fragrant flowers. The common yellow jasmine, Jasminum fruticans, is a native of the South of Europe, yet it did not reach this country so early as the white jasmine, as Gerard tells, in 1597, that it had not been seen in this country, and Mr. Martin is therefore mistaken in his statement that it was cultivated by Gerard in that year. Parkinson tells us, in 1629, that the yellow jasmine "will well abide in our London gardens, and anywhere else." This shrub is easily increased by suckers or layers, but, being different of odour, it is much less cultivated than formerly. Sheep eat the leaves and young branches of this shrub when they find the chance with great delight. The Italian yellow jasmine, Jasmine humile, produces larger flowers than the common yellow variety, and is therefore preferred in the shrubbery, when it requires a southern aspect and sheltered situation. It was first cultivated with us in 1730, but its native soil still remains unknown; it acquired its name from being sent from Italy with orange trees, etc. The ancients employed the berries of the jasmine in their pretended divinations, and the oil obtained from the flowers was used in the baths of their ladies.

The flowers of one of the double varieties, known as "Moogree," are held sacred to Vishnu, and used as votive offerings in Hindu religious ceremonies. In China the flowers are used for scenting tea. The Spanish or Catalonian jasmine, Jasmine grandiflorum, grows wild in the Island of Tobago, and is very like Jasmine officinale, but differs in the size of its leaflets, the branches are shorter and stouter, and the flowers very much larger, and reddish underneath. By grafting it on two-year-old plants of Jasmine officinale an erect bush, about three feet high, is obtained, requiring no supports. In this way it is very extensively cultivated in Cannes and Grasse, in the South of France: the plants are set in rows fully exposed to the rays of the sun; they come into full bearing the second year after grafting: the blossoms, which are very large and intensely fragrant, are produced from July to the end of October, but those of August and September are the most odoriferous; an acre of land is said to yield about 500lb. of blossoms, each season, the value being from £25 to £35. The aroma is extracted by a process known as "enfleurage," i.e., absorption by a fatty body, such as purified lard or olive oil. Square glass trays, framed with wood, about three inches deep, are spread over with grease about half an inch thick, in which ridges are made to facilitate absorption, and sprinkled with freshly-gathered flowers, which are renewed every morning during the whole time the plant remains in blossom; the trays are fitted up in stacks to prevent the evaporation of the aroma, and finally the pomade is scraped off the glass, and melted at as low a temperature as possible, and strained. Three pounds of flowers will perfume 1lb. of grease. Syrup of jasmine is made by placing in a jar alternate layers of the flowers and sugar, covering the whole with wet cloths, and standing it in a cool place; the perfume is absorbed by the sugar, which is converted into a very palatable syrup.

In conclusion, I should like to give two or three quotations from the poets on the jasmine. I have already quoted from Sir Thomas Moore; again speaking of Eastern brides, he says:

"And brides as delicate and fair
As the white jasmine flowers they wear,
Hath Yemen in his blissful clime."

Cowper says:

"The deep dark green of whose unvarnished leaf,
Makes more conspicuous and illumines the more,
The bright profusion of her scattered stars."

Thomas Hood says:

"Jasmine is sweet,
And has many loves."

Then sweetly sings another, I know not who:

"Then let our shadowy beauty bloom
When the stars give quiet light,
And let us offer our sweet perfume
On the silent shrine of night."

And again:

"A starlike flower of snowy white,
Whose odours waken in the night,
And feed the passing breeze."

One quotation more before I conclude, and that will be from the pen of Mary Howett:

"To comfort man, to whisper hope,
Whene'er his faith is dim,
That He who careth for the flowers,
Will much more care for him"

Halstead. H. C. Philbrick.

FAGGOTS UNDER ASPARAGUS BEDS.

Some persons have very strange ideas regarding the draining of asparagus beds and the kind of material to use for the purpose. A few years ago a gentleman whom I knew very well, insisted upon having a layer of faggots under the new asparagus bed. The soil was naturally somewhat clayey, and required special treatment, but even without it very fine crops of this useful vegetable were obtained. The plants were grown in beds well raised, with fairly deep alleys between them. This method, however, did not meet with the approval of the owner, who said more drainage was necessary, and that faggots of wood, which were very cheap in that district, would provide a sound drainage. So the soil was removed to a depth of about 3ft., a layer of faggots put in, and the soil replaced on them, with a thick covering of littery manure. Strong asparagus crowns were duly planted, and for several years good crops of this popular plant were obtained. Then the trouble came in the form of a fine crop of fungus. The wood had decayed, and the usual result was experienced. Inexperienced cultivators should avoid burying wood in any soil where crops are to be cultivated. G. B.

SOME APPLES OF RECENT INTRODUCTION.

The hitherto long list of apples has recently been increased by a few varieties which give promise of ranking among the best, either for market or private use, as most of them have good size and colour.

One of the brightest in colour is Red Victoria, recently seen at the R.H.S. meetings, and judging from some of the fruit clusters shown it appears to be very prolific, so it has two excellent qualities to recommend it to the grower for market. I do not know its origin, but the fruits, in shape and rib, have a resemblance to September Beauty. For colour and size it may oust Ben's Red as a market fruit.

Encore is a variety which from its parentage and promise should prove a useful kind, while its late-keeping qualities and size increase its value. The variety named after the Rev. W. Wilks is another promising apple. The young trees recently shown at Vincent Square have indicated its cropping quality, while it has size and a pleasing exterior to recommend it.

Crimson Bramley appears to possess all the good qualities of the well-known Bramley's Seedling, with intense colour thrown in, so that it should be a fine market variety. Jersey Beauty is apparently an old Jersey variety known as Gros Rouget, and is recommended as a good bearer and late keeper; when well grown it is fit for dessert. Hector Macdonald, one of Mr. Ross's seedlings, is a remarkable cropper, of good size and appearance.

Norfolk Beauty comes from two good parents, and as I have had it the fruit resembles Warner's King, with a little of the keeping qualities of Dr. Harvey. I have not found it keep very much longer than Warner's King, but seasons are often responsible for keeping quality. Another large apple of the Warner's King type is Baron Wolseley; it comes in later than Norfolk Beauty, is equally as large, and carries more colour. It has the merit of being a good grower and cropper, and may prove a good exhibition fruit.

Star of Devon is a dessert variety, combining colour, good cropping, and late-keeping qualities. It is of pleasing flavour and good appearance. I have known the raiser make very good prices of this apple in late spring, and it should, therefore, prove useful either for market or private use. Lord Stradbroke is an apple of the largest size, a good keeper, and a good and healthy grower. King's Acre Pippin comes from a good stock, and should keep well; its flavour is good, it is of medium size and attractive appearance, and should prove a good addition to late-keeping dessert apples.

A good early dessert apple is Langley Pippin, of excellent flavour, good colour, and a free cropper; it is a very pleasant eating apple which should commend itself to all growers. A very promising variety which recently was honoured by the R.H.S. is St. Everard. Being a seedling of good parentage, if there is anything in heredity, this new apple should soon become a favourite. Two apples that have much to recommend them are Rival and Coronation; they are most beautiful in colour, especially the first-named, and both are of good flavour; they follow each other in season, and in good samples the colour alone should sell them. T. H. Slade.

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

FORESTRY LECTURES AT ABERDEEN UNIVERSITY.

A course of lectures on forestry, to be delivered on Wednesday evenings during the winter months, in Aberdeen University, by Mr. William Dawson, M.A., B.Sc.(Agr.), lecturer in forestry, was inaugurated a few evenings since. This course was arranged on the representation of a number of young foresters and gardeners, and has had the active support of the northern branch of the Scottish Arboricultural Society. The lectures will deal with tree growth, aids and barriers to forest extension, forests and climate, etc.; trees, their identification, their habits, and life histories, sylviculture, pure woods, and mixtures, etc.; methods of regeneration, natural and artificial; rearing and management of forests; products of the forest, enemies of forest, and forest protection. Mr. Dawson has evinced great interest in the project, and has prepared a course of lectures which should prove of great interest and value. The attendance at the opening lecture was a splendid one. Mr. George Nicol, C.E., Aberdeen, harbour engineer, was called to the chair, and in opening the proceedings said he had come as a student, and as one who had to use wood after it had been grown and produced. He had much pleasure in introducing Mr. Dawson to that large audience.

Mr. Dawson, after a few preliminary remarks as to the benefits likely to accrue from an extension of our forest area, and the large amount of land in Scotland suitable for afforestation, proceeded to refer in a most interesting manner to the natural circumstances which aided or hindered tree growth, and said that from those conditions they could adduce reasons why the whole of the land available in Scotland was not afforested. The forester, he pointed out, must be a botanist, knowing especially the lower forms of plant life; a zoologist, a geologist, a practical mathematician, and a business man, to know how to secure the maximum of output with the minimum of cost. Hitherto in forestry the desirability of the kind of tree had been the guiding principle, and little attention had been paid to the suitability of its place of growth, but it was now recognised that the tree which best suited the situation was the best paying tree. Trees were by no means exorbitant in regard to soil, and no soil was so poor that it would not grow some kind of tree. Forestry began where agriculture stopped, and it must be remembered that agricultural land was not wanted or needed for forestry, and was, indeed, in some cases, unsuitable. The elm, ash, and sycamore were trees that needed the best land in the forestry sense, when agriculture had stopped. Then followed the oak, beech, sweet or Spanish chestnut, and silver fir. After those came the lime, elder, horse chestnut, spruce, and larch. On the poorest class of soil the poplars and willows grew, and, last of all, were the birch, stone pine, and mountain pine. It was a most fortunate circumstance that those trees in most demand in commerce were those that were easiest to satisfy with regard to soil, and the trees of our northern regions were satisfied with little. Of much greater importance than the chemical richness of the soil was its physical condition—texture, depth, and moisture. Some trees had the power of accommodating themselves to dry soils or to wet soils, but there were some which preferred such soils. They were accustomed to hear that willows, for example, would only grow on damp soil, but that was not the case—a fresh soil best supplied their needs.

With regard to atmospheric conditions, tree growth was dependent on a sufficiency of moisture, both atmospheric moisture and rainfall. In a year that had not been a dry one tree growth had been extra good, and, generally speaking, the increment in both young and old trees had been phenomenal. The question as to the influence of the forest on climate was a much-discussed one. The belief generally was that the influence of forests on the various factors that went to make climate was far-reaching and powerful, namely, that forests made climate milder, but it had been proved that the influence in this direction was much smaller than was supposed. The actual effect was small. So it was with the influence on temperature. Apart from the breaking of cold winds, the effect of forests on temperature was not great. The action of the forest was, however, certainly beneficial in minimising the effects of stormy winds. The direction of the wind was altered, and its intensity was also diminished. In this respect forests were of the greatest benefit to a country, and particularly to its agriculture. Another real benefit which an extensive forest brought was that it minimised the dangers of flooding. It was a fact that in districts where the upper reaches of rivers had been cleared of wood, floods were much more common, and the lecturer gave examples of this by pointing to several districts in Aberdeenshire where, since the clearing of the forests, flooding had been much more frequent. There was no doubt, however, of the beneficial influence of trees in purifying the air.

The lecture was greatly enjoyed by the large audience, and at the close the chairman highly complimented Mr. Dawson on the excellence of his lecture, and proposed a hearty vote of things to him—a compliment which was most enthusiastically awarded.

GALEGA HARTLANDI.

Hartland's goats' rue is a charming plant, which has steadily grown in the affections of all who have cultivated it. Even those who object to the frequent use of variegated-leaved plants are enthusiastic in favour of this flower, as a rule, and it is a highly admired border plant in many places. In its spring condition it is remarkable for the fine variegation of the leaves, this being of a clear white and green, becoming more creamy as time goes on. Later in the season the variegation is less marked, but in spring the plant is exceedingly pretty on account of the distinctness of the colouration.

When in bloom this goats' rue is equally fine, the flowers being what may be called a fine lilac and white. It grows about four feet high, and is a prettier plant altogether than any other galega in cultivation. It was first introduced by Mr. W. B. Hartland, of Cork, and in this galega he secured a notable acquisition. It can be easily grown in common soil, and is propagated by division in spring or after flowering. I have been told that a considerable number of the seedlings it produces are true to the parent, but I have no personal experience of this.

S. Arnott.

Forcing Shrubs.—The present is a very suitable time to lift or buy a stock of these. Lilacs, wistaria, and laburnums are best if prepared in pots a year or so beforehand, but Azalea mollis, Staphylea colchica, Spiraea confusa, the double flowering peaches, almonds, and cherries, Deutzia gracilis, and D. Lemoinei, magnolias, rhododendrons, etc., may all be lifted now and successfully flowered in pots during the spring months. Most of them should be potted in a fairly light compost of loam, leaf-soil, etc., in pots as small as they can conveniently be got into without injuring the roots too much. After potting thoroughly water them, and stand them out on ashes while the weather is open, as this tends to harden the wood. Fill in among the pots either ashes or leaves, the latter for preference, as this induces root action, and protects the pots from frost. Here they may be left until it is necessary to take them indoors for forcing.—T. Stevenson, Woburn Place Gardens.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

CATTLEYAS.—There are several hybrid cattleyas, lælio-cattleyas, and other allied orchids that have recently passed out of flower, and are rooting freely at the present time. Such plants should be examined, and where repotting is desirable, they should be attended to without delay. Cattleya labiata and C. Dowiana aurea, among the species, should also be examined at this season, and where actively rooting, should have their requirements attended to. C. Dowiana aurea resents any great bulk of potting material, and the plants are best accommodated in shallow pans, so that they may be suspended near the roof-glass. Give plenty of drainage, and use a lasting compost, so that the plants may be grown in the same receptacle for more than one year. I would advise a thorough watering immediately after they have been repotted in the case of the whole of the cattleya family. After this water must be given with discretion, only sufficient being necessary to keep the pseudo-bulbs and foliage plump. Cattleya Warscewiczi should be placed in a cooler, dry position, or, at least, in the coolest position that can be obtained in the cattleya house, as soon as the pseudo-bulbs are completed and they have finished rooting. I do not think that there is anything that will assist the flowering of the plants so much as retarding the growth and exposing the plants to ample light through the winter and spring months. The plants will only require sufficient root-moisture to retain the pseudo-bulbs plump.

WATERING AND DAMPING.—These are two of the most difficult matters to deal with during the winter season, and, with the different and ever-varying conditions of the outside atmosphere, more than ordinary forethought and discretion is required. To know when to give and when to withhold water is the art of orchid growing. There are more orchids ruined by careless watering in our warmer divisions than by any other means. There is one item in particular that should not be overlooked, and that is the temperature of the water used. It will frequently be found that, after a heavy shower of rain the temperature of the water will be many degrees below the temperature of the house. Melted snow naturally causes a chilling effect when it reaches the soft water tanks. It is advisable to test the temperature of the water, and where this is found low, sufficient warm water should be added to raise the temperature a few degrees above that of the house.

DAMPING must be governed by the outside prevailing conditions, as well as by the particular situations. There is one orchid establishment in the West of Scotland which I am acquainted with, where no damping whatever is necessary during the great portion of the year, as the outside atmosphere is so thoroughly saturated. Under ordinary conditions damping may be done immediately the normal temperature of the house has been reached. It should be done sufficiently early in the day to permit of the excess of moisture becoming distilled before night.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

POT ROSES.—Now that we have had a frost or two to remove the foliage from the pot roses, a batch of plants may be placed in a cool house, keeping them quite dry and cold for a week or two before pruning; after pruning they may be gradually inured to a little more warmth, but this for some time to come must be very slight, or weak shoots without any flowers will be the result. Tea and other roses planted out in a house should be ready for pruning, providing they have been kept dry at the roots for the past few weeks. After pruning the house should be thoroughly well washed down, and the walls, etc., whitewashed; and, if the plants have been infected with scale or red spider, a good washing with some approved insecticide will do much to keep them clean during the coming season. A top-dressing of good soil, with a little bone meal, should be given, and a thorough soaking of water, then the house will be ready for starting. Fire heat should not be necessary yet, though this will depend on the time or date that they are required in bloom.

FREESIAS.—The very latest batches of these should now be potted up and placed in a frame quite free from frost. The earliest batch should now be throwing up their flower spikes, and these may be advantageously given a little weak liquid manure, and be staked before the growths begin to fall about. If they are wanted in bloom by Christmas it may be necessary to push them on a little, but do not be too free with the fire heat or the blooms will be soft, and only stand a short time when cut.

LILIUMS, TULIPS, NARCISSI, and other forcing bulbs must be kept growing, and larger batches may be put in to take the place of chrysanthemums, etc., as these go out of bloom. The liliums, if flower buds are well forward, will stand a fair amount of heat, as also will tulips, and these latter must be pretty heavily shaded if good long foliage is required.

POTTING SOIL, ETC.—Up till the past week or two the very wet weather has in many instances delayed the cutting and storing of loam, but now that the ground has become somewhat drier no time should be lost in cutting the necessary supply, or in ordering the same. It is best if secured from fields where the cattle have been well fed for a few years, as it can then be stacked without the addition of manure, though the addition of a little lime at the time of stacking is, I consider, quite essential, as we are very apt to feed pot plants far more than those growing in the open ground, and without the addition of plenty of lime in the soil many manures are inoperative. Should the soil be poor or light, then the addition of some good short manure, such as horse droppings, etc., will greatly help it. Last year's leaf heap should now be turned over, and well broken up in the process, and, if possible, a portion of it wheeled indoors, as it will not be many weeks now before plenty of potting material will be required again, and this, if placed indoors a few weeks beforehand, will be in a much better condition for handling.—Thomas Stevenson, Woburn Place Gardens.

THE FLOWER GARDEN.

MULCHING.—Many plants will be considerably benefited if a covering of well-decayed manure is placed around them at this season, and while the weather is frosty, and wheeling is easily done, this work can be pushed forward. All of the roses, including the ramblers and those in the rose garden proper, should be now treated thus, as this not only protects, but gives the beds a neat appearance. Other plants include the ornamental vines and choice creepers, and at this season, after the herbaceous borders have been cleared of all the decaying growth, and neatly raked down, a mulching of old mushroom bed manure or leaf-soil will help to make these neat in appearance. Beds containing rhododendrons and other allied subjects should also receive a good coating of well-decayed leaf-soil, manure, and peat, and all newly transferred subjects, where possible, should be given similar treatment.

COLOURED STEMS.—The value of planting in masses for the purpose of creating a fine and brilliant effect in winter by means of groups of plants with coloured bark, is now becoming apparent. And this system can, and should be, practised in places of all dimensions, and as the majority of the subjects are fairly common very little expense need be incurred. By the sides of drives, and in open positions in the woodland, ideal places are found for these irregularly shaped beds. As in these situations, when the ground is covered with snow, and plenty of light is obtained, the colours show to the best advantage. Such beds may now be formed at any time when the weather allows, and to get the best results the soil must be well broken up. Add plenty of decayed leaves, garden refuse, and road scrapings, as ground of this description is often in a crude condition. The plants should be set about fifteen inches apart, and, each year, to get the best effect, just as they commence to break into growth in the spring, cut them down to the ground level. The willows answer particularly well to this treatment, and Salix viminalis (the common Osier), with yellow stems, and S. cardinalis, with red stems, are two excellent varieties to plant. The cornus, too, including Cornus alba and its varieties, soon establish themselves, as do also Spiræa Douglasi, the white-stemmed Rubus biflorus, and R. incisus, Rosa rubrifolia (syn. ferruginea , and also R. rugosa. The last two should only have the old growths removed. Populus alba pyramidalis, P. deltoidea aurea, and Pyrus nigra are also good.

PROTECTION.—All half-hardy subjects in pots are best plunged to the rims in finely sifted coal ashes, or in leaves. All subjects now occupying frames should be placed as closely together as possible, and strict attention be paid to protection each night. Admit air whenever possible, and during spells of bright weather remove the lights entirely, examine the plants, and water any that require it early in the day. Give a good covering of finely sifted coal ashes to kniphofias, etc., in the borders, heaping them well round the crowns to protect from frost. Place handlights over Christmas roses to protect and keep the flowers clean.—Edwin Beckett, Aldenham House, Elstree.

HARDY FRUITS.

PYRAMIDS AND BUSH - TRAINED TREES are often planted in the borders of the vegetable garden, and, as a result of the restricted area in which they are growing, hard pruning has to be resorted to to prevent them from outgrowing their position too rapidly. The leading growths should be cut back to within six inches, and all laterals to one and a-half inches of their base. This close pruning of some varieties encourages a superabundance of wood growths at the expense of fruit spurs, but this may be remedied by a judicious shortening of the main roots at this season.

ESPALIER AND CORDON TRAINED TREES that have filled their allotted space should have their leading and lateral shoots shortened back to within one and a-half inches of their base. Trees grown on these lines may be often seen with their branches overcrowded with fruit spurs, and this condition is not only detrimental to the health of the trees, but the fruit, owing to the absence of sun and air, cannot attain to the perfection it would otherwise do. If a few of the longest of these spurs be cut away each season the trees will be kept in a healthy and fruitful condition for many years. Young trees which have further space to cover should have their main shoots cut back so far as will ensure the pushing forth of the dormant buds next season, always pruning to a wood bud which is pointing toward the position the branch is to take. Treat the lateral growths as advised for the older trees.

PEACHES, NECTARINES, AND MORELLO CHERRIES produce their fruit on the young wood of the preceding season's growth. If these were disbudded as advised during the summer very little pruning will be necessary now. Cut away the old fruiting wood, and replace it with the young shoots which had been reserved for this purpose, keeping these on an average of six inches apart. The Morello cherry may have its young wood laid in a little closer than advised for the others, and all surplus growths pruned back to within an inch of their base, when they will develop into fruiting spurs. Endeavour to have the whole surface of the trees equally covered with young wood. Young trees should have all their main growths shortened back from one-half to one-third of their length, to ensure the centre being well furnished with young wood.

BLACK CURRANT GALL MITE.—Bushes badly infested with this plague should be dug up and carefully conveyed to the fire heap and burnt, while those with only a few enlarged buds should have these picked off and burnt.

REMINDERS.—When pruning be careful to remove from the trees all dead and decaying wood. Carefully collect all prunings and dead leaves and convey them to the fire heap to be burnt. See that permanent labels are properly fixed to all newly-planted trees before the name on the nurseryman's label is obliterated. Examine and remove every old tie that is at all likely to press into the bark during the next season, on trained trees, and when refastening allow ample room for the natural swelling of the branch. Select scions for grafting purposes, tie them up in small bundles, properly labelled, and lay them in by their heels in a cool border until required for use in the spring.—Geo. Woodgate, Rolleston Hall Gardens.

APPLE BRAMLEY'S SEEDLING

It would be difficult to say too much in favour of this apple, for its merits are numerous. It was found at Southwell, in Nottinghamshire, and sent out by Messrs. Merryweather and Son, who describe it as the finest apple on earth, and I am not disposed to question the correctness of the description. As a kitchen apple it has many merits. Its cooking qualities are undeniable, the fruit keeps quite firm under ordinary circumstances until April, it is of full size, and if there is an apple crop at all some are sure to be found on the trees of the variety. One especial point in its favour is its adaptability to all soils and situations, and its freedom from canker. The growth is vigorous and semi-drooping or horizontal, especially when grown as a standard or half-standard. This form of training appears to suit its habit of growth, and so does the horizontal espalier, where its branches can have a free run. In this way the trees come into bearing so much sooner. As a bush it is a little late in bearing, especially if it be restricted to space or subjected to much pruning. The natural tendency of the variety is to grow away quickly, and to soon cover a wide area. For planting in an exposed situation less fruit will be blown from the trees of Bramley's Seedling than from those of any other variety. Where a garden contains one or more "miffy" growing varieties my advice is graft the trees with Bramley's. As a market apple at Christmas time Bramley's is fast making a reputation, but, ordinarily, does not command the price its merits as a cooking apple deserve, but that is not the fault of the fruit.

E. Molyneux.

The Ox-eye Chamomile.—An old-fashioned flower is the Ox-eye Chamomile (Anthemis tinctoria), which makes a good border plant, and supplies us with multitudes of flowers resembling those of the yellow single marguerites, such as Cloth of Gold. The typical plant has finely cut leaves and pretty yellow flowers on longish stems. These reflex their petals at night, and are then less attractive. There is a white variety, called alba, which I do not care much for; a pale yellow one of some beauty, called pallida; a fine lemon-coloured one, which passes under the name of Buxton's variety; and a handsome one with canary-yellow flowers, called Kelwayi. The last-named is one of the very best. This anthemis likes a rather dry soil and a sunny position, and is propagated by division, seeds, or cuttings. The two first methods are for spring, and the last-named may be performed at any time from April to September, striking the cuttings of growths under glass.—S. Arnott.

THE PERPETUAL FLOWERING CARNATION SOCIETY.
GREAT WINTER SHOW OF CARNATIONS, ROYAL HORTICULTURAL HALL, Vincent Square, Westminster, S.W., WEDNESDAY, December 8th. Admission, 1 p.m. to 5 p.m., 1s.
Schedules and Particulars from the Honorary Secretary, Mr. HAYWARD MATHIAS, "Lucerne," Stubbington, Fareham, Hants.
ANNUAL DINNER, WINDSOR HOTEL, same evening, at 7 p.m. Tickets from Mr. E. F. HAWES, Royal Botanic Gardens, London, N.W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, November 23.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Messrs. C. Shea, A. Rolfe, W. Hales, E. M. Holmes, A. Worsley, S. U. Pickering, J. Fraser, J. T. Bennett-Poë, and F. J. Chittenden (hon. secretary).

POTENTILLA WITH VIRESCENT FLOWERS.—Mr. E. M. Holmes showed a flower of Potentilla sp. in which the carpels were leafy. He also reported that the acorns which stock refused to eat, shown by Mr. Bowles at a recent meeting, were those of Quercus pedunculata, and showed no morphological difference from the ordinary form of that plant.

MONSTROUS APPLE FLOWER. — Mr. Pickering showed the flower of Bramley's Seedling apple, to which he referred at a recent meeting having twenty-five petals, but otherwise completely formed.

GARDEN PANSIES.—Mr. Fraser referred to the degeneration of the flowers of garden pansies when allowed to seed themselves in cultivated ground. He found that bees, cabbage butterflies, and other insects, but especially the silver Y moth, visited them with great regularity, and it seems probable that the degeneration is due to crossing with other species.

CATTLEYA WITH DIPHYLLOUS GROWTH.—Mr. Hawkes, of Osterley Park Gardens, sent a growth of Cattleya Gaskelliana which had produced two leaves. This condition, Mr. Rolfe said, is probably a reversion to an ancestral type, and is occasionally seen in other monophyllous cattleyas. Mr. Hawkes also sent a vigorous shoot of Rochea (Kalosanthes) coccinea, having at the apex of the stem numerous shoots about 6in. long, instead of flowers. The committee thought that the condition was the result of growing the plant in a moist atmosphere, an opinion confirmed by the fact that roots had made their appearance at the apex of the main stem.

JUGLANS AILANTHIFOLIA FRUITING.—Mr. W. E. Gumbleton sent ripe fruits of Juglans ailanthifolia from his garden at Belgrove, Queenstown. This is the first time the tree has fruited since Mr. Gumbleton planted it thirty years ago. The fruits are dark and velvety in appearance, smaller than those of J. regia, and are borne six to eight in a raceme. Mr. Gumbleton said that, so far as he was aware, the tree had only once before fruited in the kingdom, at Abbotsbury, in Dorsetshire.

BITTER-ROT IN PEARS.—From Mr. R. B. Rogers, of Hexworthy, Launceston, came pears attacked by the fungus Glocosporium fructigenum, causing the "bitter-rot." It was stated that "the disease seems to begin as small rounded brown patches on the outside, and in some cases if these are cut out the rest of the pear is quite good, but in other cases, although the inside of the pear looks quite good, a strong bitter flavour goes right through it. The varieties which have suffered most are Thompsons, Fondante d'Automne, and Beurre Hardy; Louise Bonne has also suffered a good deal, and some other varieties slightly, but Durondeau not at all." The fungus is said to form canker spots on the stems, and these should be cut out and, with the pears, destroyed by fire. If thrown on the rubbish heap, or if the diseased fruits are allowed to rot on the ground, or are fed to pigs, there is a danger of the spores escaping and attacking the fruit next year. The spores produced on diseased fruits in the store are able to attack and cause disease in neighbouring fruits. The disease is to be kept in check by the destruction of the diseased fruits as recommended, and the spraying of the trees with potassium sulphide or ammoniacal copper carbonate. If, however, the trees are sprayed against "scab," that operation will tend to keep the "bitter rot" in check.

Colonial and Bottled Fruit Show.

The exhibition of Colonial fruits, held in conjunction with an exhibition of home-grown and bottled fruits, at the Royal Horticultural Hall from December 1 to December 4, was a very fine one, the hall being well filled, and the displays excellent in almost every case. It was certainly the finest display of its kind yet held, and the superb contribution from the Government and the different growers of British Columbia was worth a long journey to see.

In spite of the very wet weather there was a good attendance at the opening ceremony on December 1, when the Duchess of Argyll declared the show open.

We regret our inability to give a complete list of the medals awarded to the Colonial and other non-competing exhibitors, as these were not made public when our representative was compelled to leave, about 1.30 p.m., to go to press. Further, as prize slips had not been fixed to the class cards in the bottled fruit, jams, and jellies classes (competitive), we cannot deal with this part of the show at present, further than to say that this section was an admirable one, and showed a great advance over previous efforts.

The great feature of the exhibition was the superb displays made by growers in British Columbia. The Agent-General for the Columbian Government was responsible for a wonderful array of grand fruit, tastefully set up and comprising beautiful examples of such apples as Newtown Pippin, King of Tompkins County, Gravenstein, Spitzenberg, Cox's Orange Pippin, Emperor Alexander, Winter Banana (very large and showy), Rome Beauty, Blue Pearmain—a very effective apple, Northern Spy, Baldwin, Russet, and Wagner. Individual Columbian growers filled the whole of the top end of the hall with what, even for them, was an unusually fine display. We made special notice of Spitzenberg apple from Mrs. J. Smith, of Spencer Bridge; Peasgood's Nonsuch, from Mr. Lawes, of Enderby; Winter Banana apple, superb Russets, and Newtown Pippins, from the Okanagan Fruit Union; Rome Beauty and Russet apples from Messrs. Stirling and Pitcairn, of Kelowna; splendid Ribston Pippins, Blenheim Orange, and Gravenstein, from the Kootenay district; Winter Banana of immense size from Mr. Cooney, of Kamloops; Northern Spy from Mr. Webster, of Summerland; King of Tompkins County, from the Salmon Arm Farmers' Exchange; and equally fine fruits of this variety from Salt Spring Island. In every case the exhibitors showed splendid fruits, all grown on standard trees, and shown as packed in the original cases after travelling 6,000 miles by rail and steamer.

From New Brunswick's Produce Commissioner, 13, Victoria Street, came apples kept in cold storage since last June. The display was principally for the purpose of illustrating the great industries of the Dominion—i.e., wine-making, fruit culture, bee-keeping (the honey was fine), vegetable and fruit canning and bottling, and grain production, all of which the Government are fostering. Mr. W. Hubbard, Fredericktown, New Brunswick, contributed a collection of New Brunswick apples, but these did not compare favourably with the Columbian samples.

Dominican produce, brought together by Mr. A. E. Aspinall, West India Committee, Seething Lane, consisted largely of huge shaddocks, limes, lemons, oranges, and bread fruits. Montserrat sent cotton, guava jelly, limes, of course; while Trinidad sent a great variety of Colonial fruits, bottled and otherwise preserved, and baskets of yams, limes, King oranges, maize, eddoes, Brazil nuts, bananas, Cohune nuts, cocoa pods, papaws, shaddocks, and many other wonderful things in the way of fruits and nuts, shown with an accompaniment of bamboo canes of immense size, grass plumes, and crotons.

The Agent-General for Victoria, Melbourne Place, Strand, was responsible for cases of beautifully-prepared dried and crystallised fruits, the raisins, figs, apricots, and peaches being alike good. The big photographs representing fruit and cotton culture, and some of the beauty spots in Victoria, were very interesting.

The West Indian Produce Association, Fenchurch Buildings, Fenchurch Street, had a most varied exhibit, including Jamaica cigars of various kinds, fruit jellies, liqueurs (including the famous old Carribee), bananas, limes, shaddocks, oranges of many kinds, hot pickles, spices, tea, guava cheese, nuts, and edible roots. Cape wines and liqueurs were on view from Messrs. Westmacott and Co., Leadenhall Street, E.C. Messrs. A. W. Gardner and Co., Gamage Buildings, Holborn, contributed seedless oranges, fine samples, and grape fruits, from Jamaica. South African dried fruits and fruit rolls, produced by a woman on a South African farm, were interesting, but not particularly appetising in appearance.

An interesting collection of Colonial produce set up by the Army and Navy Auxiliary Co-operative Supply, Lim., Francis Street, Westminster, included Jamaica oranges, Claret bananas, Nova Scotian cranberries, Jamaica grape fruits, Barbadoes shaddocks, and Nova Scotian apples in quantity. Messrs. B. Shearn and Son, Tottenham Court Road, showed a collection of no fewer than twenty kinds of nuts, these including pistachios, hickory nuts, brazils, walnuts, almonds, butter nuts, lychees, cocoanuts, pine kernels, and other interesting things.

Messrs. James Veitch and Sons, Chelsea, presented a fine lot of home-grown apples and pears, and some finely-cropped trees of the late Calville Blanche apple; there were excellent dishes of Lane's Prince Albert, Washington, Bismarck, The Queen, Cox's Orange Pippin, Sandringham, Blenheim Pippin, and other excellent apples. Both home-grown and Colonial apples were presented by Messrs. Ambrose Palmer and Co., Upper Halliford, Shepperton, who also presented excellent bunches of Muscat of Alexandria, Canon Hall Muscat, Alicante, and Gros Maroc grapes.

Messrs. G. Bunyard and Co., Maidstone, put up a collection of English-grown fruits that for colour and fair size compared favourably with the Colonial samples, while their Uvedale's St. Germain, Marie Benoist, Verulam, Belle des Arbres, and Catillac pears were particularly good. From the Woburn Experimental Fruit Farm came the exhibit to which we referred in connection with the recent R.H.S. meeting. A non-competitive display of jams, fruit jellies, and bottled fruits was tastefully arranged, from the Studley Castle Horticultural College for Women.

Mr. W. Poupart, Twickenham, had a grand lot of bottled fruits on view, and where all kinds were fine it seems useless to particularise; but apricots, raspberries, Monarch plums, mulberries, cherries, and Pond's Seedling plums, all in glass-stoppered bottles, were beautifully clear and fine. Altogether this was one of the finest displays of finely-bottled fruits ever exhibited. Fruit jellies, lavender water, and table jams from the Elsenham Hall Estate, Stanstead, Essex, attracted a great deal of attention. Miss S. Miller, of Marlow, sent jellies, syrups, and other fruit preserves. Miss Martin, Auburn, New York, sent brandied fruits in quantity. Bottled fruits and jams from the Middlesex Jam Company, Brentford Bridge, Brentford, brought into prominence a great industry in the old Middlesex county town

Mr. Otto Henninger, Water Lane, E.C.; Messrs. G. Fowler Lee and Co., Reading; Messrs. Abbott Brothers, Southall; and Miss E. Bradley, Hollingbourne, Kent, all showed bottles, sterilisers, and fruit-bottling apparatus generally.

National Chrysanthemum Society.

The annual dinner of the National Chrysanthemum Society, held at the Holborn Restaurant on Monday evening, November 29, under the presidency of Sir Albert K. Rollit, LL.D., D.C.L., was a great success, as the attendance was larger than for several years past, and the floral decorations were splendid as set out by Mr. R. Felton, and consisted entirely of fine chrysanthemums.

After the loyal toasts had been honoured, the President presented the Society's fine cups and trophies to the Dulwich Chrysanthemum Society; Mr. T. Waller (Holmes' Cup, President's Cup, and Dean Memorial Medal); Mr. Higgs (Holmes' Cup for incurved for the twelfth time); Mr. Rigby (Icthemic Company's Cup), and Mr. H. J. Jones (Gold Medal for best trade exhibit at the Crystal Palace).

Mr. E. F. Hawes briefly proposed "The Donors of Special Prizes," thanking them for their kindness, and this was responded to by Mr. R. F. Felton.

Mr. J. W. Moorman very pleasantly and ably proposed "The Exhibitors and Affiliated Societies," and pointed out that this year there had been several new and eminently successful competitors, and the Society had also retained its old competitors, and been ably supported by the foremost trade growers, who invariably exhibited of their best. There were now a hundred and fifty affiliated societies spread over the whole world, all of whom were spreading abroad the cult of the chrysanthemum. He hoped that the numbers of competitors and affiliated societies would steadily increase. This toast was coupled with the name of Mr. H. J. Jones, who was accorded a very hearty reception when he rose to respond. He stated that during his twenty years' association with the Society as an exhibitor he had been awarded seventy gold medals. He thought the Society scarcely did all it should to encourage the small grower—he hoped the members would bear this in mind. He also pointed out that the N.C.S. Certificate was one of the most coveted awards at the shows of affiliated societies, and the increase of these societies meant an immense increase in chrysanthemum enthusiasts.

The toast of the evening, "The National Chrysanthemum Society," proposed by the President, was most heartily received. Sir Albert said the title of National was a good one because the Society had a long history, and did a national work. On its committees it had the services of the best experts, men who did not make awards in haste or give them too freely; indeed, only sixteen awards had been made from one hundred and forty-three entries. As regards the shows, though the Crystal Palace was not so get-at-able as one could wish, yet for space, light, and staging there was no place so fine. Sir Albert referred to several of the leading exhibits, and said that Mr. Higgs would not again compete for the Holmes' Cup, so that other growers would not have to fear such a capable grower in the future. The association of the trade with the Society was a most useful and excellent one, and he remarked that a society that helped the trade advanced business and generally extended the culture of the flower for market and home use was worthy of every help. The President referred to the educational work of the Society, and strongly urged that conferences and the publication of reports should be continued. They were also international, as in Mr. C. Harman Payne they had a foreign corresponding secretary who kept the members in touch with societies abroad. In the matter of finance the Society now saw that the money was forthcoming before they spent it; the order was economy with efficiency. He also pointed out that the chrysanthemum would not fall out of the ranks of Flora like other old florists' flowers, because it filled a place no other flower could do. Referring to the splendid floral decorations of the evening, Sir Albert made kindly reference to Mr. Felton's efforts, there and elsewhere. He urged that every member should do his or her part in extending the influence of the Society, and closed with a reference to the high æsthetic, refining, and moral influence exerted by the culture of the golden flower that was the basis of the highest order in the great eastern island Kingdom of Japan. He also claimed that the Society promoted good fellowship, and not the least of its useful functions was the annual dinner which brought them together that evening. He was glad to see so many ladies present, and he enlisted their services in the furtherance of flower culture. He also acknowledged the great services rendered by Mr. R. A. Witty (the secretary) and Mr. T. Bevan (the chairman). The latter replied to the toast, heartily thanked the president for his able speech, and said the committee and officers all did their best for the Society. He referred to the Society's work, and made special reference to the conference held at Essex Hall in October. He hoped that at the great Brussels International Show to be held in 1910 the members of the Society would put up a splendid exhibit of chrysanthemums to show our Continental friends what could be done at home —but he knew this would be an expensive proceeding, but what was done at Paris years ago could and should be done at Brussels next year.

As Sir Albert had to leave somewhat early, the toast of "The Chairman" was ably proposed at this stage by Mr. J. H. Witty, who referred to the many honours showered upon the president, and to the high position he held in the world of commerce, and also of horticulture. Sir Albert humorously acknowledged the toast, which was given with great heartiness and with musical honours.

The other toasts were "The Ladies and Visitors," proposed by Mr. J. T. Simpson and responded to by Mr. E. J. Husey, F.C.A. (the official receiver at the Crystal Palace); and "The Press," proposed by Mr. D. B. Crane and responded to by Mr. George Gordon, V.M.H., of the GARDENERS' MAGAZINE; and "The Secretary, Mr. R. A. Witty," proposed by Mr. G. Gordon.

The proceedings were enlivened throughout by vocal and instrumental music, given under the direction of Mr. H. Briden.

Beckenham Horticultural Society.

At the recent meeting Mr. G. B. Lees, of Oakwood Gardens, Chislehurst, lectured to a very full meeting on "Roses and their Culture," Mr. W. A. Murrells occupying the chair. The lecturer elected not to deal with the propagation of roses, this part of their culture, in his opinion, being best left to the trade. French, Irish, and English-grown roses were stated by the lecturer to each bear characteristics that he could recognise, even after two years planted. The rose garden, he considered, should be sheltered from south-west winds. The beds should be trenched to a good depth, and old mortar rubbish and charred material from the garden fire should be incorporated with the staple, if clayey. Bush roses were recommended to be planted two or three inches deeper than the junction of stock and scion. November was given as the best time for planting, but it was advised that, if planting was contemplated and could not be proceeded with till the spring, to buy in the plants in autumn and pot them for later planting.

A manurial preparation used by the lecturer as a fillip when the flower-buds are showing is as follows: Peruvian guano, 6 parts; bonemeal, 4 parts; nitrate of soda, 1 part; and basic slag, 8 parts; these to be mixed together. For mildew he advised the use of black sulphur applied with the Ideal bellows on damp mornings. Lifting and replanting should, he asserted, be more often practised —say, every four or five years. The lecturer did not deal with climbing roses, that subject being promised for a future evening. A good discussion followed, after which Mr. Lees was heartily thanked for his practical lecture.

Mr. Langford was awarded a special certificate for a collection of chrysanthemums in pots. The plants were in splendid condition, and carried magnificent blooms of Miss Nora Davis, Leigh Park Wonder, J. H. Silsbury, and Perfection, etc.

British Gardeners' Association.

At the last meeting of this association Mr. R. J. Frogbrook in the chair, it was reported that 360 circular letters had been issued to candidates at the recent Borough Council elections in reference to a minimum wage for gardeners. About 25 per cent. replied, nearly all in favour, while many were of opinion that a minimum wage of 30s. was too low.

Thirty-two new members were elected, bringing the total up to 1,594.

Bristol Gardeners' Association.

A crowded and enthusiastic meeting was held in St. John's Parish Room on November 25, presided over by Mr. S. Shaddick. A practical paper upon "Grapes" was given by Mr. Wilkinson, gardener to Mr. R. A. Gibbs, M.P., Tyntesfield. The paper was full of cultural hints, and the information given was much appreciated. Mr. Wilkinson said the construction of a vinery should be placed in the hands of a thoroughly practical and capable horticultural builder. A great mistake often made is to have the wires too near the glass. He advised a distance of not less than thirty inches as the best. This, he said, would prevent much burning of foliage and scalding of berries. A border 3ft. in depth was strongly advised, allowing 10in. for drainage. The border should, in Mr. Wilkinson's opinion, be above the general level, as it should allow for the more rapid escape of an excess of water. The lecturer named May and June as the best period in which to plant, transferring the young vines from 7in. pots. The canes, he suggested, should be stopped when 5ft., and laterals be pinched back at first leaf, preserving the foliage till the last. The vines should be cut down to within 3ft. of the ground at the end of the first year. Mr. Wilkinson recommended 50 deg. for starting black, and 55 deg. for Muscat grapes, gradually increasing the temperature as growth proceeds, drawing special attention to the stopping of growths at not less than four leaves beyond the bunch, and to the avoidance of excessive fire-heat.

The Chairman, and Messrs. Scott, Taylor, Candy, Wakefield, Curtis, Morse, Bird, Brooks, Bastin, Hayball, and Woodward took part in the discussion.

For two bunches of grapes, Mr. Wakefield was first; second, Mr. Shelton; third, Mr. Jennings. For orchids, Messrs. Gostling and Woodward were awarded three points each, Mr. Curtis two.

Twickenham Gardeners' Association.

At the meeting of this society held on Wednesday, November 17, Mr. W. E. Reeves presiding, a very interesting and instructive lecture on "Lawns" was delivered by Mr. Shipway, and illustrated by lantern slides. The lecturer dealt with his subject in a very concise and practical way, and this, with the numerous views, enabled those present to thoroughly understand the various points dealt with.

In the course of his remarks Mr. Shipway pointed out how necessary it was to properly prepare the soil if good results were to be obtained, by thoroughly cleaning the soil from weeds, and special care should be taken when importing fresh soil to see that it was not obtained from a place where weeds had been allowed to seed. Sometimes when the result was not satisfactory the seedsmen were blamed for supplying weed-infested seeds, whereas the weeds were usually imported with the soil. The lecturer stated that it was much cheaper to obtain a good lawn from seeds than by turfing. It had been proved at Messrs. Sutton's trial grounds that it was possible to obtain a lawn fit for play in eight months from the date of sowing.

The exhibits of chrysanthemums by Messrs. Weedon, Reeves, and Stalibrass were very meritorious. Votes of thanks concluded the proceedings.

Croydon Gardeners' Society.

At the recent meeting of this society Mr. Gibbs Box, Lindfield, gave a most instructive lecture on the cultivation of sweet peas. He advised that these charming flowers should have a good position in the garden, open to plenty of air, but sheltered from strong winds. The soil should be deeply trenched and the subsoil well broken up, at the same time incorporating a good supply of partly-rotted stable manure. A liberal dressing of bone-meal should be placed on this, and the ground left rough for winter rains and frosts to pulverise. In the beginning of March the soil should be levelled and given a dusting of superphosphate. Shallow trenches were advised for the plants, so that when the dry weather sets in and water has to be given it all goes to help the plant.

For early flowering about the end of June, seeds should be sown in October, about the first week. A good compost should be made, and good drainage put into the bottoms of 48's pots. Sow five or six seeds in each pot, and leave outside till severer weather sets in. When it does the pots should be stood in an unheated frame, admitting plenty of air. The lecturer found the seedlings would bear as much as 15 deg. of frost, that is if they have been kept properly in the earlier stages. Coddling is harmful. About the middle or end of March they should be planted out in the rows or clumps, without breaking up the soil in the pots. The space between each potful must be quite 18in.—more if plenty of ground is available. Short sticks should be put to the sides of the rows, and a dusting of lime given to prevent the attacks of slugs. By the beginning of June, if the weather is dry, watering must be commenced, using water exposed to the air for at least 24 hours. Following clear water, a little liquid stimulant should be given at intervals of 10 days, made from stable manure or artificials. Sulphate of ammonia, about 1-oz. to three gallons of water, is an excellent stimulant, but this should be varied with other compound chemical fertilisers.

Insect pests should be watched for, and syringing with extract of quassia be given as a preventive measure. Sweet peas are greatly subject to fungoid pests, according to the lecturer, and he had found Bordeaux mixture, syringed on the plants from May onwards would keep these in check. The dreaded streak disease, which has been so rampant this year, is another enemy to watch for; an early application of the foregoing mixture helping to keep this down. Some colours, especially orange, bleach badly in strong sunshine, and shading with loose tiffany must be resorted to. To obtain big exhibition blooms disbudding must be practised.

For later blooms seed should be sown in February in 60's, and afterwards removed to flowering quarters. March was suggested as quite early enough for outside sowing. Some seeds have very hard shells, and to insure quick germination they should be soaked for a few hours in water (about 75 deg.) until they swell.

The present-day demand, said Mr. Box, is for the Spencer type or those with waved standards, and the exhibitor must bear this in mind. Long stems and the greatest number of flowers on the stem are other considerations.

Mr. Box emphasised the fact that cross fertilisation is most fascinating, but the florist must be gifted with plenty of patience, and when a good thing is found in the seedlings is must be well tried before sending it out to the public.

Following a brisk discussion on the subject, the members, with unanimous accord, conveyed a hearty vote of thanks to the lecturer.

The Horticultural Club.

"CANADA OF TO-DAY."

On Tuesday, the 23rd instant, at the Hotel Windsor, after the usual monthly dinner of this club, at which Mr. Chas. E. Shea presided, Mr. Joseph Cheal gave a most interesting lecture on "Canada of To-day, Horticulturally and Generally, from the Atlantic to the Pacific," illustrating his address by a number of lantern slides of views taken by himself en route.

Commencing with a few views of New York City and of the Hudson River, he quickly passed on to Canada itself via Niagara, giving a vivid idea as he proceeded from city to city of the marvellous rapidity with which those cities had risen to importance, a few rude sheds by the side of a railway track being transformed in a very few years into a flourishing and populous town with wide thoroughfares, tram lines, and all the paraphernalia of civilisation. Views of the wild and splendid scenery of the Rocky Mountains taken in the train, and sometimes curiously evidencing the sinuous nature of the track by including the tail-end of the same train at almost right angles, interspersed with groups of settlers and natives, glimpses of fruit farms and irrigation works and of the associated buildings, vehicles and other details, to which a constant stream of anecdote and personal recollections added interest. Mighty trees 40 to 50 feet girth, and estimated as about 200 in height, were shown both growing and felled, in connection with the vast forests there, the views of which showed also now and again the dire effects of forest fires, the gaunt half-consumed trunks standing up ghastly and bare over scores of square miles. Mr. Cheal took the opportunity when there of visiting some of the settlers known to him prior to their leaving the old country. Most of them had done very well, and the moral undoubtedly to be drawn from their experiences is, that, given a fair constitution, a fund of common sense, and, above all, a determination to work hard, there was no better place than Canada for an energetic young man with a little capital to start with. Mr. Cheal's advice in this connection was that the young man should refrain from investing at all, until he had obtained practical experience by hiring himself out for a year or two, and so making himself thoroughly and personally acquainted with the nature of the climatic and the general conditions, while, if industrious and frugal, his original capital may have been increased instead of being swallowed up in paying for the experience essential for its proper utilisation. One thing is certain: the resources of Canada are enormous, as regards rich and fertile land, the main drawback being a low rainfall, and the consequent need in many parts of a good system of irrigation. The lecture was followed by a discussion, in which Mr. Griffiths, secretary to Lord Strathcona, High Commissioner of Canada, while confirming Mr. Cheal's observations, added some interesting data. These related more particularly to the vast areas of prairie land in Canada which formed, in his opinion, one of the greatest future fields of agriculture in the world. Here there was required no laborious clearance of forest, since trees there were none at all. The whole level expanse of thousands of square miles consisted of rich alluvial soil two to four feet deep, resting on clay, and only requiring to be "tickled with a plough, to laugh with a harvest." A vivid idea of this condition of affairs was shown at the Canadian Exhibition at the White City in 1908, where the prairie was shown in process of agricultural development, dotted with farms in all stages, from the wooden shanty to the comfortable family house, amid the waving crops that supported them. Mr. Griffiths referred to the contrast between the monotony of the prairie, with a horizon like that of the ocean itself, and the diversity of the mountain regions. The monotony, however, of the prairie, he said, was but a temporary sentiment, its magnitude eventually became attractive, and the dweller therein came in time to love it fully as much as a mountaineer can love his Alps.

On DECEMBER 11 will be published
.. THE ..
CHRISTMAS NUMBER
.. OF ..
Amateur Gardening
FOR TOWN AND COUNTRY

A GRAND BUDGET of Literary Fare, specially compiled for the season.

The Contents wil include:

NATURE'S LEAF EMBROIDERY.—Describing and illustrating the many examples of variation in the margins of the leaves of plants.

LIFE STORY OF A BEECH TREE.—Showing by word and picture the development of the Beech Tree from Seed to the matured specimen in Field and Forest.

DEALERS IN DEATH.—An illustrated account of the poisonous flora found in hedgerow, mead, and woodland in the British Isles.

GARDEN BEAUTIFUL IN WINTER.—A charming story, descriptive of the pretty effects obtained in gardens during Winter by the formation of frosts crystals on the leaves of plants (with pictures).

THE ORDER OF THE THISTLE.—The Thistle as the emblem of self-defence, dignity, and strength. Illustrated.

OUR OLD GARDENS.—A delightfully written essay on the charm and beauty of old-time gardens.

A SHAKESPEAREAN GARDEN.—The Flowers and Herbs of Shakespeare's Day.

BACTERIAL ODOURS AND FLOWERS.—The origin of Fragrance in Flowers.

Also a variety of shorter papers of an appropriate and interesting character, which will not fail to appeal strongly to lovers of Nature and the Garden.

A SPECIAL FINE ART PICTURE SUPPLEMENT FROM PHOTOGRAPHS OF LOVELY GARDENS, FLOWERS, AND CHILD LIFE IN THE GARDEN.
ALSO A
Double-page Plate in Colours
"THE LITTLE GARDENER"
(after a Water-colour Drawing by Miss Currie).

Price SIXPENCE; by post, 8½d.
Order AT ONCE from your Newsagent, as this Number cannot be reprinted.

Offices, 148 and 149, Aldersgate Street, London, E.C.

Reading Gardeners' Association.

In his remarks at the opening of the recent exhibition in the Town Hall, the President (Mr. Alderman Parfitt) stated that the Reading Gardeners' Association had, in the twenty-one years of its existence, grown from a promising infant into lusty manhood. The truth of this statement is more than borne out by the large gatherings assembling at the fortnightly meetings, and on Monday (November 22) this healthy indication was fully maintained by a large attendance, and by the addition of four new members to the roll of the association.

Mr. H. G. Drew, from the horticultural department of the University College, Reading, was the lecturer for the evening, and the President, who occupied the chair, in introducing Mr. Drew, remarked that, having lost an old friend from the College in Mr. Chas. Foster, the members would gladly welcome a new one in the person of the lecturer.

"Insect and Fungoid Pests of Fruit Trees, Their Eradication," was the subject of a thoughtful, instructive, and interesting paper. Mr. Drew commenced by saying that he did not propose to give an exhaustive and comprehensive list of the different concoctions by the use of which it was supposed that the great army of pests might be exterminated. Indeed, he believed it was a fact that many, in prosecuting a strenuous warfare against these enemies, were responsible for the slaughter of a good many friends. He was an advocate of commonsense cultivation, whereby the insect and fungoid foes were discouraged. Evidence was forthcoming that these pests had of late years been very considerably on the increase, but the lecturer did not think the increase was accounted for by climatic conditions and sunless and wet summers. It was on record that gloomy seasons were just as prevalent fifty years or more ago as in our own time. Mr. Drew stated that in his opinion the increase was largely accounted for by the more extensive breadths of trees grown nowadays, the extensive use of "dwarfing stocks," over stimulation in youth, planting too closely, indifference, want of recognition, too early fruiting, over-fruiting, etc., etc.

Mr. Drew then proceeded to inform his audience on the best way to combat the vast forces of insect and fungoid enemies arrayed against them, emphasising that good cultivation, proper attention to drainage, research, and cleanliness would go far to discourage the pests in obtaining a lodgment. At the conclusion of his paper, Mr. Drew satisfactorily answered the many questions and remarks addressed to him. The debate being sustained by the President, Messrs. Hinton, Loader, Wilson, Tunbridge, Exler, and others. A hearty vote of thanks to the lecturer brought the meeting to a close.

We learn that after payment of all expenses of the recent coming-of-age exhibition organised by the association, a net sum of upwards of £18 remains to be disposed of, at the discretion of the committee, between the two gardening charities.

Bournemouth Gardeners.

On Tuesday, November 16, a very interesting and instructive lecture, on "The Life, History, and Structure of a Fern," was given before a good attendance of members by Mr. F. J. Tauner, the borough bacteriologist. Mr. Tauner first read a paper giving a summary of the subject he was dealing with, and this preface prepared his audience and enabled the members to more fully understand the numerous diagrams of specimens which he displayed, and, further, to appreciate the wonderful construction of a fern, as seen in its various forms and stages of development under a powerful microscope. At the close of the lecture Mr. Tauner replied to several questions put to him by members, which enlightened them very much. A hearty vote of thanks was accorded the lecturer, and also Mr. Garner, the chairman.

TRADE NOTE.

A long and intimate association with carnations, particularly the winter-flowering kinds, has led Mr. M. Allwood to make various experiments with a view of saving some part of the vast amount of labour hitherto expended on tying. The outcome of these experiments is the Allwood Plant Support, which consists of a wire loop readily attached to a slender bamboo stake. Only one stick is necessary in each pot of carnations, and no ties are needed, as the wire loop surrounds and keeps the growths in place. The invention has the merit of simplicity and cheapness, and as it is long-lasting and easily adjusted it cannot fail to appeal to growers of carnations and many other subjects. It is sold by Messrs. Stuart Low and Co., Bush Hill Park Nurseries, Enfield.

Arum Lilies are now rapidly making growth, and in many instances producing spathes, so that, where possible, the plants should have plenty of room; and if the pots are full of roots, they will take plenty of water with a little stimulant once or twice a week.—T. Stevenson.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

PEAR SHOOTS.—D. C., Salop: We will have the matter investigated, and reply in an early issue. We do not remember to have seen anything quite like the specimens sent.

PRIMULA OBCONICA. — A. B., Ashbourne: Your strain is an excellent one so far as size of bloom and general robustness are concerned. The fact that the spikes rise tier above tier eventually is not, however, a new trait in the character of P. obconica, but is one quite common to a very large number of species of primula. You should endeavour now to secure similar robustness and size in other colour shades of this useful primula.

AWARDS TO SINGLE CHRYSANTHEMUMS.—H. W., Shotley: The next meeting of the National Chrysanthemum Society's Floral Committee will be held at Essex Hall, Strand, W.C., on Monday afternoon, December 13, and this will be the last meeting of the season. We have not space here to give all the particulars relative to the arrangements for exhibiting at the forthcoming meeting, but these can be obtained on application to Mr. R. A. Witty, Savernake Road, Gospel Oak, London, N. We may state, however, that exhibitors for awards should submit not less than three blooms of a variety, all to be in good condition, and if possible with foliage, in order to be eligible for a First Class Certificate; but two blooms only, if deemed worthy, may be awarded a Commendation. If a sport, blooms also from the parent stock for comparison. All seedling flowers must be named, as a means of future recognition. They also should state as far as possible in the case of new varieties the origin; if a sport, whether fixed or not; if a seedling, the parentage; and give any other information relating thereto that the exhibitor may possess. This information to be given to the Secretary in writing.

PIPING FOR INTERMEDIATE HOUSE.—A. R., Beeston: If you have sufficient boiler power for the whole range of glass then there is sufficient piping in the intermediate house to maintain a suitable temperature, but we rather gather that the boiler is scarcely equal to the task, and an increase of piping under these circumstances will not help matters. There is small wonder that many of the plants have a tired, dried-up look about them during winter, when you have to fire hard, because the heat rises directly under them and up between open staging. Cover the staging with slates, and lay shingle or small cinders over the slates, keeping it moist always, and the plants will be all the better for it.

ORDER OF FREE GARDENERS. — A. S. H., Ripon: So far as we understand it, the Order of Free Gardeners is conducted on lines similar to those of the Oddfellows and Foresters. Free Gardenery is more or less popular in the North Midlands, the northern counties, and in Scotland; but it is by no means confined to gardeners, any more than the Foresters' Order is confined to those connected with forestry. The Free Gardeners have seven hundred lodges, seventy thousand members, and a capital of £250,000.

NAMES OF PLANTS.

D. H. H., Coventry.—1, Juniperus chinensis; 2, Selaginella cæsia; 3, Pteris cretica; 4, Abies Veitchi; 5, Cupressus obtusa.

S. N. O., Leatherhead.—1, Calanthe Veitchi; 2, Nephrodium molle corymbiferum; 3, Adiantum Williamsi.

W. P., Harwich.—1, Masdevallia Harryana; 2, Selaginella Emileana; 3, Phyllanthus glaucescens; 4, Dracæna Sanderiana.

W. K., Guiseborough.—1, Pleroma macrantha; 2, Begonia Arthur Mallett; 3, B. socotrana; 4, Cypripedium Leeanum; 5, Eupatorium ianthinum.

NAMES OF FRUIT.

J. G., Forres.—1, Tower of Glamis; 5, Chaumontel; other specimens rotten or otherwise not identifiable.

J. S., Leamington.—1, Marie Louise; 2, Josephine de Malines; 3, Dutch Mignonne; 4, Swedish Reinette; 5, Royal Jubilee; 6, Egremont Russet.

G. B., Dublin.—See next issue; there is no need to send growths with apples and pears, but the specimens of fruit should be of good average size.

J. F., Suffolk.—1, Gascoigne's Seedling; 2, Gold Medal; 3, Gloria Mundi; 4, Bramley's Seedling; 5, King of the Pippins; 6, Bedfordshire Foundling; 7, Catshead.

W. A., Blisworth.—The pear is Hacon's Incomparable. The seedling apple closely resembles Brabant Bellefleur in appearance, but is not nearly so good in quality as that variety.

CHRYSANTHEMUM GEORGE HEMMING.

I shall be much obliged by your allowing me to correct a mistake made by Mr. E. Molyneux in his "Notes on New Chrysanthemums." He describes George Hemming as promising as a full-sized decorative variety. It is not a decorative variety, but belongs to the exhibition section of the Japanese, and has blooms of large size. It is, in fact, the largest Japanese chrysanthemum that I have raised, and on November 3 it received a first-class certificate from the National Chrysanthemum Society as an exhibition variety. One might well be excused for asking Mr. Molyneux whether he sees all the new chrysanthemums that he writes about. I am anxious that the mistake should be corrected in justice to myself as the raiser, and to Mr. Norman Davis, by whom it was distributed.

G. Mileham.

Evelyn House Gardens, Leatherhead.

Black Currants produce their finest fruit on the young wood, so sufficient of this should be reserved for next season's fruiting, and the surplus shoots pruned to within an inch of their base, and the greater portion of the old wood be cut away. Young suckers which have sprung up from the underground portion of the stem should be well shortened back to encourage them to push forth three or four strong growths, which will produce fruit in the following season.—G. Woodgate.

Early Carrots are much in request in most establishments. A mild hotbed, consisting of sweetened manure and a liberal proportion of leaves should be made, treading the whole firmly down to retain the heat. From six to nine inches of fine and rich soil may be placed thereon. As soon as the heat has settled down to a comfortable temperature sow the seeds in drills at twelve inches apart. The French type of carrots are the most suitable for forcing.—C. Flack.

NOTES OF OBSERVATION.

◆

Gooseberries and Red and White Currants are sometimes left until the spring before being pruned, with the idea of preventing a loss of buds by bullfinches, but I prefer to prune them at this time, and dust the bushes with a mixture of lime and soot a few times during the winter and spring, which makes the buds obnoxious to the birds. The leading growths on these should be left from six to eight inches long, and all the laterals pruned closely in to the cluster of buds, that is to within three-quarters of an inch from the base. Any young shoots which were reserved at the summer pruning for the purpose of replacin gold and worn-out branches should now be shortened to one-third of their length.—GEORGE WOODGATE.

Vines in Pots. — Where these are grown to give early supplies it is time to select those to be forced. Good well-ripened canes of Black Hamburgh, and if a white variety is desired, Foster's Seedling, should be selected. Muscat of Alexandria may be grown well in pots, but the vines must be started at a later period. The vines selected should be pruned at once, and a house facing south is the best for very early forcing, and a structure sunk several feet is perhaps preferable, as it is then much easier to maintain the proper temperature, and without so much fire heat. A slight hotbed, composed of tree leaves, such as oak or beech, will afford just such a gentle heat as is necessary to stimulate the roots into activity. The pots should be plunged to the rim, and, if at all dry, the soil should receive a good watering, and this will suffice for some time. The house should be closed, but fire heat must not be used for a fortnight at least. If there are sudden bursts of sunshine a little air should be given to prevent the temperature rising unduly high. On bright days the rods should be syringed. This produces a genial atmosphere, and should be done early in the afternoon.—W. A. COOK.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

HELPFUL BOOKS FOR

Christmas Presents

Published at "THE GARDENERS' MAGAZINE" Office, 148 and 149, Aldersgate Street, London, E.C.

"It were difficult indeed to think of a more welcome gift to a lover of the garden or greenhouse than a practical work dealing with some phase of that delightful hobby—the care of a garden . . . There are no better books on garden matters than these; they are well written by practical men, well illustrated, and well bound."

If you require a Book on any other Gardening subject, send for our complete Catalogue.

NOTES OF THE WEEK.

Problems in Fruit Culture.

Those who have had any considerable experience in the cultivation of hardy fruits and have achieved success by adopting the orthodox practice and carrying out the several details in a careful manner, can hardly fail to be somewhat disconcerted by the results that have been obtained at the Woburn Experimental Fruit Farm. They will, in planting their trees, have been careful to adapt the depth of the holes to the individual trees, and to make them large enough to admit of the roots being spread out regularly on all sides. They will also also have been careful to make the soil firm about the roots without converting it into a solid mass. They will also have been not less careful to prune moderately and to enrich the soil with a suitable manure when they had reason to believe that it was becoming impoverished by the activity of the roots in taking up nutrient matter for the support of the heavily laden trees. In the results obtained at Woburn in the planting, pruning, and manuring of apple trees we have the suggestion that the care which growers have taken in carrying out these details have been unnecessary. As our report will have shown, Mr. Spencer Pickering, F.R.S., the director of the Woburn Experimental Fruit Farm, exhibited at the second of the two November meetings of the Royal Horticultural Society fruit produced by apple trees with which experiments in planting, manuring, and pruning had been conducted, and accompanying the exhibit was a pamphlet containing a summary of the results that had been obtained. The apples exhibited we learn from the summary, represented, both as regards total weight and size of fruits, the crops obtained during the past fifteen years from dwarf trees on the paradise stock under different treatment. The variety shown was Bramley's Seedling, but similar results, we are informed, were obtained with Cox's Orange Pippin and Pott's Seedling. Three hundred and sixty trees of each variety were planted in 1894 for the purpose of these experiments, a point of some importance as showing that the results have not been based upon the behaviour of a few trees. "The values of the crops were obtained by multiplying the total weight of fruit by the average weight of the individual fruits, and these values were in every case compared with that of the crops from similar trees under normal treatment, expressed as one hundred." Normal treatment is described as planting carefully, cutting back at once, afterwards pruning lightly every year, keeping the ground clean and giving a moderate dressing of a general artificial manure annually. There were four sets of trees in the experiments on planting, and the results are given as follows: Carefully planted, trenched (normal), value 100; carefully planted, untrenched, 209; carelessly planted, and neglected, 13; carelessly planted, and then tended, 105. Those figures show, if they show anything, that at Woburn trenching the ground was not only a waste of effort but injurious to the trees. We do not question Mr. Spencer Pickering's figures or the conclusions he draws from them, but we have a difficulty in reconciling the results obtained at Woburn with those obtained by ourselves in trenched ground, as compared with that dug over to the usual depth, and those that have come under our notice in large numbers of gardens in which hardy fruits are grown with exceptional success. In the experiments in manuring artificial manure or dung was used, the moderate dressing being one of, or equivalent to, twelve tons of dung to the acre. The heavy dressings consisted of two or three (in one case ten) times this amount. The values were: deficient or no dressing, 108; moderate dressing, 100, and heavy dressing, 100. We learn that, although the soil is by no means specially rich, these dressings, during fifteen years, have had no appreciable effect upon the trees or the crops. The results are to us surprising, if not startling, as doubtless they will be to not a few of our readers. We should have expected that trees in a rather strong soil, to which 540 tons of manure per acre had been applied in fifteen years would have made an excessive luxuriant growth, and presented a different appearance to those which had not received manurial assistance. In our experience in both light and heavy soils, there has been a very marked difference between apple trees that have received a little assistance from fertilisers and those which for some reason or other have been left to themselves. There can be no question that apple trees when upon the crab stock are able to extract large quantities of nutrient matter from the soil, as witness the growth of trees in orchards to which but little, if any manure is applied; but the trees with which the experiments were conducted at Woburn were on the paradise stock, which has a different root system. The values in root pruning were: no root pruning (normal), 100; root pruned every fourth year, 44; root pruned every second year, 7; and root pruned every year, 1½. They are not so striking as the others to which reference has been made, and as so well known, the advantages or otherwise of a pruning of the roots depends wholly upon the growth made by the trees. At Woburn one would hardly expect root pruning to be beneficial after being informed that an annual dressing of twelve, twenty-four, thirty-six, or 120 tons of manure per acre had no appreciable effect. In the experimental pruning of the branches, the values were: no pruning, 131; light pruning, 100; rather harder pruning, 71; hard pruning, 28; and summer pruning, 70. From these

MR. W. BATES.

results it appears, according to Mr. Pickering, that the less pruning done, consistent with keeping the trees sturdy and in shape the better. It is also stated that the average size of the fruit has not deteriorated through lack of pruning, whilst the trees have increased in size in proportion as pruning has been reduced. We are opposed to severe pruning of apple trees, but in our experience the best crops are those obtained where the pruning knife is used with moderation and care. Although Mr. Spencer Pickering has not done more than give the results of his experiments, the question he raises is, Should fruit trees be cultivated? and as this is a question that immediately concerns our readers we shall be glad to give publicity to the views of those who have given attention to the cultivation of hardy fruits.

Mr. W. Bates deservedly occupies a foremost position among practical horticulturists on the south-west side of the Metropolis, for while obtaining distinction by reason of his cultural skill and administrative ability in garden management, he has rendered good service in the cause of horticulture. For some years Mr. Bates was gardener at Cross Deep, Twickenham, and in that position he specially distinguished himself as a cultivator of chrysanthemums, and his services were in constant request as a judge at exhibitions of these flowers. He was not less successful as a grower of fruit, both in the open and under glass. Later on Mr. Bates took over the Cross Deep Gardens, and converted them into a market gardening establishment, and this he continues to carry on with the success that has characterised his various activities. As one of the founders of the Royal Gardeners' Orphan Fund, Mr. Bates continues to take an active part in the management of this excellent charity, and he is so seldom absent from the committee meetings that his record must be an extremely good one. This is a point of some interest, because Mr. Bates has for a considerable period fully accepted his responsibilities as a citizen, and taken a leading part in the work of the Twickenham District Council. There is no occasion to give a list of the offices he has held during the period he has been associated with that important body, but it must be said that three or four years since he had the honour of being elected chairman. For twenty years or more Mr. Bates has been a member of the committee of the Richmond Horticultural Society, and there are but few movements that have for their object the welfare of the Twickenham district and its inhabitants in which he does not render yeoman service.

Gift of Micro-Lepidoptera to the Nation.—We learn with much satisfaction that Lord Walsingham has generously presented his remarkable collection of Micro-Lepidoptera, or smaller moths, to the Natural History Museum. The collection which by Lord Walsingham's munificence comes into the possession of the nation has no equal in any part of the world as regards the number of species, and the specimens are in the best possible state of preservation. Eight years ago, when the collection was examined by one of the museum officials, it was officially reported that it contained 200,000 specimens. Large additions have been made to the collection since 1901, and the number of specimens is approximately now 260,000. To appreciate the importance of the gift, it is necessary to understand that the collection is the outcome of about 30 years unremitting endeavour and a large outlay on the part of Lord Walsingham, and also that by its transfer from Merton Hall to Cromwell Road, nearly 45,000 species of the smaller moths will be added to the national collection of these insects. Lord Walsingham has also presented his library dealing with the literature of the micro-lepidoptera.

Retirement of Lt.-Colonel J. J. Sexby, V.D.—We understand that Lt.-Colonel Sexby, who was appointed to the general superintendence of the Parks and Open Spaces under the London County Council about seventeen years ago, is retiring from that position in February of 1910. A good deal of speculation is going on concerning Colonel Sexby's successor, and the names of those put forward as possible are not a few. We can but hope that someone with considerable practical experience in horticulture will obtain the appointment.

November in the North.—The month of November, writes our Aberdeen correspondent, will be one to be remembered in the North of Scotland. Seldom has such damage been done to crops in that month. As is well known, a large breadth of country on the north-eastern side of Scotland depends a great deal on the potato crop. This crop has suffered severely from the extreme weather, and, although a few growers were successful in securing their produce, still a large acreage was exposed to the frost. As the result nearly one-third of the crop of potatoes will either have to be used for cattle feeding or go to waste. The temperature experienced during the month varied much. It was very mild on the 3rd and 4th, but there was an intense frost on the 15th, 16th, and 17th, and also some of less severity on a few other days. Snow fell on the 13th, 14th, and 15th, covering the ground to the extent of from four to five inches, and did not quite disappear till the 21st. The frost attained its maximum severity on the 16th and 17th. A good thermometer placed on the ground upon the snow on the 17th went down 24 degrees below the freezing point, while at Alford, the Midlands of Aberdeenshire, it fell on the same date 11½ degrees lower. According to the records, a severe frost, similar to that which occurred this year, was experienced in November, 1885, and, strange to say, it happened on the identical dates of the month.

Metropolitan Public Gardens Association.—At the monthly meeting of this association it was announced that trees will be planted and maintained by the Office of Works in the thoroughfares in front of the Victoria and Albert Museum; and that a legacy of £300 had been bequeathed to the association by Mr. E. L. Beckwith. It was agreed to provide the Middlesex County Council with a plan for the garden of Hogarth House, which has recently been presented to that body.

"Sprain" in Potatoes.—In the November issue of the "Journal of the Board of Agriculture," considerable space is devoted to diseases of potatoes, and special reference is made to specimens of potatoes sent to Kew suffering from a disease called "sprain." It is therein stated that perhaps the most constant symptom is the presence of small rust-coloured spots, scattered in greater or less abundance throughout the flesh. This appearance agrees with what is known as "internal disease" in the South of England, which, again, possesses many points in common with the disease of apples called "bitter pit," the precise nature of which is still obscure. In some examples mycelium is present in the tissue of the brown spots, and in such instances, under proper treatment, "winter-rot," caused by Nectria solani (Reinke), always develops. On the other hand, in some examples no mycelium can be detected, and, however long such specimens are kept under favourable conditions, no fungus appears. Five tubers said to show "sprain" were planted in the experimental ground at Kew. Each tuber was cut in two, and each one showed rusty patches in the flesh. Three months after planting two of the hills showed no haulms above ground, and, on digging down, the "sets" were found to be almost destroyed by winter-rot. On lifting the remainder at the end of September, the crop produced by four of the "sets" was found to be infected with "sprain"—i.e., the flesh showed small spots of a brown colour. Every tuber was cut and examined, and there was not a single one exempt. The old "sets" of these four roots were in a deliquescent condition, and teeming with the conidial form of winter-rot. The four remaining "sets" produced a perfectly clean crop. The "sets" were shrivelled, but showed no signs of winter-rot. This account agrees with what had previously been observed at Kew, namely, that the brown spotting of potato tubers is in some instances an incipient stage in the development of winter-rot, and as it is not at all probable that two distinct diseases presenting similar symptoms — rust-coloured spots—are present in potato tubers, it must be assumed that in some instance the disease is arrested in its preliminary stage.

The Seed Trade and Analysis.—At the annual meeting of the Seed Trade Association held at the Hotel Cecil on the 6th inst., with Mr. Edward Sherwood, the president, in the chair, the principal subject for discussion was the appointment of an analyst for the purpose of testing the purity and germinative powers of seeds for the members of the association. This some of the speakers felt would enable the members to know better what they were selling, and thus increase the confidence between them and their customers. Other speakers urged the desirability of deferring the appointment of an analyst for a time, but Mr. H. Le May said that the practice of sending seeds to Copenhagen or Zurich to be tested was far from satisfactory. In the result, it was decided on a motion proposed by Mr. Summer and seconded by Mr. Bell to leave the matter over for the present, and in the meantime to communicate with Professor Biffen, of Cambridge, for the purpose of ascertaining whether he would undertake the analytic work of the association.

The Special Gold Medal handed to Mr. H. J. Jones in the course of the prize distribution at the recent dinner of the National Chrysanthemum Society was presented to the society by Mesrs. Clay and Son, and offered for the best exhibit in the show. It is of interest that while no stipulation was made by Messrs. Clay and Son as to methods of culture, their well-known fertiliser was freely used in the production of the fine specimens of which Mr. Jones's display consisted.

Professor R. H. Biffen, M.A., Professor of Agricultural Botany at the University of Cambridge, has been appointed consulting botanist to the Royal Agricultural Society in the place of Mr. William Carruthers, F.R.S., who has resigned. The latter has held the position since 1871, and, in recognition of his valuable services, the Council of the R.A.S. has elected Mr. Carruthers an honorary Fellow and granted him a pension of £100 per annum.

The Value of Flower Shows.—In an editorial article dealing with the flower show recently held in the city, "The Chicago Tribune" gives the following: "The flower show has come to mean more than an exhibition of beautiful plants. To its æsthetic and artistic value it is adding more and more every year a practical and utilitarian worth. It would be impossible to weigh exactly the increased incentive towards home beautification which hundreds of Chicagoans find in each exhibition, but one seeing the crowds at the show, and observing the interest which they take in the displays, is conscious that a tremendous influence is exerted. When Chicago finally succeeds in its now painful search for rounded and complete municipal beauty it will be because each individual has contributed according to his ability and his opportunity, and these flower exhibitions are doing much to discover the individual ability and the individual opportunity. The horticultural society is striving consciously to bring this about, and not the less effectively because of the element of personal interest which enters into the efforts of flower sellers to create flower lovers."

Cider Orchards.—A correspondent of the "Times," in an interesting contribution on cider prospects for the season 1909-10, states that cidermakers are beginning to realise the necessity for substituting as quickly as possible for the old, worn-out orchards, young, scientifically-planned ones. The distribution of 2,500 young standard trees to the county councils of the principal cider-making counties by the National Fruit and Cider Institute last autumn, for the purpose of establishing experimental and trial vintage orchards, has done much to foster interest in the culture of vintage fruit. Attention is being paid to the vintage characters of the varieties selected for planting, and the quality of the cider in future years will benefit accordingly. The growers are also becoming alive to the fact that an orchard cannot be expected to be profitable if left to look after itself. Concurrently with the increased attention paid to the trees may be observed the greater care with which vintage fruit is being dealt with. The fruit also is no longer handled carelessly and roughly by the more progressive growers, so that it can now be stored for a longer period without decomposition, and can be brought to the press in better condition. There are thus indications that the various operations connected with cider-making are beginning to receive the care and attention required for complete success, and that those connected with the industry are realising the necessity of proceeding upon scientific lines.

Atmospheric Impurities and Vegetation.—In the course of a paper on "Air Pollution by Smoke," by Professor J. B. Cohen and Mr. A. G. Ruston, read at the Health Congress at Leeds, the authors pointed out that it is the tarry matter in the soot which causes the latter to adhere to and blacken buildings and vegetation. It is sometimes stated that it is the domestic smoke rather than industrial smoke which is injurious to plant life, on account of its higher content of tar. There is a certain justification for this statement, for the percentage of tarry matter in the total solid impurities is highest in the residential and lowest in the industrial areas, varying from 18 per cent. in the former to 4 per cent. in the latter. When, however, account is taken of the total tarry matter deposited each year, the industrial centres are responsible for the greater quantity, which reaches in some cases ten times the amount in the residential districts. The total sulphur, either as sulphurous or sulphuric acid, is everywhere high, but particularly in and near the chief manufacturing areas. It is the sulphurous acid which imparts to town fog its choking and irritating effects. The large amount of this acid present in fogs may be gauged from the fact that the hoar-frost collected during the dense fog of January 27 contained acid corresponding to 10.29 parts per 100,000. To show the injurious effect of sulphuric acid upon vegetation, Timothy grass was sown on May 12, 1908, in boxes 1ft. square, the soil being uniform. The seed was watered at a rate corresponding to the average rainfall of 25 inches with water containing different amounts of sulphuric acid. In the case of Leeds rain water and of those waters containing a higher degree of acidity, germination was distinctly checked, and the delicate green of the young grass quickly changed to yellow or brown. Grasses watered with water containing 32 parts per 100,000 were killed in a little more than three months, and with 16 parts per 100,000 in less than a year. Chlorides are found in large quantities in the industrial centres, where, expressed as common salt, they sometimes reach 3 or 4 cwt. per acre, a quantity which must be prejudicial to vegetation.

FRUIT TREE PLANTING.

The results obtained at the Woburn Experimental Fruit Farm by Mr. Spencer Pickering in the planting of fruit trees are of much interest, and the methods adopted are deserving of the fullest consideration. A little reflection will, in my opinion, bring clearly to the mind that too much value is set upon the methods generally advocated, especially when we see results obtained by what are condemned as "slipshod" systems of planting. For instance, I have planted thousands of forest trees, such as larch, pines, etc., and taken much pains to dig out the holes, breaking up the soil, and spreading out the roots carefully, and expecting and obtaining satisfactory results. On the adjoining estate planting was going on at the same time under what I thought very indifferent conditions. A triangular cut was made in the turf with a spade, the spit hoisted on one side sufficiently to enable the roots to be crammed into the hole under the spade, the turf fell back into its place when the spade was withdrawn, and the planting completed by a stamp with the heel to make the soil firm. The trees were neither upright or lying down, but they righted themselves in due course, and have grown equally well, or better, than those taken so much pains with thirty years since. Ample time has passed enabling one to note the result of both methods, and I am forced to the conclusion that we can be too particular in methods of planting. In fruit tree planting I think it is the same.

How the trees are managed afterwards is the all-important point in achieving success. After seeing forest trees grow so amazingly in very firm soil, it would appear we are inclined to leave the soil about fruit tree roots much too loose. In firm soil the roots do not run all over the place, as it were, at once, but they grow more slowly, and it is reasonable to suppose the growth of the tree will be more in accordance with root development.be much firmer, and, consequently, in a condition to give good results when the time to bear fruit arrives.

E. Molyneux.

TREES AND SHRUBS FOR WATER GARDENS.

The prominence which water obtains in modern gardening, when contained in formal tank or basin, or in natural pond or lake, places immense possibilities in the designer's hands, so that when skilfully introduced it imparts a degree of beauty and interest to a landscape that, under less careful treatment, might pass as commonplace. A well-watered stream is an inheritance, both to an estate and to the planter; its benefits directly appeal to the latter, beside the waterway and upon the banks he augments the woodland's charm, wedding the beauty of the exotic with that of our own wildlings. In the water flourish iris and meadow sweet, reeds and grasses, willow herb and lythrum; these are watched over from the banks by countless flowering trees and shrubs, while at varying seasons the woodland glades bedeck themselves with colours, due to the presence of many kinds of bulbous plants.

The question of suitable vegetation is one that amply repays mature consideration; as already indicated, the arborescent growth "in situ" comprising subjects indigenous to the locality, represented by deciduous hardwoods and evergreens, should, as far as practicable, remain. The undergrowth, where present, will consist of smaller native trees and shrubs, among which the mountain ash and sloe may be named as typical of the highest beauty in wild plants. Broad masses of trees, composed of a few distinct species, to form the main plantings, are always effective. Beech, sycamore, and Austrian pine attain to full development upon thin limestone soil; their close set branches and abundant leafage making them valuable as shelter subjects. Birch and Scot's fir succeed on light, dry soils, and are frequently found luxuriating on steep hillsides and glens. Elm, oak, and chestnut prefer deep, cool loams, while ash, alder, and willow frequent damp positions in hollows and by watercourses. These may fittingly be regarded as the fundamental species in planting water gardens, and when used in conjunction with larch and the various pines (coniferæ), and planted upon economic lines, will form, in the aggregate, an ideal background against which plants of an ornamental character will appear in striking relief. To many the true pines of the Northern forests appeal in their picturesque grandeur and beauty; indeed, few woods can compare with those in which the Stone, Corsican, or Scotch pine predominate, and where the ground is extensive that pure woods of these can alternate or lie side by side with the ordinary run of hardwood plantings, then a landscape of more than ordinary interest results.

It is, however, among deciduous trees that the planter has greatest latitude for producing colour effects, as here the accumulated wealth of three Continents lie to his hands, and it is noticeable of our average climate that it admits of healthy development of the majority of these exotics, so much so that in most seasons we are able to appreciate and enjoy their beauty to the fullest. The American acers and oaks, amelanchiers, cratægus, catalpa, gymnocladus, liriodendron, liquidamber, robinias, and walnuts, to some extent indicate the wealth of flowering and foliage trees capable of doing excellent service in water gardening: in some respects these are rivalled, and as flowering subjects probably excelled by the cherries, peaches, prunus, and pyrus from China and Japan, yet it is impossible to dispense with any of them, and until we banish from our gardens such coarse things as cherry laurel, privet, and box, there need be no faltering of that spirit which discriminates between things coarse and refined in gardening, choosing that which most delights the eye. A group of flowering cherries would be singularly incomplete were the double form of our native gean unrepresented; as a specimen it is marvellously effective, the flowers in their absolute purity being suggestive of a winter snow scene.

Of trees which grow in the wettest parts Taxodium distichyum and the Babylonian willow are well known examples: of the latter the annularis form is a striking subject. There are also dwarf willows, like Salix alba britzensis, alba, vitellina, canadensis, and dahpnoides, which, if pollarded every year in spring will produce a thicket of slender rods with highly coloured bark, and form conspicuous objects in the winter landscape.

Dry banks and sandy wastes can always be profitably planted with leguminous subjects, of which the broom and gorse are well known instances. To the same family belong Cytisus Andreanus and its improved forms, Mayfly, Firefly, and Butterfly; these are forestalled in their flowering season by Cytisus præcox and its forms, and are succeeded by C. Carlieri in midsummer, and the sweet-scented Spartium junceum carries its golden blossoms well into autumn. Like the foregoing, Colutea arborescens, istria, and bullata are tall-growing subjects, which, with indigofera, flower from midsummer till autumn. Among dwarf-growing and prostrate brooms the best include Beani and Kewense, both hybrid brooms of rare beauty, Schipkensis, and in Genista pilosa, prostrata, radiata, tinctoria fl. pl. we have good subjects for draping rockwork. Genista hispanica is an extremely neat and compact shrub, and quite indispensable as a subject for covering banks. Where-ever leguminous shrubs succeed there also will the rock sprays or cotoneasters; the branches of adpressa, congesta, and rupestre are sensitive to contact, as they follow the surface of the ground. Cistus, olearia, and tamarisks are other genera suitable for a like position. Evergreen shrubs play an important part in water gardening: many of them are first-rate flowering subjects, while their leaves are generally attractive, and in winter they present a furnished appearance. Viburnum tinus and Garrya elliptica are good midwinter flowering plants; aucubas, pernettyas, skimmias, and Arbutus unedo are conspicuously bright at that season by reason of their coloured fruits. Gaultherias, kalmias, euonymus and bamboos illustrate the variety of evergreens that succeed under the shade of trees. Azara microphylla is a distinct evergreen, producing small yellow flowers in May, which load the air with a vanilla-like perfume. Choisya ternata has white, orange-like flowers in clustered heads. Osmanthus ilicifolius purpureus, Berberis Knighti, Daphniphyllum glaucescens, escalonias in variety, benthamia, carpentaria, ceanothus, daphne, ligustrum are typically representative of the best evergreen shrubs.

Of deciduous shrubs spiræas are essentially at home beside water; their flowering period extends from quite early in spring till late in autumn. Arguta forms a small bush, densely twiggy; canescens, prunifolia fl. pl., and Reevesiana all make large bushes with graceful arching branches; discolor is fastigiate in growth, but when in flower it appears like a cascade of blossom; ossurgens and Aitchisoni are strong growers, with pretty, compound, rugose leaves, both of which flower in late summer. From midsummer till autumn the various forms of Spiræa callosa produce their flowers, the variety Anthony Waterer being the best. THOMAS SMITH.

Walmsgate Gardens.

EXHIBITION ROSES.

An Amateur's Analysis.

It is helpful to the exhibitor to keep a record of the roses he stages at the exhibitions; it is a method of testing the value of a rose for exhibition purposes. As has been stated in previous years, it has been our practice to take down the names of the roses staged **by us as soon as the judging is over**, and catalogue them at the close of the season. The exhibitions attended this year were fewer than usual, partly owing to the lateness of the season. We could not show before July, and even then it was frequently a question of "Hobson's choice," the difficulty being to obtain the varieties; the roses were not at their best until the month of August. The subjoined list is naturally affected both by the lateness of the season and by the number of plants of each variety grown. On the other hand, the list of roses tabulated is not confined to those exhibited on a single day, but of those staged at eight of the principal shows, ranging from July 2 to September 16.

It is the fashion in some quarters to regard exhibition roses as unsuitable for garden cultivation, but a glance at the list below will show that the first eight on the list are good roses for the non-exhibitor. Exception, perhaps, might be taken to Bessie Brown, because of the blooms hanging their heads and being impatient of wet. But surely we can forgive its pendant habit, knowing that the finest flowers of this variety are produced this way. And as to the wet, a shade or two will meet this difficulty. The growth of Bessie Brown is so active, and it is such a free and continuous bloomer, that lovers of roses for the garden and house decoration would be ill-advised to reject it.

JOSEPH H. PEMBERTON.

GRAPE MELTON CONSTABLE

We seldom hear or see anything of this grape now, yet it came out with a big flourish of trumpets several years ago, and many growers, myself included, thought it might become a useful addition to popular varieties. I am afraid, however, that many have been disappointed with its quality and behaviour. With one or two other professional men I tasted this grape when the last of the R.H.S. fruit shows were held at Chiswick, and from the flavour of the berries thought it would be worth growing. We could not ascertain at the time whether the vine which produced these bunches was grown on its own roots or inarched. From my experience of this grape I should say the bunches were cut from an inarched vine, as there was a flavour in the berries that I have never found in the grape when grown on its own roots.

A year or two after the Chiswick Show I exhibited some good bunches at one of the principal shows in the West of England. They were much admired, and the result was that many vines were planted in that part of the country. The flavour of these grapes differed from those tasted at Chiswick, but the berries were larger.

I have grown the variety in early, late, and mid-season houses, but must confess it has not come up to my expectations, in fact, on its own roots I do not consider it any better than Gros Colmar. Inarched it is worth cultivating, and those wishing to grow this variety will find that the most satisfactory way of doing so. So grown, the flavour is improved, it colours well, and the berries are large, and those who like to have a big-berried bunch for the table will find it useful for the purpose. It would be interesting to know the parentage of this grape, for, if a sport, it appears to me to have reverted, and if a seedling it does not show much trace of good parentage.

T. H. SLADE.

BAYFORDBURY.

GARDENS ROUND HERTFORD—II.

Bayfordbury.

For a long period Bayfordbury, the fine seat of H. Clinton Baker, Esq., has been remarkable for the extent, beauty, and interest of its gardens, and for the distinctness and attractions of its arboricultural features. One might go back for at least a hundred years and find evidence of strenuous endeavour on the part of the owner to enrich the gardens and grounds with the most beautiful and interesting trees and shrubs that had been introduced to this country. At later periods may be found proofs of a desire to maintain the fame of the seat for its horticultural features, and at the present time the visitor will not be left in any doubt as to the keen interest which the present owner takes in his possessions. Mr. H. Clinton Baker is the local secretary for the Hertford district of the National Rose Society, and it is not, therefore, surprising to find a large space devoted to a rose garden, and plants in so vigorous a condition as to suggest their capability to produce flowers of so high a quality as to render good service in a keen competition. Mr. Clinton Baker is not less interested in alpine plants, and is so well acquainted with the finer kinds that a walk through the well-furnished rock garden under his guidance will produce so delightful an impression upon those who are interested in rock plants that it will not be readily forgotten.

While devoting close attention to his roses and rock plants and the gardens generally, Mr. Clinton Baker takes an especial interest in the arboricultural features of his extensive estate, and particularly in the magnificent cedars of Lebanon and other trees that constitute so great a charm of the pleasure grounds, and the pinetum that was formed by his grandfather, W. R. Baker, Esq., early in the last century. Evidence of the interest that is being taken in the coniferous trees at Bayfordbury is found in the fact that Mr. Clinton Baker has added all the finest of the coniferous trees of recent introduction to the pinetum, and has written an important work relating to conifers. This is published under the title of "Illustrations of Conifers," and has special reference to the trees grown in the Bayfordbury collection.

Of much interest to the tree-lover are the ten fine trees of the Cedar of Lebanon, which were planted in the pleasure grounds in 1765, to commemorate the building of the mansion. These, it may be mentioned, were nine years old at the time of planting, and had been raised by the Rev. W. Uvedale, son of Dr. Uvedale, from seed of the historic old cedar in the Palace grounds at Enfield, which was planted by the last-named about one hundred years before. The Enfield cedar, one of the oldest of the trees of its kind in the United Kingdom, was, according to "Trees of Great Britain and Ireland," supposed to have been raised by Dr. Uvedale from seed given him by Evelyn, but the evidence on which this supposition is based, is of the slenderest, and it should be remembered in connection therewith that Evelyn makes no mention of the Cedar of Lebanon in his "Silvia," which was published in 1664. However that may be, the Bayfordbury cedars are remarkable for their splendid development, and are of considerable interest from the fact that an accurate account has been kept of their rate of growth, showing girth since 1790. The figures relating to all the trees are of interest, but for the present purpose it will suffice to give the rate of the increase in the girth of two, the figures being taken from Mr. Clinton Baker's book:

	No. 3 at 5ft.		No. 4 at 5ft.	
	ft.	in.	ft.	in.
1790	4	10	3	11
1804	7	0	6	0
1825	11	1	9	6
1837	13	0	11	2
1863	16	2	14	6
1878	18	0	16	7
1900	19	5	18	0
1907	20	0	18	11

The average height of the trees is 87ft.

It is possible these cedars, which were then 77 years old, induced W. R. Baker, Esq., the grandfather of the present proprietor, to give his attention to coniferous trees, but whether that was the case or not, the fact remains that he had so strong a predilection for them that in 1837 he commenced the formation of the pinetum, which now has for many years formed so important a feature of the Bayfordbury grounds. He selected a site on the hill on the far side of the park, about half a mile distant from the mansion. The site has a western aspect, and to shelter the trees from the easterly and north winds, a belt was formed on the east side with Pinus austriaca and P. larico. The trees with which the pinetum was furnished were selected in consultation with J. C. Loudon, and they all made excellent progress until the winter of 1844, when 37 degrees of frost were experienced, and many of the Mexican kinds were killed. One might give a long list of the species that are now represented by specimens in a high state of development, but it must suffice to say that in the collection is a tree of Pinus ponderosa that was planted in 1838, and is now over 100ft. high, and has a girth of 9ft. 7in., and the specimen of Abies orientalis is of great height and perfect in contour. Since Mr. H. Clinton Baker's succession to the estate, he has enriched the pinetum with a considerable number of beautiful species that have been introduced to this country within a comparatively recent period, and as these are now well established and in a thriving condition they promise to add greatly to the interest and attractions of the collection in a few years hence. Very interesting are the three specimens of the dwarf growing Pinus pumila, which was sent from Japan to this country by Captain L. Clinton Baker, R.N. Four plants were sent, and of these one is in the Royal Gardens, Kew. Captain Clinton Baker was the first to send from Japan to this country dried specimens of Pseudotsuga japonica, of which living plants are now growing freely in the pinetum here.

FAMOUS CEDARS, BAYFORDBURY.

In returning from the pinetum to the pleasure grounds, it soon becomes evident that they are especially rich in the choicer kinds of trees and shrubs. In area the grounds are proportionate to the stately mansion, and on these great breadths of closely-shaven lawn are deciduous and evergreen trees of stately proportions, and associated with them and occupying positions specially adapted to their requirements, are many of the choicer kinds. These include such beautiful subjects as Eucryphia pinnatifida, Carpenteria californica, Cæsalpina japonica, Davidia involucrata, remarkable for its large white bracts, Sciadopitys verticillata, Azara microphylla, and the beautiful and rare Rhododendron campylocarpum, and R. Thomsoni. Noteworthy also are Bignonia grandiflora, which, trained over the front of the mansion, grows freely and blooms profusely; a fine specimen of the Judas Tree, a large example of Magnolia grandiflora, which annually produces a wealth of its large, pure white fragrant flowers; Rhus cotinus, one of the largest of the examples that have yet come under the notice of the writer, Arbutus Menziesi, equally remarkable for its yellow fruit and coffee-coloured bark, and Juglans cinerea, or the grey walnut, which has a height of 35ft.

On the south side of the grounds, and occupying a somewhat secluded position is a charming rock garden, in which are many of the most beautiful of the denizens of the Alps in a thriving condition. This garden, as will be seen from a glance at the accompanying illustration, is simple in design, but in every way suitable for the successful cultivation of a comprehensive collection, and admirably adapted to the display of their distinctive charms to the best advantage. To the writer this rock garden is of special interest, as a proof that a large collection of the finest of the alpine plants may be grown to the highest perfection and fully enjoyed in a garden in which but a very small quantity of rock is used. At no great distance from the rock garden is that devoted to roses, and the beds, pillars, and festoons of these fragrant flowers show that the relative merits of varieties and their cultural requirements are fully understood by Mr. Clinton Baker and Mr. O. Catling, his able gardener.

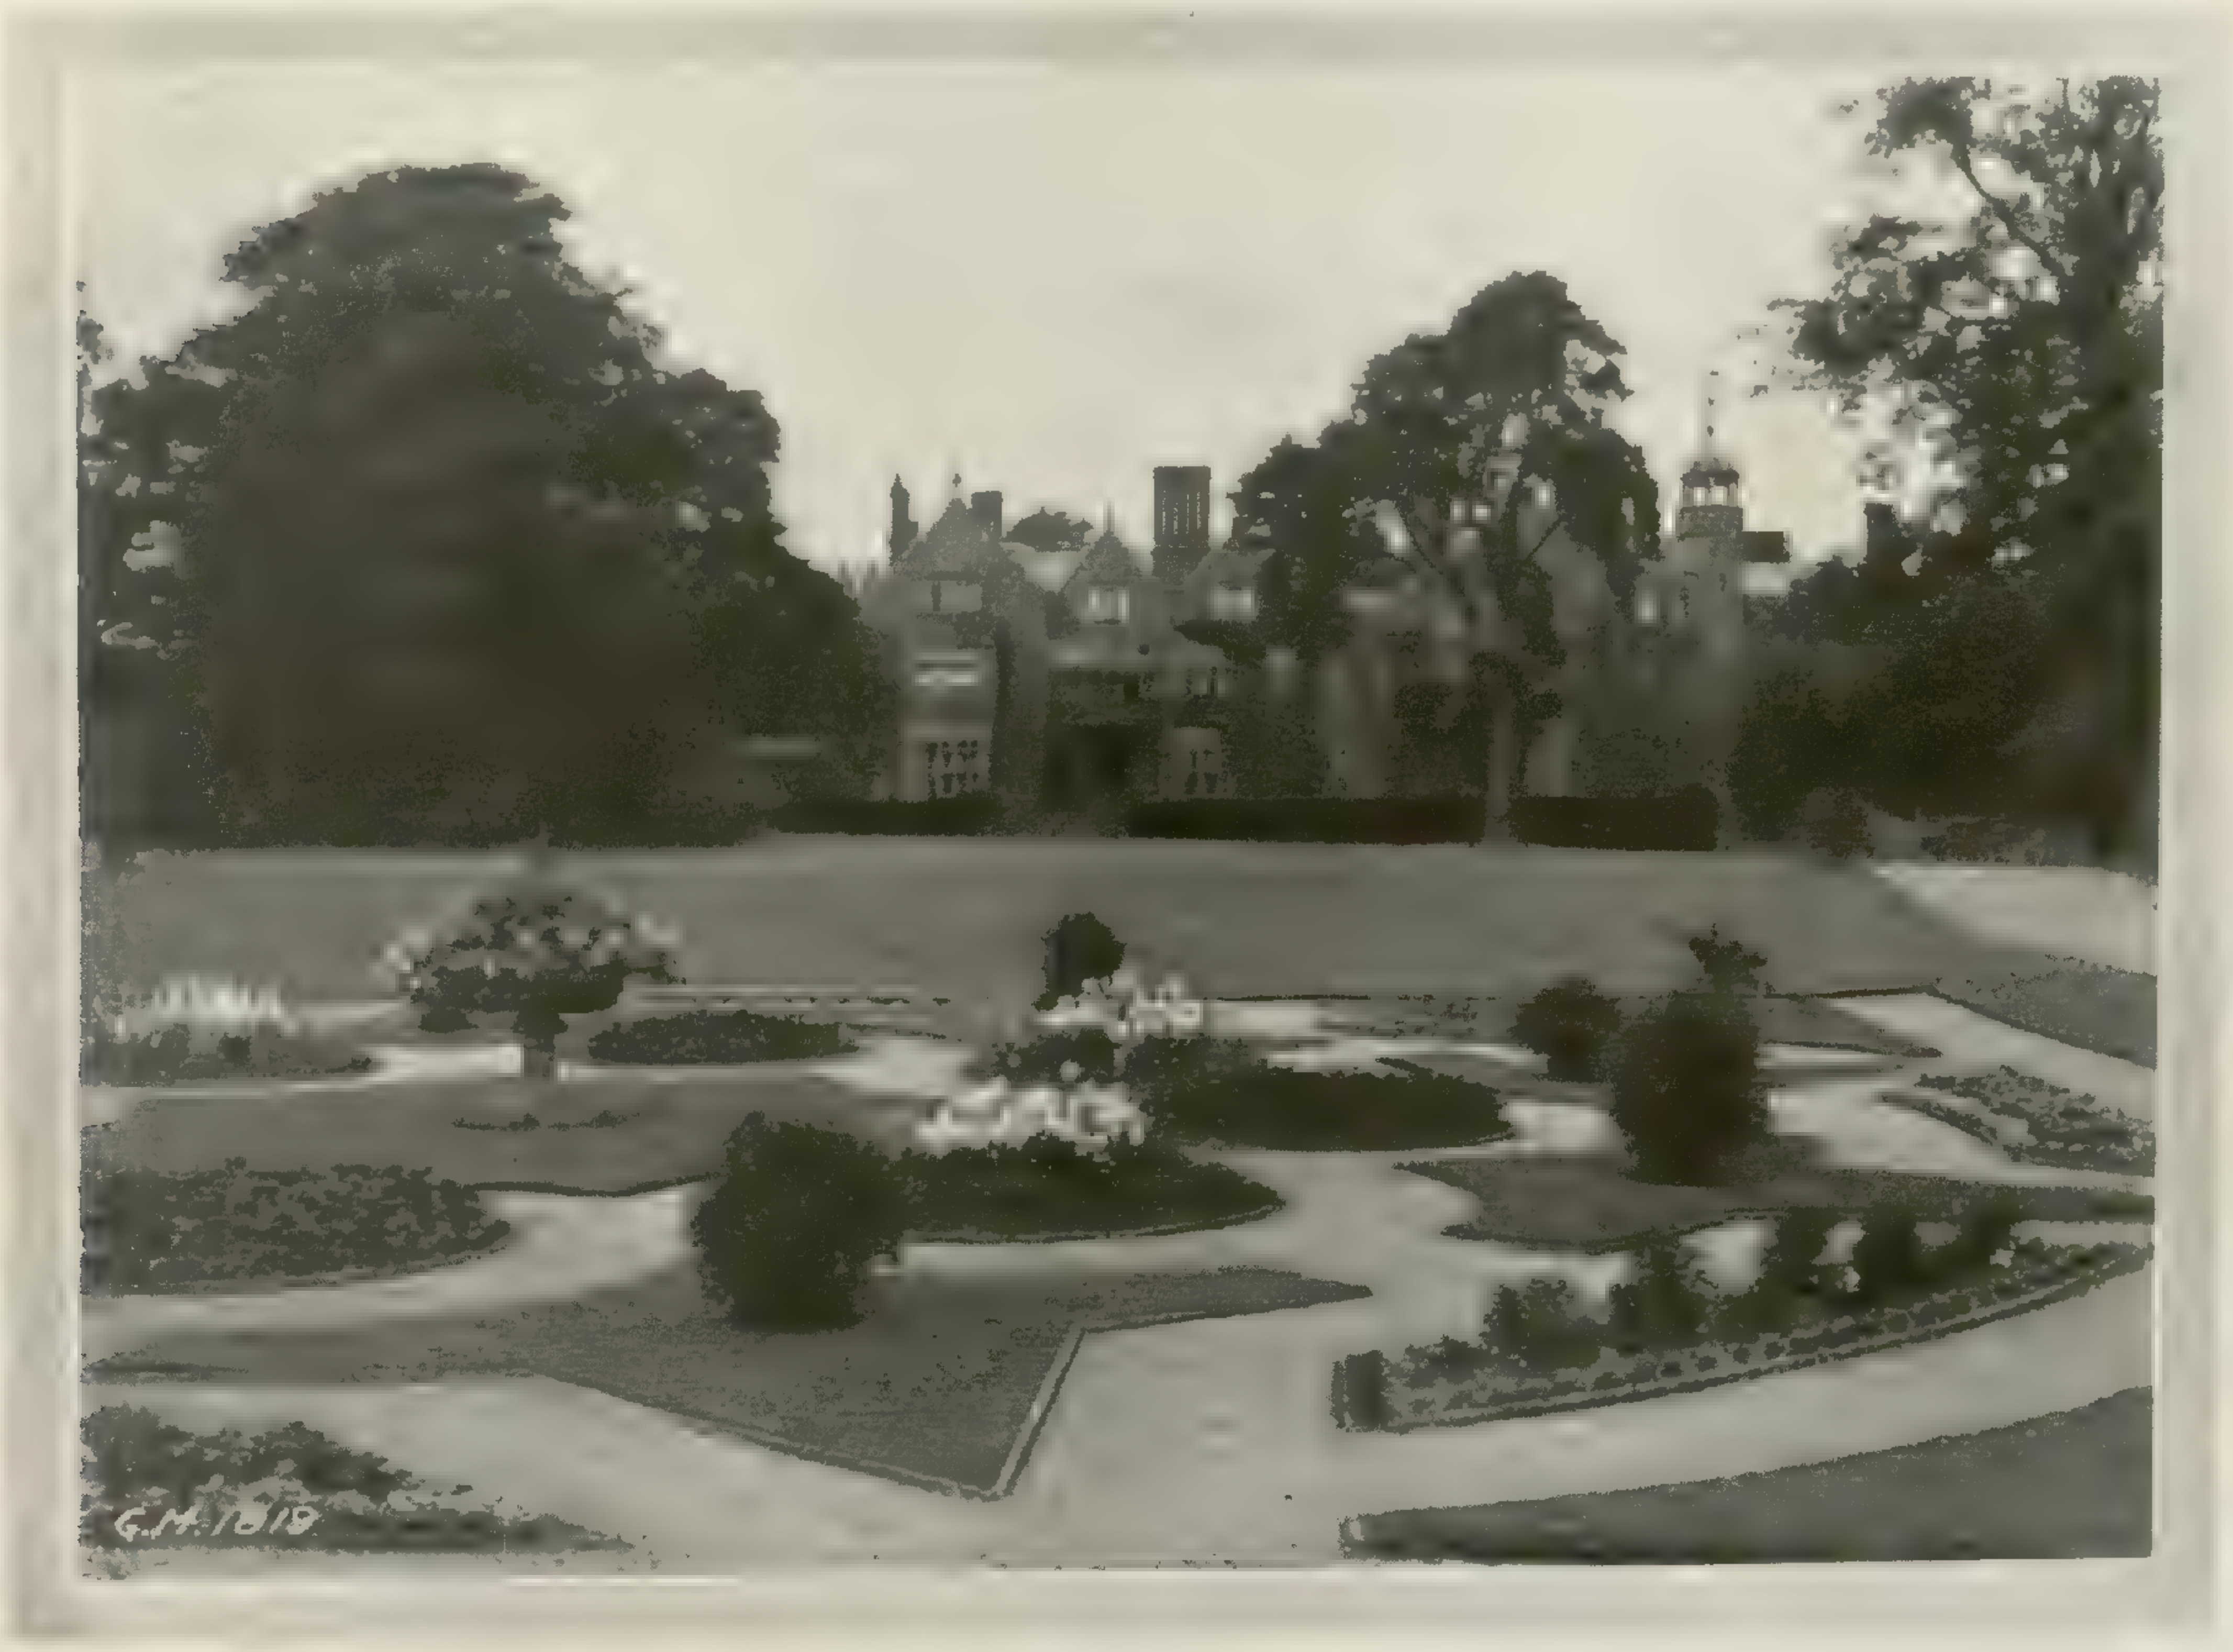
The orchard house at Bayfordbury will strongly appeal to those who are concerned with the cultivation of choice fruits, because of its usefulness and the success achieved by Mr. Catling in its management. The structure is 80ft. long, 12ft. wide, 10ft. high at the back, and 6ft. at the eaves, and is unheated except that a few small oil stoves are used when the trees are in bloom. The trees are mostly grown in pots, and the fruits include Alexander, Alexandra Noblesse, Barrington, Crimson Galande, Dymond, Early York, Gladstone, Golden Eagle, Hale's Early, and Sea Eagle peaches; Lord Napier, Pine Apple, River's Early, and Spenser, nectarines; Early Rivers' and Governor Wood cherries; and Belgian Purple, Grand Duke, and Oullin's Golden Gage plums. With this selection an abundant supply of peaches and nectarines is obtained from early in July till the middle of October; the first of the peaches to reach maturity is Alexander, and the last Golden Eagle. The cherry trees are taken out of doors when the fruit has been gathered, but the other trees remain under glass throughout the year, some of the peach trees being 30 years old, and, in common with those of the others, have borne good crops annually.

Goldings.

Between one and two miles to the north of Hertford is Goldings, the seat of the Hon. Mrs. Smith, which has long enjoyed considerable fame for the extent and high keeping of its gardens, and certainly at no period has the fame been higher than at the present time. One can speak with something, more than the usual degree of confidence upon this point, for many years have elapsed since the writer first made his acquaintance with this domain. At that time the mansion was within a quite short distance from the high road that intersects the property, but since then the old mansion has been replaced by a new one, and by setting it farther back to the south-east, and diverting the road to the north, an immense improvement has been effected, and greater privacy has been given to the largely extended grounds. Not the least of the improvements has been the widening of the river

ROCK GARDEN, BAYFORDBURY.

that passes through the estate on its way to effect a junction with the Lea, and bringing it into greater prominence in the prospect obtained from the mansion and the high ground contiguous thereto. Beautiful as is the scenery of Hertfordshire, it is extremely doubtful whether a more delightful landscape could be found than that formed by the meadows and woodlands that extend from the boundary of the pleasure grounds for a distance of several miles in a southerly direction. The writer is well acquainted with the county, and knows of none that can surpass it in loveliness.



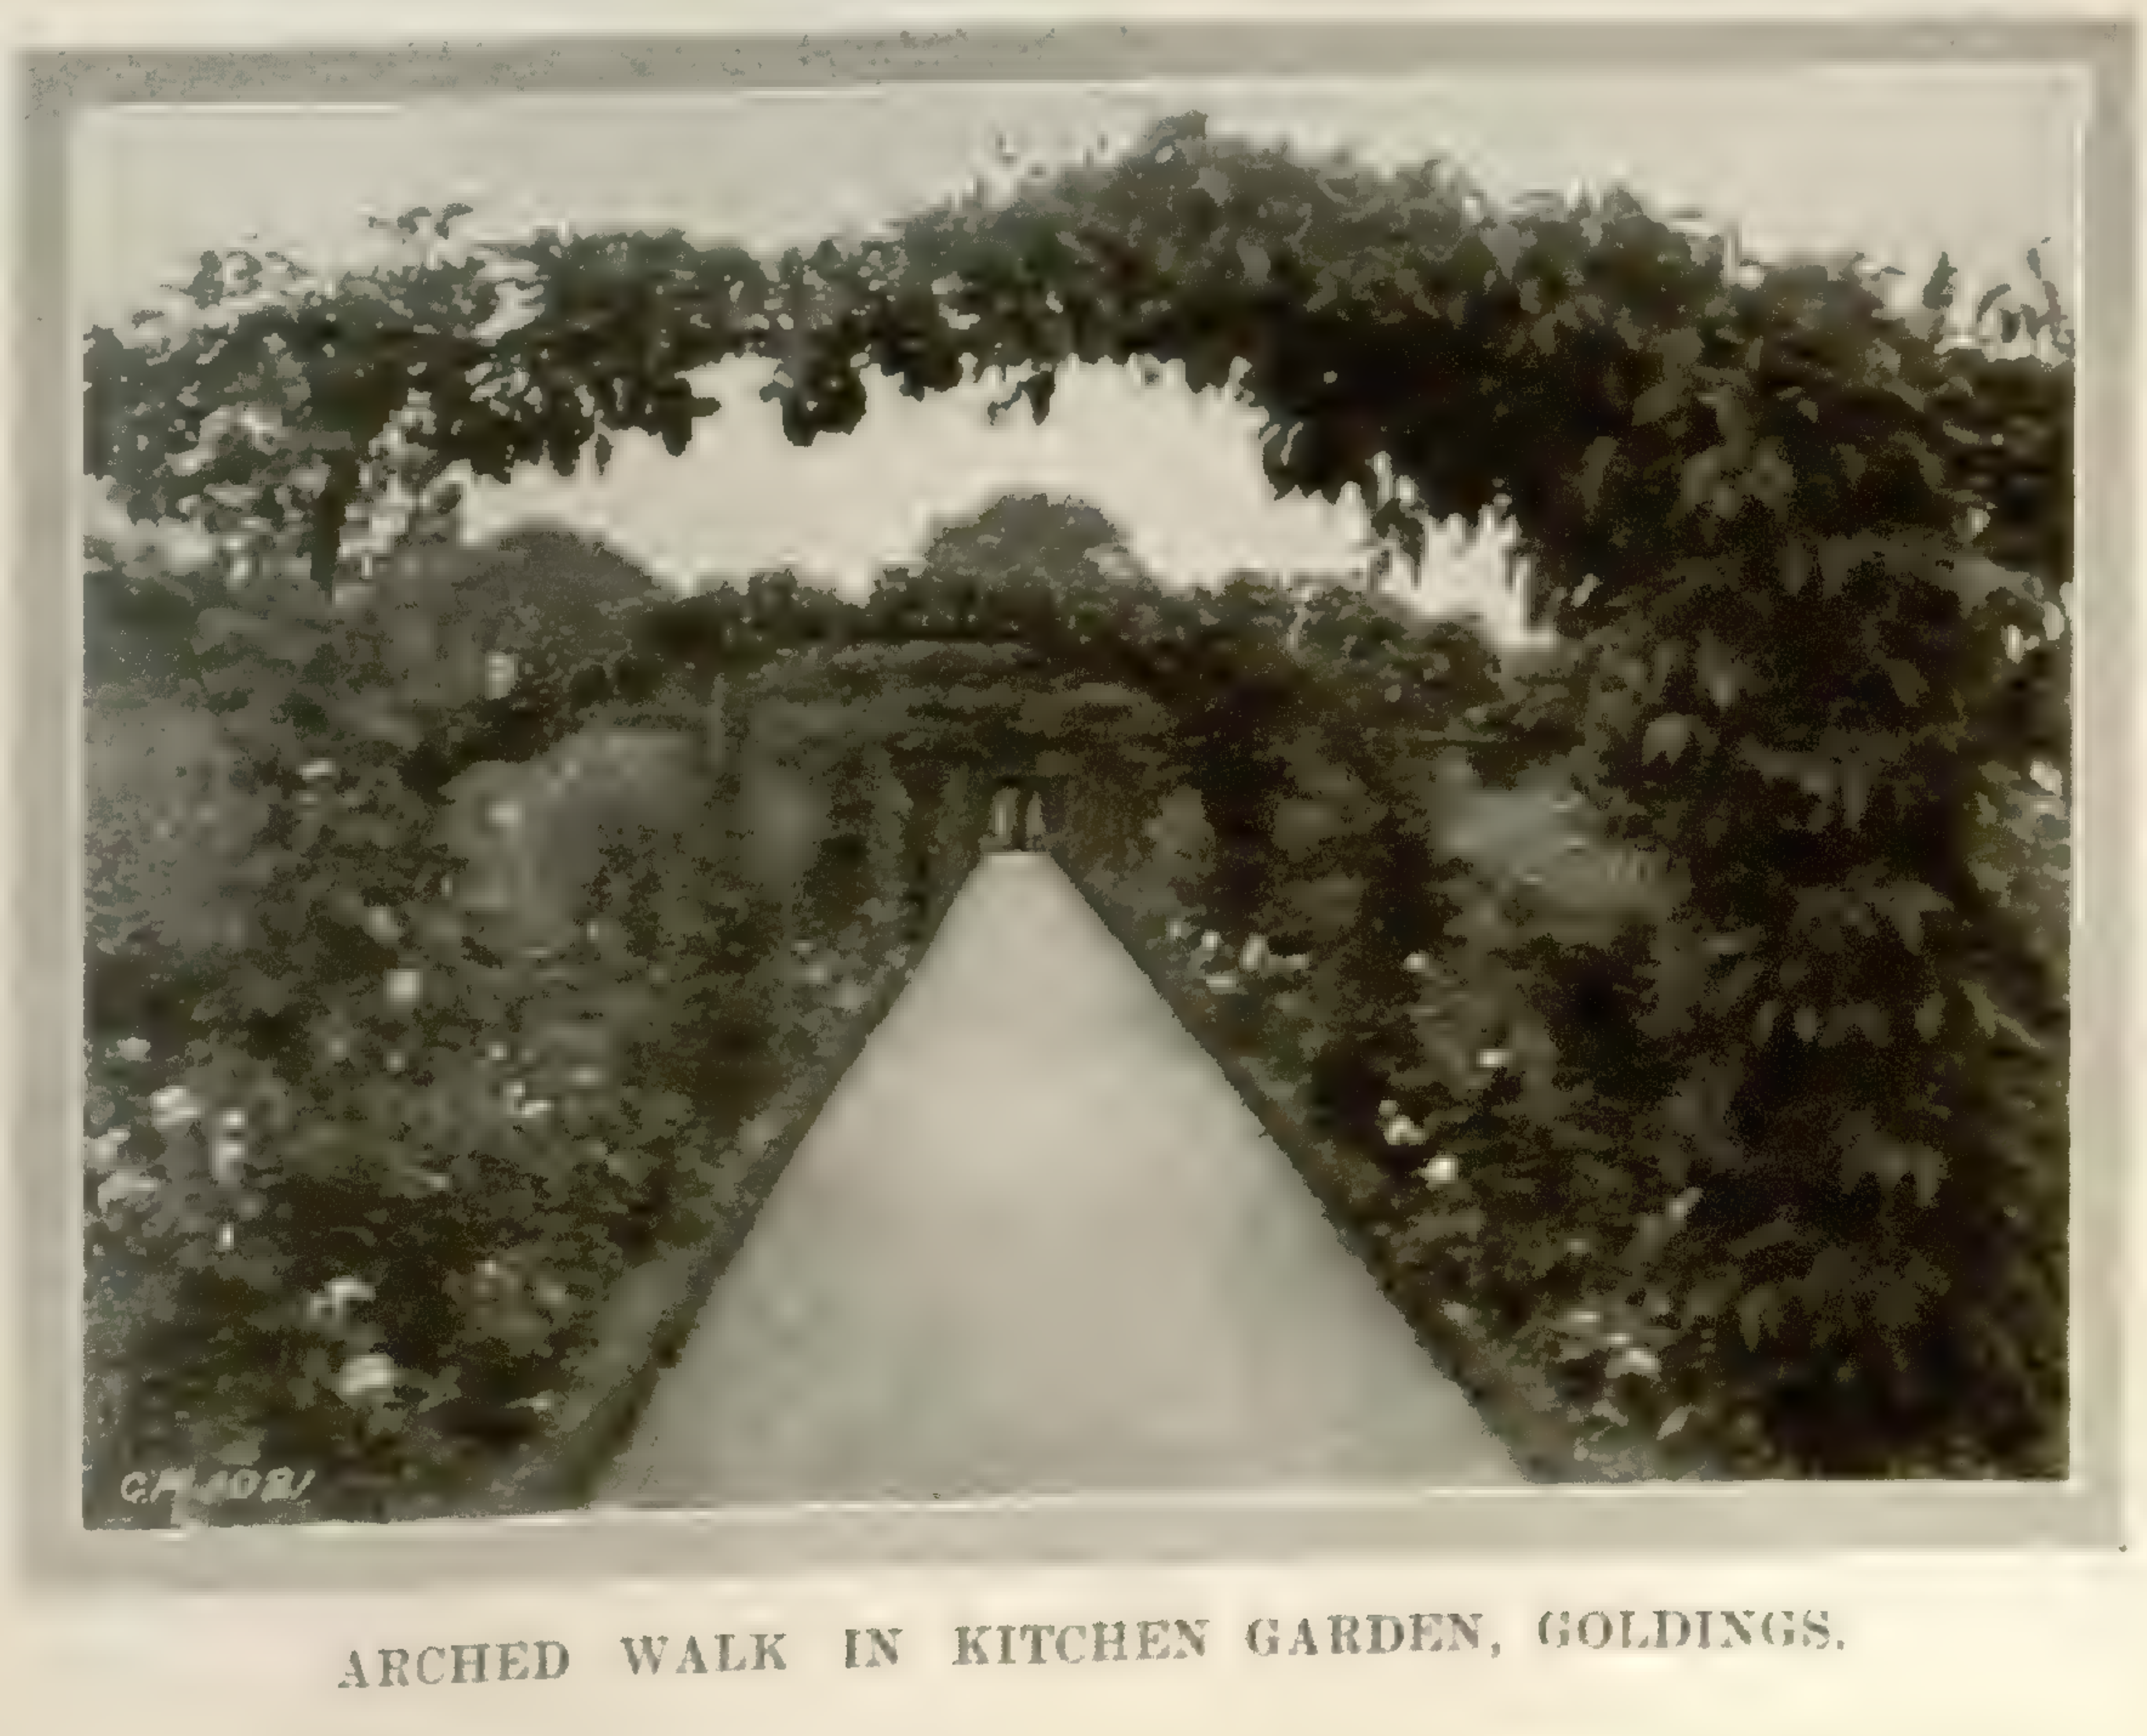
GEOMETRIC FLOWER GARDEN, GOLDINGS.

In effecting a change in the site of the mansion care was taken to preserve the arboreal features of the pleasure grounds, and, as a consequence thereof, they are rich in trees of noble proportions and other arborescent attractions. The magnificent purple beech, so conspicuous on the left side of the illustration of the geometric flower garden and mansion, is so large in size and perfect in development that probably it has but few equals among the many fine examples of this beech in parks and pleasure grounds. This tree, in common with the mansion, suffers somewhat from the photograph having to be taken in the forenoon instead of early in the morning before the sun had proceeded far on its journey southwards. The mansion, which stands on the far side of a broad terrace, also loses somewhat in stateliness owing to the illustration showing it as seen from a much lower level, this being necessary for the purpose of including the flower garden and a considerable part of the pleasure grounds in the picture. To the left of the wide expanse of open lawn the grounds are finely wooded, with numerous grass and other walks, a goodly number of finely developed specimen trees and shrubs, open spaces for the enjoyment of garden games, and structures in which to retreat from sun or rain, as may be necessary. On the high ground that rises from the other side of the mansion are two remarkably fine examples of the Cedar of Lebanon, one of which is illustrated herewith, and other interesting trees. This cedar is about 80ft. high, and has probably occupied its present position close upon a century.

Not far distant from the cedars are broad belts of shrubs, in which are deciduous and evergreen kinds representative of the finest forms that have yet been introduced to British gardens. There is no occasion to enumerate the many fine kinds represented, and it is well that this is the case, for they would form a rather lengthy list, and as space would not admit of reference to their distinctive characteristics, the string of names would probably be somewhat tedious. Beyond them is a border of great breadth devoted to the massing of hardy and other flowering plants, and on one side it is bounded by a high wall clothed with rambling and other climbing roses that produce a glorious display of colour, and are wondrously attractive during the season in which roses yield most freely of their wealth of floral beauty.

On the other side of this high wall are the fruit and kitchen gardens and here, as elsewhere, we find unquestionable evidence of the skill and administrative ability of Mr. Burbidge, who has charge of the large home farm as well as of the gardens. While one is impressed by the cultural skill that is met with on all sides, the efforts that have been made to render this attractive as well as useful are not likely to be overlooked, or the success that has been achieved likely to fail in obtaining appreciation. The broad central walk that extends the whole length of the gardens is flanked on either side by a border of roses, in which the finest of the hybrid teas have, judging from their robust state of health and abundant flower production, found quarters in every way adapted to their requirements. At intervals the walk is spanned by arches on which roses, apple, or pear trees, or climbers with ornamental foliage, obtain support. The arches that span other walks are devoted to pears and apples, and very attractive is the appearance they present when the fruits are taking on the bright colours that indicate approaching maturity. One of the walks is beautified by overarching vines of various kinds, and, while appreciating the refreshing green leaves, during the summer it is not difficult to imagine how brilliant must be the colour effect when the breath of autumn has passed over the foliage. The results obtained at Goldings by the use of arches in enhancing the attractions of the fruit and vegetable department are such as to suggest that the example here briefly referred to is one that might be generally followed. It is, of course, necessary the arches should be wide enough and high enough, to prevent them interfering in any way with a free passage under them.

The glass department is so extensive and skilfully managed as to form a feature of much interest and to render it extremely difficult to refer to it in a comparatively few words. The two principal peach houses, each eighty feet long, are furnished with trees planted by Mr. Burbidge, and now fill the allotted space and produce heavy crops of splendidly finished fruits. The fig house was of much interest for the trees were yielding heavy crops, and much of the success that is achieved here is attributed to maintaining a rather drier atmosphere than is usually considered desirable, and in keeping



ARCHED WALK IN KITCHEN GARDEN, GOLDINGS.

the wood rather thin. In the four or five spacious vineries one saw crops of Muscat of Alexandria, Black Hamburgh, Madresfield Court, and other well-known varieties that indicated skill in grape growing of a high order. The crops of tomatoes and melons in other houses were not less remarkable in their way, and with regard to these it may be mentioned in passing that Mr. Burbidge favours the cordon system of culture.

Carnations and roses are extensively grown under glass, and orchids and decorative plants generally receive a full share of attention. In addition to several plant houses in the kitchen garden there is a large conservatory attached to the mansion, which is devoted to palms, bamboos, and other plants remarkable for their elegance or nobility of aspect, and flowering plants, chrysanthemums being freely used in the autumn.

A NOBLE CEDAR OF LEBANON, GOLDINGS.

Presdales.

Presdales, the charming residence of A. G. Sandeman, Esq., occupies a commanding position on the high grounds to the south of the town of Ware, and is well known throughout the district for its great natural advantages, and for the relatively large extent, the manifold charms, and the excellent condition of its gardens. From the mansion, the terrace, and the higher parts of the pleasure grounds the prospect is delightful, and this is all the more remarkable from the fact that Ware is situate in a stretch of flat meadow land, through which the River Lea flows on its way to the sea. It is also a point of some interest that while the mansion is within a mile or so of Ware, not a glimpse is obtained from its windows of the private residences within or around the town, or of the many buildings devoted to commercial activities, among which the production of malt is prominent. It is of interest, as evidence of the grounds having been designed and laid out by a master of the art of landscape gardening. As a matter of fact, the grounds were originally laid out by Mr. Robert Marnock, and the success achieved was certainly commensurate with his high reputation. Since the property has come into the possession of Mr. Sandeman, who takes the keenest interest in his beautiful gardens, they have been greatly extended, and materially improved, by Mr. George Paul, V.M.H., who, Mr. Sandeman informed the writer, had assisted Mr. Marnock in carrying out the original design.

On the south-west front is a fine breadth of turf, intersected by the carriage drive, and here are many splendidly developed specimens of coniferous and other ornamental trees. Especially noteworthy are the fine examples of Cedrus Deodara, C. atlantica glauca, Cupressus macrocarpa lutea, twenty feet or more in height, and forming a veritable pillar of gold; C. Lawsoniana adpressa, C. Lawsonia lutea, C. thyoides variegata, and Picea magnifica. There are also on the lawn several bold groups of coniferous trees and shrubs, in which Thuja occidentalis, Cupressus Lawsoniana, and the forms with golden foliage are conspicuous. At intervals in front of the broad shrubbery borders that bound this lawn are pillars of rambling roses, such as Dorothy Perkins, Aimee Vibert, and Crimson Rambler, and finely developed specimens of lilacs, Caragana pendula, gold and silver variegated hollies, Magnolia conspicua, M. Lennei, copper beech, and one or two of the more ornamental of the oaks; Salix Vitellina pendula, one of the most elegant of the weeping willows, of which an illustration was given in these pages in one of the October issues of the GARDENERS' MAGAZINE. On this side of the grounds is an iris garden, which is well able to afford an immense amount of interest and pleasure to those who fully appreciate the charms of these exquisitely beautiful flowers. Here all the best forms of the several types are represented, and these suggest, from their appearance, that they have been placed under the conditions most favourable to their full development, and to their annually producing a rich display of colour.

The general character of the grounds on the north-east side of the mansion is shown in the accompanying illustration, and therefore a brief description will suffice. On the broad terrace are numerous specimen conifers of various kinds, notably Abies nobilis, Cupressus Lawsoniana lutea, Cupressus Lawsoniana viridis, and Abies pectinata, beds of Retinospora plumosa aurea, golden box, Euonymus radicans variegata, and various flowering plants, of which the zonal pelargoniums were especially noteworthy. The wall in front is clothed with ivy, and in the border at its foot are dwarf roses, which grow vigorously and bloom profusely, and violas, which also produce a fine display of flowers throughout the season. The attractions of the terrace garden are further enhanced by the remarkably fine specimens of Agapanthus umbellatus, which have long been occupants of the gardens, and annually give an ample return for the care bestowed upon them. On the south-east side of the mansion is a very fine specimen of Magnolia grandiflora, which reaches to the eaves and covers about two-thirds of the area.

On the lawn, to the left of the terrace garden, looking towards the mansion, there are numerous pillars of roses which are now well furnished, and as the varieties are of the best they are immensely attractive during the summer months. Here also are standard wistarias, fine specimens of Paulownia imperialis, Clerodendron trichotomum, and a host of other good things, some rare and some in general cultivation, but all highly meritorious.

Immediately below the terrace are masses of golden yews, golden box, and a few other subjects, and highly effective is the richly coloured leafage under the influence of the summer's sun, while in no way wanting in attractiveness in the dullest of weather. Just beyond these is the small lake, of which an illustration is given. The origin of this piece of water is due to a desire to provide an ample supply of water within a short distance of the mansion in case of fire; and in its formation Mr. Sandeman was careful to have it so arranged as to present a more or less attractive appearance throughout the year. On the surface of the water small wildfowl disport themselves, and on the margin are large numbers of the most beautiful of the free-growing moisture-loving plants in a robust state of health.

The firs that are seen in the water scene extend for some distance along the boundary of the pleasure grounds, and form an excellent shelter from the north and east winds, while giving a distinctive character to the scene. On the other side are finely developed oaks and other deciduous trees, and great masses of choice rhododendrons that are at all times attractive, and produce a rich display of colour in their season of flowering.

PRESDALES.

There are other features of much interest in the pleasure grounds, as, for example, the large screen that has been formed for breaking the view from the carriage drive. This has been made to not only accomplish the object in view in its erection, but to provide support for a choice selection of climbing roses, clematises, honeysuckles, and the golden-flowered Kerria japonica.

The kitchen garden, with its remarkably fine collection of apple, pear, and other fruit trees is some distance from the mansion, and on the way thither one passes through a splendidly furnished rose garden, and under a pergola, over which many of the most beautiful rambling roses throw their slender flower-laden growths in graceful profusion. Alongside the principal walk are pillars of roses connected with chains, which, as will be seen, are hidden by the growths, and form a series of festoons of roses of the most delightful character. Beyond is the commencement of the pergola, richly draped with roses, and as the visitor passes through the structure he obtains several charming peeps of the wild garden, to a part of which the pergola forms an admirable boundary. The dwarf roses are grown in circular and oblong beds on the turf, to the right of the festoons illustrated, and judging from the appearance of the numerous varieties represented the position is in every way well suited to their requirements. Conspicuous among them were such well-known varieties as Madame Abel Chatenay, Mrs. J. W. Grant, La France, Captain Hayward, and Caroline Testout, and a goodly number of the newer forms that have proved of value in the embellishment of the flower garden.

The fruit trees have been mentioned as forming a great feature in the kitchen garden, and it must be said that another feature of much interest within the spacious walled enclosure is the large border devoted to hardy perennials. Both afford many excellent object lessons, and it is very difficult to bring the notice of these beautiful and interesting gardens to a close without referring to them in some detail.

Poles.

About one and a-half miles to the north of the town of Ware, and probably double that distance from Hertford, is Poles, the seat of Mr. E. S. Hanbury, who, like his grandfather, the late Mr. Robert Hanbury, has a strong sympathy with the various aspects of horticulture. In extending and beautifying his gardens he has been ably assisted by Mrs. Hanbury, whose taste has left its mark in every quarter. When the writer first became acquainted with the Poles gardens they were remarkable for their collections of orchids and miscellaneous tropical plants, and as both collections contained many specimens that were remarkable either for their rarity or exceptional development, they brought them much fame. In those days the denizens of tropical regions were regarded with much favour by horticulturists of all grades, and they proved of so much interest to the younger gardeners that few, indeed, of those who were engaged in establishments within a convenient distance, failed to take advantage of any opportunities they may have had for visiting the gardens. Heat-loving plants no longer predominate, nor are the pleasure grounds resplendent with the brilliant hues of zonal pelargoniums and other summer bedders, yet at no time have the gardens been richer in interest or possessed greater charms. The changes that have been made are, of course, exactly what one might have expected in gardens whose owners are well-known for their taste and the gardener for his ability. As in other great gardens, showy summer bedders have been replaced by the finest of hardy perennials and roses, and a considerable proportion of the plants from the tropics have had to make way for Malmaison and perpetual-flowering carnations, and the many other subjects suitable for decorative purposes or the production of flowers for use in a cut state. Fruit culture, always a strong feature at Poles, would appear to have been extended, and certainly it has been improved in accorddance with the more advanced views that obtain with regard to this important branch of the art of gardening.

The way from Ware leads through shady lanes and pretty country, and the charming walk or drive we enjoy in the course of this short journey, gives an admirable foretaste of the charming character of the grounds and the prospect obtained when we arrive at Poles. The handsome modern mansion in red brick stands on a terrace of so great a width that it might almost be described as a plateau, and from the magnificent promenade that skirts its south-east side views of surprising beauty are obtained over the well-timbered park. The terrace is continued some distance in a north-east direction beyond the mansion, and the broad walk has a breadth of turf on either side; and set back a short distance from it on the north side is a pleached alley of limes, which reminds one of the old Elizabethan gardens, and forms

IN THE ROSE GARDEN, PRESDALES.

at once a distinct feature and cool retreat from the summer's sun.

Below the principal terrace is a belt of grass broken up into comparatively small areas, with beech hedges kept sufficiently low to prevent their tops interfering in any way with the view from the terrace. In the several spaces between the hedges there are beds of roses, and with reference to the varieties, it may be said that those in which high quality in the flowers is combined with freedom of blooming were evidently given the preference. The selection made in planting the beds was certainly exceedingly good, and the great masses of roses bloom so profusely throughout the summer as to form a delightful feature. The terrace wall that bounds these areas is clothed in part with a small-leaved ivy, and in part with clematis in variety, and with this brief statement of fact it will not be necessary to do more than say that the general effect is quiet and harmonious.

The terrace terminates at its north-east end with a magnificent oak, and, proceeding in a westerly direction towards the kitchen garden, a fine specimen of the elegant Acer polymorphum attracts attention. Not far distant is a large example of a very distinct variety of the common laurel, with long, narrow, and curiously twisted leaves. Continuing in the same direction, the yew garden is passed, and this, briefly stated, consists of a considerable area enclosed by clipped yew hedges, in which are fruit trees, chiefly apples, and flowering shrubs, the philadelphus being especially deserving of mention for their high development, both as regards growth and flower production. The whole of the area has been freely planted with bulbs, and the glorious display of daffodils, etc., in spring is one not readily forgotten by those who have participated in the pleasure it is so well able to give. The borders outside the kitchen garden have been thrown into the pleasure grounds, and the area once devoted to vegetables has been turfed over, and at intervals large beds of herbaceous pæonies have been formed, and, as indicated by their robust state of health, produce a glorious display of colour in the early days of the summer season. The wall that forms the background to the pæonies is devoted to cordon pears, and these serve to show in a marked manner that Mr. Church, the gardener, is a master of fruit culture as of all other matters appertaining to his art.

On the western side of the grounds is an extensive pinetum, in which are many notable specimens of some fifty or sixty years' growth. One might be excused for lingering among the trees and referring to them in some detail, but for the present purpose it will suffice to mention that there are exceptionally fine specimens of the Cedar of Lebanon and its glaucous variety, Cedrus atlantica, Wellingtonia gigantea, of great height and perfect in contour, Biota orientalis aurea, B. orientalis pendula, an extremely elegant form, Abies cephalonica, A. orientalis, two firs possessing much beauty, Golden Yew, and a dwarf-growing form of the yew Taxus baccata Dovastoni with horizontal branches, those of the Poles specimen having a spread of thirty-six feet. It may be mentioned as evidence of the attractions of the grounds that on the boundary of the widespreading lawn are large masses of rhododendrons that bloom with remarkable freedom, and that in the shrubbery borders there are large numbers of deciduous kinds that claim attention by reason of the great beauty of their flowers. Evidently, the usefulness of the finest of these was recognised many years ago at Poles, for the greater proportion of specimens are of comparatively large size.

Within the kitchen garden is much to interest the visitor, for the walls are clothed with trees that reflect skill of a high order, and quarters occupied with crops of much excellence. Here also are large beds of roses alongside the principal walk, numerous pillars supporting a selection of the finest rambling roses, and a spacious border of hardy perennials, which is singularly attractive for a long period. At the point where the main walk is intersected by a cross walk are arches of roses, and these supporting the luxuriant growths of Gloire de Dijon, Dorothy Perkins, Crimson Rambler, and Carmine Pillar constitute a very attractive feature of this department.

The glass department is fully equal to the requirements of an establishment of the first class, and in walking through the numerous vineries, peach houses, melon houses, tomato houses, and the several structures devoted to ornamental plants of various kinds, it is not difficult to see that Mr. Church has achieved much success in their utilisation.

George Gordon.

A PRETTY WATER SCENE, PRESDALES.

A BEAUTIFUL SHRUB FOR AUTUMN.

The charm of autumn tints in foliage or berry is so great that he must indeed be a peculiar individual who cannot appreciate the diversity of colouring afforded by hardy trees and shrubs. It is somewhat remarkable that although one seldom takes up a gardening paper in which there is not a note on the charm of this or that shrub or tree, no mention is ever made of the truly magnificent colouring of the foliage of Euonymus alata. Of the large numbers of trees and shrubs grown here that are more or less beautiful during autumn, nothing, to my mind, compares with this. I refer to the actual colouring of the leaves, and not to its beauty as a shrub. The colours of the leaves in autumn vary from a beautiful cherry-red to crimson, and when the sun is shining on them the effect is simply glorious.

A nurseryman recently told me that this shrub is not particularly well known. We are fortunate in having fifty plants. At present the species is "on trial" in the nursery, where it was planted to test its merits previous to being transferred to pleasure grounds if considered worthy. After my appreciative reference to the effective colouring of its leaves, it is hardly necessary to say that it has satisfactorily come through the trial, and a position assigned it in the grounds, to which it will be removed shortly. The examples are now from two to three feet high, but not bushy. In future, some of the growths will be pinched and stopped to induce them, if possible, to assume a bushy habit.

The euonymus are usually not particular as to soil, but, like most things, repay for good treatment. It is thriving here in a rich loam. We have not yet increased our stock by propagation, but cuttings of most varieties strike readily if the tips are taken from ripened branches and inserted in sandy loam, and kept moist by occasional spraying.

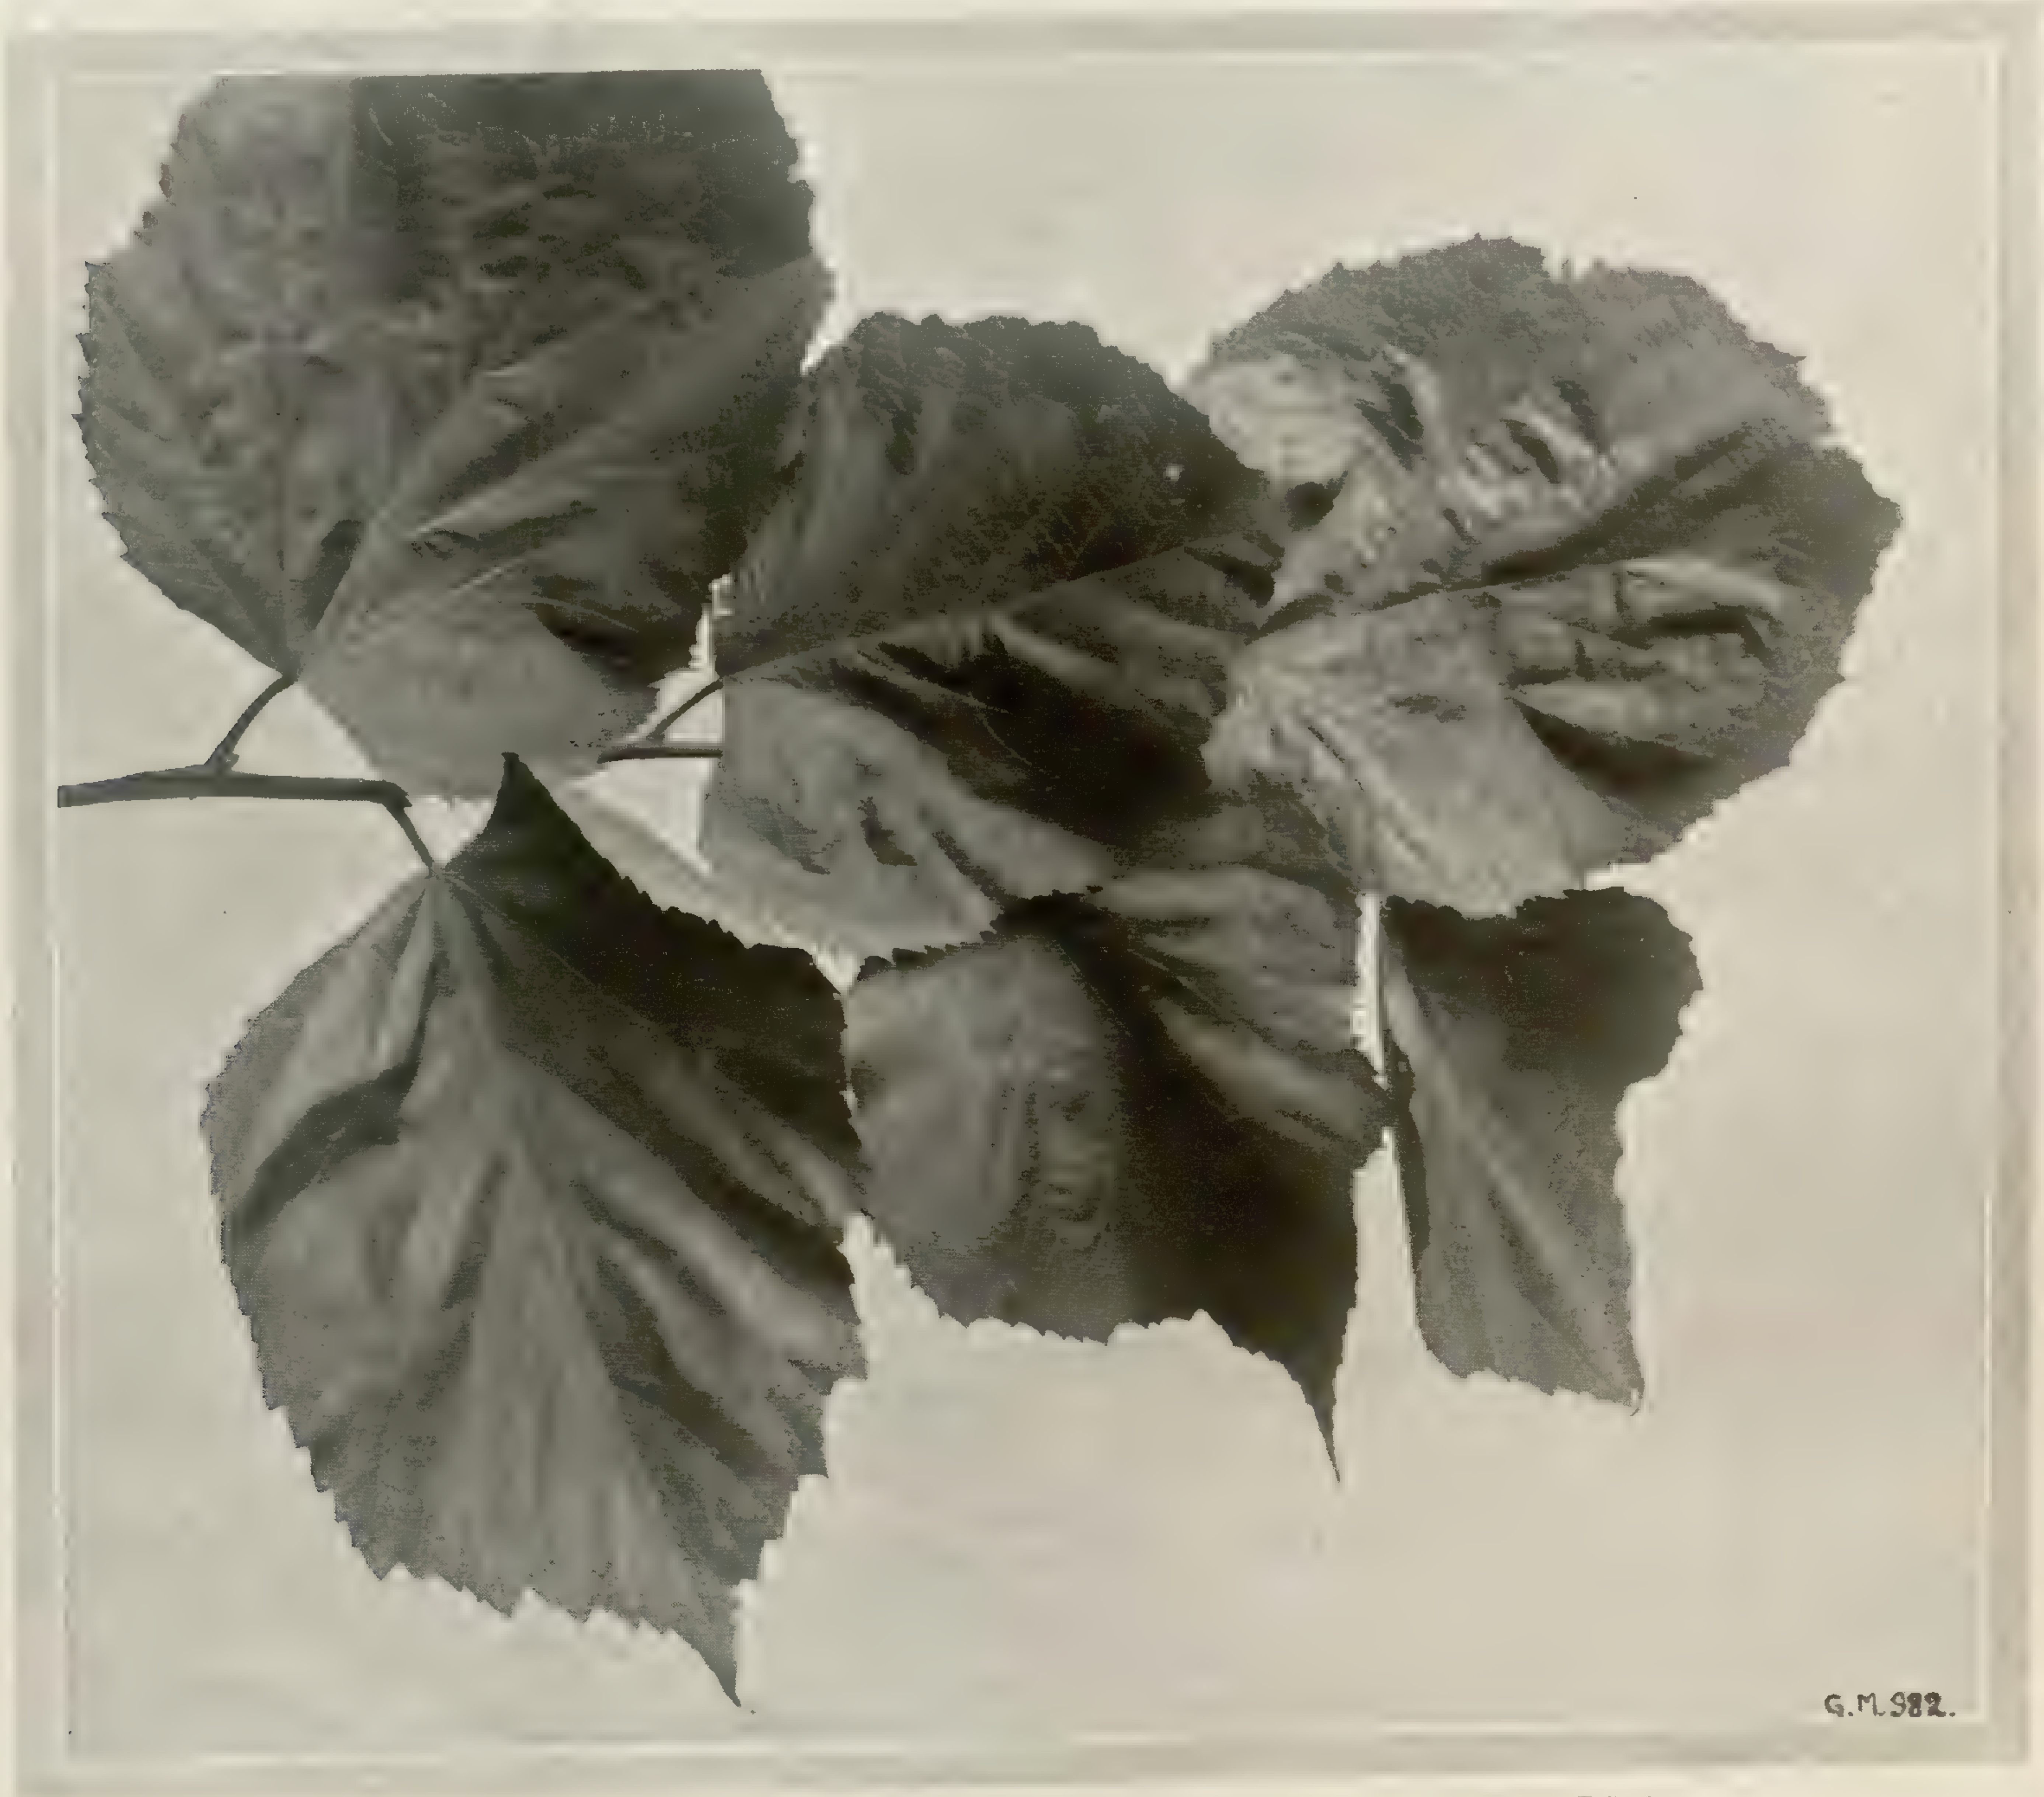
Unfortunately, the great drawback to trees and shrubs grown for their autumn tints is the comparatively transitory nature of the colour effects, as a few sharp frosts are sufficient to greatly hasten defoliation. A. Cobb.

Duffryn Gardens, Cardiff.

Chrysanthemum Howard Gould.—This Japanese chrysanthemum has been exhibited in England as Bessie G. Payne, but, having been named Howard Gould in America, it will henceforward be known under the latter name. Mr. C. H. Totty has his lists printed, and therefore to give it the name of Bessie G. Payne here would cause some confusion. This variety is being sent out by Messrs. W. Wells and Co., is quite one of the best of this season's novelties, and as such won the silver medal in Edinburgh. The full-sized blooms have wide, slightly drooping florets that curl upwards at the tip, and have an extra full centre. The colour is a golden chestnut with a reverse of old gold. I would strongly advise exhibitors to add this to their collection.—E. Molyneux.

UNCOMMON LINDENS.

The lindens, or lime trees, may be classed purely as decorative trees in this country, for the timber, such as it is, which is put on the market, is hardly worthy of consideration. Time was when really good linden, or lime, wood commanded a very good price, as the best was in demand for the keys of good pianos; owing, however, partly to inferior wood being grown, and to no notice being taken of supply and demand, the wood has now been, to a great extent, supplanted by other kinds, and it rarely fetches more than firewood price in England. It is still used in some places for toy making, and for manufacturing small domestic articles, such as spoons, butter bowls, butter prints, etc., but there is no real demand for it. For ornamental purposes, however, some of the lindens have much to commend them.



A LARGE LEAVED LINDEN (TILIA AMERICANA LAXIFOLIA)

As grown by Messrs. Paul and Son. The leaves as illustrated are less than one-half normal size.

The common Lime, Tilia vulgaris, however, is not the kind of tree to plant indiscriminately, for it has the defect of commencing to lose its leaves very early in autumn, or, rather, during late summer, for in the event of a moderately dry summer it is not uncommon for a lot of the leaves to fall during August and early September. There are, moreover, other limes that have a distinctly more ornamental appearance, therefore it is unnecessary to depend on the common kind for general planting.

Tilia americana, the "Basswood" of North America, is a distinct-looking species, by reason of its very large heart-shaped leaves. Although the leaves of the type are large, they are surpassed in size by those of some of the varieties. A very striking one was exhibited at one of the Horticultural Society's meetings lately by Messrs. Paul and Son, of Cheshunt, under the name of T. a. laxifolia, and a figure of it accompanies this article. The leaves are large, cordate, and handsome. Another variety with large decorative foliage is known as T. a. Moltkei. The leaves of this sometimes measure seven inches each way across the blades. Unfortunately T. americana and its varieties are frequently grafted on to stocks of one of the European limes, and the union is not a happy one, for the American species grows in bulk more rapidly than the stock, and the result is a gouty-looking trunk.

T. argentea, the White Lime, is found in Eastern Europe, where it forms a good-sized tree up to fifty feet or more in height. Under cultivation it forms a rather stiff habited tree of ornamental appearance on account of the silvery character of the cordate leaves. The white colour is most strikingly developed on the undersurface, but the upper surface is also of a greyish hue. It is a fairly well known tree.

T. dasystyla, a Caucasian species, is one of the most ornamental of all the limes, and is, in fact, one of our most ornamental trees. It has the advantage over other limes of keeping its foliage clean throughout summer, and never appears to accumulate honeydew as the others do. The tree is of graceful outline, with moderate-sized leaves of a dark glossy green. It grows naturally into a tall, upright tree, and is an excellent subject for avenues. Occasionally it is met with under the name of T. euchlora.

T. mandschurica, like several other Manchurian trees and shrubs, has the defect of commencing to grow very early in spring, and for this reason the young shoots and leaves are frequently crippled. Where it does escape late frosts, however, it is a handsome tree, by reason of its large heart-shaped leaves, which are sometimes from eight to nine inches long, and almost as wide. It is not to be recommended for general planting on account of the defect already alluded to, but for sheltered places in the milder counties it is worth trying.

T. Migueliana is a comparatively new species, which is found in both China and Japan. It was originally described by Maximowicz, who obtained his specimens from the latter country. Subsequently Dr. Henry found it in the province of Hupeh, in China. It has ovate-lanceolate leaves, with serrated margins. They are green above and silvery and pubescent beneath. From what can be seen from young plants it promises to be an ornamental tree of free habit.

T. mongolica is another new species, which is found in South Mongolia. It forms rather slender growths, reddish-brown in colour, with prominent reddish buds. The leaves are cordate, with deeply serrate, and, in some instances, lobed margins. They are thinner than those of most limes, and quite distinct in appearance.

T. petiolaris is an Eastern European species, allied to T. argentea, but less silvery in appearance. It forms a handsome tree, with bold foliage, which keeps its colour well right on into autumn. It is useful either as a specimen or avenue tree.

T. platyphylla is one of the commonest of all limes, and is one of the subspecies into which T. europæa is divided. Many varieties are known, of which asplenifolia, with curiously cut leaves; aurantia, with yellowish leaves; filicifolia nova with the foliage divided into unequal sized segments; pyramidalis, of fastigiate habit; and tortuosa, with curiously twisted branches are the most distinct.

In addition to those mentioned there are, of course, many other lindens in cultivation, the object has, however, been to enumerate those which are specially worth attention. W. Dallimore.

GREENHOUSE FLOWERS AT KEW.

The beginning of December is by no means regarded as a gay period in the greenhouse, yet a walk through that structure at Kew reveals the fact that there is even then a considerable choice of flowering subjects.

Begonias.

Of course, the ubiquitous variety Gloire de Lorraine is freely represented, both as bushy plants and in suspended baskets. The blush-tinted form, Turnford Hall, is also in good condition. The Brazilian Begonia Haageana, with clusters of large blush-coloured blossoms studded with red hairs, is very distinct and pleasing, while Begonia semperflorens gigantea, a large, bold growing variety, with deep rose-coloured blossoms, and the smaller Corbeille de Feu, must on no account be passed over. The most striking feature in begonias just now is, however, furnished by the various hybrids that have been obtained between B. socotrana and the tuberous-rooted varieties. When B. socotrana was first introduced, nearly thirty years ago, it was considered likely to prove of great value to the hybridist, but we had to wait some time for successful results. Such varieties as Elatior, Ideala, Mrs. Heal, Success, and Winter Cheer are, however, well worth waiting for. If there is one thing still wanting in this section it is a variety whose flowers are of a bright scarlet colour, without any tinge of carmine.

Veronicas.

Within the last few years the merits of the garden varieties of veronica as flowering plants for the greenhouse at this season have been made more prominent, and a representative collection makes a good show at Kew. Noteworthy among those now in flower are: Admiration, purple, shaded violet; Attraction, deep violet; Diamant, bright crimson; Eveline, salmon-pink; Gabrielle, rose-pink; La Seduisante, violet-purple, bronzy foliage; Reine des Blanches, white; and Valerie, blue.

Abutilons.

There is a quite extensive group of abutilons, all comparatively small plants, with single, upright stems, grown in five-inch pots. They are flowering freely, and are certainly very pretty. The best scarlet appears to be Red Gauntlet, the best white Boule de Neige, and the best pink Rosæflorum. I did not note any yellows, the best of which, as far as my experience goes, is Golden Fleece.

Bouvardias.

These are represented by many varieties, among which the vivid scarlet tint of President Cleveland stands out most conspicuous. It is somewhat singular that the two most popular scarlet-flowered varieties of the present day should have been sent to this country from such long distances, as President Cleveland hails from the States, and the other, King of the Scarlets, was raised in Australia. Other notable varieties are Alfred Neuner, double white; Hogarth flore plena, double red; jasminiflora alba odorata, white, tinged pink, large flower; Mrs. Robert Green, light salmon-pink; Priory Beauty, pink; Pride of Brooklyn, white; and Humboldti corymbiflora, which flowers earlier, pure white.

Zonal Pelargoniums.

These are more appreciated as winter-flowering plants than they once were, and though there is not a large quantity at Kew their vivid tints cause them to stand out in a marked manner from one end of the structure to the other.

Hard-wooded Plants.

The foremost heath now in bloom is the ever-popular Erica hyemalis, of which perfect little examples in five-inch pots are at this season familiar objects in Covent Garden Market. Many such are at Kew, and, in addition, there are larger bushes full of bloom which are very striking, and serve to show this heath in a new light. It is the only greenhouse kind just now at its best, for Erica caffra and Erica gracilis are nearly over, and Erica melanthera is only unfolding its earliest blossoms. The distinct white-flowered Erica colorans is also in bloom. In addition to the heaths there is a collection of epacris, with their bright-coloured blossoms; Acacia platyptera, whose golden balls are borne on curiously winged branches; Grevillea alpina, with curious flowers, in colour greenish-yellow and red; Phylica capensis, a heath-like shrub, with little rounded heads of tiny white flowers; Bauera rubioides, a twiggy Australian shrub, with saucer-shaped blossoms about half an inch across, and pink in colour; and Crowea saligna, which flowers freely in a small state, the blossoms being of a clear bright pink colour. The "Dictionary of Gardening" gives summer as its season of flowering, but it is just now in full bloom at Kew.

Eupatoriums are generally regarded as winter-flowering plants for the greenhouse, the earliest to bloom being E. riparium, and E. odoratum or Weinmannianum, as it is often called. A very pretty kind just coming into flower is E. Purpusi monticola, more often grown in gardens as E. petiolare. The flowers, borne in crowded heads, like a little daisy in form, are, when partially opened, pink in the centre, shading off to white. After expansion the flowers become white. These heads of flowers are disposed in branching corymbs, and when at their best they make a goodly show.

K.

Early Peas.—Where peas are required early, and the accommodation of glass will allow, a sowing may be made now in well-drained pots about eight inches in diameter to avoid stagnant moisture at the roots. The soil must be porous, and rich. An important point in the cultivation of this crop is that the plants have a position where they will enjoy the greatest amount of light possible, and be grown slowly in a low temperature. Unless attention is given to this point poor results will follow. Lightning is a good variety for this mode of culture.—Charles Flack, Cholmondeley Castle Gardens.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

WINTER FLOWERING CYPRIPEDIUMS.—As plants of this section pass out of flower, they should be examined, and if any need potting, it is desirable that any work that can be done should be attended to at this season, thus relieving the pressure of work at the spring season, when so many matters demand attention. The culture of winter flowering cypripediums is now so generally understood that details of culture seem somewhat out of place; but for the sake of those readers who have not had experience, it is still more out of place to assume that these details are known to everyone. Practically the whole of this section are strong rooting and vigorous growing orchids, such as require an ample rooting space and liberal treatment throughout the year. It is desirable that perfect drainage should be afforded, so that stagnation is impossible.

POTTING MATERIAL.—We have next to consider that such plants do not need annual repotting after they have grown into a reasonable size. It is thus desirable that the potting material used should consist of material of a lasting nature. We find that a suitable compost consist of equal portions of turfy loam and good fibrous peat, with a little chopped sphagnum moss and sufficient coarse sand and finely broken crocks added, to render the compost free and porous. In preparing the compost it is well to grade it, so that the larger and coarser portions can be selected for the big specimens, and the finer material for the smaller plants. The compost should not be too dry when used, or, on the other hand, too wet, or it will "bind" in the process of repotting.

PREPARING THE PLANTS.—There is always some difficulty in detaching the roots of these cypripediums, if they have become at all pot-bound, from the sides of the pots. If they are watered a day or two before they are repotted, it will generally be found that the roots can be detached readily. As soon as the plants have been turned out of the pots, carefully remove all the old potting compost and decaying material from among the roots. A point to be observed in repotting specimens of this type is that the centre of the plant is made good. The plants naturally make their growth towards the rim of the pots, and their tendency is to become hollow in the centre. It is well nigh impossible to rectify this, except at the time when the plants are repotted. It is obvious therefore that where plants have matted, entangled roots, these must be disentangled, and such divisions made as will make the centre of the pot the best furnished. There are also many old back growths that are a greater hindrance than assistance to the plants; these should be removed altogether, and if the variety is of sufficient merit to warrant an increase of stock, such growths, if put into small pots, will in due course emit young growths. When repotting, make the compost moderately firm round all large specimens. Mound it slightly towards the centre, and finish with the compost about an inch below the rim of the pots. Water with rain water as soon as potting is completed, wetting the compost thoroughly.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

GLOXINIAS.—Give frequent attention to these fine flowering plants, and see that they are not suffering from drought, or being injured, as sometimes happens, from over-excitement owing to their too close proximity to the hot-water pipes. Where successional batches are grown, and an early one is required, the plants that first show signs of growth should be selected and potted. Use a compost of about equal parts good turfy loam and fibrous peat, nicely broken up, with a little leaf-soil, and plenty of gritty sand. Do not make the compost too fine. Place the pots on a bed of cocoanut-fibre refuse, in a structure where a temperature of about 60 deg. is maintained. Give close attention to watering, because it will be some time before the tubers make many roots; occasional damping of the pots and their surroundings will be all that is really necessary. Seeds of a good strain should be obtained ready for sowing early in the New Year.

PRUNING.—Stove plants that require pruning should have that operation performed before they start into growth, but where due attention was given to stopping while growth was in progress, little pruning will be required. However, Allamandas, Bougainvilleas, and Ixoras have frequently to be cut back, and if required for early flowering this should now be done. Root action at this season being very slow, repotting should not be attempted until growth has well started.

EUPHORBIAS.—The gorgeous bracts of Euphorbia pulcherrima, when required for the embellishment of the warm conservatory, or any similar purpose, should be preserved for as long a time as possible, by maintaining a warm and fairly dry atmosphere, and keeping the roots sufficiently moist to prevent the foliage from flagging, otherwise the leaves will turn yellow and fall, and the beauty of the plants be considerably reduced. As soon as the bracts fall water should be gradually withheld from the roots, and the plants be rested by laying the pots upon their sides in a temperature of from 50 to 55 degrees until early in April, which is a suitable time to afford the plants more warmth, in order to promote growth. Euphorbia jacquinæflora, after having flowered, should be kept moderately dry before being cut back.

GENERAL WORK.—Preparations for having all stove plants thoroughly cleaned should now be made, before young and tender foliage appears, because the latter is so easily damaged by handling, syringing, or even fumigation. It is not less necessary to have all materials for potting, such as soil, pots, crocks, etc., under cover, so that everything is clean and in the best possible condition for use when required. At this season of the year the outside thermometer should always be consulted, and the weather prospects considered, so that we may not unduly excite plant life with an excess of fire heat.—Wm. Fyfe, Lockinge Gardens.

FRUITS UNDER GLASS.

THE EARLY VINERY.—If frosty weather prevails, and the temperature cannot be kept up to 45 or 50 deg., turn on just enough fire heat to obtain that temperature in order to excite the buds. If this is not done the vines will remain stationary. Great care should be taken that the pipes are only just warmed, as forcing must be very steady, and any great amount of heat will prove disastrous.

LATE HOUSES.—It will be an advantage to prune all vines as soon as possible after this date, and any grapes left must be cut and put in bottles of water. They should be cut with a good piece of stem attached, that the bunch may hang quite clear of the bottle. The grape room should be kept quite dry, and at a regular temperature of 50 deg. Muscat grapes having a south aspect should be cut now, especially in the Southern Counties, or they will begin to deteriorate. All vines should be allowed to have a rest previous to pruning, and I would warn the inexperienced that if any heat has been applied to the houses as a means of keeping it warm, the house should be thrown open for a week or two before pruning, or the vines may bleed, and if this happens it is difficult to stop.

FIG HOUSE.—The figs should now be pruned, have all their old ties cut, and the branches tied up in bundles. Then give the glass and woodwork, walls, etc., a thorough cleaning. After this tie in all the main branches with fine tarred string at regular intervals, the smaller shoots being tied with raffia. When pruning cut away all worthless shoots, and lay in only those that are fruitful; these will be found studded with small embryo fruits all along the extremities. Allow plenty of room for foliage development. Figs must not be too crowded or failure will result. The fig trees that make rank growth are rarely prolific, and must be checked by root-pruning, or running a wall up in front of the roots. The latter method has been found very effectual in several cases, and has soon brought an unproductive tree into one of extreme fertility. In some cases the variety may be at fault for forcing purposes, but if Brown Turkey or Bourjassotte Grise are used no difficulty will be found; and to these varieties may be added Negro Largo, Pingo de Mel, Castle Kennedy, and Violette Sepor, which will form a good succession, either planted out or in pots or tubs.

CHERRIES.—These should be cleaned and pruned, though, if treated on the lines advised, very little pruning will be necessary at this date. Cherries resent the knife very much. All the ties should be renewed, and the wood cleaned with some insecticide before being retied with new string and raffia. The border should not be too rich for the well-being of the cherry, as it is rich food that causes over-much growth; and consequently, if the grower is not careful, severe pruning is necessary. The soil should be composed of old loam and mortar rubbish, and this will be found a good compost for either planting or top-dressing; the soil should be rammed hard. Cherries will do well in pots, and it is a good way to grow them thus, as the house can then be made use of for other purposes when the cherries have fulfilled their mission. I prefer the cordon-trained trees, and consider the best fruit is gathered from them. Pot culture also allows a greater number of successional varieties to be grown. Amongst some of the best cherries are Early Rivers, a beautiful fruit of large size and delicious flavour, and a good grower; Bigarreau de Schreken, a fine bearer and beautiful fruit; Frogmore Early Bigarreau, extra large and of good flavour; Waterloo, very fine; May Duke; Elton, a fine cropper, and of excellent flavour. The house should be kept quite cool until a start is made, which should be about the middle of January. A cherry house is a great asset in any garden, the fruit being most popular. By gentle forcing fruits can be obtained some weeks in advance of the outdoor supply, and so enable the cherry crop to extend from the end of April until the end of September in the Southern Counties. —W. A. Cook, Leonardslee Gardens.

THE KITCHEN GARDEN.

TOMATOES.—To obtain a batch of strong plants for producing early fruit in the spring a sowing of seed should be made about this date. At this time of year I prefer to sow the seeds in thumb-pots that are filled with a light, sandy compost, placing three or four seeds in each pot. When the young plants have appeared the strongest one should be retained and the others removed. A shelf that is situated near the glass in the cucumber house provides a good position in which to grow the plants along sturdily. Sunrise is a satisfactory variety for early fruiting, as it sets its flowers better than many others, and matures its fruit in quantities if the plants are grown in 7in. pots and lightly fed with stimulants.

ASPARAGUS.—Crowns will yield to forcing better as the season advances, and the produce will be stronger; but the scarcity of outside vegetables often necessitates large quantities of crowns being lifted for early forcing. Where this is so, a mild hotbed consisting of sweetened manure and leaves should be made up in a pit, where a command of steady heat can be obtained from hot-water pipes. When the heat from the fermenting material has settled down to about 75 deg. plant the crowns in about 6in. of soil, and almost any kind of soil will do for this purpose. Water with warm water, maintain a moist atmosphere, and a temperature not exceeding 60 deg.

SEAKALE.—The plants that have been grown from throngs for forcing in the mushroom house have, owing to the rains, done exceptionally well this season. They will now be fully matured, and the greater part may be lifted from the ground. The larger roots should be shortened and kept, to be made into throngs at convenience for next season's supply. These, as well as the crowns, will keep without harm if laid in moist ashes. The permanent beds of seakale will be ready to have the foliage cleared away, and, if necessary, any blank spaces may be planted up. As a prevention against damage from slugs, etc., give the crowns a covering of coal ashes. Beds of this kind are often valuable in giving strong and succulent produce towards the end of March and the two following months.

EARLY CARROTS.—For the production of an early supply of this important crop a hotbed should be made up of sweetened manure and leaves, treading the whole firmly and evenly during its formation. Rough deal frames with good lights are suitable. Place from 6in. to 9in. of fine, rich soil in the frame, and when the heat from the hotbed has settled down to a comfortable warmth sow the seeds in drills 12in. apart. The French Shorthorn type of carrot is the best for this form of culture. As soon as the young plants are up do not allow them to become spindling in growth by unduly forcing them, but admit air to the frame whenever the weather is favourable.

EARLY BORDERS.—At the beginning of the new year these will be requisitioned for the sowing and planting of early crops. So far as is possible these valuable sites should be cleared of any existing plants, and the borders manured, deeply dug, or trenched, according to their condition. Dressings of wood ashes or rich sandy soil are often valuable in warming up and adding to the productive power of these positions, especially if the land is at all heavy.—Chas. Flack, Cholmondeley Castle Gardens.

EUPHORBIA JACQUINIÆFLORA.

The long sprays of brilliantly red flowers of this plant makes it very valuable for decorative purposes in winter time. The plants may be grown in comparatively small pots, but the best results follow when they are put in sufficiently large pots to allow of strong stems being secured prior to the formation of the flower buds without the cultivator having to feed highly. Very fine examples may be grown by planting them in a small pit about one foot deep, and the same in width, the compost being a rich, light loam two parts, peat and leaf-soil two parts. The soil should be made moderately firm around the roots of the plants.

In a garden in one of the northern counties in which I served as a young gardener they were put out in a narrow border, as here mentioned, at the back of a pine stove, and the shoots were trained over a slightly curved trellis. This treatment suited them admirably, judging from the number of long spikes of blossoms. Some of the specimens formed several side branches, which also flowered freely. Clear soot water proved very beneficial, the leaves quickly assuming a very dark green hue. G. B.

The Yield of Potatoes in Great Britain this year is estimated by the Board of Agriculture at 6.39 tons per acre, as compared with 6.97 tons per acre last year. Last year's yield was a record one, and this year's yield has only been exceeded six times during the twenty-four years that have elapsed since the official returns were first collected in 1885.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Potatoes at Bingley Hall, Birmingham.

NOVEMBER 27 to DECEMBER 2.

Ten classes were provided for potatoes at the 61st cattle show held as above, the number of tubers in competition being about 800 specimens, the whole fairly bright and shapely.

For a dozen dishes there were seven exhibits, the premier award going to Mr. Thos. Bannister, Malthouse Farm, Marston Green, who set up a very level lot, comprising Duchess of Cornwall, King Edward VII., Table Talk, British Queen, Mr. Bresee, Record, Empress Queen, Goldfinder, Factor, Tremendous, and Up-to-date; Mr. J. W. Needham, Wildsworth,' Gainsborough, second, his best being Up-to-Date, Mairsland Queen, Royal Kidney, Gold Reef, King Edward VII., Northern Star, Factor, May Blossom, Monarch, and Daniel's Sensation; the third prize was well merited by Mr. W. Coleman, an amateur, 4, Hunter Street, Buckingham, whose tubers were shapely, though scarcely so bright as those in the other winning sets; he had Eightyfold, Peckover, King Edward VII., Duchess of Cornwall, Queen of the Veldt, Up-to-Date, Table Talk, Sutton's White City, Eldorado, Factor, Superlative, and Dalmeny Beauty. For six dishes, Mr. Needham headed the list, and here his best sets were King Edward VII. and Factor; Mr. Coleman second, his White City, Mr. Bresee, and Peckover being specially strong; Mr. J. Neaverson, Eye, Peterborough, third; seven entries. For pairs of white and coloured potatoes six exhibited, Mr. Coleman led with Purple Perfection and Mr. Bresee, Gen. Roberts, and Superlative; Messrs. Neaverson and Needham taking the lower awards; while for four varieties, suitable for farm or field culture, five quartets were staged, Mr. Coleman again leading with shapely tubers of White City, Duchess of Cornwall, Superlative, and Factor, Messrs. Bannister and Needham following.

There were seven couplets of White Kidney potatoes, Mr. J. Needham securing the first and second prizes with remarkably good specimens of Factor and King Edward VII.; the Duke of Portland, Norton, Mansfield, third. There were eight exhibitors of two varieties of round forms, and Mr. Neaverson was first for Table Talk and Hackney, with Mr. Coleman a close second for Purple Perfection and Table Talk, Mr. Bannister third. Ten entrants staged one dish of Kidney potatoes, Mr. Neaverson first for King Edward VII., Mr. Needham second for the same; while eight single dishes of rounds were in competition, Table Talk securing the prizes to Mr. Bannister and Mr. Robert Cock, Rossall Grange, Fleetwood. Mr. Benjamin Parker, Scotforth, Lancaster, secured a premier for the handsomest dozen with Rival; Mr. Needham second with King Edward VII. The class for any variety not in commerce was poorly contested, the Duke of Portland coming first with a shapely kidney named Welbeck Seedling; Mr. Needham second with Rival.

Trade exhibits were fairly numerous. In the gallery, Messrs. E. Webb and Sons, Stourbridge, made a noble display of farm, grass, and garden seeds, their collection of potatoes including Up-to-Date, British Queen, The Dean, Industry, Goldfinder, Chieftain, Stourbridge Glory, King Edward VII., Express, Colonist, Record, and Queen of the Veldt. Messrs. Dicksons, Lim., made a show of grasses and clover seeds, etc. The King's Acre Nursery Company, Lim., Hereford, set up some five dozen varieties of highly-coloured apples, which for size, shape, and brilliance, fairly-well matched the near-by display of the British Columbia Government. Messrs. Dickson and Robinson, Chester, presented farm seeds and roots; Messrs. White Brothers, Evesham, sent seed potatoes; Messrs. Little and Ballantyne, Carlisle, showed Scotch seed potatoes, seedling fir trees, etc.; Mr. R. W. Green, Wisbech, had Scotch seed potatoes in variety; Mr. T. A. Scarlett, Edinburgh, sent potatoes; Mr. A. Findlay, Markinch, showed home-raised varieties of potatoes. On the ground floor Messrs. Fotheringham and King, Dumfries, showed potatoes, and Mr. A. W. McAlister, Dumfries, had a very large collection of seed potatoes in variety.

Colonial and Home Bottled Fruit Show.

The following is the official list of awards made by the Royal Horticultural Society on December 1:

COLONIAL FRUITS.

Gold Medals.—The Permanent Exhibition Committee of Trinidad, for fruits and preserves; the Government of British Columbia, for apples; the Permanent Exhibition Committee of Trinidad, for fruit; West Indian Produce Association, for a collection of fruits and vegetables.

Silver-gilt Knightian Medal.—Permanent Exhibition Committee of Dominica for a collection of fruits and vegetables; Province of New Brunswick, for apples; Botanic Station, for citrus fruits; Okamagan Fruit Union, B.C., for apples; Mr. B. Shearn, for nuts; the Jamaica Agency, for a collection of fruits and vegetables; Barbados, for a collection of fresh fruits and vegetables; the Jamaica Agency, for jams, etc.

Silver-gilt Banksian Medals.—Mr. John Smith, B.C., for apples; Kaslo District Association, B.C., for apples; Messrs. Stirling and Pitcairn, B.C., for apples; the Roseau Valley Fruit Company, for preserved fruits and jams.

Silver Knightian Medal.—The Permanent Exhibition Committee of Montserrat, for a collection of fruits and vegetables; Wall House Estate, Dominica, for limes; Victoria District, B.C., for apples; Salt Spring Island, B.C., for apples; Mr. C. T. Cooney, B.C., for apples; the New Zealand Government, for a collection of fruits, etc.; Government of Dominica, for fresh fruits and vegetables.

Silver Banksian Medal.—Mr. F. A. Hubbard, Burton, Sunburg Co., N. Brunswick, for apples; Mr. C. W. Peters, Queenstown, Queen's Co., N. Brunswick, for apples; Mr. H. Belyea, Lower Gagetown, Queen's Co., N. Brunswick, for apples; Mr. J. G. de Gannes, Trinidad, for oranges; Messrs. Gordon Grant and Co., Trinidad, for limes; Mr. J. G. Haines, Trinidad, for cocoanuts; Mr. Gordon Grant, Trinidad, for cocoanuts; the Victorian Government, for preserved fruits; Messrs. E. Westmacott and Co., for Colonial-grown tinned fruits; the Victorian Government, for preserved vegetables; the Roseau Valley Fruit Company, for jams, etc.; Mr. W. Pattinson, for banana specialities; the Army and Navy Auxiliary Stores, fresh fruits and vegetables; Government of Jamaica, for fresh fruits and vegetables.

Bronze Banksian Medals.—St. Arment Estate, Dominica, for oranges; Everton Estate, Dominica, for oranges; Corona Estate, Dominica, for oranges; Carholm Estate, Dominica, for limes; Mr. J. J. Brown, Trinidad, for cocoanuts.

COLONIAL PRESERVES.

Gold Medal.—West Indian Produce Association, Fenchurch Street.

Silver-gilt Knightian.—Messrs. B. Shearn and Son, Tottenham Court Road.

Silver Knightian Medal.—New Zealand Government; Messrs. E. Westmacott and Co.

Silver-gilt Banksian Medal. — Jamaica Agency.

Silver Banksian Medal.—Victoria Government (2); Roseau Valley Fruit Company (2).

ENGLISH FRUIT.

Silver-gilt Hogg Medal.—Messrs. James Veitch and Sons, Chelsea, for apples; Messrs. George Bunyard and Co., Maidstone, for apples.

Silver Banksian Medal.—Messrs. Ambrose, Palmer, and Co., Grosvenor Street and Halliford, for English and Colonial fruit.

FRUITS BOTTLED IN PURE WATER.

Display of home-bottled British-grown fruits in pure water, open.—Mr. W. Poupart, Twickenham, award included in gold medal; Swanley Horticultural College, silver-gilt Banksian medal.

Twenty-four bottles, including twelve different kinds at least (amateurs).—First prize, a Mercia sterilizer, presented by Miss Bradley, won by Mrs. Banks, 102, Park Street, W.; second prize, Mrs. E. Beckett, Elstree.

Eighteen bottles, including nine different kinds at least (amateurs); no entries.

Twelve bottles, including six different kinds at least (amateurs); first prize, Mr. H. Tobutt, Wallington; second prize, Mrs. M. Palmer, Darlington.

Six bottles, including four different kinds at least (amateurs); first prize, Mrs. Hartshorn, Bond Street, W.; second prize, Mrs. W. H. Plowman, Westminster.

FRUITS BOTTLED IN SYRUP.

Display of home-bottled British-grown fruits in syrup (open); first, Mr. W. Poupart, Twickenham, the award for this included in gold medal.

Twenty-four bottles, including twelve different kinds at least (amateurs); first prize, a Mercia steriliser, presented by Miss Bradley, won by Mrs. V. Banks; second prize, G.P.O. Refreshment Club.

Eighteen bottles, including nine different kinds at least (amateurs); first prize, Miss E. G. Cook, Ashford; second prize, Viscountess Galway, Bawtry.

Twelve bottles, including six different kinds at least (amateurs); first prize, Mrs. F. L. Pike, King's Langley.

Six bottles, including four different kinds at least (amateurs); first prize, not awarded; second prize, Mrs. W. H. Plowman, Westminster.

VEGETABLES.

Home-bottled vegetables (amateurs), eight bottles, including four different kinds at least; first prize, Mrs. E. Beckett; second prize, Mrs. V. Banks.

JAMS, JELLIES, ETC.

Jams in clear glass jars or bottles (open) (jellies excluded), made of British-grown fruits only, including eight different kinds at least; silver-gilt Banksian medal, to Messrs. W. Miles and Co., Hove, Sussex.

Eighteen one pound clear glass jars or bottles of jam (jellies excluded), made of British-grown fruits only, including nine different kinds at least (amateurs); first prize, Mr. E. G. Badcock, St. George's Square, S.W.; second prize, Mrs. E. Beckett, Elstree.

Fruit jellies and fruit cheese, in clear glass jars or bottles, including six different kinds at least.—Silver Knightian medal, Swanley Horticultural College, Kent; silver Banksian medal, Miss Cook, Ashford Farm.

Twelve one-pound clear glass jars or bottles of fruit jellies and fruit cheese, including six kinds at least (amateurs); first prize, Mrs. Banks; second prize, Miss M. G. Thompson.

Miscellaneous collection of home-bottled produce, pickles, sauces, etc. (amateurs); silver-gilt Knightian medal to Mrs. V. Banks.

Miscellaneous class for preserving appliances, bottles, etc. (open); gold medal to Mr. W. Poupart, Twickenham; silver Knightian medal, to the French Flint Glass Bottle Company; silver Banksian medal, to Mr. G. O. Henninger, Great Tower Street, E.C.; bronze Banksian medal, to Messrs. Abbott Bros., Southall; and silver Knightian medal, to Messrs. Fowler, Lee, and Co., Reading.

Non-competitive exhibits.—Silver Knightian medal, to Messrs. D. Politi and Sons Highbury; silver Banksian medal, to Mrs. S. Miller, Marlow; to Miss Martin, New York; and to the Middlesex Jam Company Brentford.

Royal Horticultural Society.

The meeting held on December 7 was not nearly so extensive as its immediate predecessors, but an excellent display was provided, consisting largely of orchids, begonias, carnations, chrysanthemums, and brassicas.

FLORAL COMMITTEE.

Messrs. H. Cutbush and Son, Highgate, set up a capital group of perpetual carnations, showing numerous seedlings and fine vases of White Enchantress, Winsor, Mrs. Burnett, Rosine, Rose Doré, Victory, Harlowarden, Aurora, Enchantress, and the yellow Grace Gilbert. Messrs. J. Peed and Sons again contributed alpines, their encrusted saxifrages being most interesting. The zonal pelargoniums staged by Messrs. H. Cannell and Sons, Swanley, provided a fine bit of colouring, their Clevedon and Jupiter being especially brilliant. Single and thread petalled chrysanthemums from the same firm were also very bright and interesting.

Winter-flowering begonias were again well shown by Messrs. James Veitch and Sons, Chelsea, their batches of Winter Cheer, Julius, Ensign, the brilliant Mrs. Heal, the old Adonis—one of the first of this set, and the new Elatior. Mr. W. H. Page, Tangley Nursery, Hampton, put up one of his fine displays of beautiful carnations and liliums staged in fine vases; Rose Pink Enchantress, Winsor, Victory, Harlowarden, May Day, and Mrs. T. W. Lawson. were carnations shown by Mr. Page in fine style. Mr. T. W. G. Williams, Bromyard, sent a few good single chrysanthemums, and Messrs. J. and F. Chatfield, Southwick, showed the hairy Japanese variety, named Thorny Glory.

Mr. Frank Brazier, Caterham, put up a large and bright exhibit of Japanese and single chrysanthemums. Messrs. Stuart Low and Co., Enfield, brought up carnations growing in pots, staging both seedlings and popular varieties. The central display in the hall was set up by Messrs. S. Low and Co., Enfield, who arranged their carnations in a very pretty way, in vases and bowls, in association with ferns and moss. Mr. L. R. Russell, Richmond, presented hardy evergreens, ornamental shrubs in variety, ivies. and eleagnus predominating.

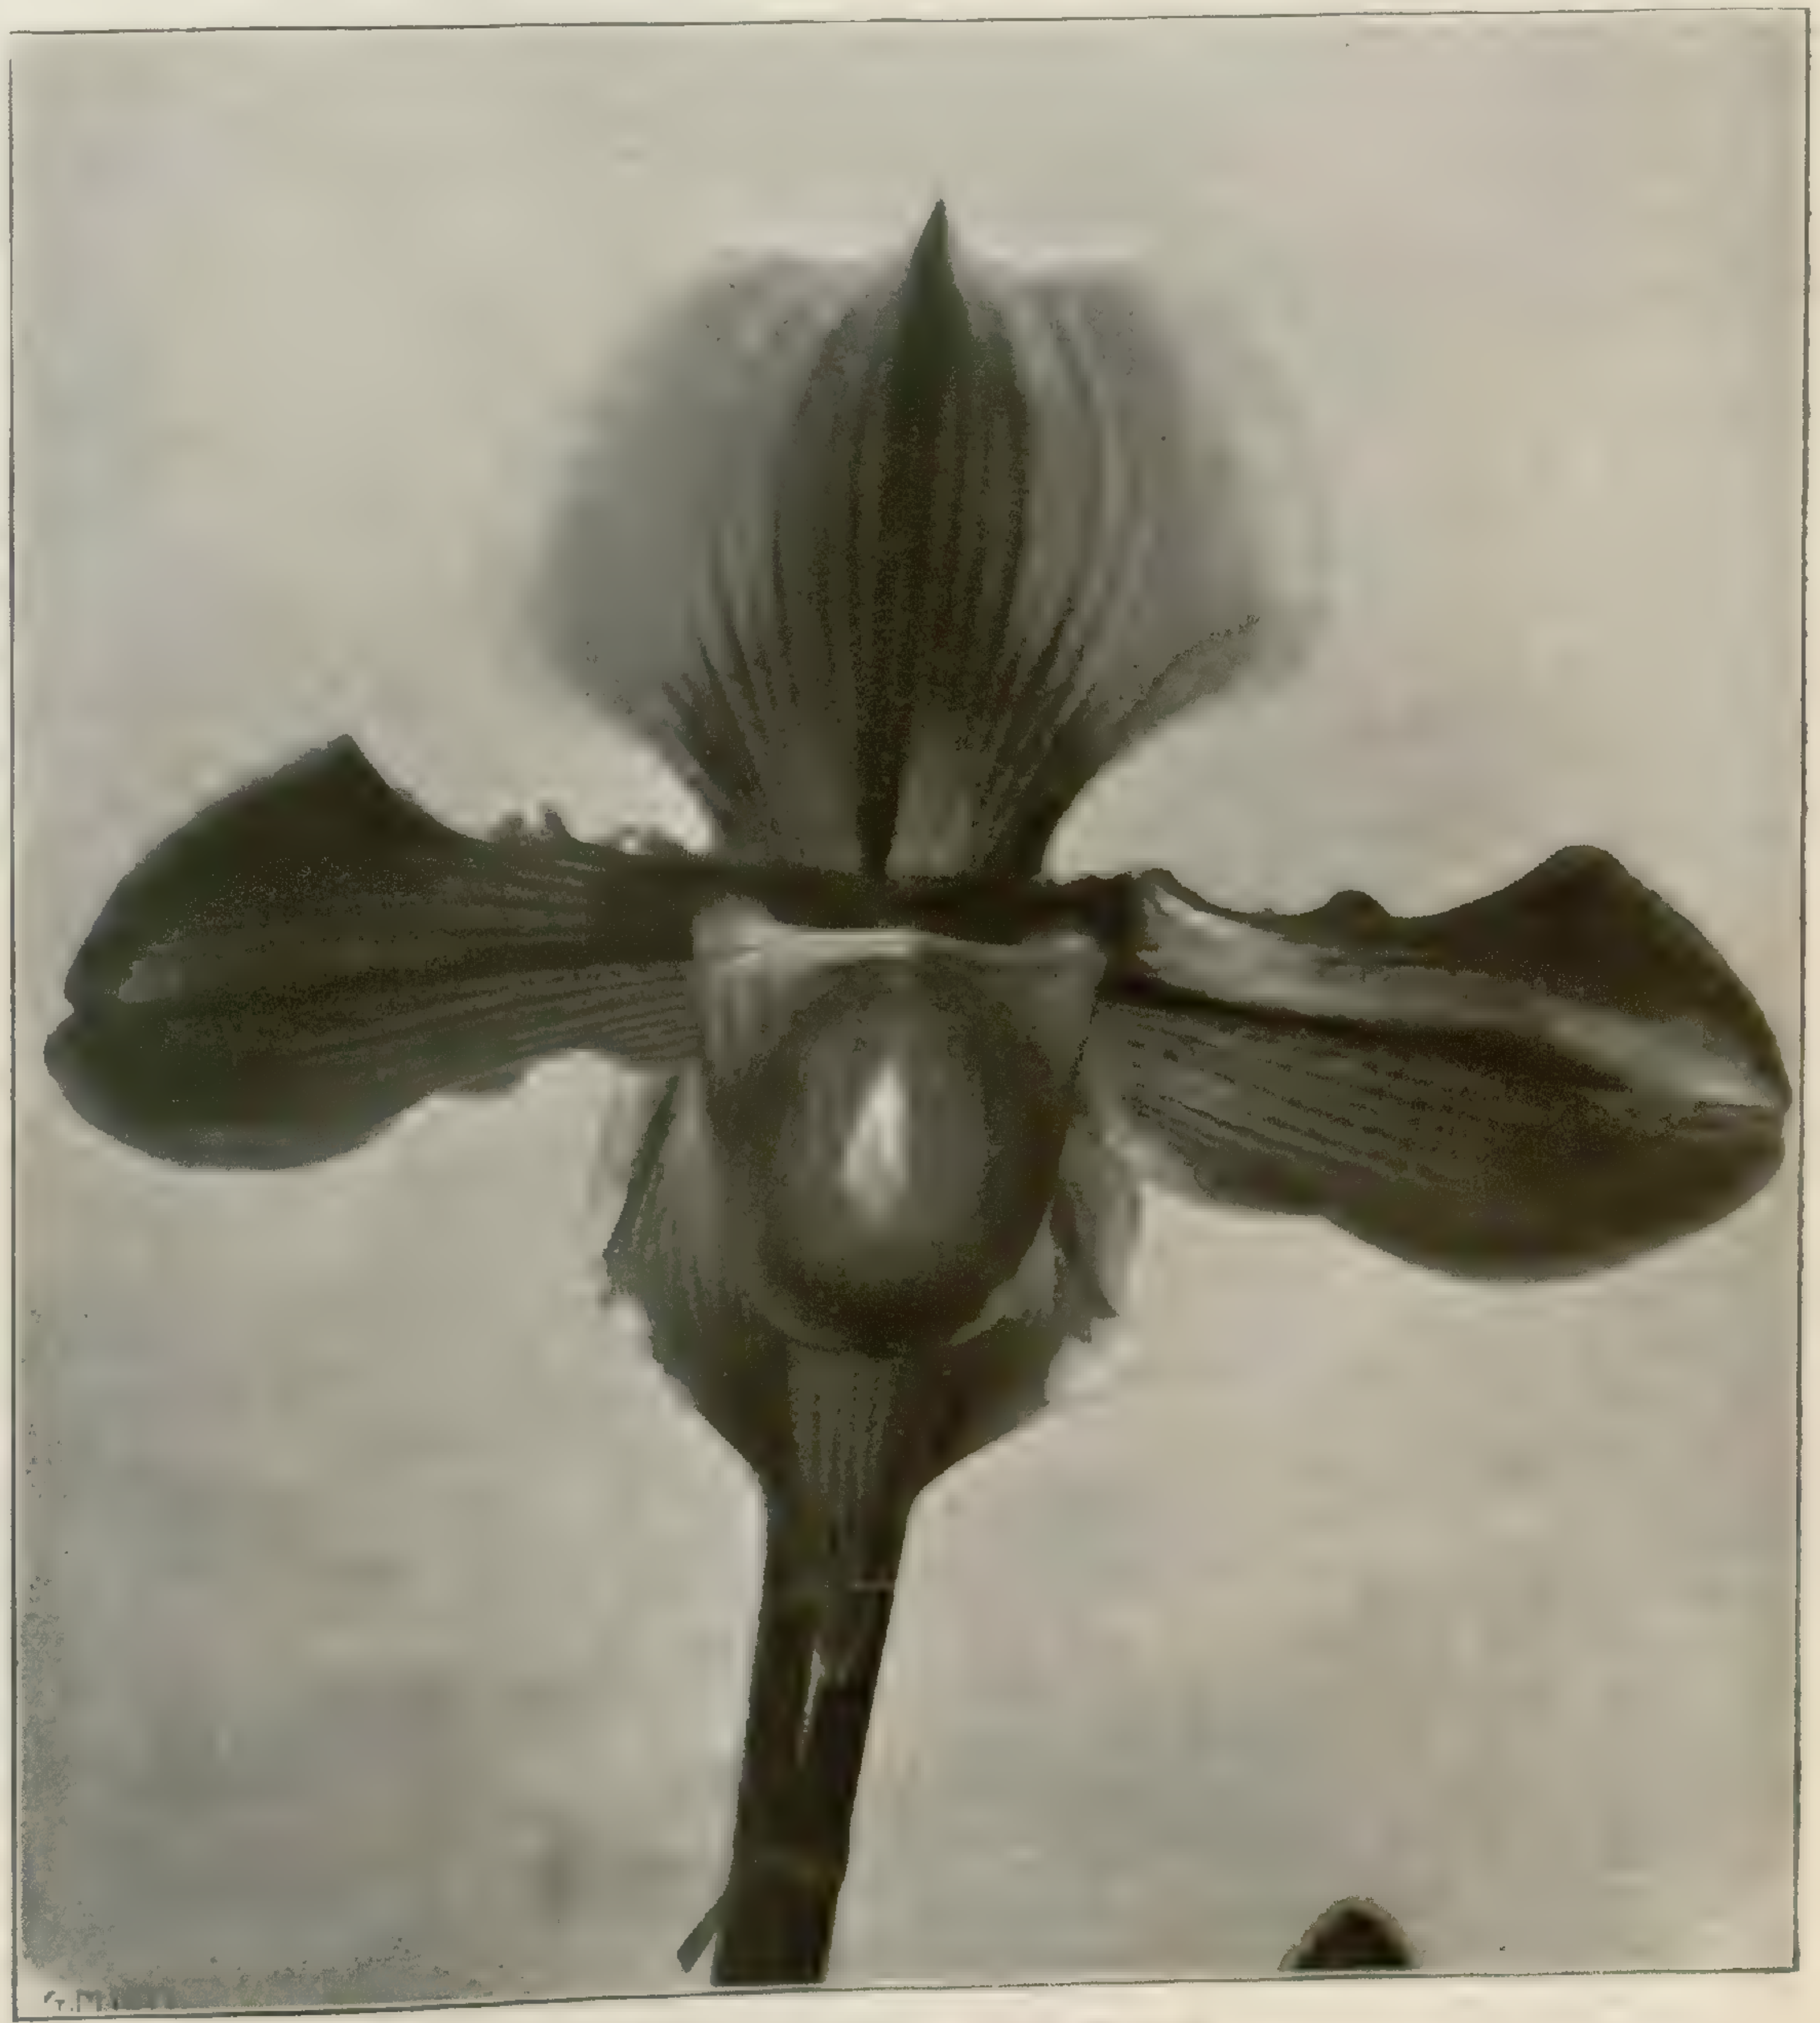
The Rev. E. H. Buckstone, Derby, showed a bank of cyclamens, setting forth well-grown examples of these very useful flowers, and including such varieties as Vulcan, White Butterfly, Giant Pink, and Giant White, all beautifully flowered. Mr. Camm, gardener to W. Astor, Esq., Taplow, showed a couple of dozen very finely flowered plants of the effective Giant Salmon cyclamen. Some wonderfully fine carnation blooms were brought over by Mr. H. Burnett, from Guernsey. Here were lovely examples of Enchantress, Aurora, Mrs. H. Burnett. Mikado, the blush-tinted Countess of March, the yellow Fortuna, Mikado, Winsor, Snow Queen, Afterglow, Rose Doré, and the new American Alvina, and several yellow and fancy seedlings.

The chrysanthemums from Messrs. W. Wells and Co., Merstham, made a good show, and included Japanese, single and incurved varieties; Miss Muriel Smith, the glorious yellow R. F. Felton, and the fine single Merstham Jewel, were all well represented in this useful display. Mr. Bradford, gardener to E. H. Brown, Esq., Roehampton, filled one table with well-grown plants of Begonia Gloire de Lorraine, Cypripedium insigne, and poinsettias, associating these with ferns and palms. Messrs. W. Cutbush and Son, Highgate, sent finely-berried hollies in variety, and the bright Hippophæ rhamnoides laden with orange-coloured fruits. Messrs. H. B. May and Sons, Edmonton, submitted a collection of nephrolepises, Stag's Horn ferns, heaths, Plumbago rosea, and Begonia Turnford Hall.

ORCHID COMMITTEE.

Mr. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, brought up well-grown and nicely-flowered plants of Cypripedium Thalia The Baron, C. The Emperor, C. Etoniense, C. Elatior splendens, and C. Memoria Martyni. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, showed Cypripedium Draco, C. Arethusa, C. Dawn—very fine, and C. Euryades leopardinum. From Messrs. J. and A. A. McBean came the lovely Cattleya Trianæ alba Kathleen. From Messrs. Stuart Low and Co., Bush Hill Park, Enfield, came Cypripedium Actæus superbum Drewett's var.; C. Leeanum Staffordianum, C. Beryl, C. insigne Blanche Moore, and a few other orchids.

Cypripediums were well shown by Messrs. J. Cypher and Sons, Cheltenham, the pick of a good set being C. insigne Harefield Hall, C. Mdme. Jules Hye. C. F. Sander, C. Leeanum Cypher's var., and C. Miss Louisa Fowler. Messrs. Mansell and Hatcher, Rawdon, Leeds, submitted Maxillaria elegantula; M. grandiflora, Cypripedium Niobe, C. triumphans Jules Hye's var., and C. insigne Sanderæ. Mr. G. Day, gardener to H. S. Goodson, Esq., Putney, put up a very bright collection of orchids, showing C. insigne Sanderæ largely, with various other C. insigne forms, odontoglossums in variety, lælio-cattleyas, etc., all well arranged with ferns. Mr. Edward V. Low, Vale Bridge, Haywards Heath, brought up Cypripedium Tityus, C. Actæus Langleyensis, C. Olivia, Oncidium ornithorhynchum album, etc.



CYPRIPEDIUM THE LION.

A.M., R.H.S., December 8. Messrs. Sander and Sons, St. Albans. Flowers deep rose, green, and brown.

Messrs. Charlesworth and Co., Haywards Heath, presented a very bright lot of orchids, showing the vivid Lælio-cattleya Cappei, L.-c. Sunray, L.-c. Pandora, and L.c. Lydia, as well as Cattleya Venus, C. Octave Doin, Calanthe Wm. Murray, C. Veitchi, Odontoglossum seedlings, finely blotched, and Vanda lamellata Boxalli.

Messrs. Sander and Sons, St. Albans. showed Cypripedium Lion (A.M.), a handsome flower; C. Alcibiades Illustrious—a grand orchid, but so much like a C. Alcibiades already certificated, that it gained no award; it had a dorsal sepal nearly 3½ inches across. Other cypripediums were well shown by the St. Albans firm, and so were Lælio-cattleya Cornelia, and odontoglossums in variety. Mr. Maurice Mertens, Ghent, brought over some beautiful seedling odontoglossums.

FRUIT AND VEGETABLE COMMITTEE.

A remarkable display of brassicas, showing the wonderful range of variation obtained by selection and cross-breeding from Brassica oleracea, was submitted by Messrs. Sutton and Sons, Reading. The wild type was shown, and a whole series of kales, including the variegated varieties, Purple Flanders, Palm Tree, Lark's Tongue, Jersey Kale, and the modern exquisitely curled forms. There were also the cross between a cabbage and Brussels sprouts, the cross between the savoy and Brussels sprouts, and a new Couve Tronchuda, with a fine cabbage-like heart. Brussels sprouts, in fine form and variety, were staged, with savoys and cabbages of many kinds and shapes. Autumn Protecting broccoli, and such uncommon brassicas as Chou Moellier, and Chou de la Sarthe. It was a vastly interesting exhibit, consisting of fifty distinct varieties of Brassica oleracea, many of them raised by the Reading firm.

Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Elstree, Herts, showed splendid samples of Labrador, Green Curled, Russian, Drumhead, The Sutton, Cottagers, A1., Scotch, and variegated kales, arranged in big piles, fresh, and tempting, and showing the range and value of the somewhat despised kale group of brassicas. Messrs. B. Shearn and Son, Tottenham Court Road, presented a collection of nuts, and Miss Martin, Willowbrook, New Jersey, contributed brandied fruits, preserves, and pickles.

Mr. Beckett scored for both red and white celery, in the competitive class; he was also first prizewinner for three kinds of beet, three of carrots—a fine set, for Brussels sprouts (stems and picked samples), endive, and savoys.

AWARDS.

No first-class certificates were awarded on this occasion.

Award of Merit. — To Cypripedium The Lion, from Messrs. Sander and Sons, St. Albans.

To Chrysanthemum Kathleen May, from Mr. H. J. Jones, Ryecroft Nursery, Lewisham.

To Chrysanthemum Mrs. W. Parker, from Mr. Frank Brazier, Caterham.

MEDALS.

Silver-Gilt Knightian.—To Messrs. Sutton and Sons, Reading, for a collection of Brassicas.

Silver-Gilt Banksian.—To Mr. H. Burnett, Guernsey, for carnations; to Mr. W. H. Page, Hampton, for carnations and liliums; to Messrs. James Veitch and Sons, Chelsea, for begonias.

Silver Flora Medal. — To E. H. Brown, Esq. (gardener, Mr. Bradford), Roehampton, for begonias, etc.; to Messrs. Cutbush and Son, Highgate, for carnations and hollies; to Rev. E. H. Buckstone, Derby, for cyclamen; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to H. S. Goodson, Esq. (gardener, Mr. G. Day), for orchids.

Silver Banksian.—To W. Astor, Esq. (gardener, Mr. Camm), Taplow, for cyclamen; to Messrs. Stuart Low and Co., Enfield, for carnations; to Messrs. H. Cannell and Sons, Swanley, for pelargoniums and chrysanthemums; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Messrs. Mansell and Hatcher, Rawdon, Leeds, for orchids; to Mr. E. Beckett, V.M.H., Aldenham House Gardens, for kales.

Perpetual-Flowering Carnation Society.

This society held a capital show on December 8 at the Royal Horticultural Hall. The competition was better than usual, and the flowers were excellent, many of them being of wonderful size and colour. Both amateurs and traders showed of their best, and the display was very interesting.

OPEN CLASSES.

Mr. C. F. Waters, Deanland Nurseries, Balcombe, secured the chief award for a display of cut carnations arranged on a space 10ft. by 3ft.; he put up a very pleasing exhibit, in which were good vases of Victory, Mrs. H. Burnett, Mrs. Patten, Enchantress, Mikado, Rose Pink Enchantress, Rose Doré, and Aurora; Mr. S. Mortimer, Farnham, was a close second.

The American Society's Cup for the best three bunches of American carnation novelties was won by Messrs. Bell and Sheldon, Castel Nurseries, Guernsey, with Pink Delight, Winona, and May Day.

In the open section for vases of twenty-five flowers the competition was moderate. Mr. W. H. Lancashire, Victoria Vineries, Guernsey, led for a white variety with White Perfection; Mr. D. M. Collins, Swanley, second; and Messrs. Bell and Sheldon third, each with White Perfection. Blush or light pink—Messrs. Bell and Sheldon first with a lovely vase of Winsor; Mr. Lancashire second with Enchantress; Mr. D. M. Collins third with Enchantress.

Rose or salmon—Mr. Lancashire first with Rose Doré; Mr. A. F. Dutton second with May Day; and Messrs. Bell and Sheldon third with Mrs. Burnett. Deep rose or cerise—Messrs. Bell and Sheldon first with Afterglow, very fine; Mr. Lancashire second with Mrs. T. W. Lawson; Mr. C. Engelmann third with Afterglow. Crimson—Mr. Lancashire first with President, extra good; Mr. C. Engelmann second with Carola; Mr. A. Smith, Enfield Highway, third with Union Jack. Scarlet — Messrs. Bell and Sheldon first with grand blooms of Britannia; Mr. Lancashire second with Robert Craig; and Mr. Engelmann third with Britannia. Any other colour or fancy—Mr. Lancashire first with the crimson-flaked Emperor, a new seedling; Mr. C. Engelmann second with Vinca, a red-purple self. Any variety not in commerce—Mr. C. Engelmann first with Carola; Mr. A. Smith second with Empire Day and Mr. J. Green, Wisbech, third with a white seedling.

AMATEURS.

Mr. Usher, gardener to Sir Randolf Baker, Bart., Ranston, Blandford, won the gold medal for a display of cut flowers arranged on a space 6ft. by 3ft. He had an arch of blooms, with vases of White Perfection, Apple Blossom, Winsor, Enchantress, Mrs. Burnett, Dahaim, etc., beneath, and every flower was a good one. Mr. P. Wilkinson, gardener to Sir Daniel Gooch, Bart., Hylands, Chelmsford, second; and Mr. F. May, Houndswood, Radlett, third.

In the smaller vase classes for amateurs six blooms were required. White—Mr. A. E. Usher first (and special) prize with White Perfection; Mr. A. Grubb second; and Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, third, each with White Perfection. Blush or light pink—Mr. Usher first with Enchantress; Mr. Vert second; and Mr. G. West, gardener to F. Ricardo, Esq., The Friary, Old Windsor, third, each showing Enchantress. Rose or salmon—Mr. Usher first with Rose Doré; Mr. E. Thayer, gardener to Mrs. Barron Newell, Woodstown, Rossdaff, second with Mrs. H. Burnett; and Mr. West third with Winsor. Deep pink or cerise—Mr. Usher first with Mrs. T. W. Lawson; Mr. Vert second with Aristocrat; Mr. West third with Mrs. Lawson. Crimson—Mr. Usher first with President; Mr. Vert second with Crimson Glow. Scarlet—Mr. Grubb, gardener to C. F. Raphael, Esq., Porter's Park, Shenley, first with Britannia; Mr. West second; and Mr. Vert third, each with Britannia. Any other colour—Mr. Usher first with Imperial; Mr. Vert second with Lord Charles Beresford, pink flaked; Mr. Thayer third with Ceres.

Mr. Usher led for a vase of twelve blooms in six varieties, and was followed by Mr. Vert; and Mr. G. Johnson, gardener to Lord Burnham, Hall Barn, Beaconsfield. Mr. G. H. Lawrence, Stratton, Godstone, had the best three white flowers, the best three blush flowers, and the best three scarlet blooms.

GROUPS AND PLANTS.

Lord Howard de Walden's silver gilt challenge vase, offered as first prize for a group of perpetual carnations, was won by Mr. A. Grubb, gardener to C. F. Raphael, Esq., Porters Park, Shenley, with a set of well-grown plants prettily arranged with maidenhair ferns. He had Winona, Britannia, White Perfection, Rose Doré, and Enchantress in fine condition.

Mr. Usher scored for six plants, distinct, showing well-developed examples of Imperial, Winsor, Rose Doré, Rose Pink Enchantress, and Mrs. H. Burnett; Mr. J. Vert, second, and Mr. Grubb, third. Mr. Usher was also first for three plants, followed by Mr. Vert and Mr. Grubb.

Mr. Usher scored for three plants of seedlings, and was first in two other classes for specified varieties, six blooms in a vase, where prizes were given by Messrs. S. Low and Co., and Mr. H. Burnett.

DECORATIVE EXHIBITS.

In the table decoration class Messrs. R. F. Felton and Sons, Hanover Square, were first-prize winners, with an excellent design in blush and crimson flowers; Mrs. Alex. Robinson, Park Hill, Carshalton, second with blooms of Mrs. H. Burnett, the corner stands arching inward gracefully; Mr. A. E. Usher, gardener to Sir Randolf Baker, Bart., Ranston, Blandford, third.

Mr. Grubb scored for six buttonholes for gentlemen, followed by Mr. Usher and Mr. J. Dudney. For ladies' sprays, Mr. Usher was a good first, with Messrs. R. Felton and Sons, second, and Mr. Grubb third. For a carnation bouquet Messrs. Bell and Sheldon were first, using flowers of Mrs. H. Burnett; Mr. Dudney second, and Mr. J. Green third. Mr. Robinon and Mr. Dudney were first and second for a basket of carnations.

Mr. Felton's prize for a vase of three dozen blooms, arranged for decorative effect, was won by Messrs. Bell and Sheldon, Guernsey, with a handsome vase of Britannia; Mr. H. J. Dudney, Erith, second for mixed flowers, and Mr. W. H. Lancashire third with Mrs. H. Burnett.

NON-COMPETITIVE.

Mr. C. Engelmann, Saffron Walden, had a very large display of carnations, showing these in vases of various sizes. His new Carola, deep crimson, was very effective, and on either hand were such charming varieties as O. P. Bassett, Pink Delight, Mrs. T. W. Lawson, Rose Pink Enchantress, Imperial, Beacon, and White Perfection, as well as numerous seedlings. Messrs. Young and Co., Hatherley, Cheltenham, exhibited large stands of Enchantress, Britannia, Lady Audley Nield, and various seedling carnations.

Growing plants of Mrs. H. Burnett, freely-flowered, were set up by Mr. Johnson, gardener to Lord Burnham, Hall Barn, Beaconsfield. Mr. T. Williams, Oxford Road, Ealing, showed carnations in rustic vases. Mr. James Green, Wisbech, contributed good vases of Enchantress, White Perfection, Britannia, Rose Pink Enchantress, etc.

A number of exhibitors who were contributing to the Tuesday meeting allowed their exhibits to remain for this show, and these included Messrs. H. B. May and Sons, Edmonton; Messrs. Stuart Low and Co., Enfield; Messrs. Wm. Cutbush and Son, Highgate; Messrs. B. Shearn and Son; Messrs. Jas. Veitch and Sons, Chelsea; Mr. W. H. Page, Tangley Nurseries, Hampton; Messrs. W. Wells and Co., Merstham; Mr. H. Burnett, Guernsey; Messrs. Sutton and Sons, Reading; and Mr. L. R. Russell, Richmond.

MEDALS.

Gold.—Mr. C. Engelmann, Saffron Walden.

Silver-Gilt.—Mr. W. H. Page, Hampton; Mr. H. Burnett, Guernsey.

Silver. — Messrs. W. Cutbush and Son, Highgate; Messrs. Stuart Low and Co., Enfield; Messrs. Young and Co., Hatherley; Mr. J. Green, Wisbech; and Lord Burnham (gardener, Mr. Johnson), Hall Barn, Beaconsfield.

Smithfield Club Show.

The great exhibition of fat stock, produce, and implements, which was held in the Agricultural Hall, Islington, during the past week, was in most respects very similar to the shows of previous years. Well-known firms occupied their usual stands, and displayed their specialities in their accustomed manner. It must, however, be added that, in point of quality and individual merit, the exhibits bear striking testimony to the immense improvements that have been effected by skilful and careful workers in their several spheres.

The exhibits of direct interest to horticulturists were, as usual, located in the extensive gallery, and, in our opinion, the show would have been well worth a visit, even were there no more to see than the splendid exhibits of vegetables, roots, and fruits which were here staged by the leading firms from all parts of the kingdom.

It is with particular pleasure that we record the fact that on Monday his Majesty King Edward VII. made a tour of the galleries, and showed much interest in the exhibits of Messrs. Sutton's, Webb's, King's, and Carter's roots and vegetables, and also the fruit exhibited by the Government of British Columbia. We were also pleased to meet a larger number of gardeners than usual.

Among the many good things to be seen on the elaborate stand erected by Messrs. Sutton and Sons, Reading, we particularly noticed the potato Sutton's White City, and a number of yellow-fleshed varieties, which were shown as "connoisseur's potatoes," it being claimed that they are of particularly fine flavour. Mushrooms, onions, tomatoes, and many other first-rate vegetables were to be seen on the stand, which was made the more attractive by the introduction of some fine cyclamen and a few other plants. Messrs. Webb and Sons, Wordsley, Stourbridge, had capital examples of many newer varieties of potatoes. Webb's New Guardian, Colonist, and Chieftain were three that we made special note of. Onions, and, in fact, most vegetables were represented by perfect specimens.

Messrs. Fidler and Sons, Reading, brought a grand lot of potatoes, their Charles Fidler occupying a prominent position. Lady Llewelyn and Eclipse are two good kidneys shown on this stand.

Another capital display of potatoes and other vegetables was made by Messrs. J. Carter and Co., High Holborn. Their swedes and mangels were also marvellous specimens. Messrs. Harrison and Sons, Leicester, brought capital onions, carrots, and beetroot. They had also some excellent potatoes, and their corn and peas were excellent samples.

Messrs. J. K. King and Sons, Coggeshall, had quite a number of potatoes of recent introduction. King John, King of Potatoes, Lord of the Isles, and Rentpayer were prominently displayed and highly spoken of.

A small exhibit of remarkably bright and well-grown fruit was arranged by the Government of British Columbia. The King's Acre Nurseries, Lim., Hereford, staged about eighty dishes of apples, embracing the most popular and the newest varieties. The dessert apple William Crump, was well shown. This is a fruit of capital shape, and pretty appearance. We are also able to say that the flavour is good, and the fruit keeps well.

Messrs. W. Horne and Sons, Cliffe, Rochester, had both fruit and trees on view, and we noticed Charles Ross, Rev. W. Wilks, and Rival among the apples staged. Messrs. W. Seabrook and Sons, Chelmsford, put up a fine lot of fruit, principally apples, but including a few good pears. Messrs. Dicksons, Lim., Chester, had, in addition to potatoes and apples, a good collection of young forest trees. Young larch, Douglas fir, spruce, and other useful trees were shown as lifted, and there were also thorns and privets for hedging.

Birmingham Gardeners' Association.

There was a goodly muster of the members at the fortnightly meeting held on Monday, November 29, in view of the attendance of Mr. William Partridge, manager to Messrs. Southall Bros. and Barclay, Lim., Birmingham, manufacturing chemists, to demonstrate "Photographic Studies in Natural Colours." The chairman, Mr. T. Humphreys, presided. Mr. Partridge, who is a well-known expert in this highly interesting department of photography, prefaced his remarks by declaring that it afforded him peculiar pleasure to appear before a body of florists, who would naturally much appreciate coloured photographs of the flowers they cultivate. After minutely explaining, with the aid of coloured diagrams thrown upon the screen, the process of securing the required colours, etc., the essayist's splendid representations of the rearranged rhododendron garden in the Botanical Gardens, Edgbaston, evoked much acclamation, so beautifully defined were the various colours presented. Pictures were also given of such collections of orchids, carnations, and tulips, staged at the recent summer shows held in the gardens in question, the delineations of which were exquisite in the extreme. Supplemental to the foregoing were a series of ancient and historical residences with their flower gardens, old-fashioned thatched cottages, and other stone-built and stone-roofed cottages which so abundantly characterise the Cotswold Hills district in Gloucestershire. Especially interesting was the picturesque village of Broadway, the residence of Madame de Narvarro (Mary Anderson) of histrionic fame.

The finale of the lantern slide demonstration was a view of the unique luncheon table floral decoration in the Birmingham Council Chamber on the occasion of the visit of King Edward VII. and Queen Alexandra to inaugurate the new University last summer.

In response to a hearty vote of thanks, Mr. Partridge remarked that it would afford him great pleasure to revisit the Cotswold scenes next summer in company with the members on the occasion of the annual outing, as suggested by one of the members.

National Chrysanthemum Society.

There was a really delightful display of flowers at the meeting of the Floral Committee held at Essex Hall on December 1. Mr. G. Ferguson, The Hollies, Weybridge, showed some delightful singles. Mr. H. W. Thorpe, Worthing, contributed a splendid lot of decorative or market varieties, all of fine type, and in varied colours. Messrs. W. Wells and Co., Merstham, showed several excellent single and decorative varieties, and other exhibitors were Mr. Powell, of Ryde; Mr. H. J. Jones, Lewisham; Mr. N. Molyneux, Wickham; and Mr. Chatfield, Southwick, Essex.

National Vegetable Society.

A committee meeting of the above society was held on the 7th inst. at the Royal Horticultural Society's Hall, Westminster, the following members being present: Mr. Alex. Dean, V.M.H. (chairman), Messrs. E. T. Cook, R. Hooper Pearson, Owen Thomas, V.M.H., E. Beckett, V.M.H., C. Foster, S. Mortimer, Jacques, C. Harvey, and G. Wythes, V.M.H.

The Treasurer reported that several gentlemen had become vice-presidents, and others new members. Mr. Gibson, a member of the committee, reported that the Duke of Portland, K.G., had kindly promised to give ten guineas for a first prize for twelve distinct varieties of vegetables at the forthcoming show, and that he wished the new society every success, and would give the same amount annually. The Chairman reported that the Royal Horticultural Society had kindly granted the use of the hall for the show on September 28, 1910, but as the hall was engaged for the next day, it was necessary to clear the exhibits at the close of the show. The prize list was then considered. The Treasurer stated that Messrs. Hudson, "Country Life," and Mr. E. T. Cook would give the prizes for eight varieties of vegetables of rare kinds not much grown, the amount being seven guineas. The Chairman offered £5 in prizes for allotment holders in the county of Surrey for six dishes of vegetables, the vegetables, when the show was over, to be sent to London hospitals.

Messrs. R. Sydenham, Lim., Birmingham, offered prizes amounting to nearly £30 in three classes, the amounts for the several classes being most liberal. Messrs. Dobbie, Rothesay, also gave valuable prizes for their vegetable specialities, amounting to £20; these are mostly single dish classes, and they will include two lots of potatoes. Messrs. Dickson and Robinson, Manchester, also offer substantial prizes, amounting to £21, for their own specialities; these are largely single dish classes.

Messrs. Wood and Sons, Wood Green, will give liberal special prizes for vegetables grown with their fertilisers, to the amount of £20. The Right Hon. Lord Northcliffe, through Mr. Foster, kindly promised valuable prizes to small holders to encourage good culture and other points.

Messrs. Barr and Sons, King Street, Covent Garden, offer prizes to the amount of six guineas for their best dwarf beans, cabbage, broccoli, cauliflower, carrots, lettuce, beet, and onions. Mr. Geo. Monro, V.M.H., kindly gives five guineas for six dishes of tomatoes, distinct varieties.

Messrs. H. Cannell and Son, Swanley, Kent, also give prizes for the best-flavoured vegetables, naturally grown. Messrs. G. Massey, Spalding, and Messrs. Cheal and Sons, Crawley, Sussex, offer several prizes, Messrs. Cheal giving £4 for eight kinds of vegetables. Messrs. Clay and Son, Stratford, have promised prizes. Messrs. Clibran, Altrincham, Cheshire, gave prizes for celery, £3 10s.

Messrs. Sutton, Reading; Messrs. Carter's, High Holborn; Messrs. Webb and Sons, Stourbridge; and Messrs. Veitch and Sons, Lim., Chelsea, will subscribe to the funds of the society. A sub-committee was formed to prepare the schedule of prizes, which will be ready early in January.

It will be seen that so far upwards of £140 are offered, and this, with the society's prizes, should ensure a display of vegetables from all parts of the country.

Beckenham Horticultural Society.

On Friday, December 3, Mr. Charles Foster, Director of the Horticultural Experimental Station at Guildford, lectured on "French and English Methods of Growing Vegetables," the chair being occupied by Mr. Cardross Grant, vice-president of the society. This lecture had been looked forward to with great interest, and a crowded room resulted. The lecturer dealt with the various crops grown in frames and under cloches, and named the best varieties for the purpose. For lettuce Golden Ball and Golden Queen had proved the most profitable; radishes, French Breakfast and Scarlet Olive; carrots, Nantes and Champion Horn; cauliflower, Dwarf Erfurt, Snowball, and Magnum Bonum; turnips, Milan. These were not so tractable under frame culture as the aforementioned crops, any check causing them to flower prematurely. Then mint, tarragon, potatoes, endive, chicory, climbing French beans, seakale, asparagus, etc., were all instructively discussed. The lecturer treated his subject perhaps more from a commercial point of view than otherwise, and pointed out that in intensive culture "there was money in it," but it wanted the right men at it, i.e., good, intelligent gardeners, but he did not hold out much hope for the amateur. Mr. Foster certainly scored a point when he drew from his bag samples of beautifully blanched endive and Golden Ball lettuce, and held them up for inspection, and asked, "How many in the room can put a salad equal to this on their employer's table to-day. How many?" Only one ventured a reply to this effect, "that some employers did not care for cabbage lettuce." Mr. Foster knows that some do care for them, as those shown by him were a sample of thousands for which he finds a ready market. Mr. Foster was so plied with questions, and he so anxious to give all instructions possible, that the meeting did not terminate till ten p.m., when most hearty thanks were tendered to Mr. Foster for a lecture bristling at all points with sound, practical teaching.

Remarkable Wheat Crop at the Garden City.—As showing how small holdings can be made to pay, an experiment recently made by three men at Letchworth (Garden City) is of interest. Two acres of land were rented and heavily manured with stable manure from London costing 5s. 2d. per ton, then ploughed, and cropped with potatoes for the first year. The yield was good, the potatoes selling at £4 10s. per ton, which cleared all expenses of seed, labour, rent, etc. The following November one and a-half acres were sown with Dutch "Wilhelmina" wheat, two bushels to the acre, the seed costing 7s. per bushel. The crop was phenomenally good, and, after being thrashed, has yielded over 60 bushels to the acre. Several quarters of the wheat have already been sold at 50s. per quarter, which is 16s. above market price of wheat to-day. If the whole of the wheat is sold at this price the income will be £18 5s. This small experiment clearly shows that wheat growing can still be made to pay in this country.

NEW BOOKS.

AMATEUR GARDENING CHRISTMAS NUMBER.

(W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C. Price 6d.; post free, 8½d.

The annual issue of our spirited contemporary "Amateur Gardening," that is especially associated with the Christmas season, has once more made its appearance on our table, and the success achieved in previous years ensured a hearty welcome from us. It not only received a warm welcome, but the anticipations we had on opening its pages were fully justified before we had proceeded far in a critical examination of its contents. The literary matter we found so abounding in interest, and the illustrations so rich in attractions that were we to institute comparisons between the present issue and the Christmas Numbers of our contemporary that have preceded it, we should not hesitate to say that on this occasion all previous efforts of a similar character have been surpassed. There is, however, no occasion for comparisons; we are alone concerned with the number now before us, and with reference to it we should say that those who are wise enough to purchase the number will find delightful entertainment in the numerous interesting articles that have a place in its pages. Some will find an immense amount of pleasure in the picture supplement, which contains scenes at home and abroad illustrating happy childhood, young maidens, and old age associated in pleasing harmony with beautiful flowers and charming vegetation, features which combine to represent a garden of delight in the seasons of spring and summer. In a word, we have portrayed, life in its happiest and brightest moods that lead us on in a vein most conducive to the full enjoyment of the Christmas season. Others will perhaps derive more pleasure from the several illustrated articles on such subjects as "The Mimicry of Plants," "Life Story of the Beech," "Nature's Leaf Embroidery." Others again will enjoy to the full the whole of the Christmas fare so liberally provided, and they will certainly be wise in so doing. With the number is issued a double-page illustration in colours, entitled "The Little Gardener," from a water colour drawing by Miss Jessie Currie.

BRITISH YEAR BOOK OF AGRICULTURE, 1909-10.

(Vinton and Co., Lim., 8, Breams Buildings, Chancery Lane, E.C.). Price 5s. net.

This comprehensive and admirably-prepared work should prove of immense value to all who are in any way concerned with agriculture and the industries associated therewith. The work is divided into seven sections, and these are devoted to societies and institutions; educational matters; diseases of animals; importation and exportation of animals; agricultural publications; markets sales, and prices; statistical, legal, and general information; Colonial agriculture; list of shows and agricultural who's who.

THE MONTHS OF THE YEAR.

By the Rev. Pemberton Lloyd, M.A. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.). Price 5s. net.

This is not a book on gardening or farming in which the work to be done in the garden or on the farm is duly set forth. Neither is it a book devoted to the various means of recreation that have of late years obtained so firm a hold upon the people of this and other countries. It is not the less useful on that account, and it is certainly far more interesting. It might, perhaps, be described as a series of essays in which everything relating to outdoor life in its broadest sense in each of the twelve months is described in a manner at once fresh and entertaining. However the book may be described, there can be no question as to its originality, freshness, and usefulness, or of the remarkable literary ability displayed by the author. The traditions and poetry associated with each month are fully dealt with, and form delightful reading; the various aspects of animal and plant life are passed under review, and in each month there is much that is of interest relating to garden and other games, and to other forms of recreation that are then uppermost in the mind of those who regard some form of healthy exercise as essential to the full enjoyment of life.

We have evidence on every page that the author was well equipped for the task he set himself in preparing "The Months of the Year," and a close examination of the contents has impressed us with the remarkable success he has achieved. It is a book that can be highly recommended to those who take an interest in outdoor life, and the work of the printers and publishers has been so admirably accomplished as to render it most suitable for a Christmas present.

NATIONAL ROSE SOCIETY'S CATALOGUE.

(E. Mawley, V.M.H., Hon. Secretary, National Rose Society, Rosebank, Berkhamsted). Price 2s. 6d. to non-members.

The new edition of the catalogue of roses that has been issued to the members of the National Rose Society is on much the same lines as the edition immediately preceding it; but it has been thoroughly revised, and somewhat enlarged. As representing the work of the leading amateur and professional rosarians in the United Kingdom, the catalogue should prove of immense value to the general body of rosarians, both in making selections of varieties for various purposes, and as a guide to classification.

On the night of the 2nd inst., much damage was done to trees by the gale.

GRAPES AND HOW TO GROW THEM.—An illustrated guide to propagation, culture, and management in vineries, greenhouses, and in the open air. By J. Landell, F.R.H.S. Price 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

NEW PLANTS, ETC.

CHRYSANTHEMUMS.

Eva Smith.—A large pure white incurved variety of good size and excellent form. It has medium sized florets that overlap pleasingly. A useful late variety. F.C.C., N.C.S., December 1. Mr. N. Molyneux, Wickham, Hants.

Russet.—A very pretty market variety of Japanese form. It has good stems and substantial florets, and is of very bright bronzy red colour. F.C.C., N.C.S., Dec. 1. Mr. H. W. Thorpe, Worthing.

Mrs. Rolfe.—Another useful late decorative variety with medium sized Japanese blooms of lovely flesh-pink colour, light tinted with green in the centre. Commendation N.C.S, December 1. Mr. H. W. Thorpe, Worthing.

Mrs. Goddard.—This decorative or market variety has fair sized elegant flowers of a telling shade of reddish bronze. Commendation N.C.S., December 1. Mr. H. W. Thorpe, Worthing.

Silver Tip.—A delightful decorative Japanese variety of beautiful form and charming colour. The latter is deep reddish rose with silver tips to the central florets. F.C.C., N.C.S., December 1. Mr. H. W. Thorpe, Worthing.

Mrs. G. Ferguson.—A lovely pure white single variety of excellent form and substance, broad petalled, and free. Commendation, N.C.S., December 1. Mr. F. Smith, gardener to G. Ferguson, Esq., The Hollies, Weybridge.

Queen of the Solent.—A pretty single decorative variety, with about four rows of petals. It is of a lovely soft pink shade. F.C.C., N.C.S., December 1. Mr. A. J. Powell, Goldsworth Grove, Ryde, Isle of Wight.

Baldock's Crimson.—A brilliant and rich crimson decorative variety of excellent Japanese form, and with good foliage, solid blooms, and good stems. Fine for market, but apparently not good in spray form. F.C.C., N.C.S., December 1. Mr. F. H. Ladds, Swanley.

Miss Muriel Smith.—A beautiful and very elegant decorative Japanese variety, entirely of a rich old rose shade. It has excellent stems and neat foliage. F.C.C., N.C.S., December 1. Messrs. W. Wells and Co., Merstham.

Miss Kathleen Wells.—A large Japanese single variety of great beauty and effectiveness. The big flowers are bright red-crimson with a yellow shaded zone round the disc. F.C.C., N.C.S., December 1. Messrs. W. Wells and Co., Merstham.

Mensa.—We have already described this very fine white single variety. Commended, N.C.S., December 1. Messrs. W. Wells and Co., Merstham.

FORTHCOMING ENGAGEMENTS.

MONDAY, December 13.—United Horticultural Benefit and Provident Society.

National Chrysanthemum Society, Floral Committee Meeting.

WEDNESDAY, December 14.—Royal Meteorological Society.

Chrysanthemum H. W. Thorp.—This white-flowered incurved variety reminds one of Empress of India in its form and general appearance, except that the petals are not so wide as in well cultivated flowers of that old favourite.—E. M.

Books as Christmas Presents.—"When in doubt, give a book," is good advice for those puzzling their brains to think of suitable Christmas presents for their friends. A book is always welcome, particularly if it is one that deals with the recipient's business or hobby. For this reason, those who have friends who are connected with, or who go in for gardening, cannot do better than send to the publishers of the GARDENERS' MAGAZINE, 148, Aldersgate Street, London, for a copy of the Christmas catalogue of books on gardening, etc. These range in price from 1s. to 7s. 6d. each, and are reliable and up-to-date.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149. Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

WEEPING TREES.—C. E. H., Barnsley: Weeping trees are obtained by budding a pendulous variety upon a suitable stock. For instance, the weeping ash is naturally pendulous, and would be difficult to grow into good form if on its own roots, but budded on to a young ash of ordinary type, it quickly becomes a graceful specimen.

GARDENING IN RUSSIA. — F. L., Bohrrpobo: We shall be glad to do our best for you, but if the garden is of large size it will be practically impossible to deal with the matter in this column, and it would be necessary for someone who understands the climate and general conditions to inspect and report upon the place ere the matter could be carried to a successful issue. However, send the plan, and particulars of climate, position, and shelter, and we will advise you as to what will be the best course to pursue.

CLEMATIS.—E. R. S., Harpenden: The variety of clematis named Venus Victrix, belongs to the C. lanuginosa type. All the members of this group flower on their comparatively short summer growths, and therefore they need little pruning beyond an occasional thinning out of the shoots. All the lanuginosa class are very suitable for cultivation in an unheated greenhouse.

CORDON GOOSEBERRIES.—S. E. L., Morden: Single cordons should be planted a foot apart; double cordons two feet apart; and triple cordons a yard apart. This is, of course, a general rule, and one that may be modified according to circumstances. If summer pruning is carried out promptly and efficiently, and the land is not especially strong, then ten inches apart will serve for single cordons.

VERY FRAGRANT ROSES.—A. L. F., Dunstable: There is a very great deal of difference in the kind and quality of the fragrance of roses. Some varieties are quite scentless. The National Rose Society has drawn up a list of sweetly scented roses, which is as follows: Alfred Colomb, Cherry Ripe, Commandant Felix Faure, Common Provence, Dupuy Jamain, Exposition de Brie, General Jacqueminot, Heinrich Schultheis, Johanna Sebus, La France, Mdme. Isaac Pereire, Marie Baumann, Mrs. John Laing, Paul Jamain, Rosa Mundi, Senateur Vaisse, Ulrich Brunner, and Zephirine Drouhin.

MELON CULTURE.—H. L., Sevenoaks: The matter has been dealt with at length in our columns, and on numerous occasions. Briefly put, a suitable compost for melons is prepared with fibrous loam, and one-sixth part each of well-rotted manure and leaf-mould, with a little lime rubbish. To obtain ripe fruit in May or June, sow the seed in January or February in small 60-sized pots, one seed in each, and place where the seed will have the assistance of a good bottom heat. Shift into five-inch pots as soon as the plants have made their first rough leaf, previously warming the compost. In about six weeks plant in the beds, which should be made a few days beforehand for the soil to become warmed. Put them two feet apart along the middle of the bed, and train the plants up the trellis until they reach the top, when the points must be nipped out to promote the production of fruit-bearing laterals. Stop these shoots at the third leaf beyond the fruit-bearing flower, to the stigma of which pollen must be applied when fully developed. Leave four fruits to each plant, and remove the others when they are swelling freely. Maintain a temperature of 70 deg. by night and 80 deg. by day, and a moist atmosphere; water moderately, and carefully ventilate. Support the fruits by strands of bast, and when they begin to ripen reduce the supply of water to the roots, and increase the ventilation, but do not keep so dry at the roots as is generally the case. Later crops require similar treatment, and as there is less difficulty attending their production they are preferable for amateurs. Good varieties are: High Cross Hybrid, and Late Perfection, green flesh; Gunton Orange and Syon Perfection, scarlet flesh; and Frogmore Orange, Hero of Lockinge, and The Countess, white flesh.

DISEASED CELERY.—A. V., Barcombe: Your celery is suffering from a very bad attack of one of the celery leaf spot diseases, probably Septoria petroselini var. Apii, though some of the spots suggest the American disease, Cercospora apii. Remove and burn all diseased portions at once. It is in damp seasons that the disease becomes dangerous, and spreads with remarkable rapidity. It is very doubtful at this stage whether spraying will check the disease, as this should have been done earlier. Try spraying with sulphide of potassium, one ounce to 2½ gallons of water. First of all lift and burn the diseased plants, and then use up those next to the diseased ones on either side, and spray the rest, putting up canvas or other shelter to prevent rains from washing the solution off directly.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

SURREY. — Pittosporum tenuifolium is the name of the plant, sprays of which were used for table decoration.

A. C., Torquay.—1, Cephalotaxus Fortunei; 2, Cephalotaxus pedunculatus; 3, Cupressus sempervirens; 4, C. Lawsoniana; 5. Libocedrus chilensis; 6, Cryptomeria japonica.

D. B., Wellingborough. — 1, Cattleya Trianæ; 2, C. Harrisonæ; 3, a hybrid from Cypripedium Spicerianum, probably a form of C. Niobe; 4, Begonia fuchsioides; 5, Selaginella Kraussiana.

J. B., Hayle.—1, Ilex aquifolium ferox argentea; 2, I. a. variety; 3, I. a. aurea marginata; 4, I. platyphylla Lawsoniana; 5, I. a. aureo medio picta; 6, Thuya plicata; 8, Thuya plicata; 9, Cupressus Lawsoniana erecta viridis; 10, Picea excelsa; 11, Ilex Perado; 12, Euonymus microphyllus.

NAMES OF FRUITS.

When sending fruits for naming, will our readers be good enough to send good specimens, as without these it is not possible to accurately determine the varieties. Pack firmly, using light tin or wood boxes, and send not more than six varieties at once. Label each specimen and enclose letter with the fruit, whether a separate notification is sent or not. Address the packages to the Editor, GARDENERS' MAGAZINE, as advised in the notice at the head of "Answers to Correspondents."

G. B., Dublin.—Josephine de Malines.

W. B., Heston.—1, Lane's Prince Albert; 2, Sandringham; 3, Blenheim Pippin.

S. L. B., Diss.—1, Cox's Orange Pippin; 2, Tyler's Kernel; 3, Court of Wick; 4, Peasgood's Nonsuch.

T. M. H., Carisbrooke.—1, Gravenstein; 2, King of the Pippin; 3, Roundway Magnum Bonum; 4, Beurré d'Aremberg.

W. W. J., Exeter.—1, Cellini; 2, King of Tompkin's County; 3, Bramley's Seedling; 4, Catillac; 5, Dutch Mignonne; 6, Alfriston.

HERBERTS PARK POTTERY CO., DARLASTON, STAFFS.

CATALOGUES RECEIVED.

WM. LUMLEY, DAWN NURSERIES, DENVILLE, HAVANT.—A neat little list of new sweet peas, and with a selection of the best older varieties. The varieties are described and the list is handy for the pocket.

ROBERT BOLTON, WARTON, CARNFORTH.—An important catalogue of sweet peas, including the raisers and the American novelties, as well as the outstanding varieties previously introduced. There are numerous illustrations.

S. F. RICHMOND, OSSETT, YORKS.—A briefly descriptive list of new and standard varieties of chrysanthemums.

HERBERTS PARK POTTERY COMPANY, DARLASTON, STAFFS.—A useful illustrated catalogue of plain and ornamental garden pottery, including artistically designed window boxes, plant stands, etc.

F. S. VALLIS BROMHAM FRUIT FARM, CHIPPENHAM.—A select list of choice Japanese chrysanthemums, with four new varieties for 1910.

H. CANNELL AND SONS, SWANLEY.—A chrysanthemum list including a number of new early and single varieties, and eight Australian-raised Japanese varieties for 1910.

HOBBIES, LIM., DEREHAM.—An illustrated and descriptive list of roses.

J. M. THORBURN and CO., BARCLAY STREET, NEW YORK.—A list of American seeds, including trees and shrubs, flowers, and vegetables.

LITTLE and BALLANTYNE, CARLISLE. — This catalogue gives ample evidence of the fact that the firm specialises in forest and ornamental trees, shrubs, and fruit trees.

AMOS PERRY, ENFIELD.—Plants for the rock garden and the herbaceous border are admirably listed and described in what is entitled an "Abridged" catalogue. We look forward to Mr. Perry's unabridged catalogue.

H. LANE and SONS, GREAT BERKHAMSTED.—The red-covered departmental catalogue includes the hardy trees and shrubs, rhododendrons, and azaleas stocked by this firm. The green-covered catalogue includes roses and fruit trees.

W. LEGGETT, WEST BERGHOLT, COLCHESTER.—A very neat and well-arranged catalogue of roses.

NOW READY.

CHRISTMAS NUMBER

. . OF . .

Amateur Gardening FOR TOWN AND COUNTRY

A GRAND BUDGET of Literary Fare, specially compiled for the season.

The Contents include:

NATURE'S LEAF EMBROIDERY.—Describing and illustrating the many examples of variation in the margins of the leaves of plants.

LIFE STORY OF A BEECH TREE.—Showing by word and picture the development of the Beech Tree from Seed to the matured specimen in Field and Forest.

DEALERS IN DEATH.—An illustrated account of the poisonous flora found in hedgerow, mead, and woodland in the British Isles.

GARDEN BEAUTIFUL IN WINTER.—A charming story, descriptive of the pretty effects obtained in gardens during Winter by the formation of frosts crystals on the leaves of plants (with pictures).

THE ORDER OF THE THISTLE.—The Thistle as the emblem of self-defence, dignity, and strength. Illustrated.

OUR OLD GARDENS.—A delightfully written essay on the charm and beauty of old-time gardens.

A SHAKESPEAREAN GARDEN.—The Flowers and Herbs of Shakespeare's Day.

BACTERIAL ODOURS AND FLOWERS.—The origin of Fragrance in Flowers.

Also a variety of shorter papers of an appropriate and interesting character, which will not fail to appeal strongly to lovers of Nature and the Garden.

A SPECIAL FINE ART PICTURE SUPPLEMENT FROM PHOTOGRAPHS OF LOVELY GARDENS, FLOWERS, AND CHILD LIFE IN THE GARDEN.

ALSO A

Double-page Plate in Colours

"THE LITTLE GARDENER"

(after a Water-colour Drawing by Miss Currie).

Price SIXPENCE; by post, 8½d.

Order AT ONCE from your Newsagent, as this Number cannot be reprinted.

Offices, 148 and 149, Aldersgate Street, London, E.C.

THE AMATEUR'S GREENHOUSE.

By T. W. SANDERS, F.L.S., F.R.H.S.,

Editor of "Amateur Gardening" and "Farm and Garden." Author of "Encyclopædia of Gardening," etc., etc.

A COMPLETE GUIDE TO THE CONSTRUCTION, HEATING AND MANAGEMENT OF GREENHOUSES; PROPAGATION AND CULTIVATION OF GREENHOUSE PLANTS; INSECT, ANIMAL, AND FUNGOID PESTS, AND HOW TO ERADICATE THEM.

To be obtained by order from any Bookseller; or will be sent, post free, packed in box, for 5s. 6d., by the Publishers.

W. H. and L. COLLINGRIDGE, 148 and 149, Aldersgate Street, London.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

NOTES OF THE WEEK.

National Rose Society.

The report and financial statement which the Council of the National Rose Society presented to the members assembled in annual meeting, were so eminently satisfactory that it was not surprising they should have been unanimously passed without comment other than expressions of approval of the splendid work that had been accomplished. The outstanding feature was, perhaps, the enormous increase in membership. During the year 900 new members joined, or an increase of 115, as compared with 1908, bringing the total, after allowing for deaths and resignations up to 3,797 members, a total that must exceed the anticipations of the most optimistic of those who looked for a material accession of strength from the adoption of an expansive policy. Twenty years ago there were probably not more than 500 members on the society's books, and five years since the number was only 1,308, these figures being of interest as showing that during the last-named period there has been an increase of 2,489 in the list of members. Under any circumstances, we should derive much gratification from being able to record a large increase in the strength of a society engaged in promoting the advancement of an important branch of floriculture. But in this case we are especially pleased because the growth of the society proves to demonstration the soundness of the views we have so persistently urged upon societies engaged in the furtherance of floricultural and horticultural pursuits. As will be remembered by our readers, we have strongly advised societies that are more or less of a national character to take a broad view of their duties, and endeavour to accomplish something beyond the holding of an exhibition annually. It may not be possible to do much; but if the members who are not exhibitors have evidence of an endeavour to assist them in their hobby, their interest in the society is greatly increased, and one result of this is usually an accession of new members. Twenty years ago the only publication of the National Rose Society was the schedule of prizes, but now it issues several publications annually, all of which are more or less interesting and useful. In the development of the new policy the society had to begin in a small way, and for a time the members provided the necessary funds out of their own pockets. Two or three editions of the catalogue were published by means of funds raised by private subscription. For a long period the society limited its endeavours to what are commonly known as exhibition roses, and very attractive were the exhibitions to the general public; but when a policy was adopted that embraced encouragement to all classes of roses, the popularity of the shows, both in London and the provinces, increased at a rapid rate. Last year the attendances at the metropolitan and provincial shows established records. The first of the two exhibitions mentioned, though highly successful, was hardly so extensive as some of the competitive gatherings in recent years, and it was decidedly below the average in the quality of the blooms. The backwardness of the season is assigned as the cause of this falling off, and the severe frost in May and the low temperature that was experienced until the end of June, unquestionably prevented the general body of exhibitors staging so freely or so well as usual. It should, however, be remembered that July 2 is too early a date on which to obtain a thoroughly representative exhibition of roses of the highest class, excepting in a season in which the climatic conditions are especially favourable to an early development of the blooms. The falling-off in the quantity and quality of the blooms is exactly what might have been expected, for on few occasions during the past thirty-five years have the exhibitions held on July 1 or 2 been equal to the average. We are pleased to see that the Council is busily engaged in building up a substantial reserve fund, and we trust there will be no relaxation of effort until it reaches at least £2,000. The object of the National Rose Society is of course, to encourage the cultivation and development of the rose; but it should not be difficult to see that a society with a reserve fund proportionate to its responsibilities and operations is in a far better position to accomplish useful work than one which has to send the hat round or materially curtail its activities after the sun has hidden his face behind a cloud for a short period. We might give many examples in proof of this, but for the present purpose it is sufficient to mention the fact that the Council of the National Rose Society fully appreciate the importance of a strong financial position.

MR. WILLIAM COLLINS.
Secretary of the United Horticultural Benefit and Provident Society.

Mr. William Collins,

a well-known figure in the horticultural world, began his gardening career before he was twelve years of age, in a clergyman's garden in Sussex, where he remained for some few years, and then went to Arundel Castle Gardens, where he remained for three years. He then went to Messrs. B. S. Williams and Sons' nursery at Holloway for a time, and from thence passed on to become foreman at Danesbury Park, Welwyn. His next move was as head gardener at Highbury Grange, where he remained for two years, leaving to become head gardener at Chesterford Park in Essex. From Chesterford he went to Harewood, near Bletchingley, and thence to Merton Abbey, Surrey, where he remained nearly five years, as gardener to H. Clark, Esq. Leaving there he became engaged to J. Seligman, Esq., Lincoln House, Clapham Park, S.W., with whom he remained for six and a-half years, and then entered the service of A. A. Vlarts, Esq., Clapham Park, where he was head gardener for nearly sixteen years, until Mr. Vlarts died and the establishment was broken up. It was during the time he was there that Mr. Collins was elected secretary of the United Horticultural Benefit and Provident Society, which was at that time a very small affair, and he was well able to do all the work of the society during his evenings. He has held this important position now for nearly twenty-three years, and during that time has had the pleasure of seeing the society gradually advance to its present dimensions and position, and he hopes to see it increase still further in numbers and prosperity. Mr. Collins is always ready to assert that the success of a society does not altogether lie with a secretary, but with a good working Board of Management, and the general co-operation of the members. We agree, but all the same, we ourselves believe that the success of a society that is soundly based and well managed lies more with the secretary than with any other member of the administrative body. Therefore, we wish to pay our tribute to Mr. Collins' secretarial ability and his constant kindly good humour. Mr. Collins has been a member of the United Horticultural and Benefit Society exactly forty years, and secretary for twenty-three years, and though during that period he has been the channel through which enormous sums have passed for sick pay, and almost numberless acts of benevolence, Providence has been so kind to him that he has never missed a committee meeting and never drawn a penny in sick pay from the society. May he long continue in health and strength.

"**The Gardening Year Book for** 1910" is now published, and will be found to admirably fulfil its purpose, which, briefly stated, is to give trustworthy information on all matters relating to the garden and its management. We shall take an early opportunity of referring to the issue and its contents, but we would now mention that a page with ruled paper is provided for each month of the year for the making of garden memoranda.

Foreign Fruits were imported in somewhat larger quantities in November than in the corresponding month of last year, and one of the most notable increases was in the imports of apples. The aggregate imports of these fruits was 702,079 cwt., of the value of £424,064, or an increase in quantity of 85,869 cwt., and in value of £59,348. Bananas were also received in larger quantities, the total having been 435,814 bunches, of the value of £124,900, the increase in number being 21,382 bunches, and in value £2,935. Grapes show an increase in quantity of 1,678 cwt. and in value of £881, the total having been 94,866 cwt., of the value of £98,555. Large as was the quantity of grapes, it was less than half the imports in November, 1907. Lemons were imported in rather larger quantities, but there was a falling-off in the imports of oranges, and also in the various kinds of nuts. Pears were received in smaller quantities, the total imports having been 44,934 cwt., of the value of £34,463, or a decrease of 3,459 cwt., and a reduction in value of £6,464. In the imports of plums there was a big increase, the aggregate having been 2,658 cwt., of the value of £1,437, against 57 cwt., of the value of £40, in the corresponding month of last year. The value of enumerated fruit amounted in the aggregate to £21,820, or an increase of £1,397. The total value of the fruit imports was £1,135,335, as compared with £1,116,206 in November, 1908.

Royal Horticultural Society.—There will be no show on Tuesday next (December 21) at the Horticultural Hall, but the committees will meet upstairs for the purpose of dealing with novelties.

London Gardens on Vacant Land.—Presumably, as the result of the success that has been achieved by Mr. Fels in utilising vacant land in the Metropolis, the "City Gardens" movement has been adopted by the Church Army as a means of helping the unemployed by converting vacant and it may be unsightly land into productive gardens. The Ecclesiastical Commissioners have generously placed at the disposal of the Church Army two plots in Westminster, and when ready the sites will be let free of rent in plots of about one-eighth of an acre to deserving men. A few days since the movement was inaugurated by the Lady Mayoress, who planted a cabbage in the Stillington Street Garden, and briefly explained the scheme, which we hope will prove a complete success.

Windsor Chrysanthemum Society.—The King has given a new silver challenge cup to this society to take the place of his Majesty's trophy, which was won outright by Mr. T. Stevenson, at the exhibition held in November.

R.H.S. Exhibitions and Meetings, 1910.—The following are the arrangements made by the Royal Horticultural Society for next year, but they are, we are informed, still subject to modification. Spring Bulb Show, March 8; Exhibition of Vegetables grown under Intensive Culture, March 23; Auricula Show, May 3; Carnation Show, May 19; Exhibition in Temple Gardens, May 24, 25, and 26; Holland Park Show, July 5 and 6; Sweet Pea Show, July 12 and 13; Carnation Show, July 26; Autumn Rose Show, September 15; Vegetable Exhibition, September 28; British Fruit Show, October 13 and 14; Exhibition of Bottled Fruit, December 6. The Fruit, Floral, and Orchid Committees will meet January 11 and 25, February 8 and 22, March 8 and 22, April 19, May 3, 17, and 24, June 7 and 21, July 5 and 19, August 2, 16, and 30, September 13 and 27, October 11 and 25, November 8 and 22, and December 6. The annual meeting will be held February 8.

Fruit Culture in the North.—At a conference of delegates from the more important horticultural societies in Northumberland, held at Hexham, it was decided to hold a fruit congress and exhibition in that town next year, and the dates fixed are October 20, 21, and 22. The promoters of the meeting have already obtained promises of co-operation, and among those who have undertaken to read papers are Professor Theobald, of the Wye College, who will deal with insect pests, and Mr. H. Somers Rivers, of Sawbridgeworth, who will take as his subject "Stocks for Fruit Trees." The Rev. J. Bernard Hall, of Corbridge, is the honorary secretary, and will be pleased to hear from those who may be desirous of assisting in bringing the congress and exhibition to a successful conclusion. Sub-committees have been formed for dealing with finance, exhibition, congress, reception, railway arrangements, and other matters.

An Interesting Orchid Case.—On Monday last, before Judge Lumley Smith, K.C., Mr. J. F. Alcock, of Berkhamsted, brought an action against Mr. Francis Wellesley, J.P., of Woking, in the City of London Court, to recover £100 for breach of warranty. The plaintiff's case was that he purchased a plant, at the sale of Mr. Wellesley's collection, described in the auctioneer's catalogue as Cypripedium insigne Francis Wellesley, but which, when it flowered, he considered was C. insigne Harefield Hall, and therefore worth only from two to five guineas, whereas the plaintiff had paid 80 guineas for it. The defendant's case was that the plant had not yet become strong enough, after division and potting, to produce the true character of C. i. Francis Wellesley. Judgment was given for the plaintiff for £70, and costs, in one action, and £25 in another action. Our readers may be interested to know that C. i. Francis Wellesley was illustrated in the Gardeners' Magazine of February 8, 1908.

Instructor in Horticulture for Norfolk.—The Norfolk County Council have just appointed Mr. H. Goude, of The Grange Gardens, Old Catton, Norwich, out of sixteen applicants, unanimously to the post of horticultural instructor for the county. During the several years that Mr. Goude has been in the district he has done much good work in the local gardening societies, and has been a most successful exhibitor.

Vegetable Imports in November were much larger than in the corresponding month of last year. Potatoes show an increase in quantity of 47,315 cwt., and in value of £7,981, the aggregate imports having been 174,401 cwt., of the value of £26,683, and of this quantity 139,148 cwt., of the value of £19,628, were received from France. The imports of onions were very large, the total being 837,517 bushels, of the value of £107,037, as compared with 620,202 bushels, of the value of £101,037. The imports of onions for the eleven months ending with November were 6,958,137 bushels, of the value of £1,144,994. The value of unenumerated vegetables show an increase of £5,550, the total having been £25,109. The imports of tomatoes were 59,578 cwt., of the value of £46,813, these figures indicating a decrease in quantity of 14,714 cwt., and in value of £11,833. The total value of the vegetables imported during November was £205,642, which is certainly a very large sum to pay foreign growers for products, which, with the exception of tomatoes, can be successfully grown in this country.

Staffs in Botanical Departments.—In an appendix to the "Kew Bulletin," a list is given of the staffs of the Royal Botanic Gardens, Kew, and of botanical departments, establishments, and officers at home and in India and the Colonies in correspondence with Kew. The list is somewhat lengthy, and is of much interest, more particularly to those who are concerned with the botanical work that is being done in Great Britain and her possessions and Colonies. We note among the names of the assistants in the herbarium at Kew that of Miss J. J. Clark, B.Sc. There are now three ladies on the herbarium staff.

New Irish Public Park.—The Corporation of Bangor, co. Down, Ireland, having offered a premium for the best design for laying out their park, a large number of designs were submitted, and that of Messrs. J. Cheal and Sons, of Crawley and London, was awarded the first premium.

ROYAL BOTANIC SOCIETY.

In our issue for November 13 we published a letter that had been written by the Rev. W. Wilks, secretary of the Royal Horticultural Society to the Duke of Teck, G.C.V.O., president of the Royal Botanic Society, with reference to the Gardens of the last-named society. Mr. Wilks suggested in his letter that a committee from the Council of each society be formed, and that the two committees meet to consider and discuss any proposals which might be made for securing the preservation of the Regent's Park Gardens for horticultural purposes.

This suggestion was acted upon, the two committees were appointed, and a meeting was held at the Horticultural Hall, Westminster, on November 24. Since the meeting the following correspondence has taken place between the two societies. The first communication, dated November 26, is:—

A Memorandum from the Royal Horticultural Society

Consisting of a skeleton outline of a suggested working arrangement between The Royal Horticultural and the Royal Botanic Societies.

POSITION OF AFFAIRS.—A circular issued by the Royal Botanic Society's Council on November 6, 1909, describes the position thus: "The R.B.S. will come to an end. . . within four weeks' time unless. . . a sum of £2,000. . . is immediately paid."

In a previous official statement sent out by the R.B.S. the expendiuture for the year 1908 is shown to have been £6,290, and the receipts £4,503, that is to say, there was a loss of £1,787, or of £1,053 even if the £734, the interest paid on debentures, be deducted; and, looking back on the previous balance-sheets, the R.B.S. appears to have been working for some time at an annual loss. The Council of the R.B.S. is therefore amply justified in their "apprehended close of the Gardens" and the consequent loss of all the Fellows' rights and privileges, and enjoyment therein.

OBJECTS AIMED AT.

1. To safeguard and secure in perpetuity all existing rights and privileges of the Fellows of the Royal Botanic Society in the Regent's Park Gardens.

2. To secure the continued use of the Gardens for the service of horticultural and botanical science.

3. The constitution and establishment of one great united Horticultural and Botanical Society for the Metropolis and Kingdom.

SCHEME.

(a.) A new society of similar or joint name to be formed under the auspices of the R.H.S., each of the contributing societies nominating members of council in proportion to the number of existing Fellows.

(b.) The R.B.S., with the assent of the Department of Woods and Forests, to sublet or assign their lease to the new society for the full term of such lease (less one month), the Department of Woods and Forests agreeing to accept payment of rent from the new society and giving it their receipt in discharge.

(c.) A covenant to be inserted in the assignment that the joint society is to give up the Gardens and buildings at the close of the lease in as good a state of repair as when assigned.

(d.) The Fellows and Associates of the R.H.S. to rank as Fellows and Associates of the new society on the same terms and conditions, and with the same privileges as attach to them as Fellows and Associates of the R.H.S.

(e.) The Fellows and debenture holders of the R.B.S. to rank as Fellows of the new society on the following conditions:—

1. Subscribing Fellows to pay to the new society the same rate of subscription they at present pay to the R.B.S., and to retain all their existing privileges at Regent's Park and have added thereto all the privileges of the R.H.S. as well.
2. Life Fellows and Debenture Holders to retain all their existing privileges at Regent's Park, and have added thereto the rank and privileges of Life Fellows of the R.H.S. as well.

(f.) At the termination of the Lease all Life Fellows and Debenture Holders of the R.B.S. to cease to rank as Fellows of the R.H.S. unless the lease be renewed.

FINANCIAL ASSISTANCE.

1. The question of the possibility of the R.H.S. affording immediate financial assistance to the R.B.S. does not rightly come under a scheme suggested for the purpose of maintaining the rights and privileges of the Fellows of the R.B.S. in perpetuity and securing the upkeep and present user of the Regent's Park Gardens.

2. The President of the Royal Horticultural Society nevertheless would bring before the Council and Fellows of his Society the apparent necessity that some financial assistance should be given, but he wishes it to be distinctly understood that he has no power whatever to pledge the Society to agree to this proposal.

NOTE.

The suggestions embodied above are in no sense offered as an ultimatum, but as forming a convenient basis for further friendly negotiation, and in the hope that the Fellows of the R.B.S. would prefer such a scheme rather than that their Society should perish, and they themselves lose all their rights and privileges therein.

The Royal Botanic Society's Reply

to the suggested agreement between the Royal Botanic Society and the Royal Horticultural Society is as follows:

The Special Committee of the Royal Botanic Society appointed to confer with the Special Committee of the Royal Horticultural Society, wish at the outset, to acknowledge their very frank and courteous reception on the occasion when they met by invitation at the Royal Horticultural Society's Hall in Vincent Square. And the Special Committee, as desired, accept as a basis for further friendly discussion between the two societies, the memorandum received by them on the 27th inst.

As regards the memorandum itself, they cannot help saying that its shape leaves something to be desired. As regards, for instance, the circular of November 6, to which prominence is given in the memorandum, it was explained at the interview that circumstances had altered considerably since that circular was written.

The actual position of affairs would seem to be as follows:

The Royal Botanic Society is emerging from a critical financial position, but is gathering its forces together. And with the support and self-sacrifice of its Fellows, and the considerate action of the debenture holders, is now in a better position relatively than for some years past. Prompt financial assistance would, of course, further improve matters. The Royal Botanic Society has possession of admittedly the finest garden in London, which, if lost, could never be replaced, and the prospects of the society for next season are good.

The Royal Horticultural Society is in a strong financial position, and has a hall in Vincent Square, where flower shows are held fortnightly, supported by a brisk trade element.

On the other hand, the Royal Horticultural Society has no garden of its own in London, and depends for its more important gatherings on the friendly aid of the owners of the Temple Gardens or of Holland House, or on the hire of grounds such as those of Chelsea Hospital, etc.

Turning to the memorandum itself, it is not clear whether there are intended to be three societies "in perpetuity," namely, the Royal Botanic Society, the Royal Horticultural Society, and "The Great United Society," or only one society. And if only one, what is to become of the rights, properties, and incidents of the two other societies?

As to the mutual extension of the privileges of each society over the territories of the other, it is necessary to remember how this would operate in practice. One society has (say) for the purpose of argument, 1,100 Fellows, and the other has (say) 11,000 Fellows, and the smaller society has a garden, whilst the larger society has none.

Again, the effect of vesting the ownership or management of the gardens in the larger society, whether by sub-lease, transfer, or otherwise, unless the matter was very carefully arranged beforehand, would be that the smaller society would be submerged and swamped in the larger body, and it would cease to have practically the same enjoyment of what are now its own gardens.

Under the heading of "financial assistance," it is to be gathered that the Royal Horticultural Society do not think this rightly comes within the scheme at all. The President generously expresses his willingness to lay the matter before the Council and Fellows of the Royal Horticultural Society, "but has no power whatever to pledge the society to agree to this proposal."

If, therefore, the negotiation is to proceed with hope of useful results, the Special Committee invite the Royal Horticultural Society to make their proposals more clear and definite, especially as to finance.

Without interfering with the constitution or independence of either society, it would, of course, be possible to arrange for the Royal Horticultural Society to enjoy similar facilities at Regent's Park to those which they have had in previous years at the Temple Gardens or Holland House or Chelsea Hospital. And the Special Committees of the Royal Botanic Society would cordially consider any proposition in that respect for the ensuing season of 1910.

PEARS VERSUS TOMTITS.

There have been seasons when the pear crop has been seriously jeopardised by the presence of the tiny, but often destructive, tomtits. By a curious coincidence, though the birds were, during the past season, numerous, as they always are in the vicinity of gardens, they gave no occasion for the slightest anxiety about the pears, though they certainly did about the pea rows in the kitchen garden. It is well known what a partiality there is for sunflower seeds on the part of tomtits, and as there were goodly quantities of these, both annual and perennial, in fairly close contiguity to the fruit garden, it has occurred to us that possibly this accounts in some measure for the passing immunity of the pears. We have observed them actively engaged in taking seed from the sunflower heads, not only last autumn, but in other years as well, but it has not previously occurred to us that the growth of these flowers outside the pear plantation may be an easy and effective means of decoy. Many devices are adopted to protect pear crops from their ravages, including a cardboard disc placed over the stem of each fruit, so that they cannot reach to sample the pear. That these birds are useful agents in clearing trees of obnoxious insects at some period of the year is pretty common knowledge, but there are many pear growers who would choose the insect pest as the lesser of two evils. It proves once again that no uniformity of habit occurs in the life of birds in respect of their food, and this applies to other birds. It would be interesting to learn whether other readers have experienced this same immunity this year, and what may be the contributing causes for such lessened attention on the part of the birds. We may be in error by inferring that the sunflower harvest so engaged the birds that they deferred their annual visit sufficiently to allow of the ingathering of the pear crop, and so obtained a maximum of the season's yield. W. Strugnell.

IMPERFECT SEEDING OF WAVED SWEET PEAS.

The following is the text of the paper read by Mr. William Cuthbertson, J.P., (of Messrs. Dobbie and Co.), at the conference of the National Sweet Pea Society on the 10th inst.:

Those of you who remember the story of "The Vicar of Wakefield" will remember how smoothly ran the career of the family until the eldest son left Oxford and the elder daughter came to a marriageable age. You will remember the loss of the vicar's fortune, and the other remarkable adversities which followed in its train—the selling of the horse by Moses for £3 5s. 2d., which, instead of bringing home in cash, Moses (who was the second son of the family) converted, at the instigation of a sharper, into "a gross of green spectacles."

Now for 200 years the career of the sweet pea ran its course as unperturbed as did the family life of the Vicar of Wakefield at first. But we are now embarked on trying times—and all our troubles date from the advent of Cole's Countess Spencer, but I am sure we can follow the simile of the Vicar of Wakefield a little further. The story ends as all good stories ought to end—most of the characters got married, and lived happily ever afterwards! I am sure something good is also in store for us sweet pea growers. Out of our troubles our flower will emerge like gold from the furnace of the refiner.

In the early days we dealt with certainties. In these days we deal with uncertainties. Speaking of certainties, reminds me of a visit I once paid to my friend Mr. R. Sydenham. He took down a great volume in which he had entered up for years all the sweet peas he had sent to be grown in America, and with that exactitude for which "Robert" is famous, he had scheduled the produce of every seed sent. For example, he bought 100 packets of a novelty, and he knew almost to a pound how much seed he was going to get back, and that it would be practically true. So did all of us. My firm's practice was to sow four ounces to 100 feet, and we knew what the produce would be in five seasons out of six. But all that is changed. We have entered on the "green spectacle" period. In the few minutes at my disposal I shall endeavour to show as clearly as I can by means of photographs and some flowers which have been kindly sent me by the Rev. Macduff Simpson, of Eldrom, the essential differences between the old and the new type of sweet peas, and in conclusion state why, in my opinion, the waved or Spencer type seeds so imperfectly.

Last season was altogether an abnormal one, and I am not therefore disposed to argue from the experience of it, but if we look at an average season I think you will agree with me if I put it that on an average the old type seeds ten times better than the Spencer type. Having said that I have not said all, because a number of the finest Spencers are far below the average, and are nearer being twenty times worse seeders. Think of Etta Dyke and Dorothy Eckford—Clara Curtis and Mrs. Collier or James Grieve—the King and King Edward VII.—Mrs. Chas. Foster and Lady Grisel Hamilton—Earl Spencer and Henry Eckford—Mrs. Hardcastle Sykes and Prima Donna!

Let me explain the process of fertilisation, i.e., what must actually take place before we can have any seed at all in any of the types.

The essential organs of the flower consist of the anthers (stamens) containing the pollen, otherwise the male organs. You see the stigma (pistil) attached to the ovary, the female organ. Now the pollen must be transferred from the anthers to the stigma. Unless this happened there could be no seed. The pollen escapes from the anthers at a very early stage, as all of us know who have tried artificial cross-fertilisation. In the old type of sweet pea the pollen escaped and could not help coming immediately in contact with the stigmatic point, as they were all squeezed up together. In many of the Spencer or waved forms the stigma from the very earliest stage has grown out beyond the anthers. It is quite apparent, therefore, that the chances of fertilisation are much reduced when this condition of things exists. The old type and the Unwin type cannot help being prolific. They are abundantly self-fertilised before they expand. The pollen grains, after attachment to the stigma, begin to grow. They produce a tube which pushes its way down through the tissues of the style (the style is that long upright portion extending from the stigmatic point to the entrance of the ovary). This is a very marvellous process. It is said to be directed and induced to do this by chemical stimulus—otherwise chemiotactic influence. At any rate it is done, and those who have a good microscope can easily observe for themselves, as I have often done, the beginnings of the growth of the pollen tubes. On an ordinary microscopic slide place a drop or two of a weak solution of sugar and water, and into this place a few grains of pollen (if in a moist chamber so much the better). In a suitable temperature these grains will begin to produce their tubes in 45 to 60 minutes, actually while you sit and watch them. Well, this tube extends right down through the tissues of the style to the entrance to the ovary, and there is directed towards a micropyle (a narrow opening into a young ovule) in which resides the nucellus containing the embryo sac and ovum. The generative cell from the pollen grain passes down the pollen tube, and coalescing with the oosphere or female organ, marks the beginning of a new independent life—otherwise a fertile seed.

You can readily understand how this delicate process can be adversely influenced by cold wet weather, either in its preliminary or secondary stage, and especially in the case of Spencer flowers with their more open keels.

Let me now return to the position of the stigma in the flower of the Spencer varieties. You will observe that it protrudes beyond the anthers. In some flowers it seems to do this right away from the beginning, and may be seen slightly protruding in the earliest bud stage. My theory regarding this is as follows: We all know that the anthers dehisce, that is, shed their pollen in the very earliest bud stage of the flower. Unless, therefore, the point of the stigma, in pushing its way to the outside position just referred to, gets coated or partly coated with pollen, the flower runs an exceedingly poor chance of producing seed. If the stigma has not been pollinated before it protrudes, what chance has it of being pollinated afterwards? Very little indeed. It is not in the nature of pollen to rise above its own level. It is subject to the same law of gravitation as other things, and, consequently, will drop down into the keel and lie there without having an opportunity to fulfil the function for which it was made.

Some people argue that sweet peas are pollinated by wind-borne or insect-borne pollen, and that accounts for the variations we get in so many stocks of Spencer sweet peas. I have not been able to subscribe to this theory, because I think I have had as large an experience as most, and have not observed it happen in practice. The plan we adopt at Mark's Tey is to grow the different varieties in lines of 100ft. long. There may be four lines of The Marquis, followed closely by four lines of Countess Spencer, then four lines of Helen Lewis, and so on. If the wind or insect theory of cross-fertilisation held good we should not get pure seed, but as a matter of fact we do. Then again it is suggested that in America there must be insects, unknown in this country, at work there to give us the fine variations we so frequently get! I should like to have Mr. Burpee's or Mr. Morse's opinion on this point. Fifty years ago so extremely careful an observer as Charles Darwin wrote: "Whatever the cause may be, we may conclude, that in England the varieties of sweet peas never or very rarely intercross. But it does not follow from this that they would not be crossed by the aid of other and larger insects in their native country."

Before concluding, there is another condition of things which I must speak of—the liability of the pods after they are formed to rot off. Last season this was particularly noticeable. Close to the footstalk the pods became brown, as if attacked by a fungus. When this happened the pods were doomed. It was only a matter of a few days until they dropped off. This remark reminds me of something else. After the petals dropped on some varieties—notably on Earl Spencer and Edrom Beauty—the young pod appeared all right, but on the slightest touch it dropped off. I remember one evening Mr. William Heal and I were examining some rows at Mark's Tey, and he remarked, "You have a good promise here." I took out a pencil and walked along the row, merely touching the young pods with it, and quite 50 per cent. of them dropped. I think the abnormally cold weather had much to do with this.

To sum up, I must put as the first and foremost cause of imperfect seeding in Spencer varieties—the open keel in conjunction with the protruding stigma, otherwise imperfect fertilisation. Then the extreme sensitiveness of the type to adverse weather conditions. Its very shape, the large waved standard, makes it much more sensitive than the old type. How often have we noticed in bad weather the standard almost rotting and falling down and clasping the keel and pod! Sunshine supervening after such conditions made the standard adhere to the keel and pod as if they had been glued round them, and they could only be removed by being pulled sharply.

Permit me, in conclusion, to say that to all but the seed-grower this non-seeding is an advantage. It means a longer continued period of bloom, and this must enhance the value of the sweet pea as a decorative object. The consolation I would offer the seed-grower is this. The choicest things in the world—the things most worth having—are the things most difficult to get. Nature seems to decide for us that the more perfect we make her productions from our point of view, the more difficulty we shall encounter in reproducing them. This law holds good right through the floral world.

LINARIA GLOBOSA.

This is a very pretty little toad-flax of a quite different habit from Linaria cymbalaria, which is often called the Kenilworth ivy, although it is said to be simply a variety of that charming, if common, trailing plant. Anyone who has seen and examined the little Linaria globosa has, however, grave doubts as to the close relationship supposed to exist, and these feelings of scepticism are increased by the knowledge that L. globosa comes true from seeds. It is a bonny little pot plant, and is a gem for the rockery, seeing that it makes close rounded masses of pretty glaucous green leaves, and gives a wealth of little lilac flowers. It is a charming rockery plant, especially in dry soil, which it much prefers, and where it is less likely to die out than in stiff and wet soil. Seeds of this pretty globe toad-flax are obtainable, and increase of stock can also be effected by means of division before or after flowering. As a dainty little plant it will be welcomed by many.

S. Arnott.

Figs growing in the colder districts will require some protection from severe frosts, and one of the most convenient methods to adopt for this purpose is to loose the branches from their supports and tie them up in convenient bundles, which should be encased in straw or bracken, afterwards making them secure from damage by rough winds or snow by refastening them to the wall.—Geo. Woodgate.

CHRYSANTHEMUMS IN CONSERVATORY DECORATION.

In presenting an illustration of a remarkably successful example of the use of chrysanthemums in beautifying the conservatory there is no occasion to refer to the value of these flowers for decorative purposes under glass. The fact is fully recognised by all who are fortunate in the possession of glass structures that are devoted to plants from temperate regions or are engaged in their management. They are indeed so highly appreciated that there are but few conservatories in which chrysanthemums are not freely used in the production of colour effects in the autumn. It is also a matter of common knowledge that groups of chrysanthemums are almost invariably seen at the autumn shows, and that they frequently form an attractive feature.

A TASTEFUL ARRANGEMENT OF CHRYSANTHEMUMS, ASTON ROWANT.

It might indeed be said that of the several classes of flowers to which attention is given at the present time, not one has been so freely utilised in the formation of decorative groups in the conservatory as the chrysanthemum in its diversity of form and colouring, and that on no one class of flowers has so much artistic taste been shown in the endeavour to display its charms to the best advantage. At the autumn shows much has been done with a view to present groups of chrysanthemums to public notice in a tasteful manner, but the efforts that have been made have not been invariably successful. In too many cases the exhibitors have failed in their endeavour, and the lessons to be learnt from a considerable proportion of the groups have been of a negative rather than of a positive character. The failing of exhibition groups has been overcrowding, and for this the exhibitors have not been wholly to blame. Committees and judges have something to answer for. The former, owing to the pressure on their space have limited the exhibitors to an area whereon a really tasteful arrangement is practically impossible, and the latter have in not a few cases given too much encouragement to masses of colour. There is no occasion to labour this point, but it must be said that it would have been an enormous advantage, if it had been possible for committees generally to have allowed more space for groups, and given definite instructions to judges to regard overcrowding as a serious defect. Had this been done we should have seen much less crowding at exhibitions, and certainly a greater number that would have served as models for the use of chrysanthemums in the conservatory.

Happily cultivators have not in the arrangements of chrysanthemums in the conservatories under their charge endeavoured to imitate the style characteristic of so many of the groups seen at the exhibitions. Consequently, in visiting gardens in the season of chrysanthemums many have been the opportunities for seeing chrysanthemums under conditions favourable to the full enjoyment of the varied charms of the flowers. The successful example in the conservatory at Aston Rowant, the charming seat of Sir William and Lady Plowden, of which an illustration is given herewith, is especially deserving of attention. It brings into strong relief the desirability of giving each plant sufficient room for the display of its distinctive characteristics, and it affords unquestionable evidence of the increased interest and attractiveness of displays in which the several sections are associated. Here there is a happy combination of the leading Japanese varieties with blooms so highly developed that they would have done good service on the exhibition stage, and also of the best of the single varieties. It is, of course, not uncommon to see in conservatories several sections in harmonious association, but the illustration in no way loses in value as an educational factor in consequence thereof. It should be added that since the photograph was taken the plants of scandent habit with which the conservatory is furnished have filled their allotted space, and the general effect at all seasons is greatly enhanced. G.

DECEMBER IN THE ROSE GARDEN.

With the exception of being rather wet we have had a good time for moving rose trees, and the work should be finished in all but a few cases. I am not much in favour of late December or January planting, preferring to have planting done by mid November, while the soil is still fairly warm; or else wait until late in February or early in March, when plant life generally is once more becoming active.

There can be little doubt that early planting is best, as the roots commence to grow at once, and can thus help against the drying effects of frost and wind. On the other hand, if we can procure plants that came through the winter untouched they will do well from March planting, provided they are looked after in the matter of firm treading and careful mulching. One cannot always choose an ideal time, but even up to the end of April plants from pots can be used, and the price, especially for the popular tea scented and hybrid teas, is not much greater.

A little protection during this month is useful; at all events, it is better to have material ready to hand, as any day may see a complete change in the weather. Too many over protect or else leave it alone entirely. I do not practice tying straw around our plants, as if they were immense wine bottles. The slightest break against wind and severe frost is all that is needed in the majority of cases. Oftentimes, I have traced failure, especially among dormant-budded plants of the previous season, to heavy mulchings of manure during winter. When most wanted this is not much protection, because its tendency to hold moisture increases the danger from frost. Light litter may be very well while the atmosphere is quiet, but when the piercing and frost-laden winds prevail this is always carried to some sheltered corner of the garden, or against the hedge, where it is useless. It is also subject to saturation, like the manure, and I am convinced wet and frost combined are the greatest difficulty we have to contend against. Use twigs of birch, spruce, or similar trees. They are easily procured, can be stuck into the ground with little trouble, do not retain the wet, and allow free passage of air; nor do they drift into useless corners. Earthing up the dwarf plants should always be practised. This is almost certain to keep the base of your plants safe, no matter how severe the winter. It also aids in throwing off superfluous wet around this most vital part of roses.

CARNATION PINK DELIGHT.

As shown by Messrs. Bell and Sheldon at the Perpetual-flowering Carnation Society's Exhibition.

It is usual at this time of year to trim up the beds a little, such as removing dead wood, a few weeds, and general rubbish. After the worst of this has been raked off some growers dig between the plants. I would like to warn them against the use of spade or spud too deeply. Give a slight dressing of manure, and then turn the ground over just sufficiently to bury this. Frequently a large number of valuable roots near the surface are torn off through deep digging. Moving the soil in winter is no doubt beneficial in several ways, but it cannot assist the rose.

When the weather is dry, and not too cold, much may be done among pillar roses and those upon pergolas. The latter may be strengthened and generally repaired, while a considerable amount of rose wood can generally be cut away now, and thus ease the work during March and April, which invariably brings on so many things that must be attended to at once.

When building a pergola do not spend so much thought upon making it neat and tidy in itself. Oftentimes a rougher built structure not only suits the purpose better, costs much less in labour, etc., but has a far better effect. However ornate the structure itself may be, this is soon hidden when the plants grow, and they must grow more or less at random if the best effect is to be secured. By all means have several extra strong supports, or the whole will be coming down just as the plants are at their best and needing a great deal of support. So long as it is strong, I think the rougher the better. Small, spray-like pieces of wood or thin laths are useless. We want solidity, and then the plants will afford much support to themselves from their stronger growths.

Roses may have a very taking appearance among other subjects upon pergolas, and are undoubtedly helped by a few clematis, honeysuckle, etc., but it is not an easy task to use the knife properly among mixed subjects, and we have such a choice among roses alone that I would endeavour to keep to them as much as possible. The dead wood of climbers like Clematis Jackmani twines around the rose growths so that it is difficult to remove.

Uckfield. A. Piper.

VASES OF CARNATIONS.

The highly successful exhibition held by the Perpetual-flowering Carnation Society at the Horticultural Hall on the 8th inst., was fully reported in our last issue, and we have now the pleasure of illustrating two of the vases of flowers that were shown. Pink Delight, which forms the first illustration, is a comparatively new pink variety that has been introduced from America, and has the promise of becoming popular among growers on this side of the Atlantic. The vase of flowers of this variety was one of the three for which Messrs. Bell and Sheldon, Guernsey, were awarded the cup presented by the American Carnation Society for three vases of carnation novelties raised in America. The other illustration is given for the purpose of showing how highly attractive mixed carnations are when the colours are well selected and tastefully arranged. As colour is essential to a full appreciation of the charm of arrangements of carnations in which several distinct varieties are used, an illustration in black and white must fail somewhat in its purpose, but it will be useful as an indication that a very charming effect may be produced otherwise than with blooms of one variety. This vase was second in the competition for the prizes offered by Mr. Felton for thirty-six blooms arranged for decorative effect, and the exhibitor was Mr. J. Dudney, Erith, who may be congratulated on his success in deviating from the usual practice in the display of these flowers.

An International Rose Congress will be held at Paris in the summer of 1910, under the auspices of the National Horticultural Society of France and the French Rose Society. The subjects arranged for discussion are: (1) Synonyms of roses; (2) The best remedies for the fungoid diseases of roses; (3) The best roses introduced to commerce in 1907; (4) The most suitable terms for describing the heights of roses; (5) The influence of magnesia as a plant food in rose culture; and (6) The employment of roses in garden decoration. The papers bearing on these subjects must reach the office of the National Horticultural Society of France not later than March 31, 1910. Awards will be made to the best papers by a committee composed of members of the two societies, under whose auspices the congress will be held.

INFLUENCE OF STOCK ON SCION.

There are few members of the craft who have not some little hobby which they like to follow. With some it is grafting, and the trees grafted are generally fruit trees. There is much to be said in favour of heading back large trees of inferior varieties, or of those which may not be in request, and placing on such cutbacks grafts of superior varieties.

There is, however, not always that due consideration given beforehand as to how such unions of stock and scion will affect the after-crop, and this is one of the weak points in the procedure. Fortunately, most of this heading back and grafting is practised on orchard trees, although other forms of trees are operated on, and at times so-called dwarfing or early fruiting stocks are used for garden trees. If such dwarf stocks are of the best for the purpose there is less to say against the practice than in the case of orchard trees, as with the dwarf or trained trees there is only the stock, pure and simple, whether it be the broad-leaved English or other paradise stock. The best stocks should be used, but these are supposed to be absorbed by the trade, which may be a wise provision.

As during winter the grafts are generally selected the selection should be such that the best results may be obtained from the grafting, and, having made the selection of grafts, or, rather, the varieties, note should also be made of the trees and varieties intended to be used as stocks. One of the first considerations is that the trees reserved for heading back should be not too old, and perfectly clean and healthy, free in every respect from woolly aphis and canker. There should also be some selection as regards affinity of qualities, as this is one of the influences likely to assert itself in the quality of the after crop.

Generally, too much weight is attached to the fact that the tree intended for the stock is a strong, free-growing kind, and herein lies one of the principal objections to such trees being used. A tree that corresponds more nearly in many ways to the variety from which the graft is taken is most likely to give the best results. A strong-growing variety as a stock might produce a heavier weight of fruit, but probably at the expense of flavour.

I have recently been examining and tasting some apples which have been grown on trees that had been cut back and grafted. The scions were from one of the best dessert apples in cultivation, and the stock was also one of the best culinary kinds we have, but the fruits were almost uneatable, and I question whether, if they had been used for cooking, they would have been more satisfactory.

Here then was so much loss of time and labour in the grafting of such varieties through using unsuitable stocks. It may have been done with the best of intentions, but without due consideration of the natural influences which might be brought into operation. I have seen many instances of such unions in the West, and have been surprised that more pains have not been taken in the process of selection, but thought is not always given to the "survival of the fittest."

It is reminiscent of commencing hybridisation by a method that is ten years behind the times instead of using the material of the present day. It can scarcely be expected to make much progress working on such lines. T. H. Slade.

ASTER ALPINUS.

Ere the glamour of the autumn-flowering starworts fades from our memory, it may not be inappropriate to bring the merits of the dwarf alpine species before the notice of readers of the Gardeners' Magazine. These are suitable for the majority of gardens, requiring but ordinary cultivation to bring them to perfection, and their floral beauty is of so high an order among hardy plants bearing "daisy" flowers that only a very few equal them in individual beauty and refinement.

Aster alpinus and its varieties have long been known to gardens; the type has purple flowers some two inches across, and these are borne singly upon stiff stems some nine inches in height; the leaves are lanceolate, broader toward the point, which is somewhat blunt. A. alpinus speciosus is a most desirable plant, and in this form the ray petals are bright purple, while the central disc is orange; the individual flowers measure three inches in diameter, and are freely produced, singly, upon stiff stems that vary in height from twelve to fifteen inches. A. alpinus albus is a white variety, but it is neither so reliable or so effective as the purple varieties.

These dwarf asters grow freely when planted upon the dry slopes of rockwork, and, once established, they prove most reliable and generous subjects. When in bloom, during June and July, the great daisy-like flowers of A. alpinus speciosus stand out quite distinct, and, when suitably placed, these composite flowers provide a marked contrast to the various tufted and creeping subjects which adorn the rock garden.

As edging plants they introduce a quite new and distinct note in the garden scheme, but when employed in this manner on no account must they experience a surfeit of moisture during winter, while some measure must be employed to ward off the attacks of slugs, otherwise the floral display will be endangered, as these enemies are extremely partial to the crowns. Aster alpinus is readily raised from seeds sown under glass in spring, the seedlings being pricked out into boxes and hardened off in frames before planting out. It is also increased by division of the crowns in early autumn or during spring.

A BEAUTIFUL VASE OF MIXED CARNATIONS.
Shown by Mr. Dudney at the Winter-flowering Carnation Society's Exhibition.

WINTER-FLOWERING BEGONIAS.

The winter-flowering begonias to which present reference is made are a distinct and increasingly popular class, and do not include either the winter-flowering species or the Gloire de Lorraine family, for the latter must now be regarded as a family, seeing there are so many varietal forms.

The Veitchian race of winter-flowering begonias is comparatively new to the majority of growers, and yet the earlier hybrids were raised over twenty years ago by Mr. John Heal, V.M.H., Messrs. J. Veitch and Son's clever hybridiser, to whose skill this race is entirely due. Rather more than twenty years ago I was with Mr. Heal in the Chelsea Nurseries, and took a modest part in the propagation of these earlier varieties, and I have never been able to quite understand the reason why these beautiful and extremely useful begonias have come so slowly into popularity. Perhaps the chief reason has been a want of care during the resting period, a period that lasts throughout springtime, and, further, the earlier varieties were too often regarded as winter flowering representatives of the tuberous varieties, and treated accordingly to a severe "drying off" or resting process, and this they could not stand. The tuber is small, and, in some cases, not much more than a thickened rootstock or crown, consequently severe drying under the stage or in a cupboard was more than they could stand. An intermediate temperature is advisable, growing on, resting, with a drier atmosphere during the latter period, and an occasional watering at wide intervals to keep the tuberous portion from shrivelling up entirely.

A FINE COLLECTION OF WINTER-FLOWERING BEGONIAS.
Shown by Messrs. J. Veitch and Sons, Lim., at a November Meeting of the Royal Horticultural Society.

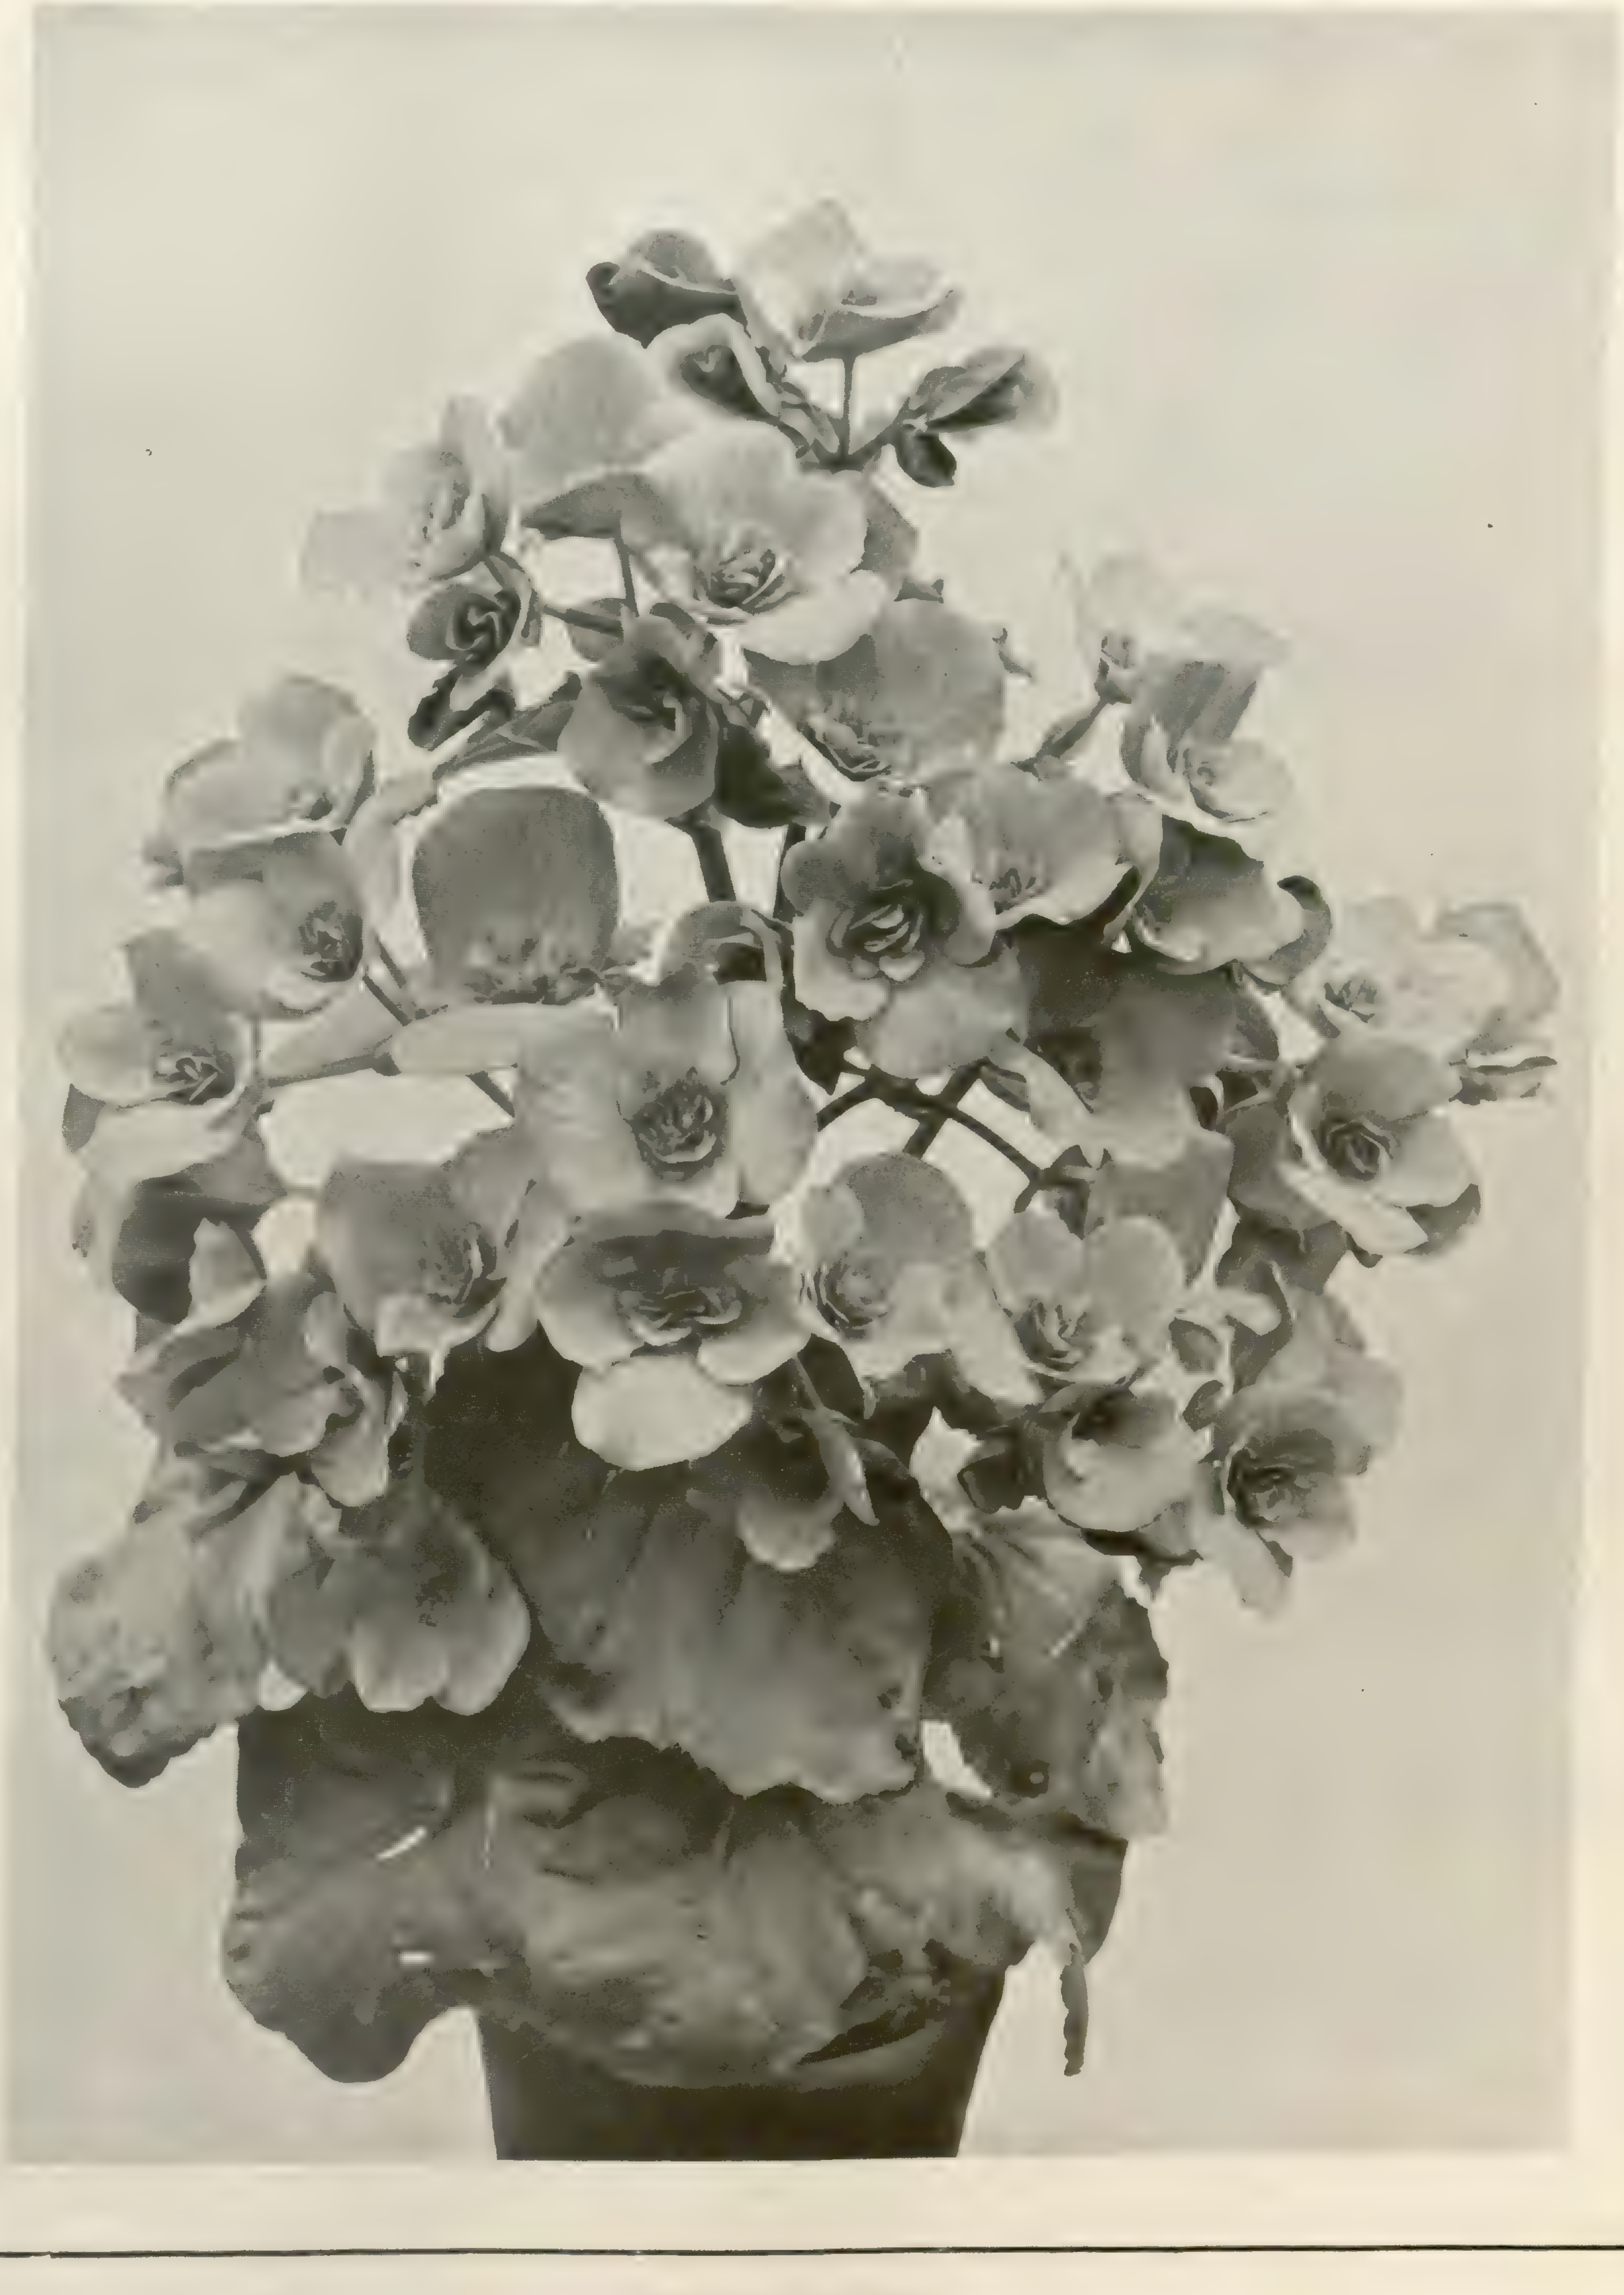
The resting period is the critical one, and, unfortunately for these begonias, it comes at a period when gardeners are intensely busy, but upon the care bestowed at that season the success or failure depends. Plunging the store pots in larger ones, with cocoanut fibre refuse packed between the two pots, and kept just moist, affords an easy method of keeping the tubers from harm either by drought or excess of moisture.

When the resting plants start into growth again all is plain sailing. Propagation by cuttings of the young shoots, or tops of young rooted plants, is a quite easy matter, if small pots, very sandy soil, and a close frame in the propagating pit are provided, and sufficient moisture afforded. Large pots are a mistake, as the plants respond readily to feeding, and a very fine example can be grown in a 32-sized pot. Charming late-struck plants in small sixty-sized pots, suitable for table decoration, can be easily produced.

Those who have not seen the splendid exhibits of these carmine, rose, or crimson-scarlet flowered varieties made by Messrs. James Veitch and Sons, Chelsea, will be interested in the accompanying illustration of a display made recently at the Royal Horticultural Hall. Several well-known gardeners have also exhibited similar varieties in fine form lately, notably at Norwich, Hitchin, Sheffield, York, and Edinburgh. This quite disproves what I was once told, i.e., "John Heal raised them, and only John Heal can grow them." The long houses full of variously-sized plants of these begonias at Messrs. Veitch's Feltham nurseries also disproves this statement, for, presumably the plants are grown for sale, and not for the personal pleasure of the members of the firm and staff; indeed, the amount of stock is always an excellent indication of popularity.

Begonia socotrana, introduced from Socotra, by Professor Bayley Balfour, in 1880, laid the foundation of the race; crossed with the tuberous Begonia Viscountess Doneraile, it gave B. John Heal, the first socotrana hybrid. This variety very rarely produced a female flower, and its blooms, of rosy-carmine hue, lasted a very long time even in the none too clear atmosphere of Chelsea. It gained an A.M., R.H.S., on October 13, 1885, and though still grown, it stands little chance against the later varieties. B. Adonis came next, and was derived from an orange-scarlet tuberous begonia crossed with B. John Heal. It is a fairly strong grower, and has large carmine flowers, but it, too, is passing out of cultivation. B. Winter Gem was obtained by crossing B. socotrana with a crimson-scarlet tuberous variety, and it was, indeed, a little gem, producing vivid crimson-scarlet flowers in midwinter, but, alas! it was difficult to grow, and is now very rarely seen, but it is a lovely thing when successfully managed.

B. Mrs. Heal was, and is, a great success, and resulted from a crimson-scarlet tuberous variety crossed with B. socotrana. It is a fine grower, and has large scarlet flowers of great brilliance. One of the very best of the set. It gained an A.M. on October 15, 1895, and a fortnight later B. Success secured a similar award. The latter has rosy-crimson semi-double flowers with a pale yellow centre. B. Ensign followed, and secured an award in November, 1896; it has large carmine-scarlet, semi-double flowers. Both Success and Ensign were raised by crossing a rose-coloured semi-double tuberous variety with B. socotrana. B. Julius is an outstanding variety, with light rose-pink flowers often two and a-half inches across. B. Winter Cheer is still larger, being about three inches across, rather less than semi-double, and bright rosy-carmine. These varieties gained awards late in 1897; the former had a semi-double white, and the latter a semi-double crimson tuberous variety as one parent, with B. socotrana as pollen parent. B. Winter Perfection, with bright rose-pink flowers, was introduced in 1898; Ideal, a dwarf rosy-carmine, in 1901; B. Elatior in 1906, and the new B. The Gem gained an A.M. in November last, and is not yet in commerce. In every case B. socotrana has been one parent, so that these begonias are hybrids, and not merely selections or cross-breds from seedlings of hybrids. B. Agatha and B. Agatha com-



BEGONIA ELATIOR.

A beautiful winter-flowering hybrid raised by Messrs. J. Veitch and Sons, Lim., and bearing bright rose-carmine flowers.

pacta, also raised at Chelsea, belong to the B. Gloire de Lorraine group, and have, in each case, a fibrous-rooted begonia as one parent.

A good selection of the foregoing would be Elatior, Julius, Mrs. Heal, Success, Winter Cheer, and Winter Perfection.

C. H. Curtis.

GARDENERS' IMPROVEMENT SOCIETIES.

The recent meeting in London in connection with the various improvement associations for gardeners, does not appear to have advanced matters very much for the general body of those connected with them. Matters in connection with those interested in the art and science of gardening are moving very rapidly, and it is clearly apparent on every hand that the future will be in the hands of those men who have a clear knowledge of the important matters in their work.

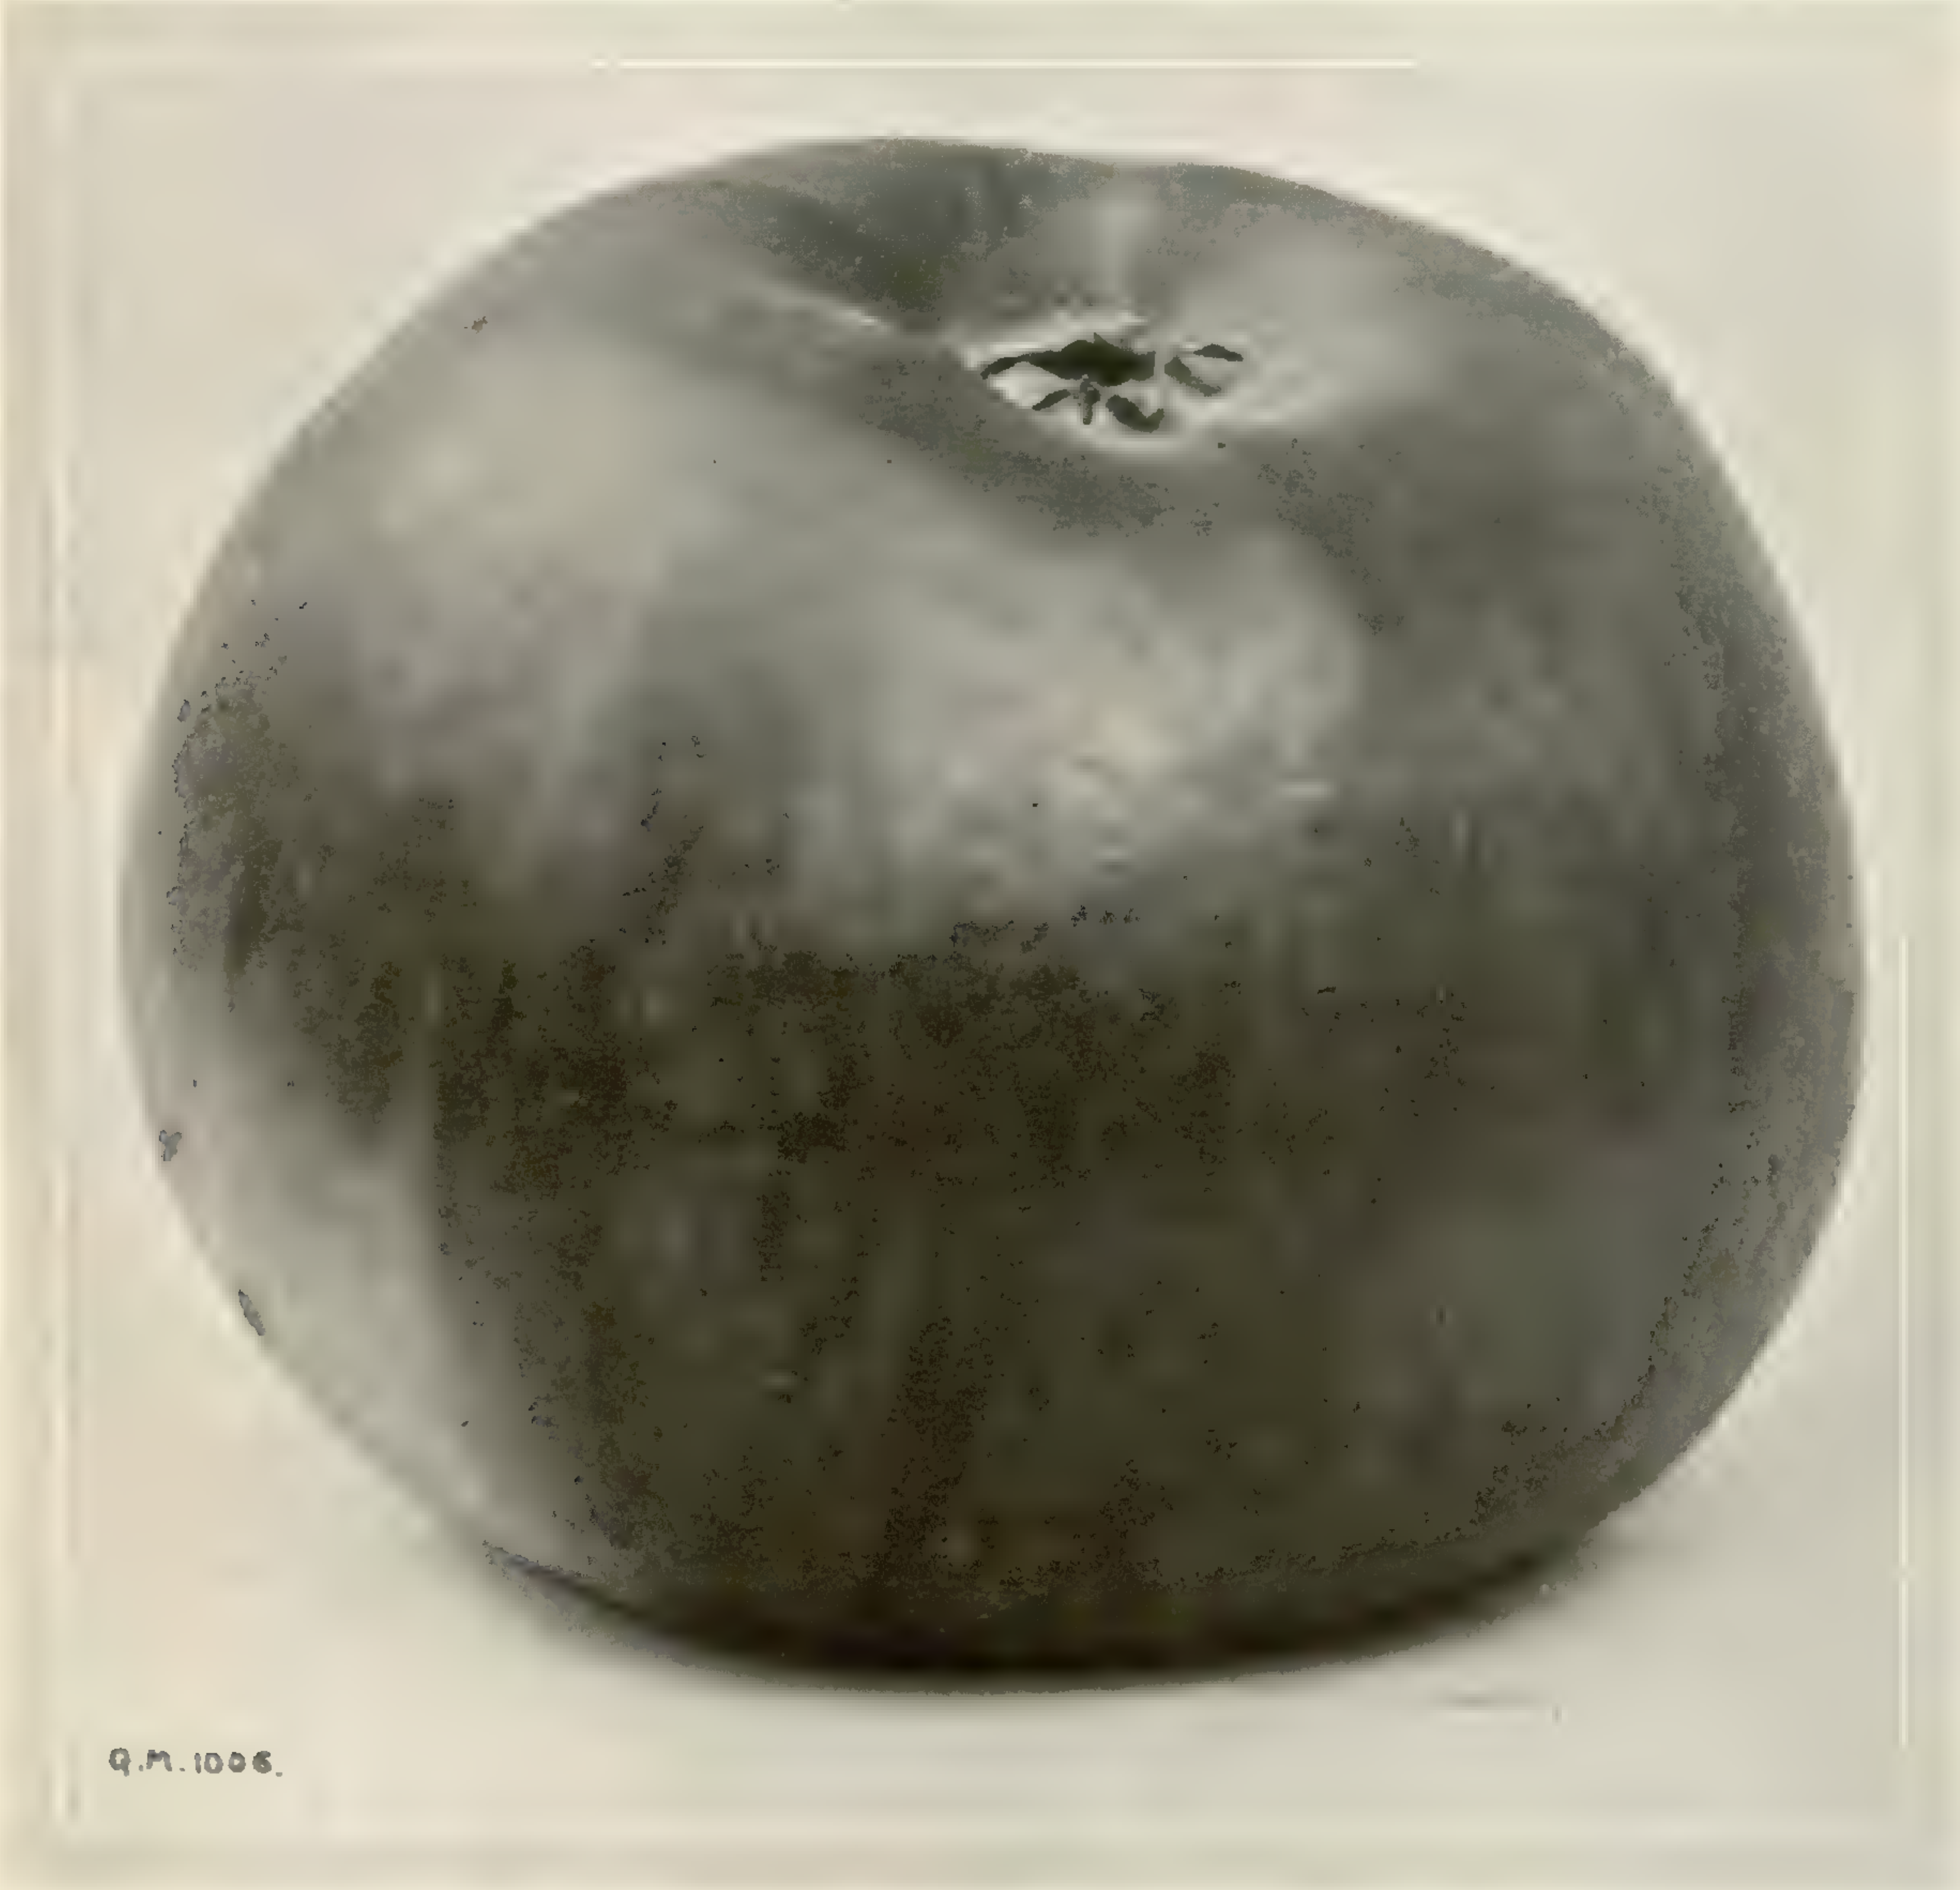
At the present time many associations do little else but listen to papers read either by their own members or those from societies of a similar nature. Many of the papers read are excellent, and well thought out, but it rarely happens that there is much time for discussion afterwards, and very frequently it is only a few of the leading men who have anything to say after the lecturer has finished. I think the greatest good that could be done in connection with such societies as these would be the organisation of classes for the young members. These young men look forward to the time when they will be recognised heads of our leading country establishments, or fill other openings which appear to be widening every year. What is being done by these societies to open out and broaden the views of these young members who have joined them, hoping to benefit thereby? Single lectures upon given subjects are useless to them from an educational standpoint, because there is not sufficient time to deal thoroughly with any one subject. The lectures given are often, educationally, of more value to the lecturer than to the audience, and thus they do some good. The details of many are only grasped by experienced gardeners who have been grinding slowly through the mill of routine work, and have encountered various checks, which, when overcome, have left them wiser, more fully equipped, and better able to avoid future disasters.

We move faster in the present day in many ways, but from an educational standpoint, as regards the finished article in gardeners, I do not think the general hothouse system of development brings out all that is best in a man's character, and until a man takes as much interest in the soil of his flower or kitchen garden, as in his various pot mixtures, his success will never be what it might.

Now, if all these societies were to organise classes specially for their young members, I feel perfectly sure that they would assist such members to arrive at definite conclusions about their work years sooner than it is now possible for them to do. They should be taught how to learn, and if men well versed in given subjects, and connected with each association, were asked to conduct six or a dozen lectures upon a subject, there would be some possibility of the members getting a grip of their work. There are many men in the gardening world at the present day who have learnt much by having to impart their knowledge to others, and I venture to say that they are few who would not acknowledge such benefit. Of course, whether such classes were a success or not would depend entirely upon the teacher; but, properly directed, nothing but good could come of such work. That it would be appreciated by genuine young gardeners need not be doubted. Once they are shown the quickest and correct way of acquiring knowledge upon important matters dealing with their work, it is quite astounding how eager they are to go deeper into their subjects.

Many scoff at "theory," as it is termed, but the worker who has a good basis of "whys" and "wherefores" and intelligently applies them, will work out his own salvation. The mere theorist in horticulture must ever go to the wall, he is useless in such a profession, and must always fail in dealing with practical details. The young gardener begins at the right end, viz., the practical end, and providing he is well drilled in a good vegetable, fruit, and flower garden, interested in his work, inquisitive about it, and anxious to do all work entrusted to him in a thorough manner, he will some day be a credit to the craft. Such opportunities for helping young men, who are too ill-paid in many cases to pay for receiving tuition, ought not to go unnoticed, more especially in largely populated centres. Of course, young men attending such classes should take notes, subject themselves to being questioned, and in turn be allowed to ask questions. Possibly they would be glad to subject themselves to an examination on paper upon the subject dealt with. All these things are simple to arrange, and would, I believe, be popular with young gardeners connected with these associations. At present the young men feel hopelessly outclassed by the older members, and for other reasons are sometimes afraid to express their views. Given encouragement, their latent qualities will develop, and daily work will be more of a pleasure to many than it now appears to be.

Guildford. C. Foster.



APPLE, RIVAL.

A distinct variety, equally suitable for culinary purposes and dessert, raised by Mr. C. Ross, and introduced by Messrs. J. Cheal and Sons.

APPLE RIVAL.

This handsome apple, although of recent introduction, has been in cultivation a sufficient length of time to be submitted to a thorough test, under varying conditions of soil and climate, two important factors in determining the merits of apples and other hardy fruits. It is one of the several useful varieties raised by Mr. Charles Ross, and is described as having originated as a cross between Peasgood's Nonsuch, so well known for its large size and attractive colouring, and Cox's Orange Pippin, which in its season has no equal in flavour. If in the production of this variety the veteran raiser was not successful in obtaining an apple of the size and colour of Peasgood's Nonsuch with the rich flavour of Cox's Orange Pippin, he succeeded in obtaining one that is of much merit. The fruits are, as already intimated, attractive in appearance, being of good size, shapely, and bright red on the side next the sun, and the flesh is of excellent flavour. The variety belongs to the class of apples that are adapted for both culinary purposes and dessert, and well coloured examples of medium size are remarkably attractive when seen undere artificial light. The tree is of free growth, has an upright habit, and is an excellent cropper, and well suited both for garden and orchard culture. Rival was submitted to the Royal Horticultural Society's Fruit Committee on the occasion of the meeting held October 9, 1900, when an Award of Merit was made in its favour, and it was distributed by Messrs. J. Cheal and Sons, of the Crawley Nurseries.

AUTUMN COLOURING.

This has, I believe, been generally considered a bad year for autumn tints, and certainly with me in the Cotswolds the colours have been much less bright than usual, but I am sorry to say they never are very good in my garden, and what I should like to know is whether autumn leaf colouring is caused by soil or temperature, or situation, or by a combination of all three.

I find many people who are interested in their gardens pay little or no attention to autumn colouring, but I think that anyone who has the scope ought to plant for autumn effect. I have planted a considerable number and variety of shrubs, which, in many places, put on gorgeous tints in autumn, but with me are often most disappointing. My soil is strong loam and clay, and my garden, although 550 feet above the sea, lies low, and near a river. I have hitherto regarded the lowness of the situation and the strong soil as the cause of things failing to colour well, but, on the other hand, I have visited places with all kinds of soils, and have sometimes found the leaf colouring as bad, and worse, than with me. Elms never colour well with me, though I have seen them in other places on similar soils a magnificent colour. Of course, one may often see two elms growing side by side in a hedgerow, one a beautiful golden colour, and the other quite green. It is the same with the English maple, which is often so fine in the Cotswold hedgerows—no two of them are alike.

This autumn I went over to the Batsford Park gardens to see a specimen of Rhus cotinoides which had turned the most gorgeous and indescribable colour I have ever seen, but it was the only one of perhaps a dozen plants which had coloured at all. I have only one plant of this variety, and it has never coloured at all. Rhus cotinus is disappointing, although I have seen it finely coloured in some gardens.

Vitis Coignettæ, which is very fine at Batsford, hardly colours with me, though it has grown 50 or 60 feet high. On the other hand, Vitis Thunbergi was quite good this year.

Berberis Thunbergi colours very finely with me in one part of my garden, but in other parts, not more than 50 yards away, it hardly assumes its autumnal tints. The liquidambers and scarlet oaks are, perhaps, the most satisfactory and consistent colourers in my garden, and when the leaves do turn they hang on for a long time, right up to the end of November. The Japanese maples are occasionally very fine, but sometimes most disappointing, and this year, for instance, they shed their leaves before they were nearly at their best. Parrottia persica is sometimes splendid, but failed to colour this year.

Euonymus alatus is very fine in some gardens, but has never been any good with me, nor has Berberis virescens, which I have sometimes seen very richly coloured. I think the best thing with me this year in the way of shrubs was Prunus sinensis fl.-pl., which was a lovely shade of pink – in fact, I have never seen it so good before. Other subjects, to mention a few at random, which are generally more or less good, are Spiræa prunifolia fl.-pl., Pyrus arbutifolius, Euonymus europæus and atropurpureus, Viburnum opulus, some of the Japanese cherries and bird cherries, maples in variety, tulip trees, azaleas, Rhus glaber, and Andromeda arborea. On the whole, I should award the palm to Berberis Thunbergi, which begins to turn scarlet with me early in August, and continues till November.

But the question is what causes this colouration? Of course, I know that things generally colour best on poor soils, or, at any rate, do not colour properly until they are well established and have exhausted the soil they are growing in, but even then they are not always satisfactory, and I am inclined to think myself that individual shrubs may vary in the same way as any other individual plants, such as a delphinium or a hollyhock may vary from seed—some may be good and some not worth keeping. However, I should be glad if someone who has had more experience than I have, and who has more scientific knowledge, would enlighten me. M. F.

APRICOTS UNDER GLASS.

Inexperienced cultivators are very liable to make a mistake in their treatment of apricot trees under glass by forcing them unduly.

I would like to draw attention to two excellent varieties for growing under glass, and to give inexperienced cultivators a few hints on their management. In the first place I would point out that both varieties make strong growth in an ordinary good soil, and that it would be inadvisable to construct for them a too rich border.

Healthy trees must be planted, and in a careful manner, to avoid bruising the bark. If the soil is at all deficient in lime procure some old mortar rubble and brick ends; break up the latter, pound them with a heavy hammer, and, together with the lime rubble, mix one bushel with seven bushels of fibrous loam. The drainage must be good and efficient, the rooting medium about twenty-two inches deep. All the new compost below the roots of the trees must be made thoroughly firm while it is in a medium state of moisture; especially is it harmful to make it firm while very wet. Spread out the roots evenly, and then make the soil very firm around them, also keep the structure cool and well ventilated. In summertime be content with sturdy, short-jointed shoots, as they are the best, and avoid as much as possible late autumn growth. When the trees are in good fruiting condition do not give too much artificial heat, but be lavish with ventilation while the flowers are open and the resultant fruits are ripening.

The two varieties I refer to are New Large Early and Royal. The former has very large, clean fruit, and the flavour is very rich. The fruit ripens well. Royal follows in ripening, and the fruits of this variety are large, juicy, rich, and of good colour. I have grown both with much success under glass with other varieties.

Geo. Garner.

ANTHEMIS BIEBERSTEINI.

Although it is not everyone who admires the anthemises, or chamomiles, there are several of the species which merit the favour of cultivators of hardy flowers. They have, as a rule, remarkably pretty, finely divided, and, frequently, silky or silvery foliage, while the flowers in the majority are of considerable beauty.

Anthemis Biebersteini, which is figured herewith is one which is usually a favourite with those who cultivate it, either in the rock garden or grown in pots in a frame to be taken into the alpine house to flower. This species is a native of the Caucasus, and has been in cultivation in this country for a considerable time. It is perfectly hardy with us, and forms a neat growing plant composed of a number of white and silky leaves divided in a pinnate manner, and giving in themselves a pleasing aspect to the plant. From this rise stems bearing yellow flowers, which are large for the size of the plant, and, although not in the first rank of floral beauty, are usually admired by the owner of the plant and his friends. The height of the plant is usually about a foot, but it is frequently exceeded in rich soil.

ANTHEMIS BIEBERSTEINI.
Flowers yellow.

Bieberstein's chamomile is easily cultivated in a soil composed of sandy loam and leaf-soil, with some grit added, although it is not particular in this respect. It prefers a sunny and rather dry position, and is increased by means of seeds sown in pots or pans, in the usual compost for hardy flowers, and by cuttings or division. The latter may be done in spring or immediately after flowering is over. As a rock garden or border plant Bieberstein's chamomile deserves the consideration of intending planters.

S. Arnott.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

TEMPERATURE.—The temperature of each department of the orchid houses should now be reduced to the minimum degree. This will avoid, to some extent, fluctuations, but as the outside atmosphere is so liable to frequent and rapid changes, the temperature inside the houses must of necessity be affected, one has to be constantly on the alert to counteract these varying conditions and to minimise, as far as possible, any undesirable conditions caused thereby. It is a considerable advantage where there is an ample provision of hot-water piping. There is then never that dry, smelling heat, which is so undesirable. It is all very well for the builder, at the time of erecting glass-houses, to state that the amount of piping is ample for any demands. Pipes cost money and are a big item when contracting for new glass-houses. Ample piping not only diminishes the undesirable conditions always in evidence on a cold night where the heating surface is limited, but, what is still a greater consideration in after years, the cost of fuel is very considerably reduced, and, with diminished labour, removes the anxiety from those who have to look after fires and the well-being of the plants. The advantage of lath roller blinds on the roofs of the houses cannot be overestimated, especially in exposed positions; letting them down at dusk is of considerable advantage on cold and especially windy nights.

CLEANSING THE ROOF GLASS.—In the neighbourhood of London, after a fog, the glass becomes so thickly coated with dirt that it resembles slates. With so much deposit it is desirable that it should be removed as soon as possible, so that all the advantages of the little available light may be afforded the plants. I have found that the brushes used by railway carriage cleaners are the most useful for this purpose, but care must be observed to prevent any back-wash being forced through the laps of the glass, as water and dirt combined falling on the foliage and young growths of the plants is very undesirable. In more favoured districts considerable advantage is afforded to the plants by washing the outside glass at the present season, choosing a mild day for the work. The dirt should not be permitted to enter the soft-water tanks, so that all down spouts should be stopped and the gutters cleaned.

EXHIBITING ORCHIDS.— Taking plants out of the houses for show purposes in another item that requires some forethought. I find that plants can be taken and brought back over hundreds of miles (in my own case they are frequently three days in transit) with little or no ill-effects. I find that if they are allowed to become reasonably dry, very little danger is experienced, and especially is this the case with tender subjects, if precaution is also taken to place them in the cool odontoglossum house for a day or two previously to their being packed for the show. I have also found this method particularly beneficial in the case of calanthes for use in the house.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CHRISTMAS DECORATIONS.—The festive season is almost upon us, and at most places in the country preparations are in hand for the entertainment of visitors, consequently gardeners will have their hands full, and where the conservatory is attached to the house every care must be taken to make it as bright and attractive as possible. The structure should be thoroughly overhauled and the plants rearranged, and if the colour scheme can be carried out in red and white it will then be as bright as is possible to make it, and quite in keeping with the season of the year. The season having been a wet one, chrysanthemums are generally late, and there should be a good batch of white varieties to draw from. Amongst other tall white flowers in bloom now are Lilium speciosum album, Lilium longiflorum, and arum lilies, whilst among the dwarfer plants are Begonia Turnford Hall, carnations, freesias, and Roman hyacinths. All these, if judiciously arranged with salvias, poinsettias, euphorbias, etc., should make a good show and last in good condition for at least a fortnight. If the conservatory or winter garden is used for sitting-out in the event of evening parties or dances, care must be taken to keep it at an even temperature. If lower than 60 deg. it is not at all comfortable; from 65 to 70 deg. is about the best temperature, and though this does not suit the plants and flowers, personal comfort is the one thing to be considered at such a time.

BULBS.—All the earlier batches of bulbs should now be examined, and as many of them as are well rooted should be removed from the ashes. As they are taken out, wash the pots and stand in frames where they can be shaded for a few days until the foliage becomes green and hard. Batches should be systematically brought forward into the houses ready for replacing the others as they go out of bloom.

CINERARIAS, PRIMULAS, and CYCLAMEN that are progressing towards the flowering stage will all benefit by an application of artificial manure. A small amount should be carefully sprinkled over the surface of each pot, afterwards giving just sufficient water to wash it in.

CHRYSANTHEMUMS.—Where these are intended to be grown for large blooms no time should now be lost in securing a batch of cuttings, starting with the varieties that are late in opening and those that require to be run on to the second crown to produce good free-opening blooms. Firm, stocky cuttings should be procured, and if possible should be inserted singly in thumb pots, using a light compost of one part each of loam, leaf-soil, and silver sand, afterwards plunging the pots to the rim in cocoanut fibre in a frame, on an old hotbed that has just a little heat left in it, or, of course, they may be put in a close frame in a cool house. The former method I prefer, but great care must be taken not to let the cuttings become frozen, or it will very much weaken them, so mat up carefully each night, whether frosty or not, as prevention is better than cure.—Thomas Stevenson, Woburn Place Gardens.

THE FLOWER GARDEN.

DEEP CULTIVATION.—This is just as important in the production of first-class flowers as in other branches of gardening, and one which will more than repay for the what may seem to be extra time and labour spent. It is a good idea to work a small portion well each year, rather than attempt more than one can manage, and make a poor job of it. The value of deep tillage is often proved in a dry season, when, during prolonged drought, the roots have a free run, and a greater depth from which to derive the moisture necessary. Deep tillage, together with good mulching on the surface, are worth a great deal more than frequent waterings on a shallow, barren soil. Any borders or parts of the garden now devoid of plants can be treated, and, whether dry or trenched, let the work be well done. If planting is to be deferred until the new year, leave the surface in as rough a condition as possible.

THE HERBACEOUS BORDERS.—Where it is intended to renew these, the present affords an opportune time for the work, and when the newly-moved ground has settled planting may be done again, providing the ground is not too frosted. Great care should be exercised in removing the occupants and keeping them safe, together with their labels, or much confusion will arise. They must be either temporarily laid in or else be well covered, and laid out under a wall or skeleton frame, as near the work as convenient. Commence by opening out a good trench, and place a good layer of partially-decayed refuse in the bottom, adding other suitable materials as the work proceeds, according to the nature of the soil one has to deal with. When the work is finished, a good dressing of soot will be advantageous, and it should be allowed to remain on the surface for a few days prior to being forked over ready for the re-planting. Before the latter work is commenced, however, one must have an idea of what will be required and the system to be employed, otherwise there will be hopeless muddle. As with all other work, the most important thing to do is to have the general outline sketched out, and leave details to the last. The heights of the various plants, colour, size of the clumps, blending of the colours, and season of flowering have all to be considered. A word as to dividing the old stools. Do not chop away at these with a spade, but divide them by inserting two forks back to back, and then forcing them apart. Plant fair-sized, healthy pieces, make them firm, and label neatly as the work proceeds. Neatly rake down the border when completed, and apply a light covering of old mushroom-bed manure.

BEDDING PLANTS.—To keep these in the healthiest possible condition they must be thoroughly examined, rearranged, and relieved of decaying leaves. Especially does this apply to standard plants of heliotropes, swainsonias, pelargoniums, fuchsias, etc., which are held in reserve for another year. Boxes of cuttings of bedding pelargoniums will require similar attention, so will calceolarias, pentstemons, echeverias, etc. Air should be admitted whenever possible, and water sparingly given. All plants in cold frames should be made thoroughly secure against frosts each night.—Edwin Beckett, Aldenham House Gardens.

HARDY FRUITS.

VINES.—These should be pruned if the weather is favourable; cut all lateral shoots back to a couple of eyes. Young rods which have been left for extension or for replacing worn-out branches should be shortened back to three or four feet, according to their strength. Give the rods a couple of sprayings, with an interval of three days between each, with the liver of sulphur emulsion, which will assist to keep red spider in check—the worst enemy of outdoor vines. Remove a little of the old surface soil, and add some good turfy loam, in which finely-broken old mortar, wood ashes, and a little vine manure have been incorporated, afterwards mulching with farmyard manure.

QUINCES AND MEDLARS do not require much pruning, but some of the smaller wood from the centre of the trees should be removed to prevent overcrowding, and the leading shoots be shortened a little to strengthen the branches. Trees in bearing require some extra assistance to enable them to produce choice fruits, and this is best applied in the form of a good dressing of farmyard manure at this season, with the addition of several applications of liquid manure during the summer.

DAMSONS are a most useful fruit, and are generally much appreciated, and more especially so when the plum crop is below the average. The trees should have a little of the spray wood removed from among the branches each season to allow the air and sun to penetrate to all parts of them. A good sprinkling of lime should be applied to the surface every alternate season, lightly pointing it in with a garden fork, and if the trees have borne good crops of fruit a dressing of manure over the roots will prove beneficial.

WALL TREES.—As the work of pruning and refastening is finished, collect all prunings and dead leaves and burn them, and then lightly dig over the surface with a garden fork, being careful at the same time not to damage any of the young fibrous roots. On most soils an annual dressing of fresh lime, soot, and wood ashes will prove beneficial to the trees. The older trees, which are in full fruiting condition, should have, in addition, a light sprinkling of one of the well-known fruit manures to maintain them in a healthy and fruitful condition. Young trees and others which are making too much growth should not have manure applied to them.

FRUIT ROOM.—Keep the atmosphere cool and dry by admitting a little air whenever the outside conditions are favourable; remove all fruits which show the least signs of decay, and endeavour to use up the several varieties in their proper season. Labels, with the name of the variety, and the period when it is most fit for use written upon them, are very useful as reminders.

LIQUID MANURE.—At this season of the year there is generally an abundance of this useful commodity, and it should not be allowed to run to waste. Trees which are well established and in a good fruiting condition, will be greatly benefited by a few good soakings during the winter, but it should not be applied in a too strong state, nor when the soil is frozen.—GEO. WOODGATE, Rolleston Hall Gardens.

THE MANAGEMENT OF FORESTS.

In the series of lectures now being delivered by Mr. William Dawson, M.A., B.Sc. (Agr.), lecturer in forestry at the Aberdeen University, under the auspices of the Aberdeen and North of Scotland College of Agriculture, none has yet proved more delightful and instructive than that given on "The Management of Forests." There was, as usual, a large and highly-interested audience, comprising foresters, assistant foresters, gardeners, estate factors, and many engaged in legal offices in the City of Aberdeen, having factorial or estate management duties as part of their business.

Mr. Dawson, in his introductory remarks, spoke of the natural and artificial methods by which forests were established and regenerated. When all was said and done, the naturally regenerated wood, he pointed out, was the exception and not the rule, and artificial regeneration was the system likely to remain. There was a choice of two methods: They might sow the seeds where they were to spring up, or they might sow the seeds in specially prepared gardens or nurseries, and, after a certain number of years, plant out the young trees. The first-mentioned method, he showed, could scarcely be adopted in regard to the afforestation of sand dunes and shifting sandhills. As the method employed in dealing with these sandhills was somewhat exceptional, he described the process adopted in sowing or planting grasses, erecting palisades, etc., so that the sand might be, as far as possible, prevented from moving. The sowing or planting of trees then proceeded, the result being that even where there were shifting sands, the ground was firmed up and woods were reared successfully to produce an excellent crop of valuable timber. Mr. Dawson, in this connection, pointed to the destruction that had been done to much valuable agricultural land on the shores of the Moray Firth, and to the steps taken to have sand dunes fixed along those shores, and also at Cruden Bay, by planting trees.

There was also a strong movement afoot in outlying parts of Germany, the lecturer said, for the afforestation of old agricultural land which had become deteriorated and where it no longer paid to grow agricultural crops. There were certain areas in our own country where land of that class might be profitably utilised for the growing of timber. The "ball-planting method" adopted by the German Government was described, the young trees in this case being transferred to the place where they were to be set with a considrable ball of earth attached to the roots, and planted in holes prepared for them. That method, although more expensive than others, was generally found to be very satisfactory. Another method of planting described was that known as "notching." The "T" notching method was still a favourite in many places, but did not give such satisfactory results as it ought to give.

Mr. Dawson then proceeded to refer to the much-discussed question of the distance trees ought to be planted from each other. The former method was all in favour of wide planting, and it had been advocated that oaks ought to be set 40ft. apart. So with conifers it had been the rule to have them planted wide apart. Nowadays, however, the pendulum had swung to the opposite extreme, and trees were planted closely. By means of the lantern the lecturer showed at this stage, very clearly, the results of open and close plantation—the former encouraging the tree to send out numerous wide-spreading branches and diminishing the amount of good timber available, and the latter giving tall, straight, uniform trunks, without knots in the timber. It was necessary in good afforestation, the lecturer emphasised, not only to start the forest close, but to keep it close, in order to have the most satisfactory results. To give a tree plenty of room meant that it would develop naturally, and the forester did not wish that, because it not only took up much more room, but it did not become a good timber tree. It might be said that the branches could be pruned, but pruning was expensive, and it was impossible entirely to control the pruning so as to get rid of the branches altogether, and, in any case, pruning generally left its mark upon the timber.

If they planted 200 trees on an acre, where they looked for a crop of 200 trees, there would be no opportunity of selecting, whereas, if they had 4,000 trees planted on an acre they could select only those trees to remain to the end that would be the best timber trees. Admirable illustrations were shown on the screen of trees in close plantation. The object of the practical forester, Mr. Dawson showed, was to deprive the tree of the amount of space it demanded, and in that way thinning must be very moderate if the best results were to be obtained. The thinning might be a little heavier during the last fifteen years of the forest's growth than at the beginning.

In concluding his lecture, Mr. Dawson dealt with the subject of replanting. The generally accepted idea for long had been that after a wood had been cut down the ground required a rest for seven years to replace the waste of plant food, and make up for the degeneration of soil. That idea of rest, the lecturer pointed out, was based on faulty observation. It was seen that conifers did not grow on ground when planted so soon as trees had been immediately felled, but that was due to the ravages of the pine beetle, which appeared in the stumps of old trees, and which fed upon young trees. In the course of a few years the stumps became no longer habitable for these beetles, and it was noticed that after the beetles had taken their departure young trees grew. Nowadays they had methods by which the ravages of the beetle could be counteracted.

In regard to transport, that was of more importance than the timber itself, on account of the expense involved. Here were shown various slides with forest tramway rail "shoots" by which logs were sent rapidly down a mountain side, and also methods of transport by log-rafts. In this country transport by water used to be quite common, the Dee and the Spey being rivers on which much of this work was done.

The usual votes of thanks were accorded to Mr. Dawson, and in reply, Mr. Dawson thanked the audience for turning out in such large numbers, and for listening to his lecture so attentively.

Growth of the United States Fruit Industry.—Twenty years or so ago the United States imported fruit to the value of about £4,280,000, and exported fruit valued at about £625,000. In 1907 the fruit imports were valued at about £7,293,405, and exports at £3,646,702. During twenty years the increase of imports has been 80 per cent., and the increase of exports 540 per cent., notwithstanding the increased domestic consumption.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

National Rose Society.

The annual meeting of the National Rose Society, held at the Westminster Palace Hotel, Westminster, on Thursday, December 9, in the afternoon, was well attended, almost all the prominent trade and amateur rosarians being present, and the proceedings were characterised throughout by excellent good humour and friendliness.

The minutes of the previous annual meeting were taken as read, and after the notice convening the meeting had been read, the annual report was presented by Mr. E. Mawley, V.M.H., the veteran hon. secretary, and Mr. G. W. Cook, hon. treasurer, presented the statement of accounts.

ANNUAL REPORT.

In presenting their report the committee have pleasure in stating that during the past twelve months more new members have joined the society than in any previous year, showing that their efforts on behalf of those interested in roses and rose culture in this country and elsewhere are becoming each year more generally known and appreciated. In fact, in the last four years the society has more than doubled its membership.

The Metropolitan Exhibition again took place by the kind permission of the President and Council of the Royal Botanic Society in their delightful gardens in Regent's Park, the date of the show being July 2. This, the leading exhibition of the society, proved as varied and interesting as ever. Owing, however, to the backwardness of the season, the display of roses was not quite as extensive as usual, and the general quality of the blooms was below the average standard. In other respects this must be regarded as having been a most successful show, the attendance of visitors being the largest, the tents the cleanest and best, and the refreshment arrangements more complete and satisfactory than at any previous exhibition. For the fifth year in succession Her Majesty the Queen, the Royal patroness of the society, paid a visit to the exhibition soon after it was opened—an honour greatly appreciated by all present.

The committee, in carrying out the arrangements for the show, were, as on previous occasions, ably supported by the secretary, assistant secretary, the superintendent of the Gardens, and other members of the staff of the Royal Botanic Society.

The Provincial Show was held at Luton, in conjunction with the Luton and District Sweet Pea and Rose Society. This was, with one exception, the largest exhibition the society has yet held in the provinces, while the general quality of the flowers was in advance of that at the Metropolitan Show held a fortnight earlier in the month. The thanks of the committee are due to the president, Mr. Francis Crawley, and the other officers of the Luton Society, as well as to the local committee, for the excellent arrangements made for the exhibition, and more particularly to Mr. R. H. Marks, the senior hon. secretary, who took such a leading part in carrying out those arrangements. There was a very large attendance of visitors.

The sixth Autumn Show of the Society took place in the Royal Horticultural Hall, Vincent Square, Westminster. It was of about average extent, and was noteworthy for the keenness of the competition in the leading class for nurserymen, no fewer than thirteen exhibits being on that occasion staged. During the year new and carefully revised editions of the "Handbook on Pruning Roses" and the "Official Catalogue of Roses" were issued to the members, in addition to the "Rose Annual for 1909." In mentioning these publications the committee feel that they cannot too warmly thank the members of the Publications Committee for the time and care they devoted to their preparation and improvement.

At the last annual general meeting Mr. G. W. Cook, previously one of the hon. auditors, was unanimously appointed the hon. treasurer of the society, Mr. Charles Brannan, chartered accountant, being shortly afterwards engaged as auditor.

Six new rose and other horticultural societies have become affiliated during the past year, bringing up the total number of societies in affiliation to the National Rose Society to 55. The committee record with regret the death of Mr. T. B. Hall, of Rock Ferry, in Cheshire. Mr. Hall was for a long time a member of the committee, and for many years a leading exhibitor at the Society's exhibitions, and in 1887 and 1888 carried off the Society's Jubilee Challenge Trophy.

FINANCE.

The amount received in gate money from the general public at the exhibition in the Royal Botanic Gardens exceeded that at any previous exhibition held by the society. The receipts from all sources during the past year, including a balance from the previous year of £427 8s. 2d., amounted to £3,151 6s. 4d., and the expenditure to £2,714 15s. 10d., leaving a balance at the bankers' and in the treasurer's hands of £436 10s. 6d. after £300 had been placed to the reserve fund. The reserve fund now stands at £750.

MEMBERSHIP.

During the past twelve months exactly 900 new members joined the society, or 115 more than in the previous year. Allowing for the losses by death and resignation, the total number of members is now 3,797. Taking the year as a whole, between two and three members a day have, on an average, been added to the list of membership.

INCREASE IN MEMBERSHIP SINCE 1904.

	1904.	1905.	1906.	1907.	1908.	1909.
No. of Members	1,308	1,637	2,034	2,484	3,150	3,797

ARRANGEMENTS FOR 1910.

The Metropolitan Exhibition will again be held in the Royal Botanic Gardens, Regent's Park, the date fixed for the exhibition being Friday, July 8. The Provincial Show is not yet arranged. Arrangements have been made with the Royal Horticultural Society to hold the Autumn Show in the Royal Horticultural Hall, Vincent Square, Westminster, on Thursday, September 15. During the coming year the following publications will be issued to the members:—The "Rose Annual for 1910," and new and revised editions of the "Hints on Planting Roses" and the "Enemies of the Rose."

To the donors of special prizes the committee offer their grateful acknowledgments, and also to those hon. local secretaries, who, by their zeal and activity, have assisted so much in promoting the interests of the Society. They especially desire to mention Mr. H. E. Molyneux (Purley), the President (Stratfieldsaye), Mr. R. E. West (Reigate), and Dr. A. H. Williams (Harrow), as having been the most successful in obtaining new members. The committee feel they cannot close this report without tendering their warmest thanks to Miss Willmott, V.M.H., vice-patroness of the Society, for her kind services during the past year.

The President, Rev. F. Page Roberts, who presided, moved the adoption of the report briefly, and it was seconded by Mr. E. J. Holland, and carried. We may point out the chief items of expenditure during the year were: Printing, stationery, etc., £640 18s. 8d.; postage and telegrams, £232 8s. 9d.; show expenses, £440 1s. 11d.; prizes, £818 3s. 7d.; invested in Consols, £300; office expenses and honoraria, £230.

Mr. Mawley was voted a honorarium of £100, together with grateful appreciation of his services.

A formidable looking list of alterations to the rules and bye-laws was presented, and each and all of them was moved by Dr. A. H. Williams, and mostly seconded by Mr. Shea. But these alterations were not of a revolutionary character. They transformed the General Committee into a Council, thus adding dignity to the governing body, which will now consist of forty elected members and the officers of the Society; they defined the various standing committees (previously sub-committees) and their functions; they legalised the appointment of local hon. secretaries as well as the bye-law that insists that "in all boxes for single blooms the tubes must be five inches apart each way from centre to centre of the tubes"; and, finally, they altered the numbering of various rules so as to group these in better order. There was very little discussion, though minor points and possibilities were raised, and the alterations were all adopted.

Messrs. Strange and A. Turner, the scrutineers, reported that the house list of officers and committee had been adopted.

Then followed a delightful incident, i.e., the presentation of the first Dean Hole Memorial Medal to the Rev. J. H. Pemberton, for conspicuous service as an author and exhibitor in connection with the rose. The President very pleasantly made the presentation; Mr. E. Mawley epitomised Mr. Pemberton's history as a rosarian, and everyone acclaimed the medallist, who very feelingly and modestly acknowledged the presentation, referring to his long association with the late Dean Hole, and to the fact that the great credit for his own success as a rose exhibitor was due to the work of his "head gardener" —his sister, Miss Pemberton.

Dr. Shackelton proposed, and Mr. C. E. Shea seconded, a vote of thanks to the chairman, which was most heartily accorded.

Instead of the annual dinner a conversazione was held at the Westminster Palace Hotel at the conclusion of the business meeting. Music and light refreshments were provided, and there was a large gathering of members and their friends, the proportion of ladies being very considerable. The opportunities which the conversazione afforded rosarians to meet and chat with each other appeared to be much appreciated. The arrangements, we would add, were such as to bring much credit to the president and hon. secretary, who were mainly responsible for them.

National Sweet Pea Society.

This young society held its annual general meeting at the Hotel Windsor, Victoria Street, Westminster, on Friday, December 10, at three o'clock. There was a large attendance, and, owing to the unavoidable absence of the President, Sir Randolf Baker, Bart., Mr. Horace J. Wright presided.

The minutes of the previous annual meeting were taken as read and other preliminaries were quickly disposed of. The Hon. Secretary then read the Report of the Committee for 1909, of which the following is an abridgement:

REPORT FOR THE YEAR 1909.

At the end of the year 1908, the society had 779 members on its books and 51 societies in affiliation. During the year just ended no fewer than 280 new members have joined the society, a few of these having entered for the coming year. There have been several losses from death and removal, and again a number of members have failed to respond to the several requests for payment of subscription. After deleting the latter, the membership stands at 938, while the number of affiliated societies is 101.

The President for 1909, Sir Randolf Baker, Bart., is a great lover of sweet peas, and his flowers have achieved success in many a keen competition. He has rendered the society valuable assistance in many ways and his year of office will be long remembered. Mr. H. J. Wright, formerly hon. secretary, fulfilled the office of chairman of committee in a most able manner and kindly presented a handsome silver cup for competition at the London show. Mr. N. N. Sherwood, V.M.H., and Mr. E. Sherwood (treasurers), and the hon. secretary, have each had a considerable increase of work and have carried out their many duties cheerfully and efficiently.

In conjunction with the Saltaire Rose and Horticultural Society, the Provincial Sweet Pea Show was held in Saltaire Park, Saltaire, on July 13, but the somewhat early date, coupled with the lateness of the season, resulted in a comparatively poor display. The growers in the Lake District and others from Surrey and Hampshire showed well, and the Provincial Cup was again won by Mr. T. Stevenson. Mr. P. H. Illingworth, M.P. (President), Mr. A. Jowett (chairman), and Mr. E. A. Wright (hon. secretary), did all in their power to make the show a success.

Held on Thursday, July 23, at the Royal Horticultural Hall, Westminster, the society's London show was a great success. There were nearly two hundred exhibitors, and in the small growers' section the competition was very keen. Palms were kindly lent by Messrs. W. Cutbush and Son, and the music gallery was decorated florally (for the first time) by the hon. secretary and Mr. H. D. Tigwell. The attendance was a record one, and £38 10s. was taken at the doors.

The society's trials were not so entirely successful this year as they have been in previous seasons, owing to the vagaries of the weather. Thanks are due to the Council of the University College, Reading; to Mr. Charles Foster and to Mr. Drew, for the conduct of the trials. There were three hundred and fifty varieties or stocks of sweet peas on trial at Reading.

The work of the Floral Committee has been unusually heavy The members paid two visits to Reading and held one meeting in London. They made awards sparingly, drew up a list of Too-much-alike Varieties, and made a selection of the best varieties (in commerce) of each colour for the guidance of members. The following awards were made at Reading: First-class Certificate to Trial No. 186 (this the committee considered a perfect stock of Clara Curtis), from Mr. W. J. Unwin, Histon, Cambs.; Award of Merit to Charles Foster (Trial No. 7), from Mr. Robert Bolton, Warton, Carnforth; Award of Merit to Edrom Beauty (Trial No. 250), from Mr. A. Malcolm, Duns; Award of Merit to Mrs. W. J. Unwin (Trial No. 289), from Mr. W. J. Unwin; Award of Merit to Dazzler (Trial No. 334), from Mr. C. W. Breadmore, 120, High Street, Winchester; Award of Merit to Sunproof Crimson (Trial No. 338), from Messrs. Dobbie and Co., Rothesay; Highly Commended to Mrs. Watson (Trial No. 86), from Mr. R. Bolton, Carnforth; Commendation as a Market Variety to Mercia (Trial No. 136), from Messrs. G. Stark and Sons, Great Ryburgh; Commendation as a Garden Variety to Colleen (Trial No. 305), from Mr. William Deal, Brooklands, Kelvedon.

The forthcoming "Annual" will be larger than any of its predecessors, but there will be no advance in price.

THE NEW CERTIFICATE.

Miss Williamson has designed the new certificate which will be issued to affiliated societies, and will serve as an award either in conjunction with the society's medal or distinct therefrom. As a slight acknowledgment of her assistance the committee has presented Miss Williamson with a suitably engraved silver-gilt medal. Miss J. Cuthbertson was awarded a gold medal for her services in compiling the "Catalogue of Sweet Peas."

The committee has been fortunate enough to secure the Royal Horticultural Hall for the purpose of a two days' show in 1910, and the dates already fixed for the London exhibition are Tuesday and Wednesday, July 12 and 13. No provincial show will be held next year. Mr. Charles Foster will again superintend the trials, which will be conducted at the Times Experimental Station, Sutton Green, near Guildford. Then also, immediately the new committee is formed, it will proceed to appoint a special sub-committee for the purpose of investigating the various diseases to which sweet peas are liable.

FINANCE.

The turnover of the society for the year was £710 19s. 2d. The chief items on the revenue side are: Balance for 1908, £32 8s. 11d.; subscriptions, £315 5s.; affiliated societies, £48 16s. 6d.; trials charges, £39 12s. 6d.; gate money, £38 10s.; prize fund and Saltaire contribution, £129 8s. 6d.; sale of annuals, £26 8s.; advertisements in publications, £42 3s. 6d. On the expenditure side the leading items are: Medals, £58 0s. 6d.; trials expenses, £37 2s. 7d.; printing and stationery, £240 8s. 2d.; postages, carriage, etc., prizes, London and Saltaire, £134 14s.; honorarium to hon. secretary, £26 5s.; grant for office room, fire and light, £20; balance in hand, £84 18s. 9d.

The Chairman moved the adoption of the report and balance-sheet, pointing out the work and advance of the society. Mr. A. Dean, V.M.H., seconded the motion, and made special reference to the great increase of affiliated societies, and the admirable work of the Floral Committee. The motion was carried unanimously.

There were numerous resolutions put and carried, and the chief speakers were Mr. W. Cuthbertson, Commander Humphery, Mr. John Collingridge, Mr. S. B. Dicks, Mr. J. S. Brunton, Mr. A. Ireland, Mr. C. W. Breadmore, Mr. J. H. Dick, Mr. Shane. The chief matters dealt with were: thanks to officers and committee; the election of Mr. N. N. Sherwood, V.M.H., as president for 1910; election of Commander Humphery, R.N., as chairman for 1910; Mr. Edward Sherwood as treasurer; election of Mr. R. Gluyas as auditor; and election of Mr. C. H. Curtis as hon. secretary, accompanied by a honorarium of £32 10s. for his services in 1909. A new rule was also adopted, which debars members of committee from re-election if they make fewer than two attendances. The majority of the old members were re-elected on committee.

Mr. S. B. Dicks' proposal that the old minute and signature books and copies of all publications of the society should be placed in a safe at one of the depositories was heartily agreed to. Mr. Leak suggested a reorganisation of the colour classification, and as he is now a member of committee he will bring the matter up for discussion.

A vote of thanks to the chairman concluded the proceedings.

DINNER.

Under the genial presidency of Commander Humphery, R.N., about three dozen members dined together after the annual meeting. There was little speechifying, the toasts being "The King," "Success to the N.S.P.S.," and "The Chairman." The latter urged the adoption of the sweet pea as the Imperial Floral Emblem.

CONFERENCE.

Nearly sixty members gathered in the North Room of the Hotel Windsor at seven o'clock for the conference proceedings. Mr. H. J. Wright presided. The papers read were "The Imperfect Seeding of Waved Sweet Peas," by Mr. William Cuthbertson, J.P.; and "Sweet Pea Names and Naming," by Mr. W. J. Unwin. These two excellent papers we hope to print in extenso.

An interesting and brisk discussion followed each paper. Mr. Cuthbertson's reasons for imperfect seeding (illustrated by diagrams) were closely followed. More open positions and less feeding were suggested as inducements to better seeding, while the opinion that the waved varieties were more succulent and lacked sexual vigour was freely expressed.

Mr. Unwin's hope that names should not be multiplied unduly was heartily endorsed, and Mr. Foster protested against distinctive names for a highly selected stock of a variety. The evidence given that varieties gaining awards this year at Reading are being listed for sale by a certain seedsman whereas these novelties have not left the hands of the raisers and cannot be offered by them owing to short stock, raised a very strong protest. Both Mr. Cuthbertson, Mr. Unwin, and others asserted that it was impossible for anyone to sell these novelties, as they held the entire stocks of those for which they gained awards, and therefore to list them and supply seeds purporting to be those of the novelties in question was a great wrong.

We congratulate the society upon its work, and especially upon the vigour of its conference proceedings, and we echo the opinion expressed by the chairman that a conference may be an annual function. We may add that every member attending the annual meeting was furnished with a copy of the report, balance-sheet, and the programme for the day; and that each member attending the conference received a printed copy of each paper, and so was able to follow the speakers readily.

Wootton Gardeners' Association.

At a meeting held under the presidency of Mr. Joseph Stoney on the 2nd inst., a lecture was delivered by Mr. O. Horton, superintendent of Calderstones Park, Liverpool, on "Flowering Trees and Shrubs." The selections given were adapted to moderate surroundings. Methods of propagation and soils most suitable for them were detailed, and special reference was made to those kinds of trees and shrubs that can be successfully grown in the neighbourhood of Liverpool. Details were given as to position and grouping to give the best results.

At the request of Mr. Haigh, the lecturer gave a list of hardy shrubs suitable for forcing, and also replied to numerous questions and criticisms by those present.

A cordial vote of thanks was tendered to the lecturer for his valuable paper.

Perpetual-Flowering Carnation Society.

Following its annual show on December 8, many members of this society dined together at the Hotel Windsor, under the presidency of Mr. J. S. Brunton, who established a record by inducing the speakers to so limit their remarks that twelve speeches were made just inside fifteen minutes. The toasts given were "The King," "The Judges," "The Exhibitors," "The Visitors," and "The Press," the speakers being the Rev. J. Jacob, and Messrs. C. H. Payne, Wallace, H. Mathias, S. Mortimer, E. F. Hawes, C. Engelmann, L. Cook, and C. H. Curtis.

The annual meeting followed immediately upon the dinner, and after the usual preliminaries, Mr. Hayward Mathias, the hon. secretary, read the report, and Mr. Laurence Cook, hon. treasurer, presented the balance-sheet, which were as follows:—

REPORT FOR 1909.

Your committee have much satisfaction in recording the steady increase in the membership of the society. The fact that the new members are for the most part amateurs would seem to show that the policy of your committee in increasing the number of classes and prize money in the section of the schedule confined to amateurs is judicious and beneficial to the Society.

Various schemes for the advancement of the sphere of usefulness of the society have been under consideration during the past year, but the carrying of many of these schemes into effect has been, so far, impossible owing to the lack of the necessary funds. Your committee again desire to express the earnest hope that each member of the society will do his or her utmost to enrol new members.

Your committee trust that the "Year Book" of the society which will be published early in 1910, will prove useful, especially to the amateur section of the society.

During the past season the suitability of the perpetual-flowering carnation for open-air culture has been tested at the Royal Botanic Gardens, Regent's Park, and the report of the trial will be made in due course.

Your committee have concluded that in future it will be to the advantage of the society to close the financial year on October 31, and a balance-sheet for the period from January 1 to October 31, 1909, is accordingly presented.

The membership roll of the society at October 31, 1909, was as follows:—Total at December 31, 1908, 166; admissions to October 31, 1909, 75; resignations, 11—total, 230, or a total increase in membership, and that in 10 months only, of 64.

The artistic and valuable challenge vase, presented to the society by the president,

BOULTON & PAUL, LTD., HORTICULTURAL BUILDERS, Norwich.

EFFECTIVE, PRACTICAL CONSERVATORIES.

Boulton & Paul Ltd
Norwich 1906

Ladies and Gentlemen waited upon by appointment.

HEATING APPARATUS installed by experienced workmen in Horticultural, Public, and Private Buildings.

These Houses are sent out well made, painted three coats, Glazed 21oz. glass, and Carriage Paid.

CARRIAGE PAID on orders of 40/- value to most Goods Stations in England.

the Right Hon. Lord Howard de Walden, and the challenge cup, presented by the American Carnation Society, were first competed for at the March, 1909, show. The vase and cup were on view during the show, and were very greatly admired by the carnation growers present. The committee are much indebted to these donors, as also to those who during the past year have so generously offered specials for competition among the members. The committee take this opportunity of inviting others who may be willing to give specials for competition, at the 1910 shows, to communicate with the hon. secretary, as these specials are undoubtedly a great help in the successful financing of the society.

The cordial thanks of the society are due, and are hereby tendered, to the Horticultural Press for their very great assistance in bringing the aims of the society to the notice of the public, to the judges for their gratuitous services at the exhibitions, and to Mr. Curtis and Mr. Pinches for auditing the society's accounts.

FINANCE.

The turnover of the society for the year was £153 6s. 5d. The chief sources of income were: Subscriptions, £83 4s. 8d.; gate money, £12 7s.; advertisements, £11 1s.; and balance brought forward, £25 2s. 3d. On the expenditure side, prizes come to £64 7s. 7d.; exhibition expenses and advertisements, £11 18s. 10d.; printing, stationery, insurance, etc., £43 9s. 4d.; leaving a balance of £28 11s. 5d. to carry forward for next year.

The adoption of the report was moved by Mr. J. S. Brunton, who briefly reviewed the society's work, and referred to the hopes for the future, especially referring to the proposed new "Annual," which would be free to members, and on sale at 1s. to non-members. Mr. W. H. Page seconded the motion, and the report was adopted. On the motion of Messrs. Sherwood and Blick, the balance-sheet was adopted.

A slight alteration of one rule was passed enabling the committee to close its year and accounts on October 31 of each year instead of on December 31.

Thanks to the officers and committee were heartily welcomed. Lord Howard de Walden was re-elected president; Mr. J. S. Brunton, as chairman; Mr. S. Mortimer, as vice-chairman; Mr. Hayward Mathias, as hon secretary; Mr. Laurence Cook, as hon. treasurer; and Messrs. Curtis and Pinches, as auditors. Most of the retiring members of committee were re-elected, with Mr. Burnett at the head of the poll.

A vote of thanks to the chairman concluded the very pleasant proceedings.

Bournemouth Gardeners' Association.

On December 7, Mr. G. Chapman, Stanley Green, Poole, gave a very interesting and instructive lecture on the "French Intensive Culture of Vegetables," before the members of the Bournemouth Gardeners' Mutual Improvement Association. Mr. Chapman dealt principally with the financial side of the subject, and his foreman, a very able Frenchman, gave some excellent cultural details; thus the members present had the question of intensive culture of vegetables placed before them in a plain, concise manner by experts who did not attempt to argue that every French garden was a gold mine.

At the beginning of his lecture Mr. Chapman strongly condemned the absurd booming of the French system in certain quarters, and effectively criticised some of the statements made that seven hundred pounds, and more, could be realised per acre. Because so much money was made from the growing of a certain number of plants on a given space, it did not follow, said the lecturer, that the same sum, in proportion, could be realised from an acre. It often happened that a glut was caused by a number of cultivators sending consignments at the same time, of the same kind of vegetable or salad, to the same market, and then prices dropped very much. Owing to certain articles being written booming the French system of culture, many quite inexperienced persons had been led to believe that anyone could make a fortune out of a very small garden, said Mr. Chapman, and he gave several instances, and referred to the great number of letters he had received on the subject.

One old lady wrote stating that she had a capital of twenty-five pounds, and quite believed that she could make a living by investing the sum in a French garden and by giving sewing lessons in her spare time. This was one instance given proving how misleading the articles were, and the false hopes they raised in many people's minds.

The garden which Mr. Chapman manages is, he said, being conducted as an experiment, but on commercial lines, with a view to the teaching of the system to other people; and he maintained that, at the expiration of two or three years, the concern would be a very good paying one. He had come to the conclusion that from sixty to seventy pounds per acre could be realised as profit from this system of culture when once a garden was rightly established.

The lecturer gave useful hints as follows: The site must be an open one, that is, open to the sunshine, but sheltered from cold winds; light, air, artificial shade when required, good heating material, which means the best stable manure easily procurable. In Paris, said the lecturer, the best horse manure can be procured at two shillings per ton; but he had to pay five shillings per ton for it. Another cause of handicapping British growers was the fact that in France the sun's rays in January were much stronger than they were in England; and, although frosts were often more severe in France in January than in this country, the growers in France were enabled to place their produce on the English market quite a fortnight before we were.

The lecturer strongly urged his audience not to embark upon the French system of cultivation unless they had plenty of capital and were able to engage expert labour. A very free discussion took place; many questions were asked and very intelligently replied to; the French foreman to Mr. Chapman giving some most useful replies. All the members felt that they had listened to a very instructive lecture, and passed a hearty vote of thanks to Mr. Chapman, his foreman, and Mr. Chamberlain, who presided.

East Anglian Horticultural Society.

The annual meeting was held on the 8th inst. at the Boar's Head Hotel, Norwich, when a large number of local horticulturists assembled. Mr. W. L. Wallis, secretary, presented the annual report of the past year's work of the club. Among the losses through death was Mr. T. G. Bishop, who was manager at Messrs. Daniels Bros.' Nursery, and had contributed some useful papers to the society. The membership naturally had fluctuated somewhat owing to removals, but there were now upon the books a membership of 337, which places this society as one of the first of its kind in the kingdom. The finances are in a sound condition, the year concluding with a balance at the bank, etc., of £134 15s. 7d. Assistance had been granted to distressed gardeners, which is one of the good objects of the society. The monthly exhibitions had been a great feature, larger entries being received, and the quality of the exhibits well maintained, thus giving educational lessons of good culture to the young members.

Christmas Presents

Essays from various members, and lectures had been given monthly, and the subjects dealt with had been fully discussed by the members.

Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, won for the first year the silver challenge cup presented by J. J. Dawson Paul, Esq., and he also takes the championship of the club by reason of having secured the most points at the year's exhibitions.

The other useful sides of the work are all mentioned, including the splendid library, which is of great service to the young gardeners. This report was unanimously adopted.

Mr. J. Powley said he wished, owing to advancing years, to vacate the presidential chair, which notification was received with regret.

Mr. T. B. Field, Ashwellthorpe Hall Gardens, was elected president, and Mr. L. Smith, Shotesham Park Gardens, vice-president. Mr. Charles Daniels was re-elected treasurer, and, amid great applause, the popular secretary, Mr. W. L. Wallis, 12, Royal Arcade, Norwich, was re-elected. Messrs. F. Neave, T. Notley, C. H. Fox, F. Williams, W. Endersby, W. Laws, and J. Clements were elected upon the committee for a term of three years.

There was a fine display of flowers, fruits, and vegetables upon the exhibition tables. Begonias were well shown, and a plant of the newer type Ideal, from Mr. W. Shoesmith, was a fine example of skilful culture. Grapes from Mr. Palmer were well coloured. Mr. W. Laws, gardener to G. E. White, Esq., Eaton, staged a bunch of seedling tree carnations of his own raising, these were all good types, non-splitters, but required more pronouncement in the colour. Messrs. Hobbies, Lim., Dereham, had a beautiful display of the best single decorative chrysanthemums. Messrs. Daniels Bros.' class for their leek Champion was well filled, and some fine examples were staged. The Secretary read out a list of lectures and essays for 1910.

FORTHCOMING ENGAGEMENTS.

TUESDAY, December 21.—Royal Horticultural Society: Meeting of Fruit, Floral, and Orchid Committees at Noon.

ANSWERS TO CORRESPONDENTS.

R. H. S. BULB SHOW.—H. G., Gillingham: You can obtain the fullest particulars of the bulb show to be held by the Royal Horticultural Society next spring, from the Secretary, Royal Horticultural Society, Vincent Square, Westminster.

GOOSEBERRY CUTTINGS.—S. E. F., Peasenhall: This matter should have been dealt with earlier. However, if the ground is not frozen, and has been well dug and made firm again, proceed at once to select long, straight prunings, and reduce these to a length of sixteen inches each. Carefully remove all the buds, with the exception of four at the top, and then insert the cuttings firmly, six inches apart, in rows about a foot apart. Lift and transplant next autumn.

PROPAGATION OF NEW VARIETIES OF POTATOES.—R. C. K., Southam: New varieties of potatoes can be propagated with astounding rapidity by those who are experienced. The tubers will be placed in boxes, and covered with light, sandy soil about the end of February, and placed in a temperature of about 60 deg. If the soil is kept moderately moist new growth soon commences. As the shoots attain a length of between one and two inches, they are carefully detached from the tuber with finger and thumb, and put singly into small pots. A second crop of shoots quickly follows, and, if these are removed in the same way they will be followed by a third and so on, until the tuber is exhausted. To show what can be accomplished by this method of propagation, it may be mentioned that in the spring of 1904 a gardener was given a tuber of the famous Eldorado, weighing one ounce, and from this tuber he raised about 650 plants. Under normal conditions, a potato tuber produces one shoot from each of the more prominent eyes; but when the growths are removed in the manner here described, all the eyes start into growth and produce several growths, in some instances from twelve to fifteen being obtained from a single eye. Immediately the young plants are established, they should be removed to cooler quarters, and grown as cool as is consistent with safety from frost until they are hardened off, ready for planting out. In not a few instances, plants raised by this rapid method of propagation prove unsatisfactory, owing to their being subjected to a high temperature and a close atmosphere during their earlier stages of growth.

HIGH-PRICED CRIMSON ORCHID. — L. H., Chelmsford: Your description is not sufficiently clear to enable us to determine the orchid to which you refer, but we believe you must mean Odontioda Charlesworthi, a bigeneric hybrid exhibited at the Temple Show in 1908. We do not know what price was paid for the quite small specimen shown, but it was generally understood that the sum was £1,000. The plant carried a spike of three flowers, and three buds, the flower being rich crimson-scarlet all over, save for the yellow crest. Odontioda Charlesworthi was figured in the GARDENERS' MAGAZINE of June 13, 1908, and fully described in the issue of June 6, 1908.

DOUBLE ARABIS FOR SPRING BEDDING.—W. H. C., Coventry: You are quite right, and we think your employer must have some other plant in his mind when he condemns the double white arabis for spring-flowering. Some of the most charming effects are produced by the use of double white arabis as a ground-work for bulbs. Both yellow and scarlet tulips, especially the late varieties, look well when flowering above the beautiful white mass of bloom produced by the arabis. Another pretty combination would be Muscari Heavenly Blue, and the double white arabis, the brilliant blue of the former looking very distinct above the white flowers. Point out the double arabis to your employer in the spring.

if you have plants anywhere in the garden; if not, induce him to visit some park or garden where it is used in association with bulbs. Do not feel over-much grieved because your employer has objected to this or that plant; the matter may be one of taste or mistaken identity. In the former case you must submit, with as good a grace as possible, but in the latter case you can easily provide the remedy.

CYANIDING FOR THE DESTRUCTION OF MEALY BUG.—A. W., Wokingham: Where vineries are infested with mealy bug fumigation with cyanide is a most successful method of destroying the pest. The vines must be dormant, and the vinery at a temperature of 50 to 55 degs. There are special apparatus designed for the use of this deadly poison, but they are not necessary, though very useful. Cyaniding is so poisonous that we do not recommend it except in the hands of the most careful growers, as the least carelessness may mean death to the operator. The leaflet of the Board of Agriculture on the subject states that the following quantities may be taken as a standard for use:—Potassium cyanide, 1 part; sulphuric acid, 1½ parts; and water, 3¾ parts. One ounce of cyanide per 400 cubic feet of space in the vinery appears to be the right amount for a dormant plant like the vine. The leaflet goes on to explain that the glasshouse or other place to be treated must be rendered as air-tight as possible. The sulphuric acid should be poured very carefully and slowly into the water, which may be put into an earthenware vessel, e.g., a large jam jar. The cyanide of potassium, wrapped in thin blotting paper, should then be dropped into the now diluted sulphuric acid. The vessel into which the cyanide is dropped must be so near the door that it can be reached by the outstretched arm of the operator, who should immediately shut the door and close up its chinks by paper previously prepared. Another and better method is for the operator to introduce the cyanide to the diluted sulphuric acid through a window, the cyanide being placed at the end of a long rod or stick, or be lowered into the acid by means of a string and pulley. The window must be closed immediately after the addition of the cyanide, so that the operator may escape the fumes. Strawson recommends the pouring of the diluted acid from a bottle fitted with a cork in which two slits are cut, one to let in air and the other to allow an even stream to flow upon the cyanide, the object being to provide a slow and even disengagement of gas. The bottle should be arranged so that it can be tilted up when all is ready. We may add that for glasshouses the latter method is preferable, the cyanide being placed in an enamelled or earthen vessel in such a position that when the bottle of diluted sulphuric acid is tilted the acid is steadily poured into the cyanide. It is an easy matter to fix the bottle in a little wooden cage, suspended between two uprights, and attach a cord to the base of the cage, so that the latter can be readily tilted. Everything being in position and the house made as airtight as possible, the cord should be passed through the keyhole of one of the doors; the operator must then go outside the house, shut the door, stop up the cracks with gummed paper, pull the cord (or cords, as it is better to have several bottles of acid and bowls of cyanide in a good-sized house), and keep away for an hour. At the end of this period if any ventilators can be opened from the outside, open them, but do not inhale the escaping fumes. As much ventilation as possible should be given, but no one should enter the house for at least another hour. Cyaniding should be done in the evening and during still weather.

NAMES OF PLANTS.

A. C., Winchfield.—1, Oncidium flexuosum; 2, Pteris longifolia; 3, Begonia Rex.

F. E. R., Rickmansworth. — 1, Begonia fuchsioides; 2, Exacum affine; 3, Salvia splendens.

H. Y., Stevning.—1, Calceolaria Burbidgei: 2, Cypripedium Leeanum; 3, C. insigne, a dark spotted variety; 4, Lælia anceps.

NAMES OF FRUIT.

F. E. S., Horsham.—1, Lane's Prince Albert; 2, Dumelow's Seedling.

R. D. E., Devonport.—1, Adam's Pearmain; 2, Bramley's Seedling.

H. R., Wolverton.—1, Beurre d'Aremberg; 2, Catillac; 3, Ribston Pippin.

Published by W. H. and L. COLLINGRIDGE,
148 and 149, Aldersgate Street, London.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

Cannell's Golden Seeds

Hence Sweeter Vegetables.

Apparently the only desire in vegetables has been size, and then complaining of the objectionable odour during the cooking process, sweetness when eating rarely being considered. Twenty years ago we undertook to obviate this serious defect by selecting each season the sweetest roots or tops for "Stock Seed Saving," and each year has brought us nearer to our desired object. Knowing that all Europe is practically supplied with sugar obtained from vegetable growth, we decided to carry our researches further, and in consequence we receive more and more unsolicited testimonials and repeat orders for our Golden Seeds.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Nuts.

Fruits, taking the word in its popular sense, as representing edible products of trees, bushes, or smaller plants, evolved in conjunction with their seeds rather than the actual seed itself, which is the fruit proper in the botanist's eyes, may be roughly divided into two classes, protected and unprotected. The unprotected section embraces all those in which the seed is associated with attractive pulp, designed to act as a lure to frugivorous birds or other animals with a view to dissemination of their indigestible seeds far and wide. The seeds in these cases are usually small and hard, protected by tough coats, and in themselves inedible, so that in the few cases where selective cultivation has eliminated them altogether, their loss is considered an advantage rather than otherwise. With the protected section of fruits, an opposite set of conditions prevails. Here it is the actual seed which is edible, and hence, since in the plant world the preservation of the seed from destruction is a first essential, we find it clothed in shells and skins, and fortified against would-be devourers in precise proportion to their capacity for attack, evolution in this case, as in all others, having provided only for the preservation of the fittest. Nature, howeverever, has not been content, in the great nut tribe of which we treat, with mere hardness or thickness of the protecting shell or shells, but, in some cases, has provided these with acrid and repellent juices. Let anyone gather an unripe filbert, half enswathed in its thick, juicy, semi-foliose husk, and by biting that husk, see how intensely sour a juice it contains, and we can easily see how unlikely it is to fall a prey to squirrel or other depredator at that stage. At that stage, moreover, it is all green, to match the colour of the leaves, while, when the autumn comes, and the nut is ripe, it assumes a brown tint, which, when it falls, is admirably adapted to conceal it among the brown leafy debris then covering the soil. The chestnut works, so to speak, on similar lines, but varies them by arming its outer husk with a chevaux de frise of thorns. The walnut, besides having its strongly flavoured outer husk and its intensely hard inner one, has adopted in addition a very bitter skin as a final protection to the precious seed inside. In the almond we see an interesting link between the two fruit sections we treat of, the protected and unprotected, since, as the almond proper, we see a nut-like fruit, with a single seed (sometimes double), protected by a hard woody shell and a fleshy outer one, quite on walnut lines. The almond, however, is the parent of our choicest peaches, nectarines, and apricots, the delicious pulps of which are merely the modified almond husk, precisely as all our apples and pears represent the modified seed vessels of hips and haws and other hard berries of the great rose family. Naturally, in those parts of the world where frugivorous birds and animals are larger and stronger, or, as in the case of monkeys, more cunning than our native fauna, the nut family has had to meet the case by the evolution of harder shells, precisely on the lines of the evolution of our armour-plated ships as the means of attack have been improved. Hence we find the cocoanut not only encased in an intensely hard shell, but further protected by a thick fibrous outer one, which must involve a considerable amount of labour to penetrate, to say nothing of the internal armour-plating then met with. This outer husk, however, probably plays two protective parts, since as the nuts, as a further protective device, are produced at the top of the palm, probably several scores of feet in height, its fall, if not so protected, upon hard ground, would almost inevitably shatter it to pieces. As a rule, the nut is an individual seed, but some of the tropical ones, such as the brazil nut, and the less familiar tapucaia nut, are, as their form indicates, contained to the number of a score or so in one bomb-like enveloping shell of intense hardness and considerable thickness, so that this, conjoined with the equally hard or leathery shells of the individual seeds within, secure at least that if they become the prey of monkey or other animal, the marauders shall pay for their crime in advance by a period of hard labour.

MR. GEORGE MILEHAM.

Mr. George Mileham, by reason of the great success he has achieved in the improvement of the Japanese varieties, occupies a prominent position among raisers of chrysanthemums, and his achievements are of additional interest from the fact that they have been accomplished in conjunction with the performance of the duties associated with the management of a gardening establishment of the first rank. Mr. Mileham has been head gardener at Emlyn House, Leatherhead, the residence of A. Miller, Esq., since 1888, and during this period he has distinguished himself as a cultivator of double and single primulas, cyclamen, Begonia Gloire de Lorraine, zonal pelargoniums, for which he has obtained many awards at the leading exhibitions, as well as for groups of plants arranged for effect, and fruit of various kinds, and for chrysanthemums. Fourteen years ago Mr. Mileham turned his attention to the cross-fertilisation of chrysanthemums, with a view to raise new and improved Japanese varieties, and the first of the forms from which he saved seed was the variety known as Lady E. Saunders. Sixteen seedlings were raised, and these included A. G. Miller, which at that time was regarded as possessing much merit. The success achieved was sufficient to encourage further effort, and since then Mr. Mileham has raised some seedlings annually, and of these a goodly proportion have had First Class Certificates conferred upon them by the Floral Committee of the National Chrysanthemum Society. Many of the varieties occupy a leading position at the present day, as evidenced by their inclusion in so large a number of the winning stands at the exhibitions. Especially noteworthy among the varieties that we owe to Mr. Mileham are Mrs. G. Mileham, Mrs. A. T. Miller, Miss Olive Miller, Miss Dorothy Oliver, W. Beadle, F. W. Leaver, G. Mileham 1908, James Lock, Beecham Keeling, Exqusite, Lady Edward Letchworth, and George Hemming, the last-named being a fine variety that received a First Class Certificate at the National Chrysanthemum Society's exhibition in November last. Mr. Mileham considers his greatest success in one season was in that in which he exhibited Mrs. A. T. Miller and Miss Elsie Miller at the Crystal Palace, and Miss Dorothy Oliver at a meeting of the Royal Horticultural Society, the first two receiving First Class Certificates, and the last-named an Award of Merit.

Florists' Workshops and the Factory Act.—It is notified in the current issue of the "Gazette" that the Home Secretary, pursuant to section 3 (3) of the Rules Publication Act, 1893, made on the 13th inst. an Order under section 59 of the Factory and Workshop Act, 1901, rescinding as from January 1 next, the Order made by him on October 13, 1908, granting a special exception to florists' workshops under section 46 of the said Act and so much of the Order made by him on October 13, 1908, granting a special exception under section 45 of the said Act, as relates to florists' workshops.

Presentation to Mr. James Grieve.—A few evenings since a large and representative company of nurserymen and gardeners assembled at the Royal British Hotel, Edinburgh, to do honour to Mr. James Grieve, of the Redbraes Nursery on the completion of 50 years' activity as a nurseryman in Edinburgh. Mr. James Whytock, Dalkeith, presided with his customary ability. A testimonial was presented to Mr. Grieve by Mr. D. W. Thomson on behalf of the subscribers, this consisting of a gold watch and chain and a purse of £50. In making the presentation Mr. Thomson referred to the splendid work Mr. Grieve had accomplished in the course of his long and active life, and to the high esteem in which he was held by horticulturists generally. Mr. Grieve, who received a hearty reception, suitably acknowledged the honour done him. A few months since we gave a portrait of Mr. Grieve and a brief sketch of his work.

Movement of Plants.—At the monthly meeting of the Sheffield Microscopical Society a very interesting lecture on the "Movements of Plants" was given by Mr. A. W. Bartlett, of the Sheffield University. He said the growth of plants was affected by gravity and light. Many plants had by habit a climbing growth. This was of great advantage to them because they were able to reach the same height as trees and shrubs and so expose their leaves to the sun, and their flowers to the activities of insects. Various plants had totally different ways of climbing, that of the hop being the most peculiar. That plant for a certain period grew straight up from the ground. Afterwards the top of the stem bent in a horizontal position, and revolved three or four times each day. Some plants moved in a certain direction, like the hands of a clock; others moved in an entirely different direction. Climbing plants were only able to climb upright, or nearly upright, objects. That was to their advantage, as they always climbed towards the light and sun. Leaves also were partly acted upon by gravity and partly by light.

The National Rose Society will next year hold its provincial show at Salisbury, on Wednesday, July 13. Unfortunately, it will, in some degree, clash with the Wolverhampton Flower Show, at which roses are usually well represented, but we understand that the local conditions rendered the holding of the show on the date fixed necessary.

"**Botanical Magazine.**"—The issue for the current month contains coloured illustrations of the following plants: Parthenocissus tricuspidata, which is our old friend Ampelopsis Veitchi, or A. Veitchi, under a new generic name; Asparagus tetragonus, a South African species, which thrives in the temperate house at Kew, and has been found useful for training up pillars in the greenhouse and conservatory; Prunus maritima, a distinct species, which grows freely on the sands of the Atlantic seashore from New Brunswick to Virginia, U.S.A., and should be useful for planting on the sea coast in this country; Opuntia imbricata, an interesting Mexican species, with cylindrical growths and bright rose-coloured flowers; and Euryops virgineus, a South African species, which was first introduced to this country as far back as 1821. It forms a neat shrub, ranging from one to two feet high, and produces a profusion of bright yellow flowers.

The Gardening Year Book for 1910, as already mentioned in these pages, has been published within the last seven days, and we again refer to the fact for the purpose of saying that the demands upon the publishers have been such as to show that the popularity of the book continues in an upward direction. The continued increase in an annual publication that has reached its fifty-second year is of much interest as evidence of the care that is taken to keep the immense amount of information it contains fully abreast of the times; and to add from time to time such new features as are likely to add to its interest and usefulness. As in previous years, "A Year's Work in the Garden" is described in a series of monthly chapters, and a page of ruled paper is provided in each month for memoranda relating to the garden. New plants, orchids, flowers, fruits, and vegetables are concisely described and many are illustrated. The chapters on hardy border flowers, conservatory plants, fruits, and vegetables afford the fullest information on the selecting of the finest kinds and growing them to the highest degree of perfection. The chapters on insect pests and fungoid diseases afford much information on the identification and life history of the many enemies of plant life and the best means of combating them. To those who are interested in horticultural societies and public parks the directories of these will be of much value, for they are full and trustworthy. The book, neatly bound, is published by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C., and the price is 1s. net, or post free, 1s. 3d.

New Botanical Laboratories at the University College, Gower Street, were formally opened on the 16th inst. by Dr. D. H. Scott, who was received in the Flaxman Gallery by Professor J. W. Hill, Lord Reay, and others. After having been conducted through the laboratories, Dr. Scott proceeded to the botanical lecture room, and delivered an address having special reference to the botanical work at University College. He said that botany at that college had always been regarded as equal in importance to other sciences, and the foundation of the botanical department dated from the foundation of the college itself. The first elected professor was Sir W. Hooker, and the first acting professor was John Lindley, who was succeeded by Professor Daniel Oliver, who in turn was succeeded by the present holder of this office, his son Professor F. W. Oliver. Dr. Scott referred to his own association with the college, and, after directing attention to the wide range covered by botanical studies at the present day, concluded by formally declaring the new laboratories open for use. The new department of botany compares favourably with the old one, especially in regard to compactness and the excellent lighting of the series of large working rooms on the side facing north. In all there are fifteen rooms in the department, and on the south side of the corridor there are elementary and advanced laboratories, each seating forty students, a research room for original investigations, especially in anatomical and microscopic work, and a chemical physiology room, with benches for twenty-four workers; while on the north side are the departmental library, the apse room which is to be used as an herbarium and ecology room, a central store for material of all sorts, with a small greenhouse beyond, and an attendant's room and workshop.

Woodford Horticultural Society has had a very successful year. At the recent annual dinner, over which Mr. J. Gurney Fowler, J.P., presided, Councillor S. J. Hann stated that the society commenced the year's work with £153 in hand, and completed it with a balance of £187. It would be an immense advantage were the majority of local horticultural societies in so satisfactory a financial condition as the Woodford Society.

New Seed Catalogues.—The new seed catalogues for 1910 are beginning to arrive, and in another week or so we shall be almost inundated with them. They are of all sizes, shapes, and thicknesses, variously arranged and illustrated, and all are of more or less interest. The leading firms are usually the first in the field, and the catalogues of Messrs. Sutton and Sons, Reading; Messrs. James Veitch and Sons, Chelsea; Messrs. E. Webb and Sons, Stourbridge; Messrs. Dicksons, Chester; and Messrs. Dickson and Robinson, Manchester, all arrived well in advance of the Christmas festivities.

"**Journal" of the Board o Agriculture.**—The issue for the current month is devoted almost exclusively to agricultural matters, and contains much that is of interest to those engaged in the work of the farm. Of the articles deserving of special attention mention may be made of those dealing with pig keeping, wild white clover, the lapwing or plover, British crops of the current year, and agricultural instruction at Oxford.

Single White Banksian Rose.—Mr. E. H. Woodall contributes the following interesting note on the single white Banksian rose to the current issue of the Journal of the Royal Horticultural Society. "A curious fact concerning the Banksian rose has this year come to light. The double white form of Rosa Banksiae was introduced to Kew in the early part of the nineteenth century, in 1815, but William Kerr, according to a note in the "Botanical Register," had it in cultivation as early as

1807. The double yellow was introduced some years later, and the single yellow only made its appearance about 1870. The typical form, the single white, remained unknown, though many inquiries were made for it in France, where these climbing roses abound in every garden in the Riviera, as well as in Italy and Switzerland. Four years ago I found a rose growing on the wall of Megginch Castle, Strathtay, Scotland, which seemed to me a very slender-growing form of R. Banksiae. Captain Drummond, of Megginch, told me it was a rose that his ancestor, Robert Drummond, had brought with other plants from China the year his brother, Admiral Sir W. Drummond, had cruised in the China seas, in 1796. This old rose had been repeatedly cut to the ground by severe winters, and rarely if ever had been known to flower. The impression, however, was that it was white and very small. Captain Drummond kindly gave me cuttings, which I took to Nice, and this year they flowered, proving themselves to be the typical single white Banksian rose so long sought for and hidden away in this nook of Scotland for more than a hundred years. The introduction of the Banksian rose, therefore, is due to Robert Drummond, of Megginch, who brought it from China in the year 1796."

Bishops Stortford Horticultural Society.—At the adjourned annual meeting of this society, Mr. G. Sheeter was elected president, Mr. W. Smith chairman and vice-president, Mr. J. L. Glasscock chairman of committee, and Mr. F. Glasscock vice-chairman.

The Harry Veitch Portrait.—The Rev. W. Wilks and Mr. H. B. May write: We have the pleasure to inform you that the response to our suggestion was so liberal that we have been enabled not only to have the portrait of Mr. Harry J. Veitch painted by the eminent artist Mr. Hugh G. Riviére, but are also able to present to Mrs. Veitch a replica of it by the artist's own hand, and a photogravure of it to every subscriber. The portrait will be hung for inspection in the great hall of the Royal Horticultural Society, Vincent Square, S.W., on Tuesday, January 25, 1910, and the replica will be presented to Mrs. Veitch at a small dinner, to be held on the same evening.

R.H.S. Journal. — Part II. of Volume XXXV. of the Journal of the Royal Horticultural Society has been published, and is remarkable for its interest. The more important of the contributions include "Rock Gardens," by Mr. R. Lloyd Praeger; "British Pansies," by Mr. E. Drabble; "Water Plants," by Mr. F. W. Moore; "Some Lessons from Alpine Plants," by Mr. A. Chilton Brock; "Bees in Relation to Gardening," by Mr. W. F. Reid; and "The Gardens of Lake Como," by Mr. J. Hudson. The issue also contains the reports on the trials of cabbages and lettuces at Wisley, and descriptions by Mr. F. J. Chittenden of a disease of Lavatera trimestris and of antirrhinum.

Checkmating the Asparagus Beetle.—The asparagus beetle (Crioceris asparagi) annually does much damage to the asparagus plant in various parts of the United Kingdom, and it is therefore a matter of considerable importance that cultivators should be acquainted with the best methods of checking its ravages. Dr. F. H. Chittenden, of the United States Bureau of Entomology, reports an experiment which shows that arsenate of lead may be used with success in combating the beetle. A mixture was prepared with arsenate of lead and water, the proportions being 1lb. of the former to 20 gallons of the latter, and the plants were thoroughly sprayed with it. Most of the larvæ were destroyed, and to rid the beds of those which escaped, and others that developed within the next few days, a second application was made a week later. For this the spraying mixture was used rather stronger by reducing the water to 15 gallons, while the quantity of arsenate of lead was the same. The asparagus did not appear to have been injured by either spraying, although the growths were thoroughly saturated. In a second experiment but few dead larvæ could be found after one thorough spraying. Subsequent sprayings were, however, found necessary, as beetles came from neighbouring gardens while the growing plants presented fresh unsprayed foliage for the pests to live upon.

CHOICE VEGETABLES FOR WINTER USE.

During the dull winter months, when the weather is cold, there is not much choice of outside vegetables, therefore recourse must be had to artificial means of production; usually there is not much difficulty in keeping up a supply of peas, French beans, globe artichokes, and other tender kinds till the middle of November, in favourable seasons, without the aid of fire heat, but after that date it is seldom that any of the above-named are procurable unless there be an unlimited quantity of pits at command, therefore where a constant supply of such things are needed preparations must be made in advance.

French Beans.

French beans that were sown a couple of months ago will now be coming into bearing, and will succeed those sown in pits during August and the early part of September. There is not much difficulty in growing French beans where nice, light, well-heated pits are at command, but where one has to depend on growing them in pots in makeshift places they seldom pay for the trouble bestowed on them during the short days of November, December, and January, but as the days lengthen they grow more robust, and will set their flowers more freely, and on that account are more to be relied upon. Where the family is small, and the requirements are not such as to need special structures set apart for the production of these choice vegetables, there is no necessity to make such elaborate preparations for their growth in advance, but where there is a large establishment to be kept going such things as French beans, asparagus, seakale, and the like are in constant request during the winter and early spring months.

Asparagus.

Asparagus is readily produced, for it only takes a few days from the time the crowns are lifted until the growth is ready for use, provided one can have command of well-heated pits in which a gentle hotbed can be made, but where one has to depend on fermenting material alone to generate the requisite heat to promote a healthy growth the case is different.

To produce nice green tender heads there must be a free circulation of air night and day, and this cannot be maintained when the glass has to be covered at night with mats or other material to keep up the requisite temperature. Those pale, half-blanched heads find but little favour with those who have been accustomed to having nice green tender ones similar to those cut from the open ground during the month of May. To grow sufficient crowns to lift each year for forcing it is necessary to set apart a piece of ground for that purpose, and sufficient seed should be sown to give a supply of plants. Strong crowns are essential, and as these cannot be produced in less than three years some idea of the space required for their growth may be formed by the quantity of roots lifted each season. Bought roots are seldom satisfactory for forcing as these are often lifted a considerable time before being forced, and have, on that account, lost some of their vitality. Where roots can be lifted and transferred directly to the forcing pit the results are generally more to be relied upon. Having prepared the bed for the reception of the crowns the roots should be spread out evenly over the surface, and covered with about four inches of fine soil; when this is completed give a liberal watering, and close the pit entirely until growth commences, after which there should be a circulation of air night and day, so long as the temperature does not fall below 55 degrees, but if it can be kept up to 60 degrees so much the better, as this, with a steady bottom heat of about 65 degrees, will ensure an active growth. Should it be found necessary to increase the temperature this can readily be done, provided the heating apparatus is capable of doing its work, and where forcing to any extent has to be carried on there should be ample means provided. In case of severe weather it is well to have sufficient crowns covered with litter, so as to exclude the frost, otherwise they cannot be lifted as they are required.

Seakale.

Roots of seakale may be had at all seasons of the year, for since retarding the crowns has been practised they are procurable at any time. It is, however, seldom that seakale is in demand when there are plenty of fresh green vegetables to be had, and as such kinds as peas, French beans, cauliflowers, and the like may be obtained in May seakale is seldom in request afterwards. It is usually from November through the dull months that this vegetable is in the greatest demand. To grow fine crowns for forcing it is necessary to have fertile land. The most simple way to grow them is to make cuttings of the long fleshy roots, which are broken off when the crowns are lifted. The upper portion being cut horizontally and the lower diagonally, so as to facilitate planting in spring. If these roots are covered with short litter, so as to exclude the frost, the upper end will have callused over by the time the ground is ready for planting them in March. When intended for lifting the sets should be planted in rows about two feet apart, allowing ten inches between the sets. Several growths will be produced from each of these, and when it is seen which is the strongest all but the one should be rubbed off. If the ground has been liberally manured and deeply dug the plants will not require any further aid, with the exception of being kept free from weeds during the early stage of growth, for as the season advances there will be sufficient foliage to cover the ground. After the first severe frost the roots may be lifted and taken to the forcing shed, where a temperature of about 60 degrees can be maintained. As the season advances growth will push more readily, therefore a less quantity can be introduced at shorter intervals. There are several varieties of seakale, but the best we have grown is one named Baddards; this sheds its foliage earlier than the old purple, and for this reason can be lifted sooner, which is an advantage to those who have no means of refrigerating the crowns.

WART DISEASE OF POTATOES.

The Board of Agriculture have addressed the following important letter, dated November 22, to occupiers of land infected with the Wart, or Black Scab, Disease of Potatoes:

I am directed by the Board of Agriculture and Fisheries to inform you that they have for some time past been engaged in investigating the nature of the potato disease, known as Wart Disease, Black Scab, Cauliflower disease, etc., which was present in your potatoes this year, and they have endeavoured to discover some remedy. As you are no doubt anxious to avoid a repetition of the disease among your potatoes, I am directed to send you the following information:

Experiments on wart disease were carried out on behalf of the Board by the staff of the Education Committee of the Lancashire County Council, of the Harper Adams Agricultural College, Shropshire, and of the Holmes Chapel Agricultural College, Cheshire. The experiments were made on infected land at five places. In each experiment tests were made (1) on the effect of possible remedies; (2) on a number of varieties of potato, in order to ascertain whether they did or did not contract disease.

Three possible remedies, viz., sulphur, quicklime, and soot were applied, but in every case they failed. No one of them prevented the crop from being badly diseased. Sulphur was also tried on many allotments and gardens, but in nearly every case without success. It is possible that in another season better results might be obtained, but it is clear from the experience of 1909 that when ground is infected, the use of sulphur, lime, or soot, cannot be relied upon to save potatoes from wart disease.

The trials with varieties were more successful. The following sorts were tested and were found to be attacked by wart disease: Up-to-Date, Northern Star, King Edward VII., Eldorado, Royal Kidney, British Queen, Talisman, Epicure, Sharpe's Express, May Queen, Ninetyfold. All were badly affected, though some were worse than others.

The following sorts were tested and were found to be not attacked by wart disease: Langworthy, What's Wanted, Golden Wonder, Sutton's Abundance, Findlay's Conquest, and (?) Snowdrop.

Snowdrop was not grown at all the centres. It was found that the stock of this potato was not true, a kidney form (probably true stock) was quite free from disease, but an oval form was diseased. In many cases information has reached the Board that Snowdrop is free from wart disease, and in other cases disease has been reported. This variety should therefore be regarded with suspicion. True stocks are probably safe, but there would seem to be some difficulty in securing Snowdrop potatoes true to type.

Traces of disease were found on one or two plants of Abundance and Conquest at one centre, but it is possible that the affected plants were "rogues," for not a trace of disease was found on these varieties at other centres, although growing on soil on which almost every plant of Up-to-Date was diseased.

No trace of disease was seen on Langworthy, What's Wanted, and Golden Wonder. These three sorts all belong to a type of potato formerly well known as Clarke's Maincrop. The first two are much alike; the third is a brown skinned potato of good quality grown in some parts of Scotland, but not yet common.

Of the various sorts which were not affected by disease, Conquest and Snowdrop are early, and others late in ripening.

Growers who have infected soil should procure seed of one of the sorts that do not contract disease. Conquest would probably prove best for early use, and Langworthy as a late or field potato.

This letter is being sent to you before the information is made public, in order that you may at once take steps to purchase the seed you require for next year.

Growers, where land is infected, should avoid not only Up-to-Date, but all varieties of the same class, that is, varieties having the same kind of haulm and flower, such as Factor, Table Talk, Dalhousie, Highlander, Mayfield Blossom, Duchess of Cornwall, Hero; they should similarly avoid potatoes of the same type as British Queen, Royal Kidney, or any other of the affected varieties.

The importance of following this advice cannot be too strongly insisted upon. Wart disease is not very widely spread in Great Britain, but it is very bad in allotments and gardens in most places where it has appeared. No ordinary crop is liable to be attacked by it except the potato, and if everyone plants, either disease-resisting varieties of the potato, or some other crop on his holding, it is likely that the disease will die a natural death and disappear. But it must be borne in mind that to secure this, no potatoes that are liable to attack should be planted in infected ground for many years.

T. H. ELLIOTT,
Secretary.

A WONDERFUL GROUP OF CYPRIPEDIUMS.

I have on many occasions referred in the GARDENERS' MAGAZINE to the value of winter-flowering cypripediums for cultivation in the neighbourhood of large towns and in smoky manufacturing districts, but I never felt this claim to be so great as I did at the Manchester and North of England Orchid Society's meeting held in the Coal Exchange, Manchester, on December 16.

Some dozen or more groups of orchids were exhibited, and many of these consisted wholly of cypripediums. There were exhibits from amateurs who do not employ a gardener as well as from the prominent growers, such as Mr. O. O. Wrigley, of Bury, who had some hundreds of flowers displayed in a tastefully-arranged group. But it was to the remarkable group of cypripediums sent from the collection of Samuel Gratrix, Esq., West Point, Whalley Range, Manchester (gardener, Mr. G. Shill), that my attention was particularly directed. In all my experience I have never seen such a quantity of remarkably choice kinds displayed together, and the society's gold medal was never more deservedly given than on this occasion.

To enumerate the whole of these good things would occupy more space than would be convenient for a note of this description, but as I hope to make a future reference to this remarkable collection, I will only here mention a few of the most notable kinds. There were C. The Lion (recently figured in "G. M."), C. Beryl (Mrs. Mostyn x C. Beckmanni), C. Eboracum and the var. C. E. West Point variety, which is more densely spotted and of better form than the typical variety; C. F. W. Ashton, C. Thalia gigantea, C. Thalia Mrs. Frances Wellesley, and C. Thalia West Point variety, the latter as displayed being superior to the two first-mentioned varieties of C. Thalia; and C. villosum Mrs. Cary Batten, a most remarkable form.

C. aureum Golden Glow was another remarkable variety. The C. insignes included C. i. Bohnoffiana, C. i. Salletense giganteum, and C. i. Sanderæ. The most distinct among the C. Leeanums were C. L. Carona and C. L. Gratrixiæ. C. A. J. Balfour, C. Falshawiensis, C. Ursula, C. St. Albans, C. Miss Cann, C. Germain Opoix, C. San-acderæ Cockson's var., C. Eve, and several forms of C. Hera were all shown, and these names will serve to indicate the high quality of the exhibit.

The whole of the plants were well grown, and the flowers fine in substance, reflecting the greatest credit upon Mr. Shill's ability in producing, even under unfavourable atmospheric conditions, flowers of such quality that they were the envy of all.

Oakwood Gardens. H. J. CHAPMAN.

ITALIAN GARDENS.

The issue of the GARDENERS' MAGAZINE for October 30 was particularly interesting to me, as it contained four magnificent views of celebrated Italian gardens and a very instructive article thereon by Mr. C. T. Druery. There is small wonder that fair and sunny Italy should be so much to the front with its gardens when it takes such a leading place in the countries of Europe in regard to pictures by the great masters, most of them Italians; with its architecture, as exhibited by its splendid cathedrals, such as St. Peter's, Rome, and the famous structure at Milan; with its music, as represented by the most famous operas ever composed; and with its sculpture, which is incomparable.

The first thought that suggests itself on looking at the splendid views is the tremendous cost in labour and material to produce such lovely gardens.

In laying out the gardens illustrated, the principle of "this will be near enough" or "that will do," never obtained. "Near enough" would not do. What a lesson for us to emulate in our British gardens. I am perhaps personally more interested in this subject because, at one etsablishment in which I served there is a large Italian garden, a copy of one of the celebrated gardens of Italy. The cost for stone work was very heavy, and every detail was worked out with marvellous accuracy. The fact that most of the celebrated gardens of Italy date from the 15th and 16th centuries, demonstrates the fact that the work was done well. The ponds for water were well made, regardless of expense, and the stone work has withstood the test of time.

A lesson we may learn from these, perhaps to us somewhat formal gardens, is that in such gardens neatness and tidiness must prevail, for the whole appearance would be entirely spoiled if disorder prevailed. Mr. Druery has told us that probably the number of such splendid gardens in Italy is not more than 200 all told. Only fancy! two hundred of these splendid gardens! What a vast sum of money must have been expended on them. It is rather remarkable that there seems to be a paucity of landscape gardeners in the present twentieth century, and it is rather a sad thought that we must copy fifteenth and sixteenth century gardens. During the 19th century only four or five great landscape gardeners made a lasting name in Britain, but I sometimes think that lack of funds to carry out the work has cramped the ideas and plans of some of our foremost men in this profession.

No doubt in years long passed by the garden or pleasaunce was more thought of and appreciated than it is to-day, as the tendency was to stay at home and enjoy the pleasures of the garden in close proximity to the dwelling-house. Now, with rapid means of locomotion, visiting different parts of the country is so easy, and there are so many and diverse ways of spending time that the garden from the æsthetic or beautiful point of view is not so much thought of.

The Italian gardens teach us that gardening was a great deal thought of and cared for, and to make our gardens popular now we cannot do better than try to keep them as tidy as possible, and as interesting as we know how, and this can only be done by assiduous and constant attention to every detail of good management.

Cheshire. W. M.

DECEMBER PLUMS.

The last month of the year would not appear to be a good time for a supply of fresh plums for the home garden, and yet there is nothing new or novel in a supply at such a date. December plums may suggest the popular name of Coe's Golden Drop as the supply of such fruit, because it is remembered how adaptable is that variety in the hands of some. Wrapped in soft tissue paper, placed in a cool dry room, they are said to keep for a surprising length of time after they are gathered. Personally, we have failed to gain that pleasant record from a practice so simple, but this, we are assured, was due to the want of a suitable store in which to place these late-gathered plums.

It is true that all seasons are not alike, and, consequently, their influence on late fruit of any kind varies. Thus, while normal summer and autumn weather would aid maturity in tree and crop, one naturally assumes that untoward weather would carry with it an opposite influence. It might be assumed that the summer and autumn of 1909 would be anything but favourable for retarding such a perishable fruit as the plum, yet it has proved favourable, of course, to a limited extent.

Golden Drop has, in defiance of the abnormal weather which we have grown accustomed to this year, had a more than usually prolonged season, but it is not the only variety which has continued. Coe's Late Red, a variety not regarded as of high class, has afforded December supplies. Wall trees having effective shelter from frosts have given us these late supplies this year, and though the cold season hindered the swelling of the fruit to full size, selections could be made both for culinary and dessert use. In the kitchen, possibly, the greater appreciation was shown because of the limitation of the supply from the garden at that time. For this purpose, however, the supply was not limited to this variety, for Wyedale, grown on standard trees, afforded a considerable contribution to the bill of fare, and even after being gathered for some days there was freedom from decay and loss. Except in gardens having a great extent of walls it would not be profitable perhaps to grow either Wyedale or Late Red, the space being fully utilised for other kinds. The greater risks that come from standard trees are sharp frost and heavy gales, but where there is the demand, and the available ground, certainly these are varieties as accommodating as they are dependable.

Ickworth Imperatrice is a plum the modern school of gardeners do not recognise with the same degree of appreciation as obtained in bygone days. Though they were expected to have shrivelled skins when retained for late dessert, the plums were recognised as natural sweetmeats at the table. Heavy supplies and corresponding low prices of grapes have removed these small-sized plums with shrivelled skins from their once favoured and exalted station. Their value now counts only in the matter of variety and extent of the dessert which the garden itself supplies. Grapes, no doubt, are more digestible, but plums are not grapes, nor grapes plums, each have their own peculiarities, and are favoured by varying palates, and the dessert table furnished with both kinds of fruit in December causes critical comment as well as due appreciation from those privileged to sit at it.

It would appear somewhat extraordinary, at any rate to many, that such apparently ungenial weather as we have had should permit of successive gatherings of plums extending to the end of November and the early days of December, when, in other and apparently more favourable autumns, this is so distinctly unavailing.

W. Strugnell.

Rood Ashton Gardens.

APPLE BELLE DE BOSKOOP.

This is an apple suitable alike for table and kitchen use, but it has not yet become as well known as it deserves. It is a large apple, in season from October to February. It has a russety skin, but in good seasons it is handsomely striped. A free bearer, of fine flavour, and making, on the paradise stock, an excellent tree for garden culture, Belle de Boskoop should appeal to amateur cultivators. When in bloom it is a striking object, as the flowers are very large and white. Although 1909 cannot be regarded as a first class apple season, the variety we now figure has been frequently and well shown. Our illustration is from a fruit supplied by Messrs. G. Bunyard and Co., Maidstone.

APPLE BELLE DE BOSKOOP.
As exhibited by Messrs. G. Bunyard and Co.

Tamarisk Manna is, according to Mr. D. Hooper, a substance obtained from Tamarix gallica and T. articulata, but whether produced by insect agency or as a natural secretion of the plant, has not yet been determined. In the extraction of the substance the usual method is to pound the leaves and branches, and it has been found that the saccharine matter contained in the manna is cane sugar.

WHO SHOULD GROW PERPETUAL-FLOWERING CARNATIONS?

The answer to the above question is obviously, "everyone who has a greenhouse," and no self-respecting gardener can hope to be considered as keeping up with modern times who does not cultivate some of these, the choicest gifts of Art and Nature.

Two questions are always asked by prospective growers: Will the carnations grow with other plants, and do they require much heat? As a general rule, I would answer the first question in the affirmative, but would add that, if the requirements of the carnation are made the first consideration, many other subjects will live neighbourly with them. In fact, I have known of cases where Arum lilies, and even roses, have been grown in the same house as perpetual flowering carnations, and very praiseworthy results have followed. Of course, in such cases good results would be the exception, not the rule.

Any greenhouse with a fresh, airy, normal atmosphere, where there is good light, and where a temperature of between 40 and 50 deg. can be maintained, will produce most excellent results. Few are the greenhouses where such conditions cannot be obtained. It is simply a matter of the necessary will being required to find the way.

A house, or even part of the same, filled with carnations, will prove far and away more enjoyable and attractive than a miscellaneous collection, which as a rule rarely pleases. We too often hear the lame excuse, "Oh! carnations won't grow in my district." Such a person undoubtedly lacks the determination of the proverbial Bruce's spider, and that alone is the reason for his not cultivating this glorious plant. The mistaken idea that carnations are more subject to disease than other plants is entirely unfounded, and, when the simple requirements of their culture are more generally understood, we shall hear less mention of disease.

All of us remember how that a few years ago chrysanthemum diseases were the one topic of conversation in the horticultural world; and so much was written about them; but now there is little, if any, mention made of them. Not that the danger of disease is less, but that the prevention of it is better understood. So with perpetual-flowering carnations. Plants grown under healthy, normal conditions do not become affected. Too often we deceive ourselves, like some people who always imagine they are ill, and are perpetually taking medicine for diseases which, in reality, do not exist. So with carnations. The timid way in which their cultivation is undertaken, every spot on the leaves being put down to some awful disease, and causing a fear that the plant will die, is unbecoming to both professional and serious amateur growers.

I will say this, and in following articles prove it, that in any greenhouse where good chrysanthemums or any winter-flowering plant can be grown, perpetual-flowering carnations can be cultivated with success, if their simple requirements are studied.

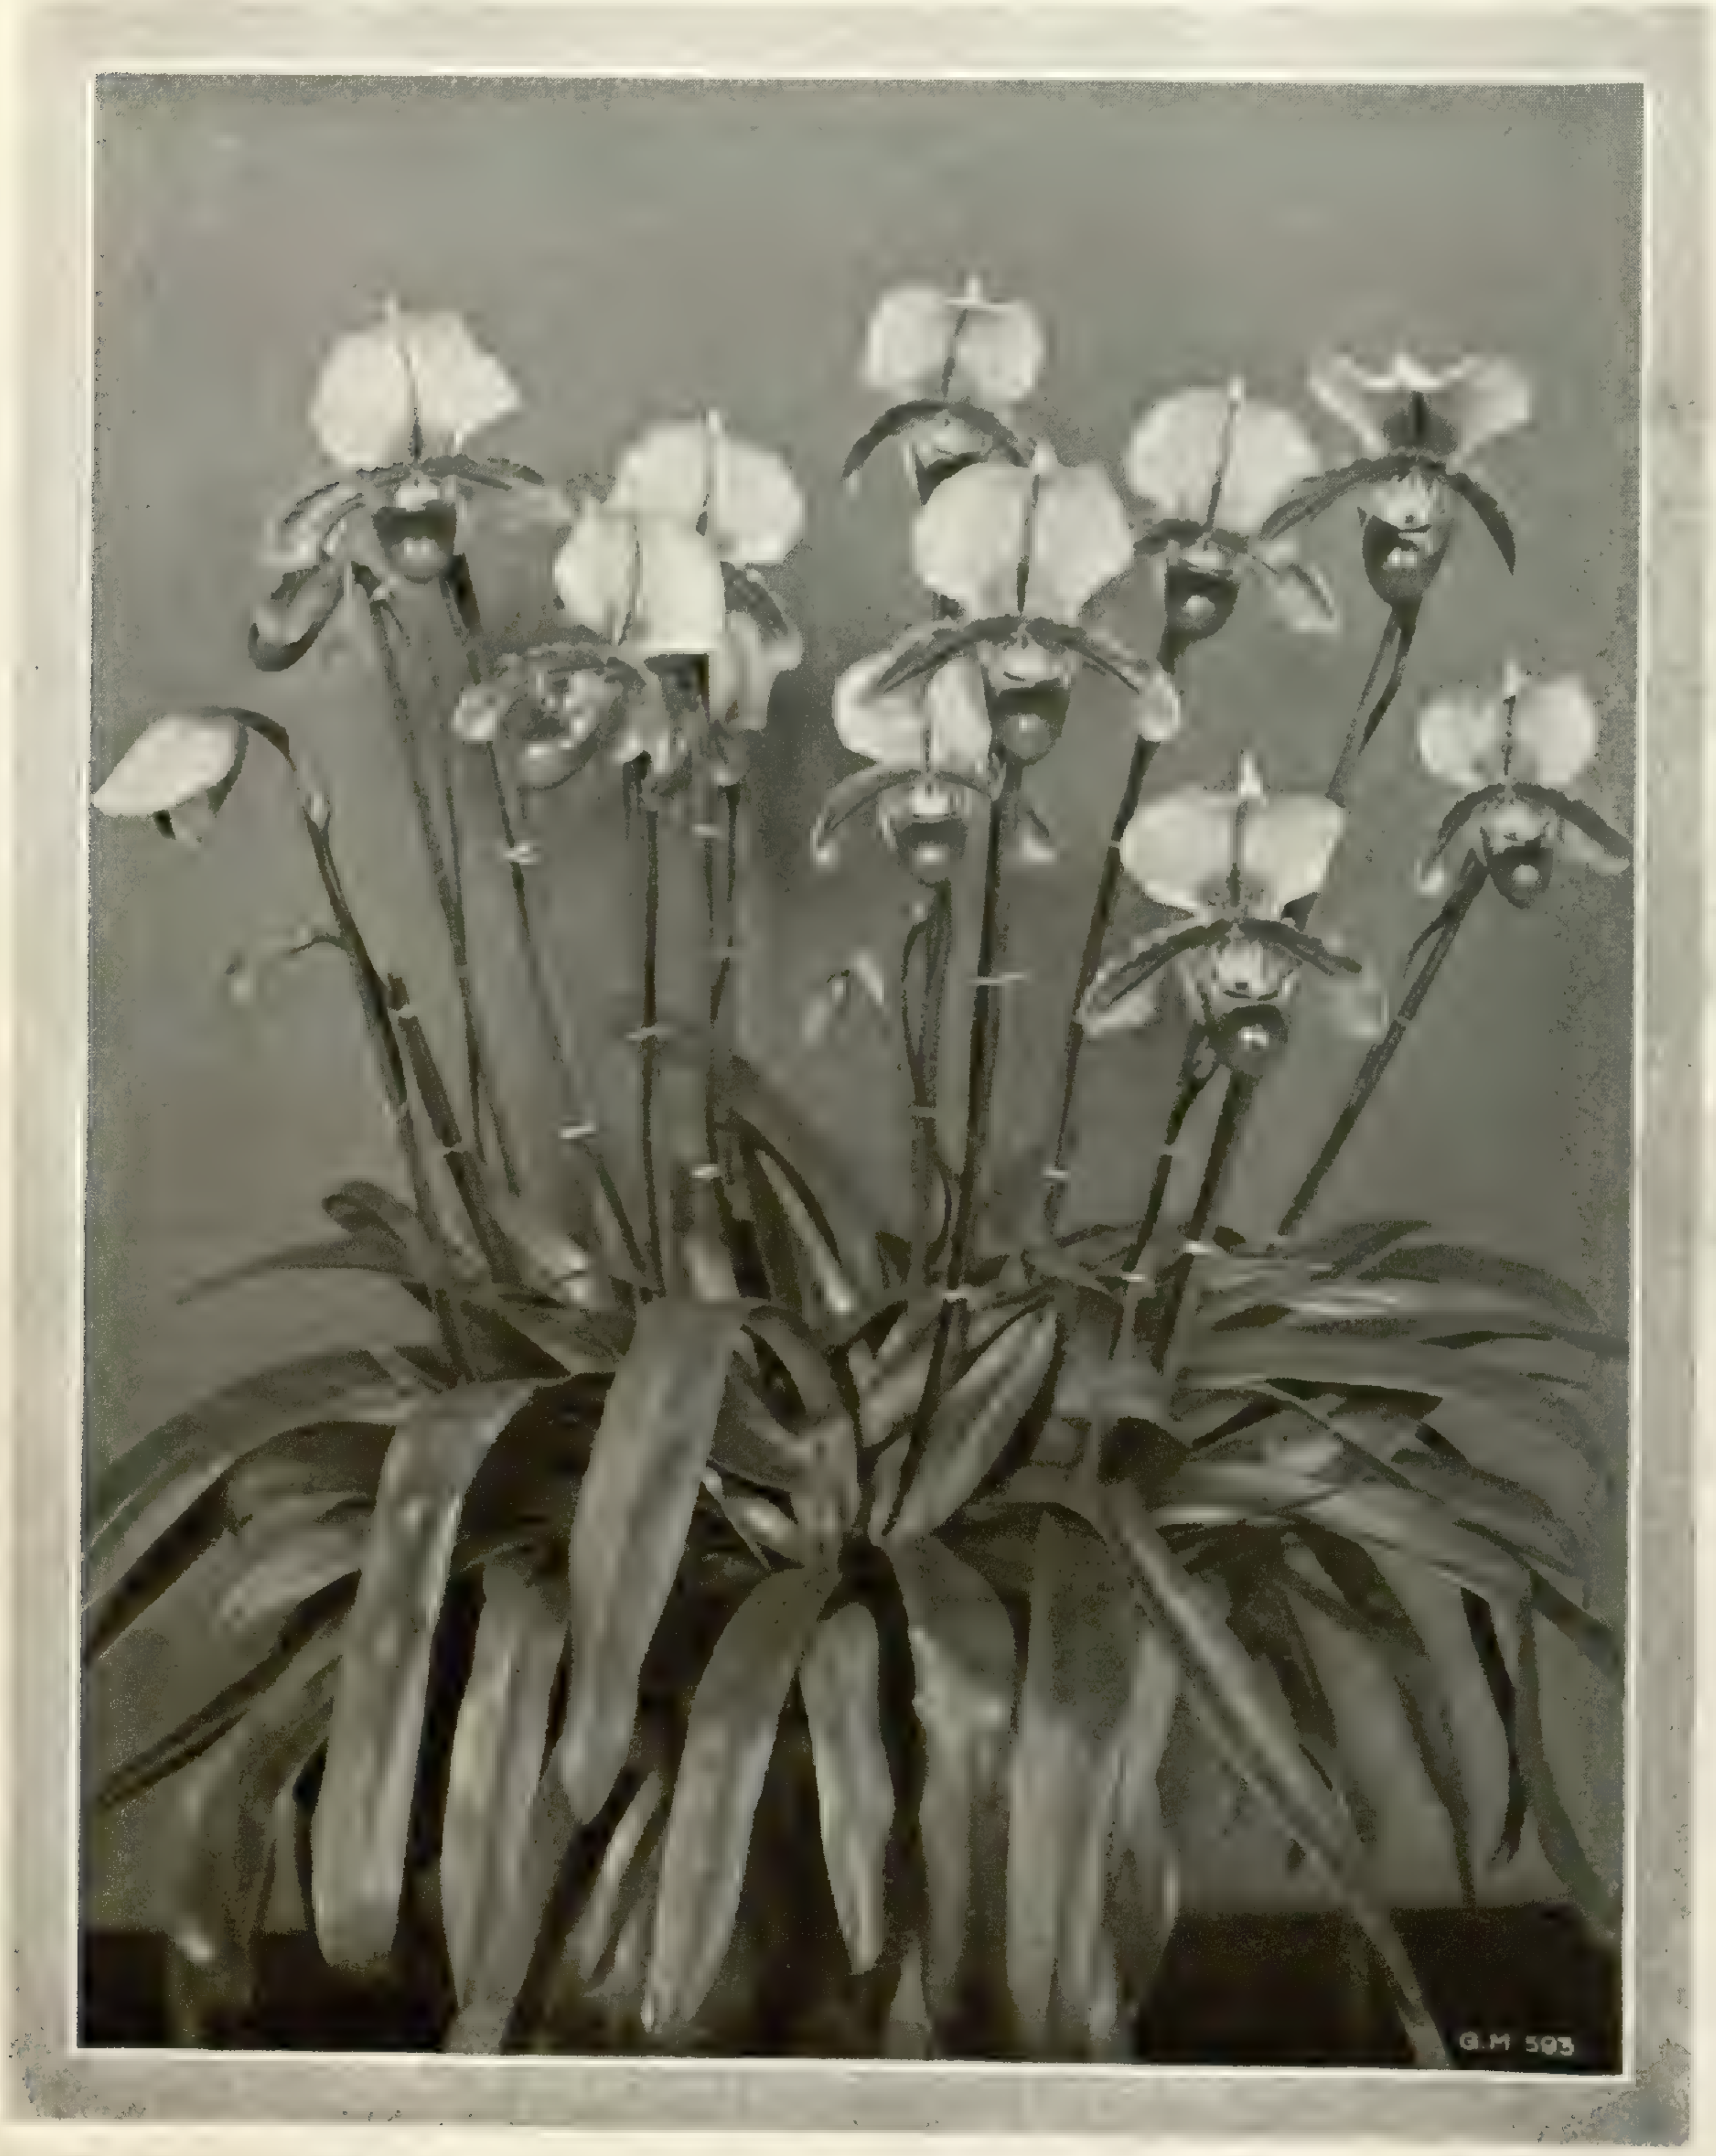
You must not work too much by rule of thumb in the matter of temperature, watering, ventilation, etc., but try to meet the requirements of your own case. For instance, if your house is of heavy structure the light will naturally be bad. To counteract that, you must grow your plants with as much ventilation as possible, and less artificial heat—say 40 deg. at night and from 45 to 50 deg. during the day. You must not stop your plants quite so late, but have them in bud in September, thus producing a continuous crop of flowers all the winter.

On the other hand, I know of establishments where carnation blooms are not required until after the festive season. In such a case the plants would be stopped later, and left in a mildly-heated frame until required to flower.

Why the perpetual-flowering carnation is pre-eminently a plant for the private garden is this: It will produce a succession of choice flowers for nine months out of the twelve. This in itself should commend it. My one desire is to convince readers that this beautiful flower is as indispensable to the greenhouse as the rose is to the flower garden or the potato to the vegetable garden.

Montagu C. Allwood.

LAWNS.—Those who desire to make a new lawn or bowling green, or to renovate and maintain existing ones in good condition, can have no better guide than "Lawns and Greens," by T. W. Sanders, price 1s. net, by post 1s. 2d.; bound in cloth 1s. 6d., by post 1s. 9d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.



A FINE SPECIMEN OF CYPRIPEDIUM LEEANUM VAR. CLINKABERRYANUM.

THE MANURING OF LAWNS.

Lawns in connection with some large private gardens and many public parks are maintained in first-class condition, being treated in a rational manner and with due regard to all requirements. Unfortunately, this state of affairs is not general, and the question how to improve and renovate lawns that have deteriorated and have lost that delightful elasticity which is characteristic of and identified with well-kept swards, is frequently put. There is an erroneous idea prevalent amongst amateurs, and not a few of the rank and file, that manures tend to encourage coarse grasses and weeds at the expense of the finer and legitimate lawn grasses. This is not, however, supported by facts, for while the first-named are deep-rooting, and consequently range far and wide for food and support, the creeping species among the poas and fescues are entirely dependent upon food that exists on, or very near to, the surface.

It is easily understood that the cutting and removal of the grass each week and at times more frequently during some eight months of the year, cannot but impoverish the soil, and while no one would dream of expecting good results or a satisfactory crop in other directions without annual dressings of manure, the necessity for such dressings is often ignored entirely as regards the lawn. It is quite true that where the natural soil is a good loam, and retentive, or similar material has been added in the formation of the lawn, no appreciable difference will be detected for a year or two, even in the absence of manure, and this fact proves a great stumbling block to many.

Artificial manures are found to do all that is required on loamy soils, but must be supplemented by dressings of short manure, which should be passed through the screen in dealing with sandy and porous ground. This should be applied immediately after the mowing is completed for the season, and if well brushed in, and washed by rains, the material is speedily lost to view. Nitrogenous manures are known to encourage the grasses and to depress the clover; therefore, dressings with sulphate of ammonia should not be given at a very early date, otherwise valuable material is wasted, for being readily soluble, it is soon carried away into the subsoil, and altogether beyond the reach of the plants it is intended to benefit. Hence the importance of very small and frequent applications dating from the time of resumed activity. I have seen as much as two ounces per square yard being applied, but experience has taught me that it is preferable to employ only one-third of that quantity at intervals of a fortnight and during or following closely upon showery weather.

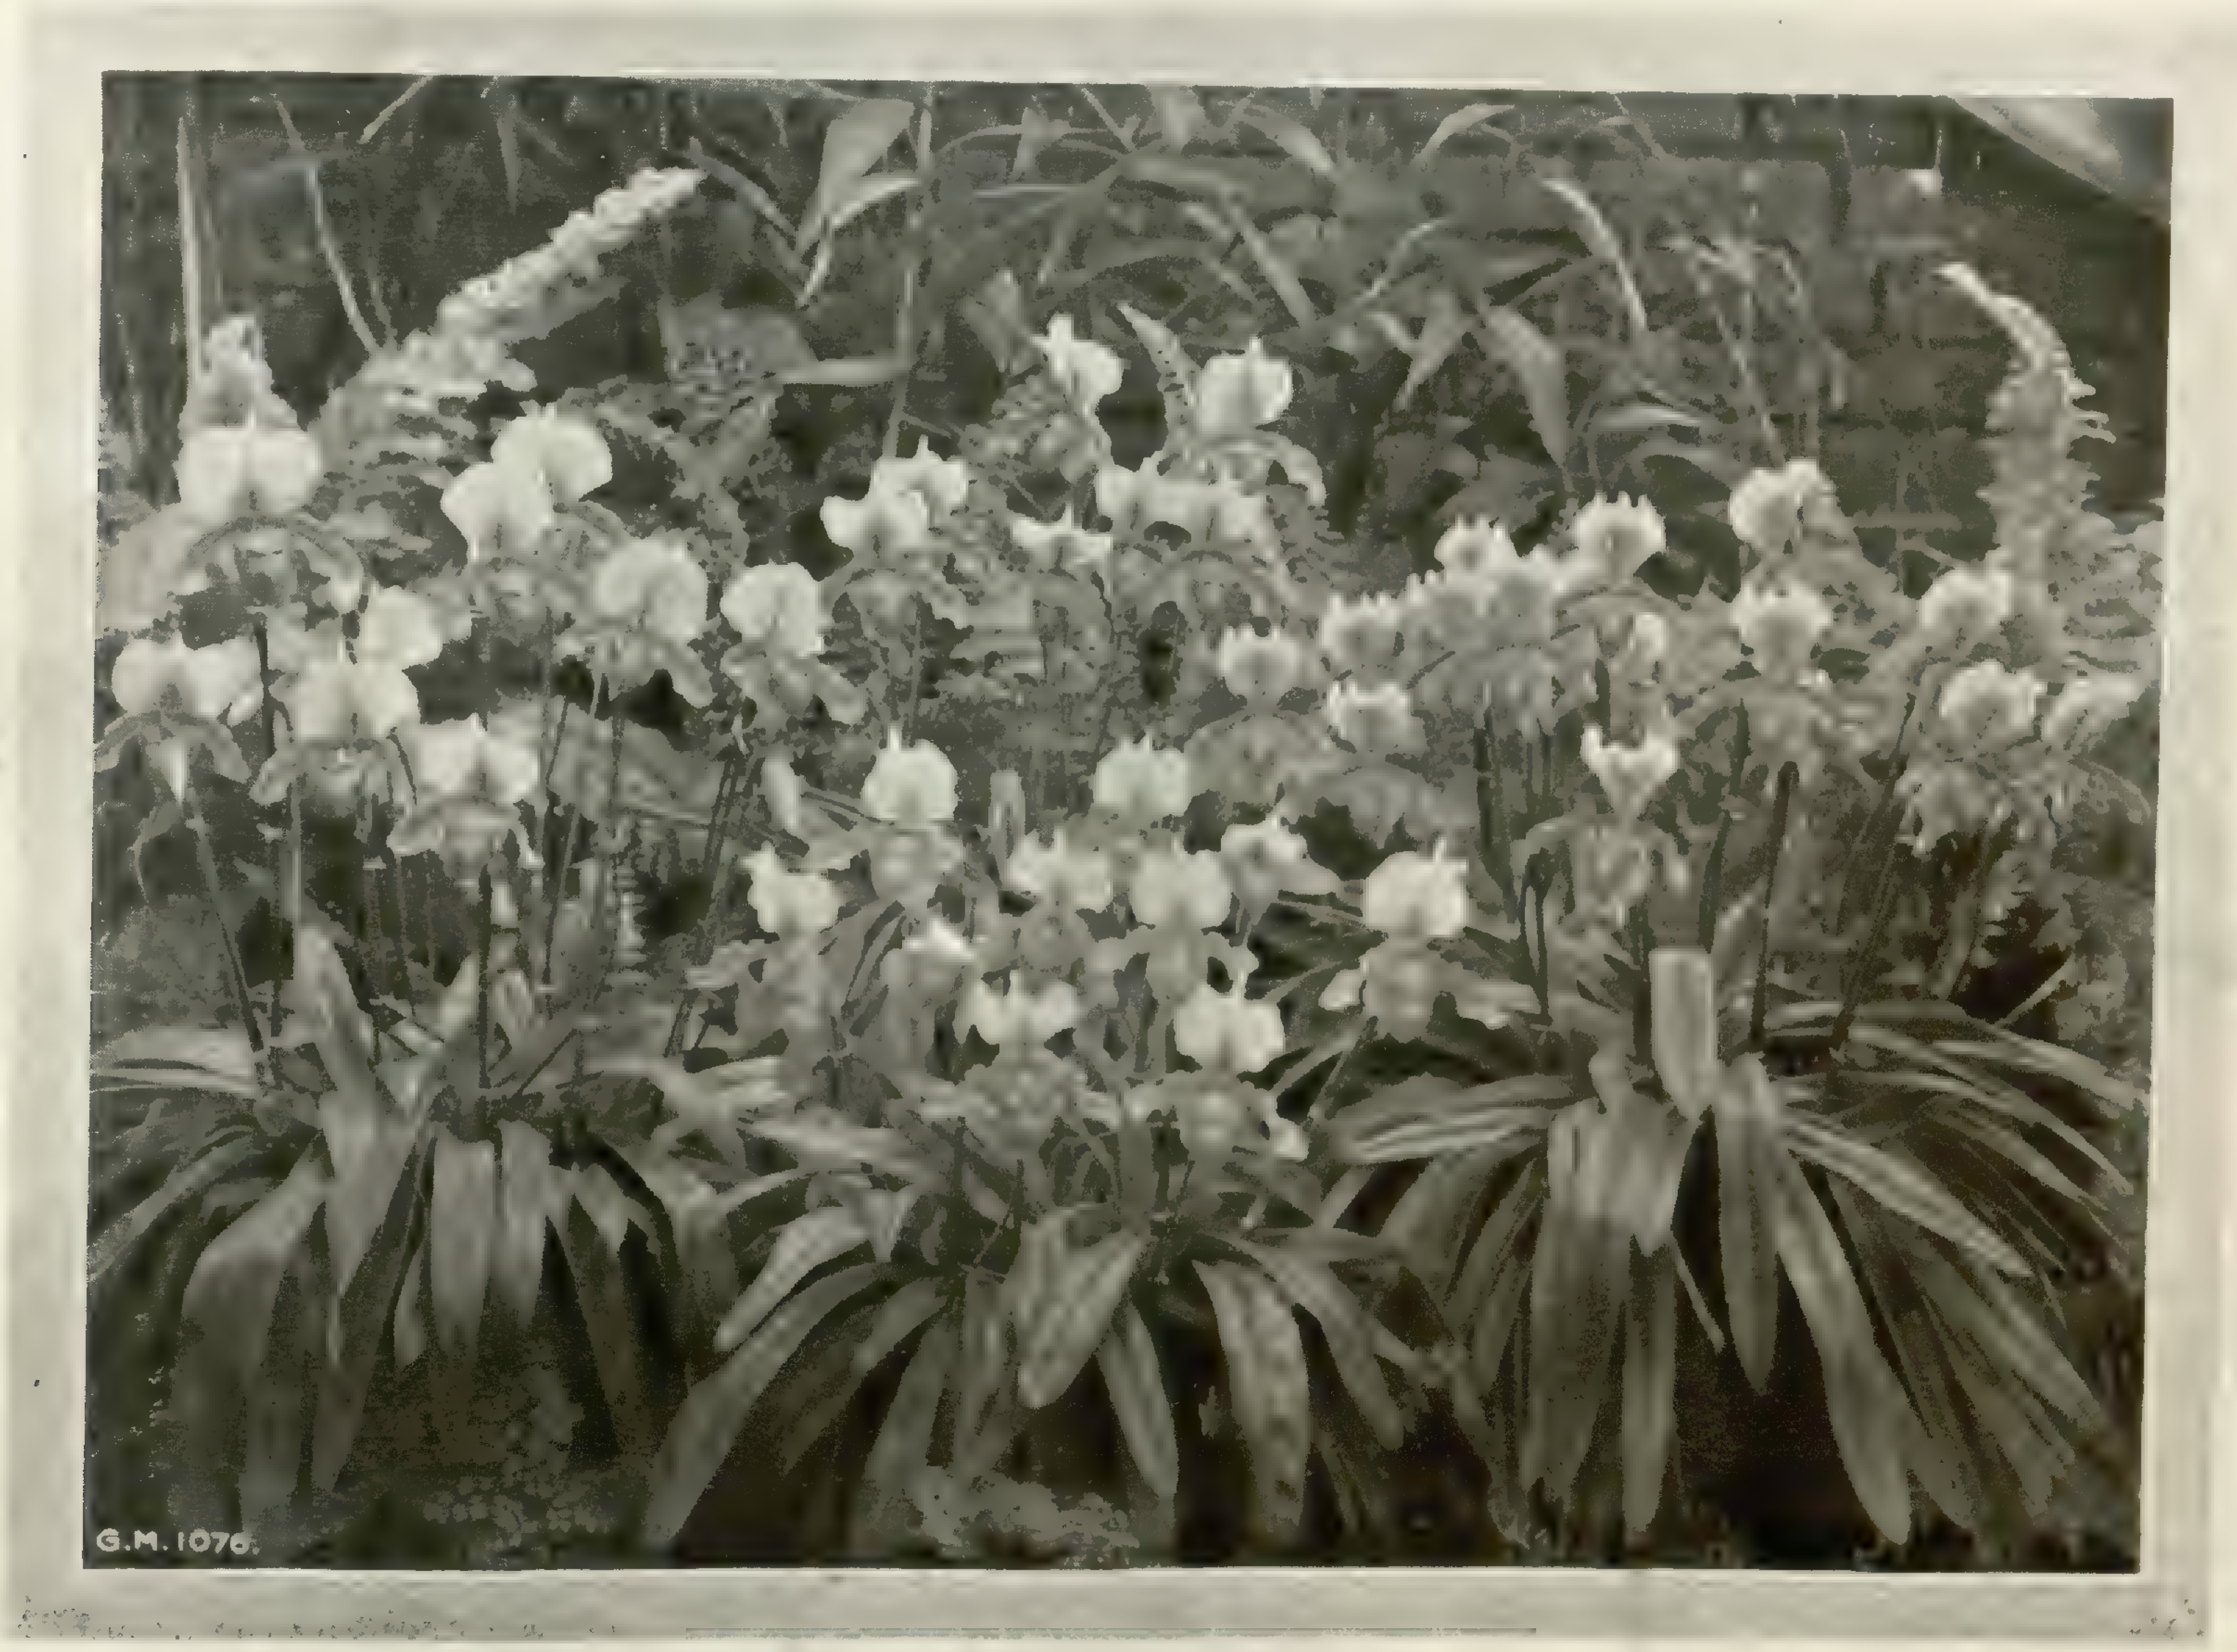
Sulphate of potash is an excellent stimulant, and, as it is not assimilable as plant food for some time after application, late autumn is a suitable time to apply it. Chimney soot and lime are both of great value upon low-lying and damp ground. In some instances the lawn suffers from improper, or an absence of, drainage, and under these conditions, it will be a constant source of trouble and anxiety, and the finer and desirable grasses refuse to thrive and die off in patches. But if the work and expense in connection with efficient drainage is too serious an undertaking, I would advise that light and frequent dressings of lime and soot mixed be applied from time to time throughout the autumn, winter, and spring. Its effects are very beneficial and most pronounced.

Bermondsey. Walter H. Aggett.

WINTER-FLOWERING CYPRIPEDIUMS.

After the chrysanthemums have passed away in all but the larger establishments, and before forced bulbs and shrubs have become general, few subjects, if any, are so valuable and delightfully interesting as the winter-flowering cypripediums. Taking only those that succeed in a comparatively cool house, where the winter temperature ranges at about 50 degrees, descending to 45 degrees perhaps on a few rare occasions when the weather is very bitter, but rising to 60 degrees and upwards when the sun shines and the wind is not keen, there is a host of varieties and hybrids to select from, and the interest can be maintained at a small cost from November to March.

Of course, Cypripedium insigne will form the basis of the collection, no matter how large or how select, for even though the ordinary type be ruled out of order, there will be a selection of named varieties (I believe there are nearly two hundred varieties now, so that we may look forward to a National Cypripedium insigne Society), that will include some of the beautiful yellow and almost spotless forms, such as C. i. Sanderæ, C. i. Sanderiana, C. i. Ernesti, C. i. Youngiana, etc. Then, too, there will be examples of C. Leeanum, the insigne-Spicerianum hybrid that is now represented by many varieties, of which C. L. magnificum, C. L. superbum, and C. L. Clinkaberryanum are excellent. C. Tityus, C. Euryides, C. œnanthum superbum, C. Actæus, C. Milo, C. Hitchinsiæ, C. nitens, and C. Prospero are a few of the other hybrids to be obtained at a reasonable price for flowering during the dreary months of the year.



WINTER-FLOWERING CYPRIPEDIUMS.
Varieties of C. insigne and C. Leeanum, grown by Mr. H. J. Chapman, at Oakwood, Wylam, the residence of Mrs. Norman C. Cookson.

The flowers of all these cypripediums last a long time in good condition, remaining in beauty for four or six weeks, and even longer in some cases. For personal adornment there is hardly a flower that lasts so well as one of these cool cypripediums; if carefully handled, it may be worn to church on two successive Sundays and to business each day between, if put in water on reaching and returning from the office. An amateur with a small glasshouse could scarcely do better than make a hobby of these lady's slipper orchids, as he will find them of surpassing interest and usefulness, and capable of yielding far more pleasure than a collection of varied plants, composed of half-dozens of many kinds and varieties.

C. H. C.

VINES AT REST.

Though during the vine's season of rest its cultural needs are comparatively few, and, possibly, to some of its cultivators, uninteresting also, there are, all the same, some very important items to be considered, which, if neglected, more or less impairs the plant's vitality, in accordance with the degree to which the neglect is allowed to extend.

Owing to the natural appearance of a vine throughout its dormant season the inexperienced cultivator in particular is liable to overlook the necessity of proper attention; to give but one example, it is by no means an uncommon thing to observe pruning being left undone until an untimely date, with the result that the vines suffer. It has occurred to me that a few notes upon this subject may prove useful to some readers of the GARDENERS' MAGAZINE; especially to amateurs and the younger members of the craft.

In all cases, provided the vines are cleared of fruit, pruning should take place as soon as the leaves fall, as the sap will be then entirely concentrated upon the vines' requirements for next season, and none be wasted (as in the case when late pruning is practised) upon wood and buds that are to be cut away, or, as sometimes happens, for a "bleeding." In the case of vines that provide late crops the fruit should be gathered and stored in the grape room by the end of December, and even in the case of earlier houses it is better, after the leaves have matured, to relieve the vines of any remaining fruit, rather than leave the fruit to sap the vines' energies, and also deprive them of the benefit of a long perfect rest.

The temperature is again of considerable importance, and should be kept at a low degree, the ventilators being left fully opened both by night and by day when the weather is mild, and closed only during spells of severe weather, for moderate degrees of frost are harmless to vines during their resting period. Much mischief may be easily, and unwittingly done in cases where tender plants are wintered in vineries, by artificial heat being injudiciously employed with a view to safeguard the plants during severe weather. By this means the vines are excited, and the buds swell, and subsequently, under altered conditions of weather, when the houses are again opened, the vines receive a rude check.

Obviously, inactivity of growth, lack of leaf respiration and evaporation, decrease of sun power, etc., the vines' demand for root moisture is small during its season of rest, compared to that required in the time when growth is active, but at the same time the borders should be kept moist throughout. Inside borders, especially those of late vineries, which have been left unwatered for weeks for the sake of the better keeping of the fruit, should, as soon as the fruit is gathered, receive attention in this respect.

T. COOMBER.

The Hendre Gardens.

THE MAIDENHAIR TREE.

Although sparingly represented in the gardens of this country, Ginkgo biloba, or, as popularly designated, the maidenhair tree, is one of the most beautiful of the many ornamental trees at the command of the planter, and it is unsurpassed in interest, as one of the connecting links between the conifers of past ages and those which now clothe large areas of the earth's surface. At present the ginkgo is known only as a native of China, but in the earlier periods of the history of the crust of the earth it had a much wider range, and the genus was not then, as at the present time, limited to one species, but contained several. In the remarkable coalfield of Vancouver Island, which, as Dawson observes, was formed before the Rocky Mountains or the Himalayas had reared their giant peaks and ridges, there are remains of Ginkgo biloba, and other members of the genus. Therefore, the tree takes us back to the time when the cycads and conifers were growing in close association, and the giant reptiles, iguanodon and hadrasaurus roamed over the face of the earth, feeding upon the leaves and fruits of such trees as flourished in those parts specially suited to their habits. It is a matter of something more than passing interest that the ginkgo so plentiful in the Meozoic flora should now be represented by but one species, and that limited to Eastern Asia. More especially is this a matter of interest when it is remembered that it will grow, although it rarely fruits, in most parts of temperate regions, and that in America it flourishes as far north as Montreal. The investigations of Dawson have revealed the fact that in the Meozoic period it occupied all these regions, and even Siberia and Greenland, with many and remarkably distinct species. In this respect it has much in common with the Tulip Tree (Liriodendron tulipiferum), which is the sole representative of a large number of species that once extended over a wide area of the earth's surface, and is now confined to the eastern side of America. Also with Sequoia (Wellingtonia) gigantea, which, with S. sempervirens, is confined to a few districts in California, although in the distant past these two, with other species, formed enormous forests in the northern hemisphere.

The ginkgo first became known to European science by the account given by Kæmpfer—who had discovered the tree in Japan, twenty-two years previous—in his "Amænitates Exoticæ," published in 1712. Owing to its having been first found in Japan it was for a long period supposed to be indigenous to both China and Japan, although Siebold, who resided some years in the latter country, stated in his flora that the Japanese considered the tree to have been introduced from China at a remote period. It is now regarded as a native of Northern China. The date of the introduction of the ginkgo into Europe cannot be exactly determined. Loudon suggests that it was introduced into Holland between 1727 and 1734, and his suggestion is based on the estimate made by Dr. Kops, at the beginning of the last century, of the age of a tree growing in the Utrecht Botanic Garden, and the trade between the Dutch and Japanese at that time.

The year of the introduction of the ginkgo into this country is generally given as 1754, and this may be regarded as approximately correct. To Gordon, the proprietor of the Mile End Nursery, belongs the credit of introducing so handsome and interesting a tree into Great Britain, and raising a stock. In 1771 Gordon sent a plant to Linnæus, who, in his "Mantissa," published in the same year, described it under the name of Ginkgo biloba. Five years later Smith renamed the tree Salisburia adiantifolia, because of the generic name being "uncouth and barbarous," and for a long period it was the most generally known as salisburia. At the present time, and properly so, the name given by Linnæus is more fully recognised. According to Loudon, it was sent to Rouen in 1776, and taken to Paris in 1780: to Schönbrunn by Messrs. Loddiges in 1781, and to America by Mr. Hamilton in 1874. These figures are interesting inasmuch as they show that if the Britishers cannot claim to have introduced the tree to Europe, a prominent part was taken by them in its distribution over the European and American continents. The manner of the introduction of the ginkgo to the Parisian gardens is worth being mentioned as showing the improvement in the method of transacting business that has been made within recent times. The story as related by André Thouin, in the course of a lecture at the Jardin des Plantes, is given at some length in Loudon's "Arboretum," and, briefly summarised, is as follows: In 1780, a Parisian amateur, named Pétigny, visited England for the purpose of seeing some of the principal gardens, and among those visited was that of a commercial gardener who had five plants of Ginkgo biloba, which was still rare in England. These five plants had been raised from nuts the gardener had received from Japan, and he asked a high price for them. However, after a full dinner and copious supplies of wine, the seller became more moderate in his price, and sold the five plants, which were growing in one pot, for twenty-five guineas. The purchaser promptly paid the money and carried off his purchase. The next morning, with a clearer head, the English gardener recognised the mistake he had made, and endeavoured to buy the plants back, offering the twenty-five guineas he had received for one of them. It is said that all the trees originally distributed in France were propagated from the five plants introduced by Pétigny. This story may have some foundation in fact, but the probability is that the plants sent from this country to France were obtained in the usual way from Mile End, where, at the time, Gordon had, presumably, a considerable stock.

A SPRAY OF THE MAIDENHAIR TREE.

The first of the ginkgos to flower in Europe was the specimen in Kew Gardens, which bloomed in 1795. A few years later a tree flowered in the gardens of Ham House, and subsequently several trees flowered in botanic and others gardens on the Continent. All the trees that bloomed previous to 1814 were males, and in this year M. de Candolle discovered female flowers on a tree at Bourdigny, near Geneva, which he assumed was planted between 1767 and 1797; but, according to a letter in the volume of the Gardeners' Magazine for 1836, from Mr. Blakie, who went from England to Switzerland as a botanical collector, and resided some time at Bourdigny, it was planted in 1790. After M. de Candolle had discovered the female tree he distributed cuttings to the more important botanic gardens in Europe. These appear to have failed to root, and in 1830 M. Delille, director of the Montpelier Botanic Garden, received two cuttings from M. de Candolle, which he grafted on two male stocks. Two years later these grafts had made sufficient growth to enable M. Delille to obtain sufficient shoots with which to cover a tree fifty feet high with grafts. In the following year the grafted tree produced one imperfect fruit, and in 1835 perfect fruits were obtained, and from these plants were raised. With regard to the presence of female trees in this country, it may be mentioned that it is not known how many were originally raised from nuts by Gordon, who was mainly instrumental in distributing it in this country, but it is known that a very large proportion of his stock was raised by means of layers of a stool of the male form.

It is evident that at one time the ginkgo was grown in China and Japan chiefly for the sake of its nuts, and, according to Dr. Abel, they were frequently offered for sale in the Chinese markets, but he failed to ascertain whether they were used as food or as medicine. According to Kæmpfer they were used by the Japanese in the preparation of several dishes, their use being due to the supposition that they aided digestion. Thunberg states that even the fleshy part of the fruit was eaten in Japan, although rather insipid and bitter.

In briefly referring to the position the ginkgo should occupy in the garden, we need only take into consideration its ornamental appearance when grown under conditions favourable to its full development. The ornamental character of a well-developed specimen is very high, and in proof of this it will suffice to direct attention to the specimen herewith illustrated which forms so attractive a feature of the gardens of Blaise Castle, near Bristol, the residence of Mrs. Harford. Here we have a tree rising to a height of eighty feet or so, and furnished throughout with widespreading and extremely graceful branches, and elegant sprays of leaves that rival in beauty the fronds of Adiantum farleyense. Added to this, the leaves are throughout the summer of a bright refreshing green hue, and when their development is complete, and the breath of autumn has passed over them, they assume a rich yel-

A MAGNIFICENT SPECIMEN OF THE MAIDENHAIR TREE (GINKGO BILOBA)

Growing in the gardens of Blaise Castle, Bristol, the residence of Mrs. Harford.

low colour. It is true the autumn colouring is not of long continuance, as the separation layer is quickly formed, and the leaves fall in a comparatively short time after they have undergone their change of colour.

The adaptability of the ginkgo to general cultivation is very great, for, provided the soil is fairly well drained, it will grow vigorously, whether it be light or comparatively heavy. A deep, well-drained loam is an ideal soil for the tree, but, like so many other occupants of the garden, it will thrive under conditions that fall considerably short of the ideal. The advantages of an open position need not be insisted upon, for unlike the other conifers, it will thrive in town gardens that are restricted in area, and where the atmosphere is by no means free from the impurities injurious to plant life. Its immunity from injury by the latter is due to the tree being free from the resinous properties that characterise other conifers, and as the surface of the leaves is firm and glossy, dust and particles of soot that may obtain lodgment are quickly washed off during a shower of rain.

GEORGE GORDON.

GERANIUM SANGUINEUM.

We find among our native crane's bills a few plants which must be recognised as good garden flowers, and among these Geranium sanguineum and its varieties generally receive a hearty welcome. Probably the typical plant, which is so common by the seashore in many parts of Great Britain, is not so generally known to amateurs as one would expect, and in all likelihood its more general cultivation would have been advanced had it been believed a native of some foreign land, and not of our own islands. But it is not a whit the less beautiful, because it may be met with in thousands on some parts of our coasts. The colour is not devoid of a slight magenta shade, which makes it unwelcome to some, but the plant, with its finely formed leaves and its large flowers, of a magenta-crimson, and from six to ten inches high, is a good occupant of the border or the rockery.

The variety album, which originated in the South of Scotland, is a very beautiful thing, which would, in some cases, almost suggest that it may be a hybrid. The leaves are more deeply cut, and the white flowers scattered over a good plant remind one almost, at a distance, of white butterflies poised upon a bush of green. This is a really fine subject for the border or rockery. In the variety lancastriense, called sometimes simply G. lancastriense, we have a gem among low-growing plants, and one which, curiously enough, does not seem so common as at one time. It comes from Walney Island, near Barrow, and in its native locality seems to vary slightly. A few forms of this are now coming into the market, I understand, but none will surpass that which we have known for years, this having delicate flowers of pink or rose, with darker veins running through the petals. It is much dwarfer than the others.

These three varieties all prefer a somewhat sandy and stony soil, and do best with full exposure to the sun. They seem to come almost true from seeds. I have never found seedlings of the white variety produce any but white flowers, and seedlings of the Walney Island variety reproduced themselves perfectly as well. These crane's bills can be raised from seeds sown in spring in the open or under glass, and they may be increased by division as well.

S. ARNOTT.

THE ROCK GARDEN IN DECEMBER.

December is essentially a time of rest in the rock-garden, the stillness and calm of the dying year pervade the scene, and plant life seems to be at a standstill. But in reality it is not so. Growth above ground is practically at its lowest ebb, and yet the minute thread-like rootlets are still being pushed out from many plants, and the bulbous subjects are busy underground in anticipation of the first spring days.

A glance around the rock garden at the present moment reveals many things. The chief feature is the way the rocks show their true outlines now that the foliage of the many deciduous subjects has fallen, and the dead flower stems have been removed. Clear and distinct, the rugged, grim, grey, and bronzed boulders show up unshrouded, save for the dark, deep colourings of mountain pines, cupressus, retinosporas, ivies, berberis, and similar trees and shrubs.

One can now estimate the relative beauty of the foliage exhibited at the present season. The trees and shrubs rank first, and just now show to the utmost advantage. Pinus montana and P. cembra, the sturdy branching species from the Alps, cap the highest projecting points with their differing shades of green. The bluish-silver shade which one gets in those charming Japanese pines, P. parviflora and P. densiflora is very effective, and the value of the prostrate junipers, such as J. sabina, J. tamariscæfolia, etc., for draping crags and boulders, is immense.

While lacking the space for a detailed description of the rock garden's trees and shrubs, I would draw attention to the charms of the New Zealand veronicas during the dull months. The intensely interesting variations of leaf-formation and colouring makes for the general interest and charm of the garden. The blue shades one finds in V. pimeoloides and others; the grey-greens of V. decumbens, V. carnosula, and V. Stuarti; the deep, intense greenery of V. buxifolia, V. Traversi, etc., combined with the purplish hues of some of the finer hybrids, as well as the specific forms, tends to enrich the rock-garden considerably. This fact, together with the varied leafage, ranging from the small, dense foliage of V. cupressoides, and V. epacroidea, to the willow-leaved V. salicifolia and V. Dieffenbachiana, give a wondrous diversity.

Hardy azaleas and rhododendrons as yet show but little sign of the glories to come, but the cotoneasters and some of the berberis are exhibiting some warm tones amongst their leafage. Other shrubs and plants which one notes with anticipation for later beauty are Camellia japonica, in its red, white, and pink varieties; the charming Daphne Cneorum, D. Blagayana, D. Mezereum, etc., and the varied ericas.

Just now one can realise the advantages of many of the sedums, saxifrages, and kindred rock-dwellers for forming hillocks, mounds, and rosettes of foliage. Mossy saxifrages, with their deep-green masses, are almost as valuable at the present moment as they are in May, when full of blossom. The silvered forms are very effective, gleaming from the nooks, crannies, and ledges; while the diverse, many-hued sedums, in red, green, grey, and bronze, add to the charm of the almost flowerless garden.

Here and there may be a stray viola, a patch of Potentilla alba, or a mass of Polygala chamæbuxus and its variety purpurea, or the rising stems of Helleborus niger are seen in the sheltered nooks; but there is little else to attract attention in the way of blossom. The "sheathed" bulb-leaves are pushing through the dark soil; muscaris and galanthuses, irises and leucojums are noted among the rising forms; and, in addition, the dark-green sword-leaves of the ramosus group of gladioli are plainly visible. All these speak of better days and bright blossoms in store.

Any pruning necessary to the well-being of the more robust rock shrubs can be done at the present time, as one is more fully able to study their lines and proportions against the rugged rock-formation, and to prune accordingly. Furthermore, one can now spare the time for a light top-dressing among the varied plants. A mixture of loam, decayed leaf-soil, and mortar-rubble will be found to suit the requirements of the majority; while for those that dislike lime one can substitute sand for the mortar-rubble, and of course give an allowance of broken peat for those subjects which revel in peat.

Thus it will be seen that the rock-garden is not devoid of interest at this season, and the work that can be done now should be pushed rapidly forward.

P. S. HAYWARD.

CANKER IN APPLE TREES.

It may be of interest to many readers of the GARDENERS' MAGAZINE if I state briefly how I cured a bad case of canker in an apple tree some few years since. The tree in question had attained a height of about 14ft.; it was a half-standard, with a beautifully-balanced head; the variety Cox's Orange Pippin. The rooting medium was rather clayey, but not excessively so. The roots were carefully examined; a few of the larger ones had penetrated the uncongenial subsoil, and these were cut back. The remainder of the roots were left intact, and the trench made was refilled with better loam, mixed with some of the original soil. The new compost was made very firm indeed.

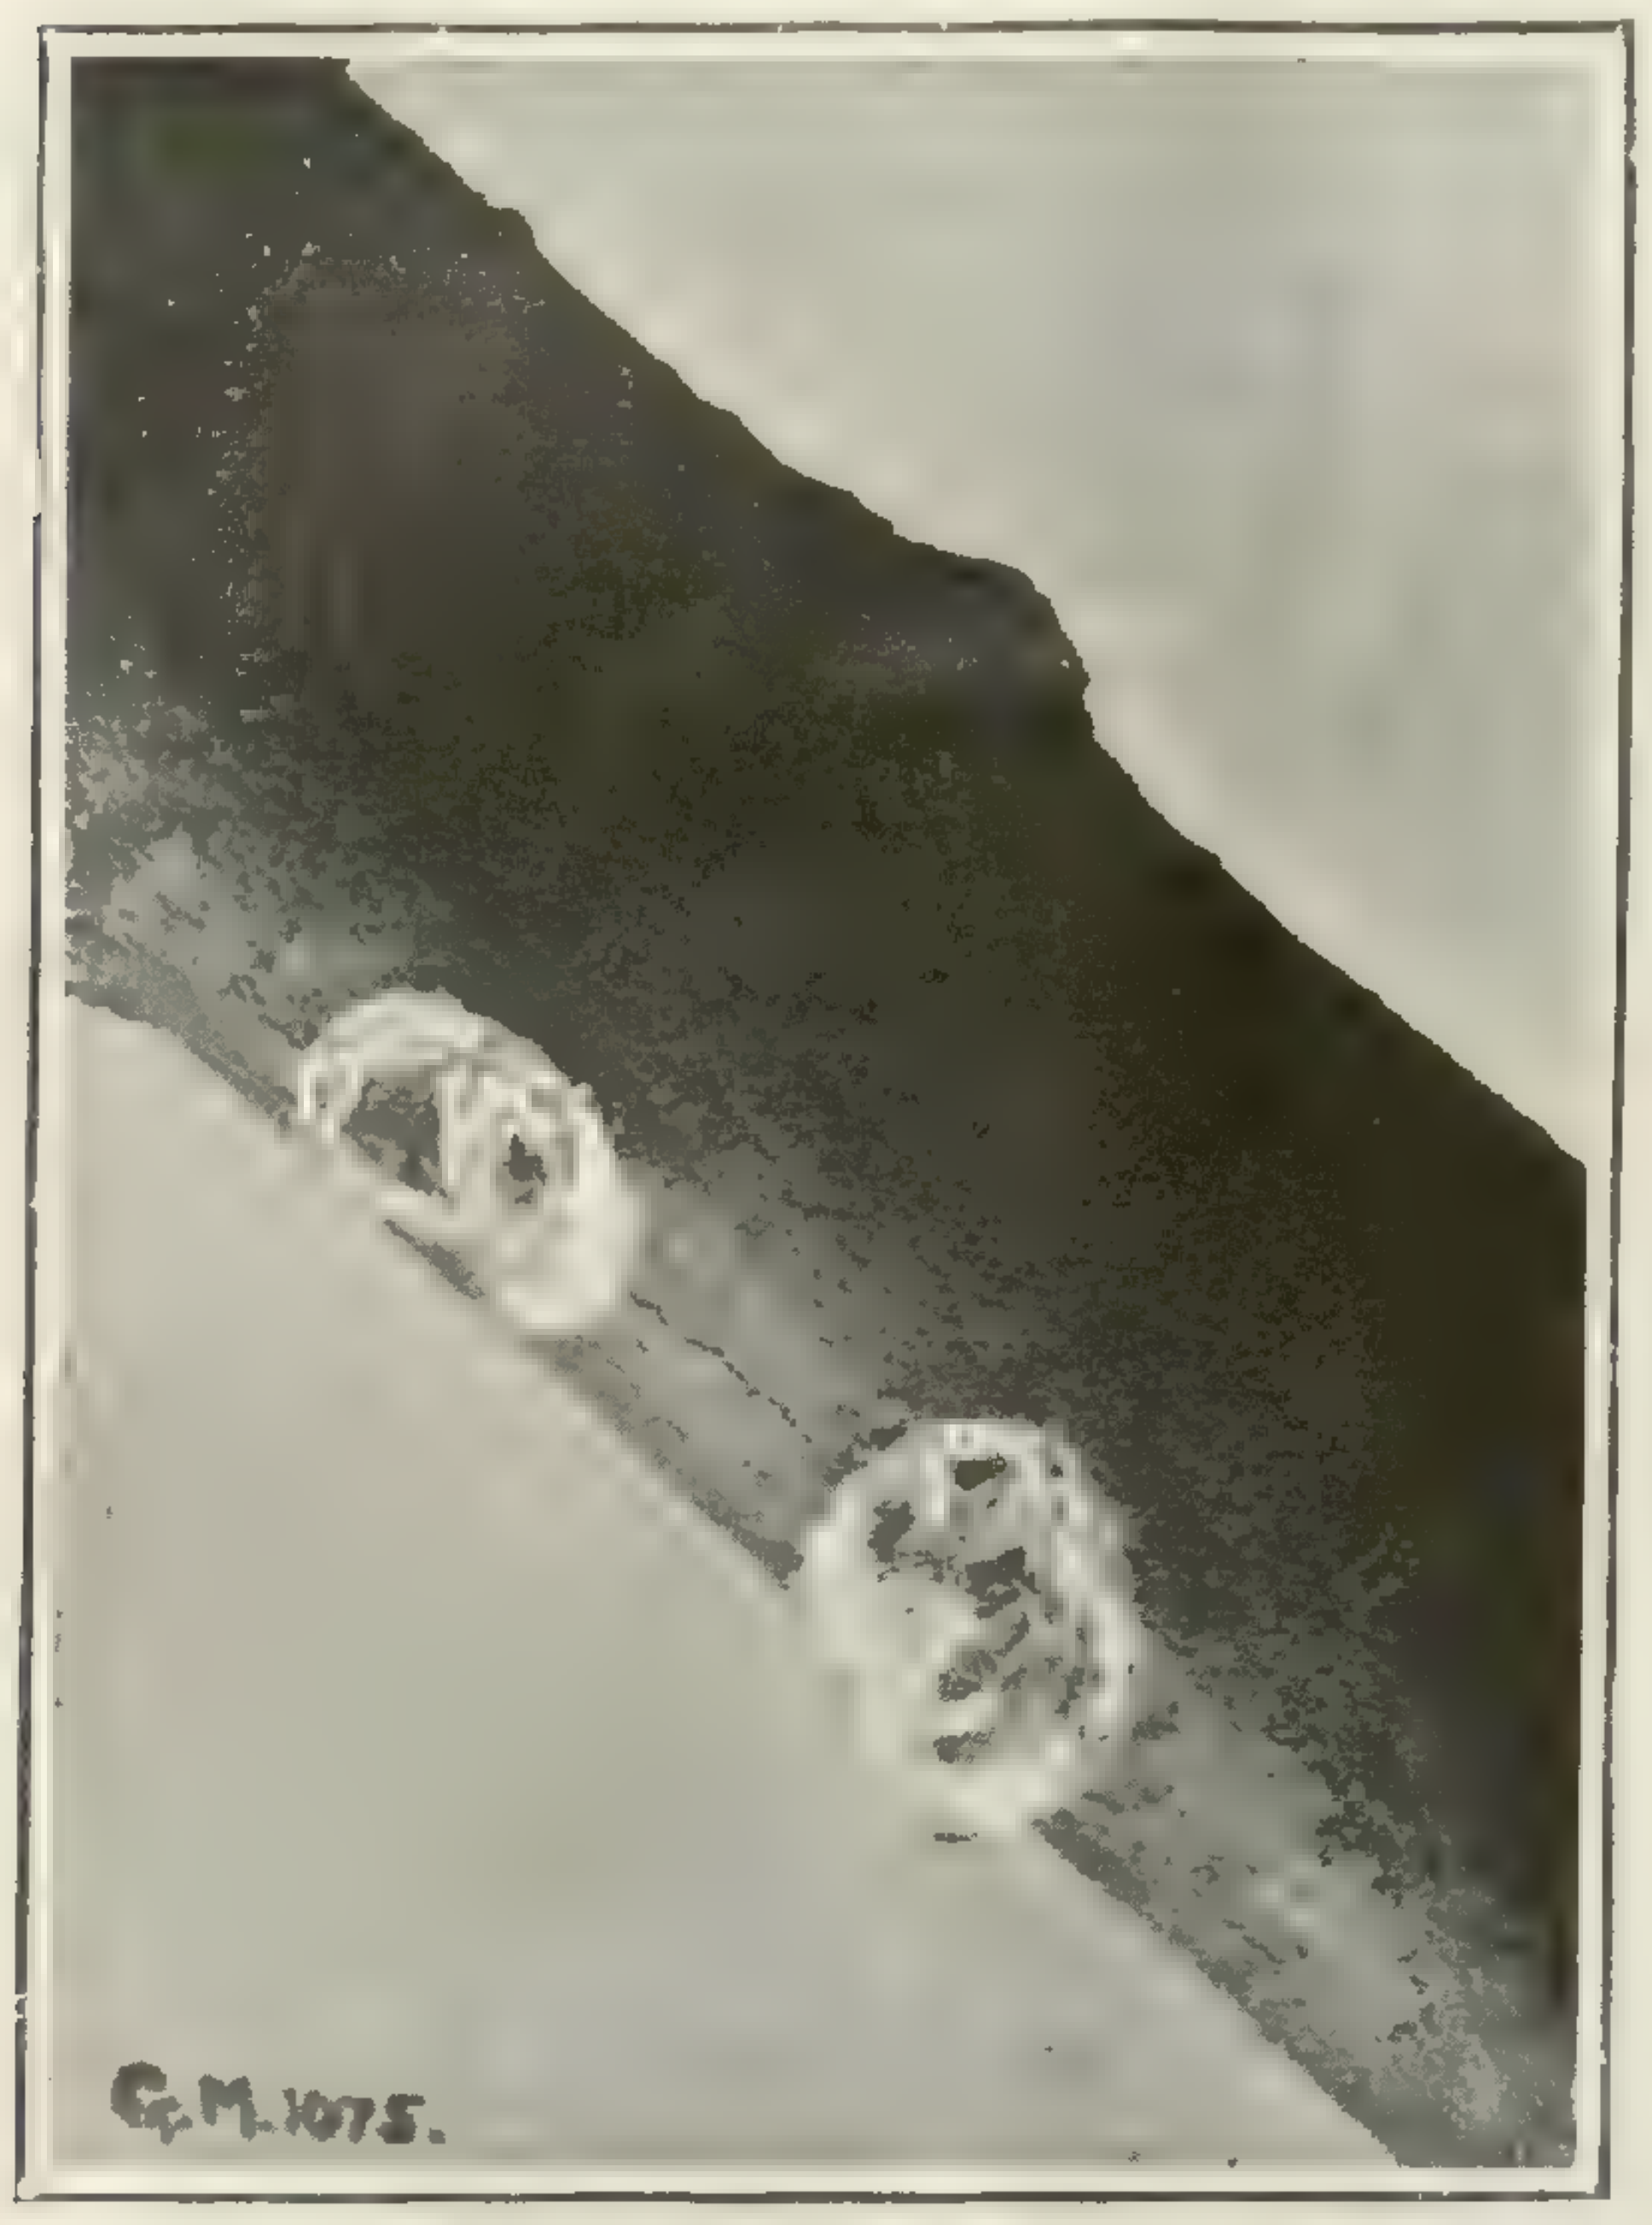
Then the branches which were cankered were dealt with. Some of them were so badly affected that perforation was complete, and the worst parts were those where the branches joined the main stem or trunk. All the affected or cankered portion was cut away with a sharp knife, and then the wounds were dressed with fir-tree oil in a crude state. The cut parts at once turned brown, but commenced to heal quickly, and at the end of two or three years all the wounds had disappeared, the holes had closed up, the whole of the bark was clean and free from canker, and the tree annually bore nice crops.

GEO. GARNER.

Filberts.—On properly-trained specimens what pruning is necessary is best done in the spring, when the small scarlet flowers are visible, but all suckers should be removed at this season, and a good dressing of farmyard manure be placed over the surface as far as the roots extend. If growing in the cultivated portion of the garden the manure may be slightly pointed in with a garden fork. Bushes which are allowed to grow in a more natural way should have a portion of the older wood cut out each year to prevent overcrowding; all the suckers must be removed unless any are wanted to replace worn out branches, when a few of the strongest should be reserved and shortened back one-third of their length; apply manure as advised for the trained bushes.—GEO. WOODGATE.

THE ROSE AS A TOWN FLOWER.

Before it is too late in the season I would like to draw attention to the rose as a town flower. All growers will readily admit that the rose thrives much better in country than in town atmospheres, but many a fine and pleasing show has been obtained almost in the heart of towns with a little care and due regard to the varieties selected. Indeed, I may say the main point lies in selection. However good your soil, you are not likely to obtain satisfactory results from A. K. Williams, Niphetos, Souvenir d'Elise Vardon, Grace Darling, and suchlike growers; but substitute for these Ben Cant, Frau Karl Druschki, G. Nabonnand, and Conrad Ferdinand Meyer (which give approximate colours), there is no reason why you should not succeed. And it is the same with almost all classes or sections of the rose: some varieties are eminently suitable, and a very great proportion are the reverse.



PROPAGATION OF MISTLETOE.
Fig. 1. First stage.

I do not care to pen notes in the form of a catalogue, and will merely remark that most up-to-date lists from the growers note a few of the best for towns. At all events, discard any described as moderate in growth, and stick closely to the more vigorous sorts.

Of course, we need to select as light a position as possible, and yet avoid the keen draught of corners. The soil and drainage need care, more so than in the open country, and it is well to dig deep enough to be certain of what these consist. There are many surprises when deep digging in suburban gardens. Often there is excellent soil a little below the surface; in short, the same that was market garden or meadow land only a few years ago. On the other hand, we too often find wretched stuff that it is an insult to ask a weed to grow in, and that has only been surfaced over a few inches, or, at most, a foot. This must be removed, the drainage made fairly free, and a good loam provided. This is labour well spent, for even if you do not want roses, or fail with them, you benefit any other crop you may select. Avoid soot among manures for town use, as there is too much of that already. Good farmyard or stable manure, with fresh loam, or the first spit of turf where possible, are great factors towards success.

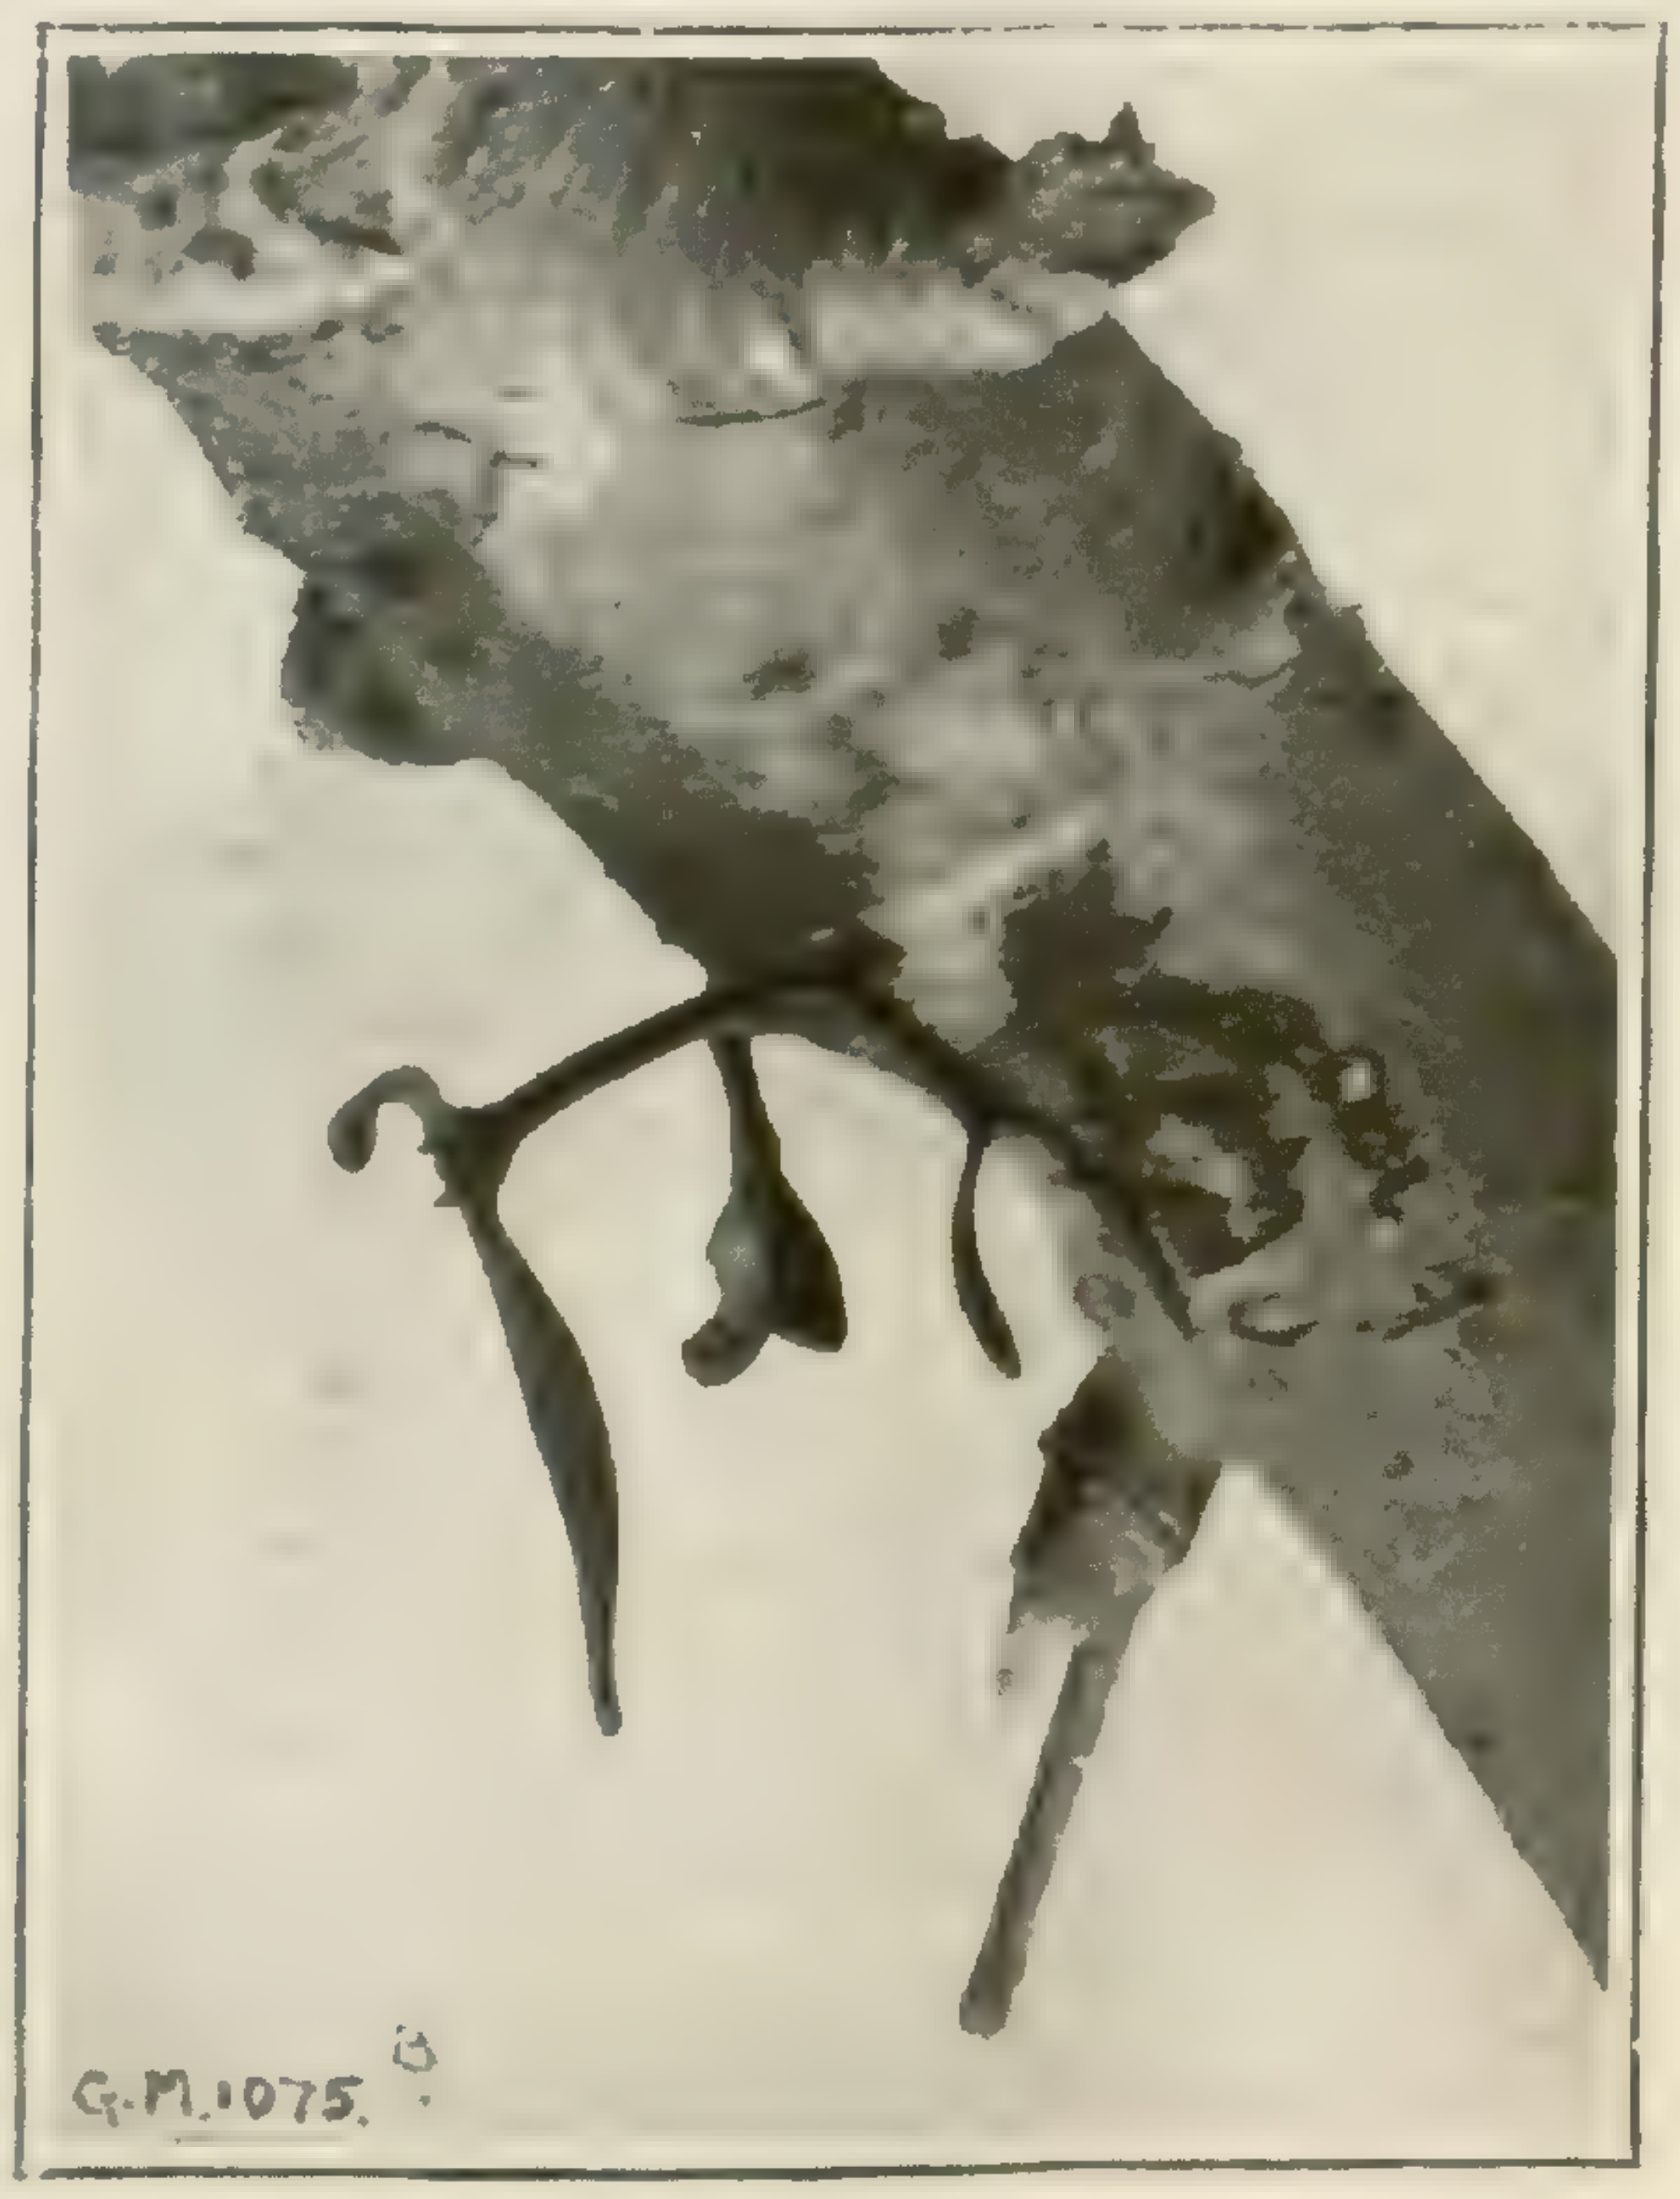
That roses can be grown in a town is proved by the excellent flowers town and suburban members of the National Rose Society so often set up, frequently securing the silver medal for the best bloom of its class in the whole exhibition. But it is not the superb show blooms I am dealing with just now, but with varieties that give us a quantity of pleasing flowers, with the delicious perfume and charm possessed by so few other subjects. If we select strong growers, and do not prune quite so hard as usual, I am certain as much pleasure can be derived from roses as from any other flowering shrubs in towns.

Uckfield. A. Piper.

PROPAGATION OF MISTLETOE.

Mistletoe, which is found growing wild in the South and Midland Counties, is never so found in the North of England, but has been most successfully propagated artificially in many places. The best trees for the purpose of host plants are apples, pears, thorns, or peaches. The berries are not sufficiently ripe for propagation until late in April, and, though the birds will have feasted on them ever since Christmas, a few are always left on the tips of the branches, where there is no firm standing place for the feathered thieves, who greedily eye the luscious fruit.

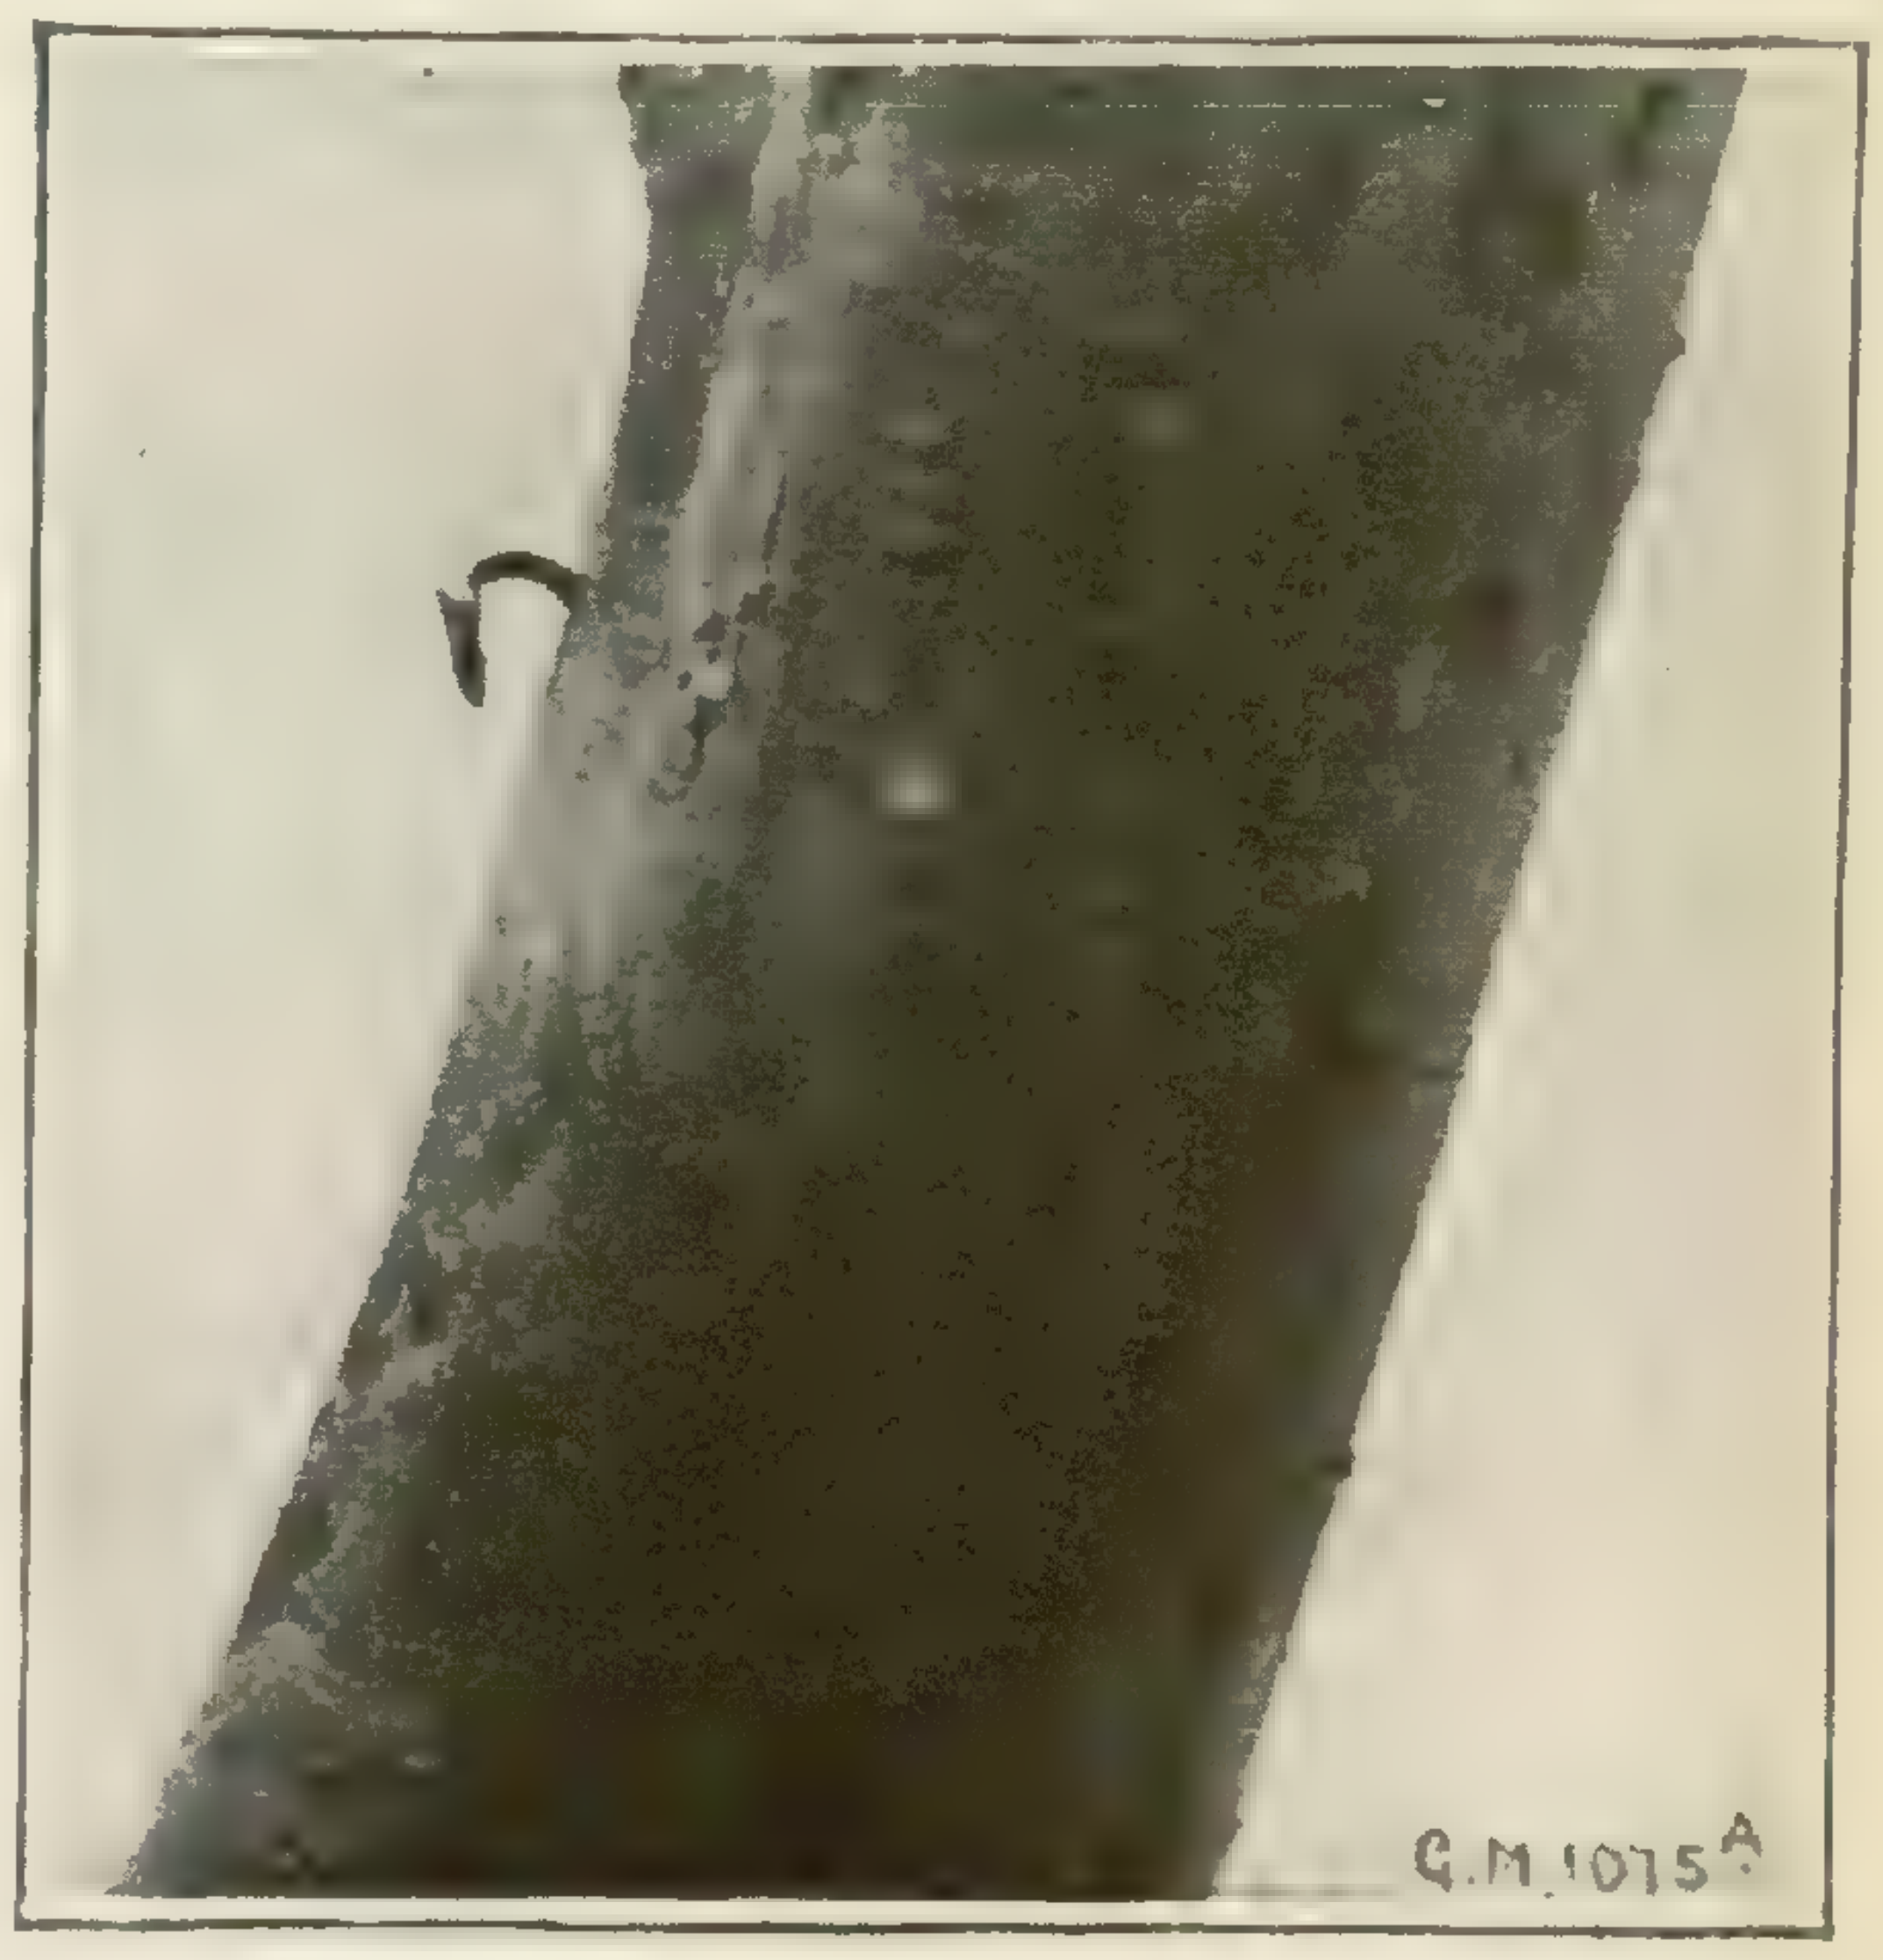
A berry, pressed on to the roughest bark of the young wood of the tree chosen for the trial, soon hardens, and the seed enclosed begins to cling to the bark. The writer has found scraping the bark lightly on the under side with a penknife—(see Fig. 1)—and then pressing the berry on, a more reliable method than even the two-year-old wood, as the bigger branch is less easily damaged. At the end of a few months the seed will have thrown out a tiny hook—(see Fig. 2)—green, and turning to the bark. Many months pass, and the hook falls off, and the amateur believes his effort has failed; but, as the year passes, the branch is seen to be swelling—very suggestive of a vaccination—and two years after the attempt was made two points of bright green gradually unfold from the swelling branch into a tiny spray of leaves, and the mistletoe is an established fact. Both male and female plants must be in the same garden, or no berries will appear. The female growth is lighter, smaller in leaf, and not such a dense mass as the male. Martia.



PROPAGATION OF MISTLETOE.
Fig. 3. Third stage.

THE GARDEN PAINT POT.

At various times nearly everything appertaining to horticulture is treated on in the Gardeners' Magazine, but I do not remember ever seeing an article dealing with the paint pot or can, which is the receptacle for the paint with which the gardener paints his wooden labels or tallies that are to carry the names of his plants.



PROPAGATION OF MISTLETOE.
Fig. 2. Second stage.

In most cases white paint is used for the purpose. A little white lead is mixed to the proper consistency with linseed oil and turpentine. Some people prefer red lead, in which case the paint is of that colour when mixed with the same ingredients. Probably most gardeners agree that white paint looks best, as when written on with a proper Wolff's garden pencil the writing is very plain, far more legible than when written on red lead paint.

Labels can be bought ready painted on one side for writing on, but I prefer to paint ours as we want them, as when written on damp paint the pencil marks better than on the dry paint.

The most important part in painting labels is not to put much paint on, the usual plan being to make a little pad of cotton wool and wipe the paint well into the label, leaving a very little on when finished. When laid about these little pads become dry and hard, then they should be burnt and a new pad made. It is always the best plan to have a very small supply of paint in the can or pot, as then if an accident occurs there is not a very great spill, and, consequently, not much paint to clean up.

The new garden boy generally makes a very great mistake when he is told to paint a label, as he tries to pile the paint on; so much, indeed, that in attempting to write on it the pencil ploughs through the paint and makes miniature furrows. The same individual is rather sceptical as to the amount of paint there should be in the pot. Before now he has returned with the announcement that "the pot is empty," as he did not understand the small quantity in the bottom. As the lad gains experience, and has seen a filled pot belch forth its contents from a foot to a yard across the potting bench, he will understand the wisdom of only mixing a small quantity at a time. W. M.

Cheshire.

There is no better guide to the kitchen garden than Vegetables and their Cultivation, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEED SOWING.—There are differences of opinion among those who are actively engaged in orchid hybridisation and in the rearing of orchids from seeds; and different methods are adopted. There is also a difference with reference to the question of sowing seeds in the depth of winter. There can be no question that difficulties have to be contended with when seeds are sown of some classes of orchids during the months of November, December, and January. There is very little benefit from light during the greater part of the months in the germination of the seeds and the development of growth in young seedlings, even in the most favourably placed situations. Yet I consider it advisable to make small sowings from the seed-pods in which the seed ripens. In the case of the majority of plants ripening their seeds during the winter months it will be difficult to easily remove other than a small portion of the seed. This can be shaken out and sown, the remaining portion of the pod should be carefully tied round with tissue paper, so that any seed ripening afterwards may be secured. It is a good plan to thus secure the pods without removing them from the mother plant; but in case this cannot be conveniently done the pods may be cut and placed in shallow pans with sufficient white or tissue paper placed around and at the bottom of the pans to prevent any loss of seed. The top of the seed vessel should be left exposed to the light and air in the house in which the plant has been grown; this will assist in properly maturing the seed, and will permit of the moisture escaping from the decaying husks of the seed vessel, which, if tied in any way close, has a tendency to become mouldy, which is anything but beneficial to the ripening of seed. In the case of cypripediums, I do not think there is any great advantage in refraining from sowing all the seed immediately the seed is ripe. There is one most essential point to be observed, and that is, "Never to place all the eggs in one basket." We frequently sow seeds from the same pod of a cypripedium or other orchid on, say, six or more pots, and perhaps we only induce the seed to germinate on one or two pots. In some cases we have perfect germination on one pot and failure on all the others, notwithstanding we have carefully prepared the seed beds and used the same material. The reason why this should be I have not been able to ascertain. I would also advise that in the case of the epiphytal kinds, such as those orchids allied to the cattleya family, they should be placed in a position near the light, especially for the first two or three weeks, instead of being placed in the propagating case in the usual way. While in this position careful observation is necessary to prevent the seed becoming dried, but at the same time they must not be at all times in a saturated state. I find that seed pans treated in this way and removed to the propagating cases towards the end of January are more satisfactory than is the case when they are placed under the warmer, moist conditions from the commencement.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

HIPPEASTRUMS.—If early flowers are required, a few of the strongest plants that do not need repotting may be introduced into heat. Remove as much of the soil as can be taken away without damaging the roots, and see that the drainage is efficient, and then top-dress with fresh loam, leaf-soil, and sand, with the addition of a little artificial manure. If given a good watering at once very little more water will be required for some time. Plunge the pots in a bottom heat of about 65 deg. with a top heat some 10 deg. lower, and by frequent syringing and damping maintain a moderately moist atmosphere. Many of the plants that were raised from seeds sown early in the year will now be in condition for potting previous to flowering. Use six-inch pots, and provide a good drainage of clean crocks, and use the same compost as advised above. In transferring the plants into larger pots take care not to bruise the roots; remove a little of the surface soil, so that the bulbs will be about two-thirds clear of the surface soil after the potting is completed. Thrips are liable to cause much damage to the plants at this stage, and often before the young growth appears; therefore, fumigate once a week with some approved material.

STREPTOCARPUSES resting under cool and dry conditions, may soon be shaken out and repotted in a mixture of loam, leaf-soil, and sand, with broken charcoal added. Give a light position in an intermediate house.

HEAT AND MOISTURE. — During the winter months, when fire heat has constantly to be provided, and, in many instances with insufficient piping the atmosphere becomes very dry. When plants are grown for the beauty of foliage some moisture-holding material for the plants to stand upon is of considerable advantage. The moisture rising from the surface of the stage upon which the plants are standing has a good effect upon the plants, as the moisture collects upon the underside of the leaves and acts as one of the best means of keeping insects in check, providing the most natural conditions for healthy growth. When open stages are used the effect of any dry air passing upwards is bad, causing the incessant use of the syringe to keep the plants in anything like a healthy condition, and even then the growth produced is not satisfactory.

ALLAMANDAS. — If required for very early flowering these, provided the wood is well ripened, may now be pruned. Cut back last season's growth to about three buds from the base, give sufficient water to moisten the soil, and stand the plants in a light position near the glass. Syringe daily, and when the new growths are two or three inches long repot if necessary, or take away the surface soil and top-dress with good loam, sand, and some artificial fertiliser.

COLEUS THYRSOIDEUS. — Plants now freely developing their flowers make capital companions for the poinsettias and white and yellow chrysanthemums. The coleus will require constant attention in the matter of watering, feeding, and ventilation, and, under favourable conditions will continue in bloom for a considerable time.—W. Fyfe, Lockinge Park Gardens.

FRUITS UNDER GLASS.

EARLY VINERY.—This should now have an increase of temperature, 55 deg. by day and 50 by night being the most suitable. See that the rods are kept moist by syringing twice daily, the first time early in the morning and the second at 2 p.m., and all dry places should be sprinkled in addition in the evening. If the borders are in a good condition, and were well watered at the commencement, they will not need watering for some time.

STRAWBERRIES.—A good batch of these may now be introduced either in a small house specially provided for them, or into the vinery or peach house, as they do not harm anything at this stage. Place the pots on stages near the glass; examine the roots for worms, and if the soil is loose ram it as firmly as possible. A very good place to start strawberries is a frame, the pots being stood on a bed of leaves.

TOMATOES.—These are fruiting nicely and setting well; still admit a little air at the top, and maintain the temperature between 55 and 60 degrees when the plants will continue to flourish. As the flowers open in the middle of the day brush them lightly with a rabbit's tail. This will assist in fertilising them; and be careful to only give just as much water as is required.

LATE VINERIES.—If all the grapes are not cut by the end of the year, no time should be lost in cutting and placing the ends of the laterals in bottles of water. Then prune the vines and clean the interior of the houses. New borders should be made ready for planting in spring, and the soil should be mixed several times. Refrain from making large borders all at once.

PEACH HOUSES.—The pruning of the trees and the general cleaning of the houses should be pushed on as fast as possible, as the opening days of spring bring an increase of work. I like to have my houses attended to by the end of the year. I have given hints for the early houses, and later houses need to be carried out on the same lines. In pruning, thin the wood sufficiently to give room for fruit and leaf development; in doing this you leave room to train a new branch for the succeeding year. If the cultivator has one fruit in every area nine inches square he will have a very heavy crop. One fruit to a foot square is a very fine crop.—W. A. Cook, The Gardens, Leonardslee, Horsham.

THE KITCHEN GARDEN.

CUCUMBERS.—In order to have early plants for putting out for spring cropping, a sowing should be made now. Place each seed singly in a three-inch pot filled with a light sandy soil. Afterwards plunge the pots in a hotbed with a temperature ranging from 75 to 80 degrees. As soon as the seeds have germinated and the plants are nicely up, place them in the strongest light near the roof glass, with a temperature of 65 to 70 degrees, that is charged with a humid atmosphere. Pot the plants on as required until they have attained strength and produced two or more rough leaves, when they will be ready for planting out over a hotbed. A good type of Telegraph or Lockie's Perfection are good varieties to grow for a private establishment.

POTATOES.—To produce the first supply of new potatoes, make a plantation of tubers in 10-inch pots. Use a turfy loam that has been laid by for some time, and lighten it with sand and leaf-mould to form a free and open compost. Good sized tubers that have one or two sturdy leading shoots should be selected. In potting, leave a sufficient space for the top-dressing which is necessary when the plants have become firmly established and forming their new tubers. A position in a newly started vinery or peach house will afford them an excellent position during their early stages of growth. Watch that the plants do not become drawn through insufficient light. A commencement may also be made with this crop by making up hotbeds under either pits or frames, for the reception of the tubers later. Good selections of the short-topped kidneys are very suitable for forcing.

SALADS.—If manure and leaves have been made ready, the forcing of salads may be commenced in frames on hotbeds. Lettuce and radishes are easily brought forward with a little skill in watching over details. Make the hotbeds from a liberal proportion of leaves, and use sweet, rich soil in which to grow the crops. If young plants of lettuce are at hand, they will be found very valuable for pricking out over the beds as soon as they are ready to receive them. Mustard and cress, too, may be successfully grown in quantity in small frames over hotbeds with very little trouble and labour. Continue to place endive and chicory in the mushroom house to blanch, and if there is sufficient to spare of partly grown outside lettuce, plant a quantity in boxes and place them to blanch in a similar position. If given plenty of water they will form small heads which will assist the salad and be appreciated.

FRENCH BEANS.—With the advent of longer days, larger and more remunerative crops can be produced. Make a good sowing in 7 or 8-inch pots now, and place them in the forcing house. They may be grown on shelves near the glass if 60 degrees of temperature can be maintained in the house.

WORK IN GENERAL.—As these notes appear the year 1909 will have finished its course, and all further arrangements will be directed to next season's supply and demand.—C. Flack, Cholmondley Castle Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

As the Royal Horticultural Hall was occupied by a toy fair on December 21, there was no exhibition of flowers, fruit, and vegetables on that date, but arrangements were made for the Standing Committees to meet and consider any new things placed before them. Some of the members of the Floral Committee came long distances, over 150 miles in one case, they signed the attendance book, and wished each other the compliments of the season, peeped in at the few orchids set up in the Council Room, looked in at the toy fair, and then went their way.

ORCHID COMMITTEE.

There was a good attendance of the members of this committee and about eighteen plants were shown. The members appeared to have been filled with the spirit of the season, for they granted five First-class Certificates, one Award of Merit, and one Certificate of Appreciation.

Messrs. Charlesworth and Co., Haywards Heath, showed the beautiful Odontioda Charlesworthi, carrying a spike of eight brilliant crimson-scarlet flowers; Zygocolax Charlesworthi rubida (F.C.C.), and an interesting plant named Oncidium hybridum (C.A.), the result of crossing Oncidium tigrinum and O. lamelligerum. This is the first oncidium hybrid artificially raised. Messrs. Sander and Sons, St. Albans, brought up a superb plant of Odontoglossum Harryano-crispum Bruggense illustris, carrying a magnificent spike of fifteen flowers, each of grand size and substance, and splendidly coloured with red-chocolate on a yellow-tinted ground, the lip being white with purple and chocolate marks. The flowers were five inches deep, and the dorsal sepal an inch and a quarter across; the same firm showed Dendrobium Phalænopsis Schroderianum album Sander's var. (F.C.C.), the finest white form we have seen. The fine Cypripedium Mrs. F. Sander (F.C.C.), with broad white dorsal sepal and pale yellow-green lip and petals, was also shown by this firm. A fine spike of Cypripedium Sedeni was shown by Mr. L. Lawrence, Shoreham.

Mr. Day, gardener to H. S. Goodson, Esq., Putney, showed Cypripedium Bellatrix, parentage unknown; and C. Lusitania, a bold flower of C. insigne descent. Mr. Alexander, grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, brought up the bold and effective Cypripedium Alabaster magnificum (A.M.); and C. Caruso, the latter a fine hybrid between C. J. Howes and C. insigne Harefield Hall.

From Messrs. Armstrong and Brown, Tunbridge Wells, came the lovely white form of the beautiful Brasso-cattleya Thorntoni, name B.-c. Thorntoni alba. Mr. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, brought up Cypripedium Hercules, with a flower of wonderful size and substance; and C. Germaine Opoix var. Imperialis.

Odontioda Keighleyensis Fowler's var. (F.C.C.), with a graceful spike of sixteen flowers and buds, the flowers of bright orange-scarlet hue, was submitted by Mr. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford.

Lælio-cattleya Firmini (L.-c. Ceres var. Queen Wilhelmina crossed with C. aurea) was shown by Mons. Firmin Lambeau, Brussels (F.C.C.); this has yellowish sepals and petals suffused with rose, and a lovely yellow, rose and crimson-purple lip. Cattleya Percivaliana alba, Clifton's var., a charming white form with yellow-throated lip was brought up by Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

SCIENTIFIC COMMITTEE, Dec. 7.

Present: Mr. J. T. Bennett-Poë, M.A. (in the chair); Messrs. A. Worsley, J. Fraser, L. Crawshay, J. Douglas, W. Cuthbertson, R. Hooper-Pearson, W. E. Ledger, and F. J. Chittenden (hon. sec.).

LOBELIA THAPSOIDEA.—Mr. Worsley showed flowers of this species, a tall growing plant reaching 7ft. in height, seeds of which he had collected at the summit of the Organ Mountains, in Mexico.

SAXIFRAGA TRIDACTYLITES.—Mr. J. Fraser showed specimens of this plant growing vigorously in a pot, reaching a size considerably greater than that attained in its usual habitat, the tops of walls and similar places in the British Isles. The seed had been collected at Weybridge, and the plants were now commencing to flower. He remarked that the plant had a wide distribution through the north temperate zone, and that although in this country it was confined to such situations as the tops of walls, on the Continent it grew among pasture plants and appeared able to compete with them.

PSYCHOTRIA JASMINIFLORA.—Foliage cut from a seedling of this plant raised by Mr. George Lee, of Clevedon, was sent illustrating the difference between the juvenile and adult forms of leaves, the latter being much broader in proportion to their length than the former, and also considerably larger. The seed had been produced eight years ago by a plant at Clevedon, and it appears rare to find it fruiting in this country, though the plant is often cultivated under the name of Gloneria jasminiflora.

TREES ATTACKED BY VOLES.—Examples of maiden apple trees with their bark bitten off below ground level all round the stem and the roots eaten, were received from Chard, Somersetshire. The committee was of opinion that the damage was the work of field voles. It was pointed out that the best way of checking the spread of these pests was by encouraging owls and kestrels. They may sometimes be trapped by digging pits wider at the bottom than at the top, and they may be driven away by injecting carbon bisulphide into the soil at the rate of about ½oz. to the square yard, or by the use of paraffin poured in small quantities around the trees, taking care not to touch them with it.

MALFORMED CYCLAMEN. — From — Rickards, Esq., of Usk Priory, Monmouth, came a malformed cyclamen, having the sepals developed into foliage leaves.

Forestry Lectures at Aberdeen University.

The last of the series of lectures on forestry which has been delivered during the past two months in Aberdeen University by Mr. William Dawson, M.A., B.Sc. (Agr.), was given on Wednesday evening the 15th inst. Throughout the course there have been exceptionally large attendances, and on several occasions standing room was at a premium, the lectures having aroused great interest and conveyed much valuable information to those attending them. They dealt lucidly, if briefly, with a great subject in a popular manner, and at each lecture the chair was taken by a gentleman of standing and eminence in the city or county of Aberdeen. Designed for those desiring a general knowledge of forestry and natural history in relation to the forest, the lectures dealt with such interesting matters as tree growth, aids and barriers to forest extension, forests and climate, trees—their identification, their habits, and their life histories; sylviculture—pure woods and mixtures; methods of regeneration—natural and artificial; rearing and management of forests, products of the forest, enemies of the forest, and forest protection.

As was befitting the occasion on Wednesday evening, the chair was occupied by Mr. Sydney J. Gammell, of Drumtochty and Countesswells, a gentleman who owns great areas of forest lands in Aberdeenshire and Kincardineshire, and who is also president of the northern branch of the Royal Scottish Arboricultural Society.

Mr. Dawson referred at the outset to the literature that existed in regard to the question of forestry, and afterwards dealt with the chief points of practical importance in the management of woods. He mentioned the remedies that should be adopted in protecting woods against the legion of enemies—namely, ground game, insects, parasite fungi, fires, and high winds. In conclusion Mr. Dawson advocated a system of forestry with reference to the felling and floating of trees. The system he would adopt was to cut annually the amount produced annually.

The series closed with a hearty and enthusiastic vote of thanks to Mr. Dawson for his most interesting and instructive lectures.

Birmingham Gardeners' Association.

At the fortnightly meeting held on December 13, the members listened to an interesting exposition by Mr. J. Stoney, Instructor in Horticulture to the Staffordshire Education Committee, on "Some Diseases and Insect Pests of the Garden." Mr. T. Humphreys presided.

It was Mr. Stoney's initial appearance before the society. The lecture was instructive and illustrated by a well-mounted series of insects and their larvæ, and also of specimens of gall-affected tree leaves. Time, however, would not allow of descriptive remarks pertaining to the latter, but Mr. Stoney promised to advert to them on some future occasion. Remedies were given for the prevention and destruction of insect pests, and for the prevention and cure of fungoid diseases that attack fruit trees and vegetables. The lecturer, however, referring to that comparatively new disease, the Potato Scab, confessed his inability to prescribe an effective antidote for it, neither had he as yet heard of one, though the subject had engaged the earnest attention of scientists and others. It was the opinion of some that the casing of the resting spores had so far resisted chemical applications. Mr. J. Webb remarked that he was cognisant of a somewhat remarkable circumstance connected with a severe attack upon a plot of potatoes last year, grown by a cottager in the district, while the adjoining plots on either side remained immune. Last spring the cottager applied a thick dressing of street sweepings that were impregnated with the gas-tar coating of the streets, potatoes were again planted on the same plot, and the ensuing crop was entirely free from disease, the assumption being that the gas-tar must have been a potent remedy. A remarkable fact, however, remains to be noted, viz., that the crops of potatoes this season upon either side of the immune plot were badly diseased, and the ground had not been manured with tarred street sweepings.

Cardiff Gardeners' Association.

The members of the above association paid their annual visit to the Central Free Library on the 7th inst., with the kind permission of the Libraries' Committee of the City Council, to inspect the extensive and valuable collection of books relating to horticulture and kindred subjects. The books were admirably arranged in groups, each group dealing with a particular subject. Mr. J. Mountney presiding.

Mr. Farr, the chief librarian, met the members, and in a brief introduction welcomed the association, and pointed out the recent additions which had been made to the library since the last visit, which included a large collection of pamphlets on agricultural and horticultural subjects issued by various Government departments and colleges in different parts of the British Empire and the United States.

A very pleasant and profitable evening was spent in inspecting the different volumes, and at the close, on the proposition of Mr. C. Lewis, seconded by Mr. Malpass, Mr. Farr was thanked for the excellent arrangements he had made for the members, and his kindness in explaining various matters in connection with the books.

Reading Gardeners' Association.

At the fortnightly meeting, held in the Abbey Hall, on Monday, the 6th inst., there was not such a good attendance as has been recorded on recent occasions. The President, who occupied the chair, facetiously remarked that perhaps some of the members felt a little nervous, as there was to be no regular subject, the evening being devoted to impromptu speaking.

The minutes of the last meeting were read and confirmed, and the Hon. Secretary presented the balance-sheet of the recent exhibition duly audited, which showed, receipts, £32 10s. 8d.; expenditure, £13 15s. 2d.; net proceeds, £18 15s. 6d. The latter sum has since been augmented by a generous donor (not a member of the association) of £1 4s. 6d., to make the amount an even sum of £20, by which the Gardeners' Royal Benevolent Institution, and the Royal Gardeners' Orphan Fund will benefit.

With the object of encouraging impromptu speaking a number of questions had been prepared, each bearing a number. The Chairman then drew from a batch of tickets bearing corresponding figures, and the holder of the number called, immediately rose and spoke on the subject named on his question paper. The programme worked out remarkably well, as apart from the regular speakers at the meetings, several members not frequently heard, notably some of the younger gardeners, were induced to display some of their oratorical powers. After the questions were exhausted, debate was invited, and an exceedingly instructive hour ensued.

Mr. Parfitt being obliged to leave early, the chairman of the committee (Mr. A. F. Bailey) presided during the latter part of the evening.

Royal Scottish Arboricultural Society (Aberdeen Branch).

The annual general meeting of this society was held in the Music Hall Buildings, Aberdeen, on Saturday afternoon, 11th inst. Mr. Sydney J. Gammell, of Drumtochty and Countesswells, president of the branch, presided over a large attendance of the members (and also a number of the public, who were admitted after the general business had been transacted), who came to hear a lecture by ex-Lord Provost Sir John Fleming, of Dalmuinzie.

Mr. George D. Massie, hon. secretary, submitted the annual reports, which showed that the branch was in a flourishing condition, and these were unanimously adopted.

Office-bearers for the ensuing year were elected as follows: President, Mr. Sydney J. Gammell; vice-presidents, Dr. James W. H. Trail, Professor of Botany in the Aberdeen University; Mr. John Michie, M.V.O., factor to the King on the Balmoral estates; Mr. A. Forbes Irvine, of Drum; and Mr. C. S. France, F.B.S., Aberdeen. The following gentlemen were added to the committee: Sir John Fleming, Mr. Alexander Dewar, factor to Sir John Gladstone, of Fasque; Mr. George Wyllie, forester to Mr. W. E. Nicol, of Ballogie; and Mr. Thomas Duff, factor to Laura Lady Grant, Huntly Lodge. Mr. Massie was unanimously reappointed secretary and treasurer.

Birmingham Chrysanthemum Society.

The annual dinner of the Birmingham and Midland Counties Chrysanthemum, Fruit, and Floral Society, was held on the 9th inst. at the Exchange Restaurant, Stephenson Place. Mr. Walter Jones (chairman of the society) presiding over a goodly number of guests.

The toast of "The Society and Officers," was proposed by Mr. R. A. Felton, who said he considered every class of business man should have a hobby, and he did not think that there was one which could be more fascinating and desirable than the cultivation of chrysanthemums. He considered their society did a considerable amount of good for the city, but that it did not receive the support it deserved. What he heard was that the last exhibition, although an excellent one, had not turned out a great financial success. To discontinue the society's work, he said, would be a calamity, and he earnestly hoped that new financial support would be forthcoming. Mr. T. Humphreys (the treasurer), who responded, said it was necessary a change should take place in the society's finances; when they looked at the list and saw there were only 350 subscribers they were surprised that the society, which had been in existence for fifty years, should have only this comparatively small number of supporters. Something would have to be done to stop the leakage. A guarantee fund was started last year, but it had not realised what the committee anticipated. In speaking further, the Treasurer observed that this year the society had lost one of its silver challenge cups, owing to it having been won outright by Mr. C. V. Powell, Hereford. The cup was presented to Mr. Powell by the chairman, who subsequently expressed the hope that some public-spirited citizen or company in Birmingham would give another cup in the place of the one they were parting with. Other speakers included Messrs. William Spinks, Alfred Cryer, J. H. Goodacre, John Hughes, W. H. Morter, A. R. Brown, and G. Pressley. The proceedings were enlivened by an excellent repertoire of vocal and instrumental talent.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Royal Horticultural Hall on Monday, December 13. Mr. C. H. Curtis presided. Four new members were elected, and one nominated. The sum standing to the credit of the late Mr. J. C. Tallack in the society's books, viz., £39 1s. 6d., was granted to his widow. Three members, over 60 years of age were granted their interest, as per Rule 18. Two distressed members were relieved from the benevolent fund. The sick pay since the last meeting was £44 7s.

British Gardeners' Association (London Branch).

The monthly meeting of this branch was held at Carr's Restaurant on December 9. Mr. E. F. Hawes presided.

The financial statement made by the treasurer regarding the smoking concert held on November 27, showed that the total receipts amounted to £4 6s., and the expenses incurred to £1 8s., leaving a balance in hand of £2 18s. This will be used to carry on the work of the branch. The concert having proved such a social and financial success, it was proposed by Mr. Andrews and supported by the chairman and Mr. Winter, that a Bohemian concert be held in March next at Essex Hall. The proposal was favourably received by the meeting, and the matter will be considered by the committee in due course.

It was announced that, as a result of the paper given by Mr. Hawes at last month's meeting, on "State Recognition of Horticulture," a sub-committee has been formed by the executive council with a view to taking some definite action in the matter. Considerable interest was shewn in the answer to the following problem submitted: "An oval bed, 16ft. by 12ft., is to be planted with bulbs placed 6in. apart; how many bulbs will be required?" The answer given by Messrs. Andrew Barnes and Tidy were 600 bulbs; the correct figures being 603.1872.

The Chairman then called upon Mr. Cockram, who gave an address upon "Battersea Park," dealing with its most interesting features. The discussion which followed was taken part in by Messrs. Gorham, Barnes, Winter, Tidy, and Feltham. The meeting concluded with a hearty vote of thanks to the speaker for his interesting paper.

Chester Paxton Society.

The annual general meeting was held on Saturday last, Mr. A. W. Armstrong presiding. The Hon. Secretary and Treasurer (Mr. G. P. Miln), presented a report of the year's transactions. This showed the affairs of the society to be in a healthy condition, both financially and as regards numerical strength. Comment was made on the recent exhibition of fruits and chrysanthemums as being the best and most successful since the inauguration of the society; and also on the satisfactory course of winter lectures.

The respected President (Mr. T. Gibbons Frost, C.C.), was re-elected, as were also the vice-presidents, Major MacGillycuddy, J.P., and Mr. James G. Frost, J.P. Mr. A. W. Armstrong was re-elected chairman of committee, and Mr. G. P. Miln, hon. secretary and treasurer, with Professor R. Newstead, M.Sc., etc., as consulting naturalist. The following were appointed as the local Executive Committee for the ensuing year: Messrs. N. F. Barnes, J. Clack, O. Edwards, W. Evans, T. Gilbert, H. Lawson, W. H. Little, S. May, E. Palin, W. Pringle, W. Reeves, Jos. Ryder, W. Seddon, E. Stubbs, R. Wakefeld, J. Weaver, and J. Wynne. Appointments were also made on the committee for the outlying districts in Cheshire and North Wales.

Bristol Gardeners' Association.

A meeting of this association was held on December 9, at St. John's Parish Rooms, presided over by Mr. E. T. Parker, and supported by Dr. Shingleton Smith. A special feature was a magnificent collection of zonal pelargoniums staged by Messrs. Garaway, containing all the leading varieties, those worthy of special mention being King Victor, Arabic, Cymrix, Hibernia, Carmania, President McKinley, and Duke of Bedford. In addition there was a bamboo stand filled with Improved Raspail. The exhibit was deservedly awarded a special certificate. The lecturer was Mr. Gostling, gardener to Mr. A. G. Groves, Horfield Lodge, who read an interesting paper upon "Manure as the Gardeners' Friend." The lecturer said since the introduction of mechanical traction there was becoming a greater difficulty in obtaining animal manure, consequently artificial manures were in greater demand. Mr. Gostling recommended nitrate of soda for onions and cabbage, and superphosphate for potatoes, he also caused astonishment by naming fir needles as being beneficial as a fertiliser for the latter vegetable. He was questioned as to whether a dressing of turpentine would not have the same result. A good discussion followed, taken part in by the chairman and Dr. Smith, and Messrs. Curtis, Candy, Binfield, Shelton, Scott, Levick, Jennings, Harford, House, Garnish, Holbrook, and Woodward. Hearty votes of thanks were accorded to lecturer and chairman. An invitation was given to the association by Mr. Groves to view his collection of hybrid cypripediums. For two cypripediums Messrs. Gostling, Jennings, and Curtis were placed in the order of their names.

Liliums.—L. Harrisi, L. Longiflorum, L. speciosum, L. auratum, etc., etc., should be potted up as soon as received from the nurseryman, using a compost of good turfy loam with the addition of leaf-soil, silver sand, and broken charcoal to keep it porous; some growers advise the use of peat for liliums, and it may be useful where the loam is of a very close nature, but otherwise it is not necessary. The size of pot they should be potted in must be determined somewhat by the size of the bulbs, and for what they are used when in bloom. For general conservatory use they are either potted singly or three in a pot, though if required for filling large vases when in bloom then from five to nine bulbs may be used. In most cases, room should be left for a top-dresing of soil when the young roots push out from the stem just above the bulb. After potting place in a frame, and water in, afterwards covering the pots with leaf-mould or old fibre. — Thomas Stevenson.

NEW BOOKS.

WARLEY GARDENS IN SPRING AND SUMMER.

By Ellen Willmott, F.L.S., V.M.H. (Bernard Quaritch, 11, Grafton Street, New Bond Street, W.). Price, one guinea net.

Warley Place has long been known far beyond the boundaries of the United Kingdom as the home of the most distinguished lady horticulturist of this or any other country; and its gardens have become famous for their beauty and interest. They are especially remarkable for the large number of rare and beautiful hardy and other plants that have found a home within them, and for the immense amount of pleasure they are so well able to give to those who have the privilege of visiting them when the flowers of spring and summer are yielding the most freely of their varied charms. Knowing how great is the interest that Miss Willmott takes in horticultural matters generally, and that her gardens are veritable treasure houses of choice plants, we are in no way surprised that there should have arisen a strong desire among flower lovers to learn something more about the Warley Gardens than is to be obtained from the plants that are from time to time submitted to public notice at the exhibitions. This desire has not been the outcome of idle curiosity, and we have therefore more than the ordinary degree of pleasure in calling attention to the eminently successful endeavour that Miss Willmott has made to enable the garden-loving community to participate in some degree with her in the pleasures the Warley Place Gardens are so well able to give. The handsome folio containing forty finely-executed illustrations of the more characteristic features is assured of a hearty welcome wherever Miss Willmott and her gardens are known.

The book may not perhaps fully satisfy those who wish to obtain information relating to the Warley Place Gardens beyond that which the remarkably fine illustrations are able to give. We should have enjoyed a description of the gardens, an account of the process of development, and a reference to each of the features illustrated. They would certainly have furnished reading of much interest, and some that would have been useful to those engaged in the solution of the problems involved in the cultivation of many of the more beautiful forms of plant life. There is, however, no occasion to dwell upon this point, and in enjoying the series of illustrations which are from photographs taken by Miss Willmott, the mind is not likely to be diverted from the pleasure they are so well able to afford or the lessons they teach.

The first of the illustrations is that of Warley Place, with its ivy-clad walls and fine old trees that occupy a prominent position in front of the mansion. This is followed by an illustration of a glorious display of crocuses, which is of much interest as showing how delightful is the effect produced by these bulbs when planted in suitable positions. Not less interesting is the picture of daffodils clustering around an old oak in the wild garden. The several views of the rock garden are so beautiful that one could wish they could be referred to in detail, but that not being possible it must suffice to mention those in which dog's-tooth violets, alpine primroses, ramondias, harebells, and mountain pinks are the most conspicuous. Not less beautiful or interesting are the several water scenes, and the illustrations of borders of hardy perennials. One of the finest of the illustrations and certainly one that appeals very strongly to us is that of Nankeen lilies, for in this we have pictorial effect and technical skill combined in a marked degree.

As this is a time for making presents, we would mention that we know of no book that would be more suitable for giving to a friend who takes an active interest in his garden. But probably the majority of those who add it to their library will agree with us that it is essentially a book to buy, and keep, as the enjoyment it affords is not likely to be soon exhausted.

CATALOGUES RECEIVED.

SUTTON AND SONS, READING.—Splendidly got up, as usual, finely and freely illustrated, the seed catalogue for 1910 is as interesting as any previous issue. The firm's specialities are well portrayed, and there are coloured illustrations of sweet peas and antirrhinums.

JAS. VEITCH AND SONS, LIM., KING'S ROAD, CHELSEA.—In this seed catalogue the Veitchian specialities in vegetables and flowers receive prominent attention, and a large number of these as well as other excellent varieties are illustrated. The descriptions are excellent, and there is a fine coloured plate of new Hybrid Gerberas.

E. WEBB AND SONS, WORDSLEY, STOURBRIDGE.—This new seed catalogue opens with a list of kinds and varieties of vegetables suitable for intensive or French gardening. There are 159 pages of matter, interesting and instructive, and freely illustrated.

DICKSONS, LIM., CHESTER.—A comprehensive catalogue of flower and vegetable seeds, flower roots, and sundries. Well arranged, illustrated, and indexed.

DICKSON AND ROBINSON, CATHEDRAL STREET, MANCHESTER.—In its new seed catalogue this firm makes a special feature of onions, peas, and lettuce, while primulas form a leading item in the extensive flower seed division.

Will be Published on January 8, Price 2d., by post, 2½d.
SPECIAL ARTICLES AND MANY ILLUSTRATIONS
AND
A Beautiful Almanack for 1910,
PRINTED IN COLOURS.
☛ ADVERTISEMENTS FOR THIS ISSUE RECEIVED UNTIL TUESDAY, JAN. 4.
Make a good start for the Year by securing space in this SPECIAL NUMBER.
Offices: 148 and 149, Aldersgate Street, London, E.C.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

CHICORY.—A. F. A., Oswestry: Chicory is very useful for winter salads, and it presents no difficulties in the matter of cultivation. Seeds should be sown thinly at the end of June or quite early in July, and the seedlings thinned out as soon as they can be properly handled, to a foot apart. In a hot, dry season a few plants will run to seed, but under good treatment and early thinning the great majority will make strong crowns that will remain, seakale fashion, after the leafage falls away in late autumn. These crowns and roots are lifted and put a few at a time in a mushroom house or other dark comfortably warm place, where they will produce crisp, well blanched leaves that are a fine addition to the salad bowl during winter.

SHREDS FOR WALL TREES.—S. P., Guernsey: Shreds for the purpose of fixing fruit trees, etc., to walls, may be obtained from the various sundriesmen who advertise in our columns. Those so purchased are treated with some preservative that lengthens their life considerably. Where there is time to do so it is a good plan to loosen a good deal of the growth of wall fruit trees each season and re-nail to the wall in regular fashion, at the same time relieving the trees of unnecessary growth. This loosening of the growths also enables the operator to use insecticides if these are necessary, or their uses seem desirable by way of preventive. We think most people cut up old clothes to provide shreds for wall trees.

SWEET PEA TRIALS IN 1910.—T. P., Worcester: We thought this matter had been made quite plain. The National Sweet Pea Society's trials of new sweet peas will be held in 1910 at the Times Experimental Station, Sutton Green, near Guildford, and will be conducted by Mr. Chas. Foster. The charge for new varieties is 2s. 6d. each, and for tests of purity of stock 5s. each; the names of the varieties, together with the charges for the trials, should be sent at once, or at any rate, very early in the New Year, to Mr. C. H. Curtis, hon. secretary, Adelaide Road, Brentford; and the seeds, together with a colour description of each variety, should be sent at the same time to Mr. Foster. Mr. Curtis will send you full particulars and instructions on this and any other matter relating to the N.S.P. Society.

"DRYING OFF" ODONTOGLOSSUMS.—A. F. H., Farningham: The old ideas that all orchids need a very high temperature to grow in, and very dry resting conditions, have long been exploded, and with greater attention to natural conditions, and consequently to cultural requirements, orchid culture is now no awful mystery, but a part and parcel of the routine work in every large establishment that is skilfully managed. The deciduous dendrobiums and the beautiful little pleiones may be instanced as kinds that need a very decided season of rest and dry conditions of root and atmosphere during that period. In the case of odontoglossums, anything approaching a "drying off" process would inevitably result in failure and loss, except with the O. grande group, which do prefer much drier resting conditions, and have a more decided resting period than the rest of the odontoglossums. In the case of O. crispum, and the large number of species and hybrids that are associated with it under cultivation, there is no period of the year when the plants need to be subjected to a dry atmosphere and absence of water at the roots. Even when there is no new growth apparent, and no spikes are being pushed forward, the plants must not be kept dry or they will lose their leaves and have their constitution impaired. At such a time, of course, the amount of water necessary is much smaller than when new growth and new roots are active.

TRIALS OF ROSES.—M. M. G., Leicester: We believe that the only public trial of roses yet conducted were those that attracted so much attention in 1909 in the Bagatelle Gardens, Paris. So far our own National Rose Society has not moved in this matter. If it would hold an independent and public trial of either Hybrid Tea or Rambling roses, we are of opinion the society would be doing excellent work, and the varieties would be judged on their merits in comparison one with the other, and their characters in the matter of continuity of blooming, growth, colour, fragrance, hardiness, etc., could be better gauged thus, by an independent jury, than in any other way.

BOSKOOP GIANT BLACK CURRANT.—W. G., Matlock: Although this variety seems far less liable to the attacks of the black currant bud mite than others, we cannot say that it is entirely immune. It is our experience and the experience of others that the variety does occasionally become attacked lightly. The variety grows strongly and bears freely, and the berries are of fine size. For the garden it is a fine black currant, but we doubt its value for market because the large berries are so luscious that they are liable to break when packed in sieves for market, especially if they have a considerable journey either by road or rail before reaching the market. If you have a local market, then the difficulty disappears.

SMALL FRUIT CULTURE IN SUSSEX.—D. H. D., Crawley: The matter is of very great importance, and would require more space to answer than we can afford under the heading of "Answers to Correspondents." The subject of "Small Fruit Growing in Kent" has been very ably dealt with in detail by Mr. C. H. Hooper in the November (1909) issue of the "Journal of the Board of Agriculture," a copy of which may be obtained through any bookseller or newsagent for 1d. As this contains the kind of information you need, and has reference to the neighbouring county, we advise you to obtain it.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

J. G., Levenshulme.—1, Solanum capsicastrum; 2, Ardisia crenulata.

H. P. A., March.—1, Helleborus niger; 2, Physalis Franchetti; 3, Cattleya Trianæ.

L. D. M., Oxford.—1, Salvia angustifolia; 2, Cypripedium insigne; 3, Erica gracilis; 4, Sparmannia africana.

F. P. S., Morpeth.—1, Pelargonium Lady Plymouth; 2, P. crispum; 3, Linum trigynum; 4, Gymnogramma Mayi.

W. F., Norwich.—1, Selaginella cæsia; 2, S. Kraussiana aurea; 3, Zebrina pendula; 4, Phrynium variegatum; 5, Cupressus Lawsoniana; 6, Maxillaria variabilis.

NAMES OF FRUITS.

When sending fruits for naming, will our readers be good enough to send good specimens, as without these it is not possible to accurately determine the varieties. Pack firmly, using light tin or wood boxes, and send not more than six varieties at once. Label each specimen and enclose letter with the fruit, whether a separate notification is sent or not. Address the packages to the Editor, GARDENERS' MAGAZINE, as advised in the notice at the head of "Answers to Correspondents."

E. B., Everton.—1, Norfolk Beefing; 2, Court Pendu Plat.

G. E. C., Weybridge.—1, Newton Wonder; 2, Dutch Mignonne.

O. D. K., Ipswich.—1, Bismarck; 2, Blenheim Pippin; 3, Court of Wick.

S. S. R., Southend.—1, Sykehouse Russet; 2, Golden Noble; 3, Catillac; 4, King of the Pippins.

MARKETS.

COVENT GARDEN.

Flowers.

An excellent demand has prevailed and the market has been particularly busy. Supplies large and good and prices fair.
